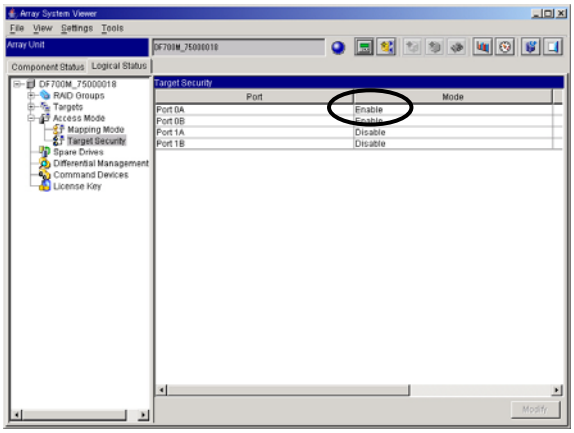
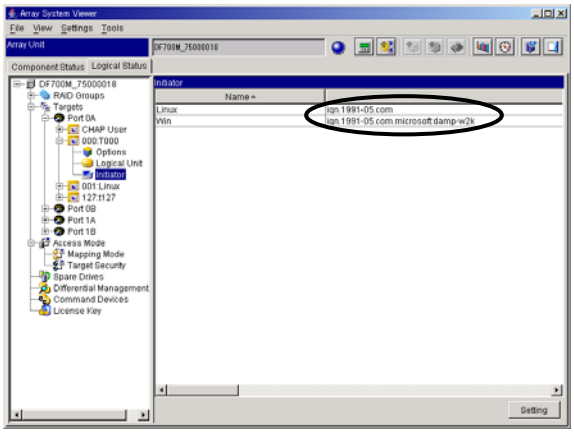
(d) On the unit window, click the [Logical Status] tab.



‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.



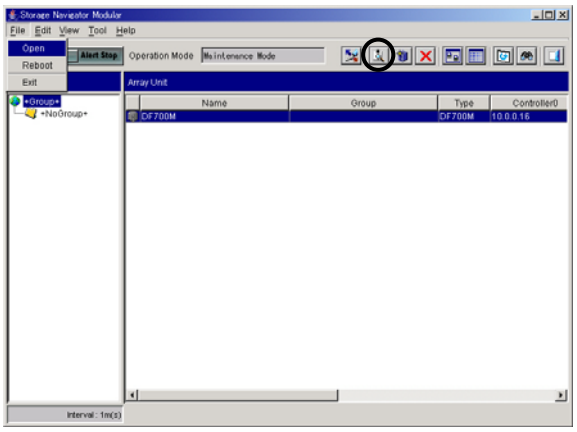
(e) Double click [Access Mode] from the tree in the unit window, and select [Target Security].

(f) Check that the target security of the specified port is [Enable].

(g) Double click [Targets] from the tree, and double click the port which enabled the target security. Click [000:T000], and select [Initiator].
Check the iSCSI Name.

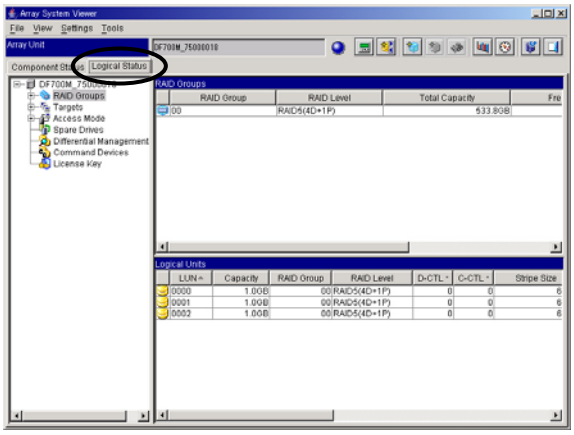
Copyright © 2005, Hitachi, Ltd.

(3) New/Change of the Initiator iSCSI Name



(a) Turn on the power supply.

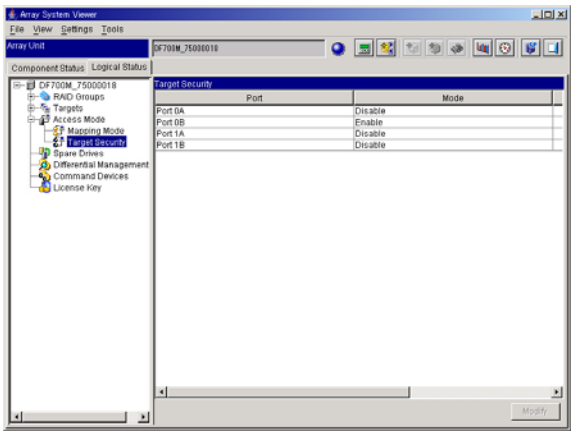
(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



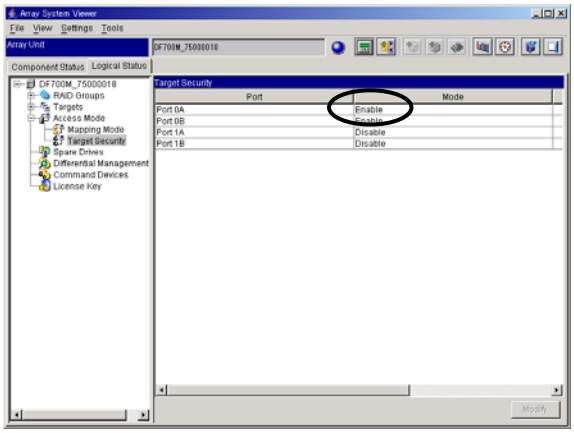
(c) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

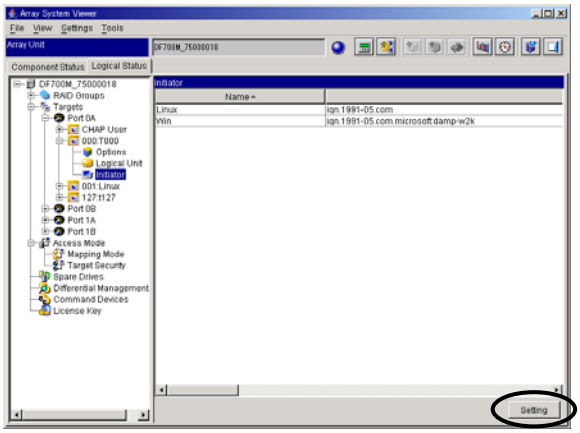


(d) On the unit window, click the [Logical Status] tab.



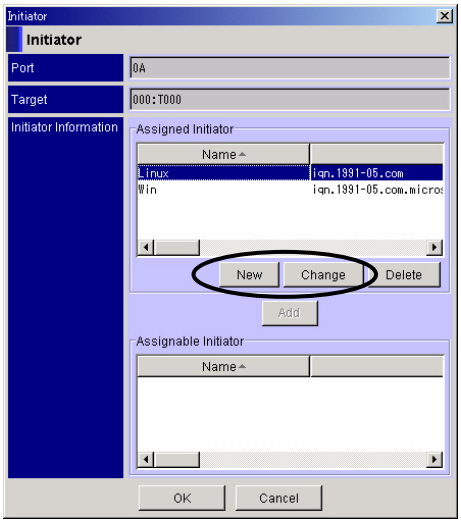
‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.

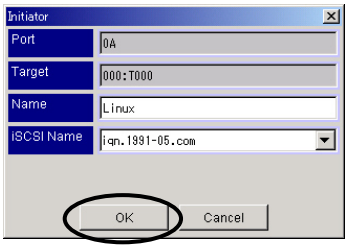


(e) Double click [Access Mode] from the tree in the unit window, and select [Target Security].

(f) Check that the target security of the specified port became [Enable].



(g) Double click [Targets] from the tree, and double click the port which enabled the target security. Click [000:T000], and select [Initiator].



Copyright © 2005, Hitachi, Ltd.

(h) Click the [Set] button.

(i) Select the name to be changed, and click the [Change] button.
If it is new, click the [New] button.

(j) Enter [Name] and [iSCSI Name], and click the [OK] button.

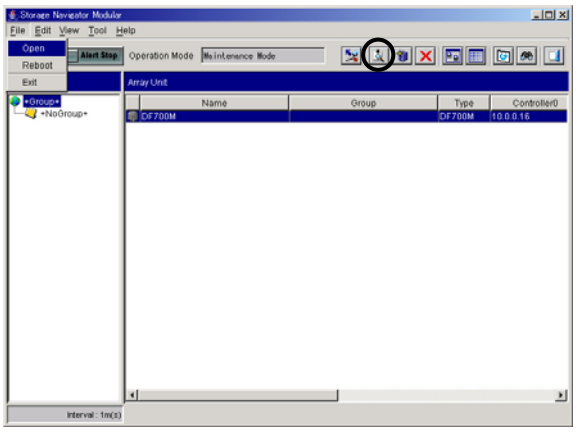
① Name : Enter the name with the half size alphabetic characters and numerals within 32 characters (excluding \, /, :, ,, ;, *, ?, ", <, >, |, and '). The spaces at the top and the end are disregarded. The same name cannot be used in the same port.

② iSCSI Name : Enter the port name with the hexadecimal number of 16 digits

(k) Click the [OK] button in the Initiator dialog box.

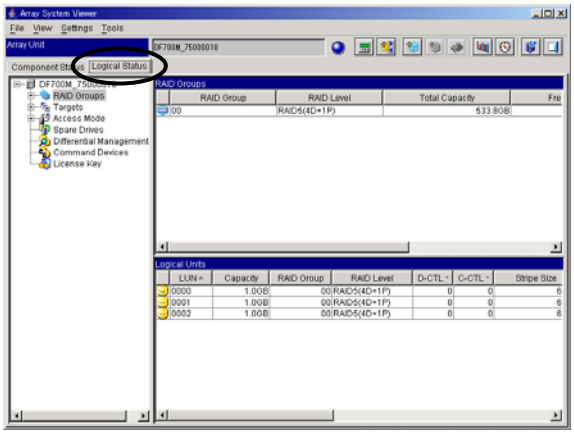
(l) The confirmation message is displayed. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.



(4) Changing the User Name and the Secret of the Initiator authentication/interactive authentication

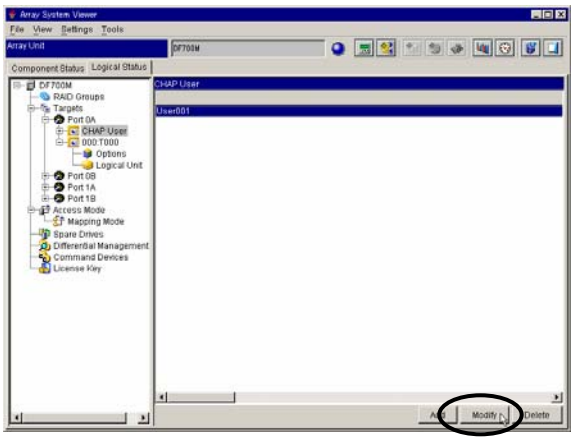
(a) Turn on the power supply.



(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).

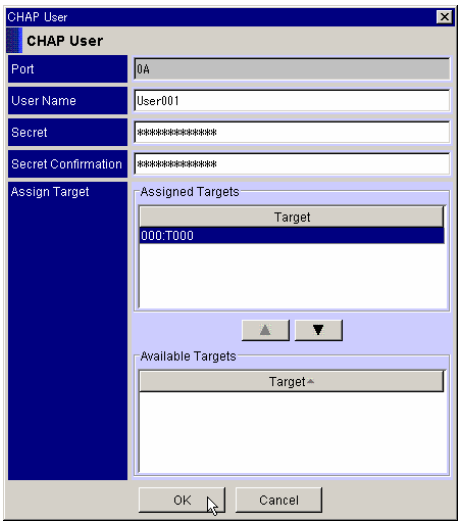
(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]



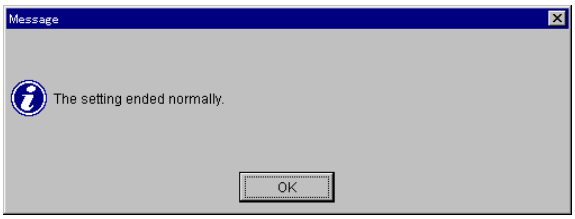
(d) On the unit window, click the [Logical Status] tab.

‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).



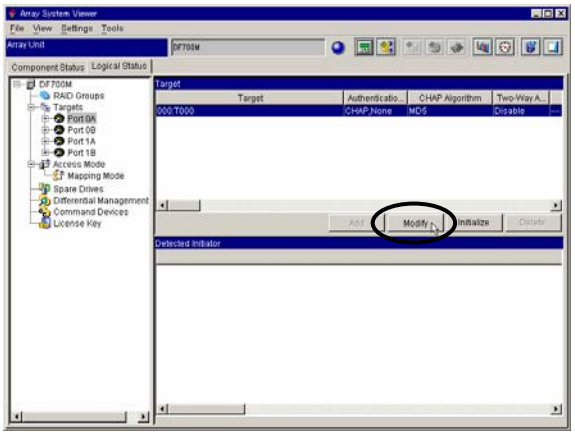
Copyright © 2005, Hitachi, Ltd.

(e) Double click the port which changes the CHAP User, and select [CHAP User].

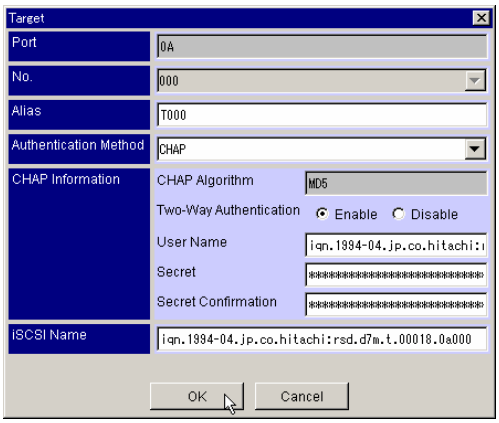


(f) Select [CHAP User] to be changed from the CHAP User list, and click the [Change] button. The CHAP User dialog is displayed.

(g) Enter "User Name" and "Secret" which are the same with those on the host computer side in [User Name], [Secret] and [Secret Confirmation] in the CHAP User dialog, and click the [OK] button.



(h) The confirmation window is displayed. Click the [OK] button.

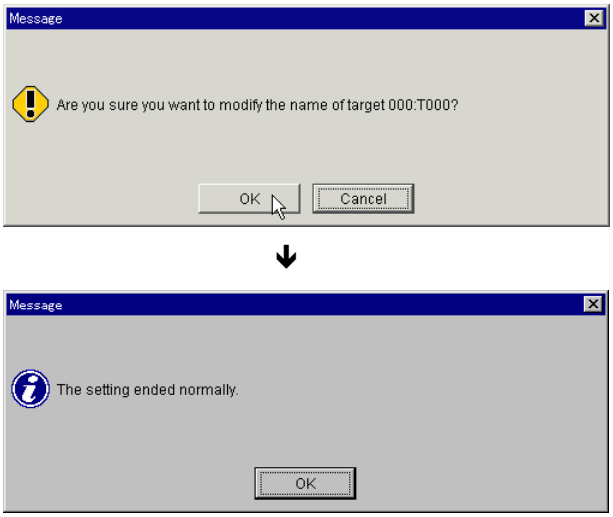


Copyright © 2005, Hitachi, Ltd.

(i) Select [000:T000] by double clicking the port which changes the information of the interactive authentication, and click the [Change] button.
The Target dialog is displayed.

(j) When the interactive authentication is [Enable], change “User Name” and “Secret” which are the same with those on the host computer to [User Name] and [Secret].

① User Name : Enter the User Name with the half size alphabetic characters and numerals within 256 characters.
The following signs can be used「.」,「-」,「+」,「@」,「_」,「=」,「:」,「/」,「「」、「」」,「~」, and space).



② Secret : Enter the half size alphabetic characters and numerals of 12 characters or more and within 32 characters in the Secret.
The following symbols can be used. (「.」,「-」,「+」,「@」,「_」,「=」,「:」,「/」,「「」、「」」,「~」, and space)

③ Secret Confirmation : Enter the characters entered in the Secret.

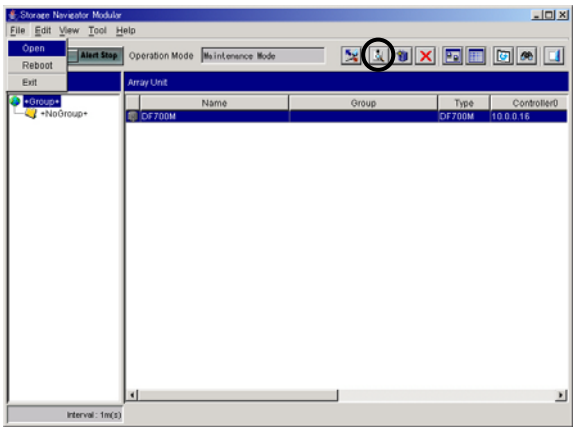
Copyright © 2005, Hitachi, Ltd.

(k) Click the [OK] button.

(l) The confirmation window is displayed. Click the [OK] button.

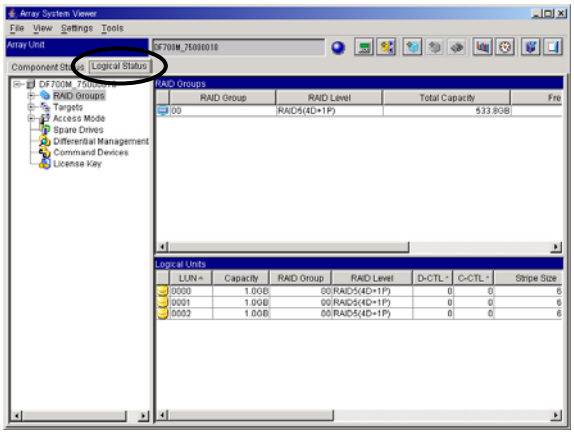
Copyright © 2005, Hitachi, Ltd.

(5) Checking the iSCSI Name of the Target



(a) Turn on the power supply.

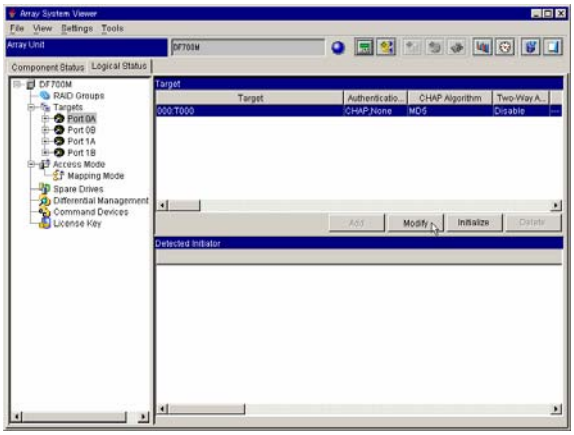
(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



(c) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]



(d) On the unit window, click the [Logical Status] tab.

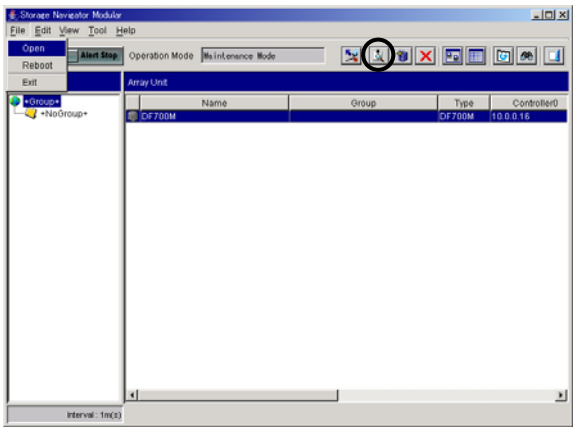
‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.

(e) Double click [Targets] from the tree, and select the port.
Check the iSCSI Name of the Target.

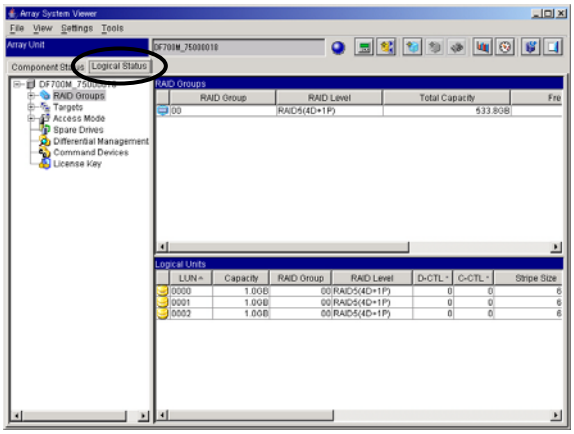
Copyright © 2005, Hitachi, Ltd.

(6) Checking the CHAP User registration



(a) Turn on the power supply.

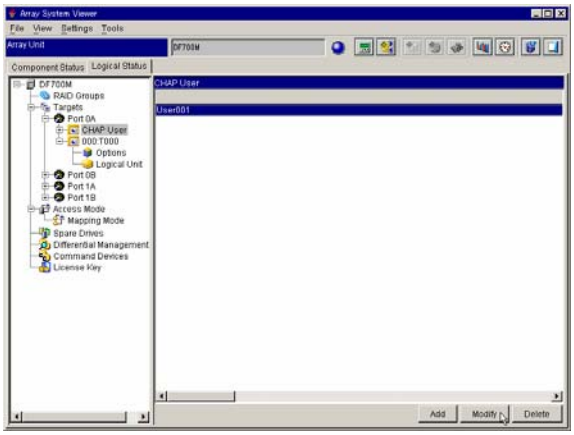
(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



(c) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]



(d) On the unit window, click the [Logical Status] tab.

‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.

(e) Double click [Targets] from the tree, and double click the port.
Check that there is the list of the CHAP User by clicking [CHAP User].

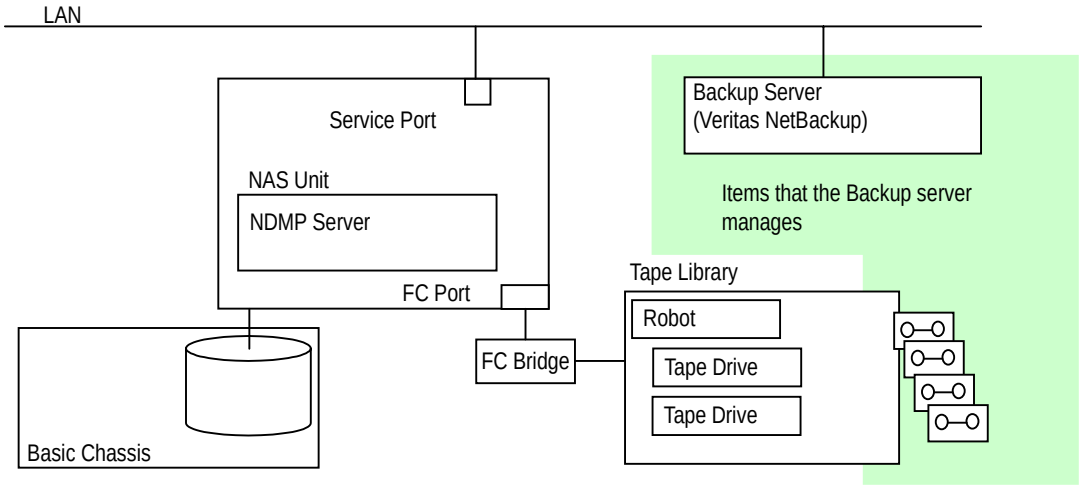
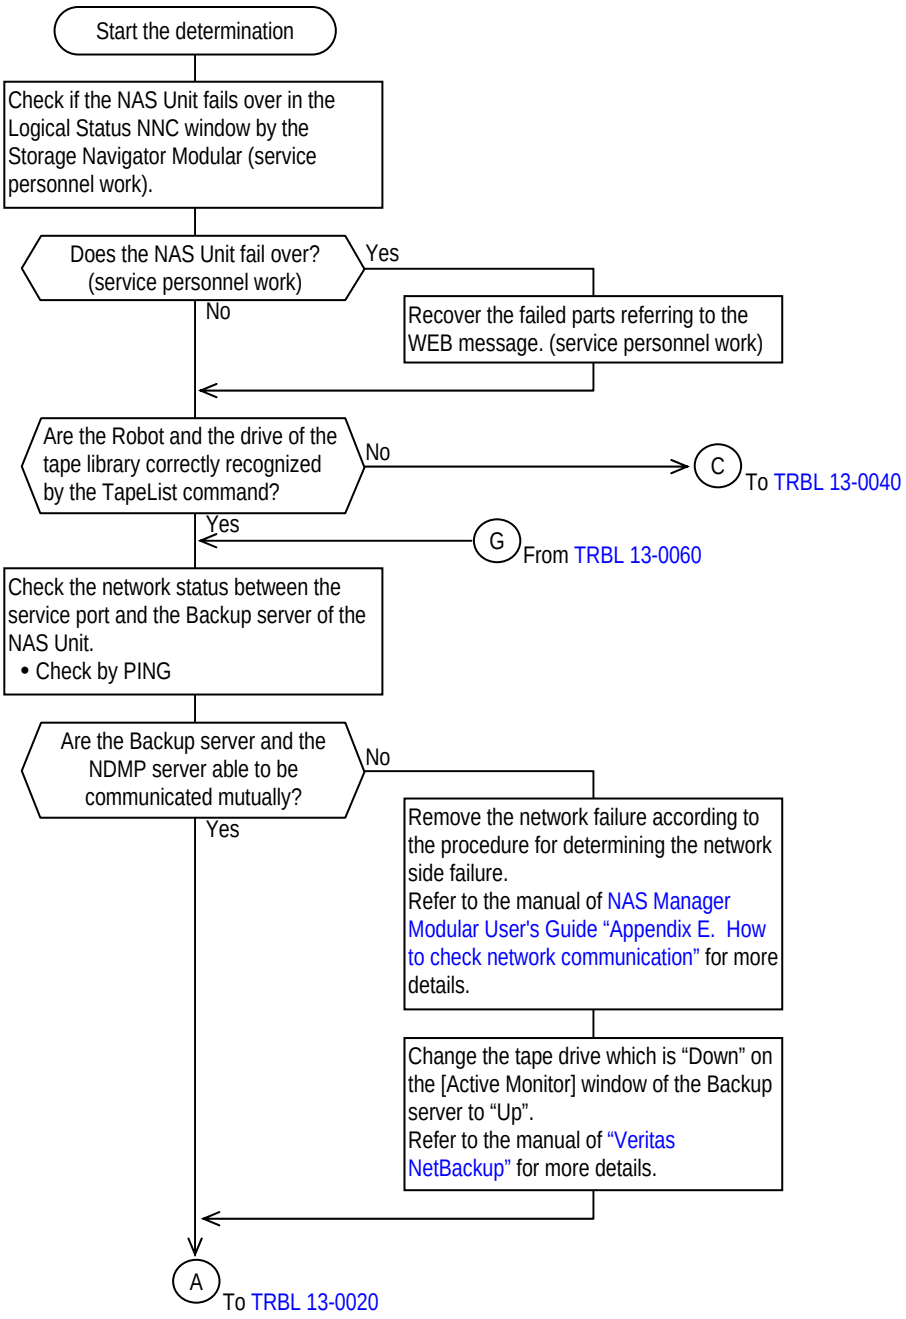
Chapter 13. Procedure for Determining Failure of Local Tape in NAS System

When a failure occurs between the NAS Unit and the Local tape, and between the NAS Unit and the Backup server, it is determined according to the following flow.
Check that the user setting is performed correctly on the Backup server before starting the determination.





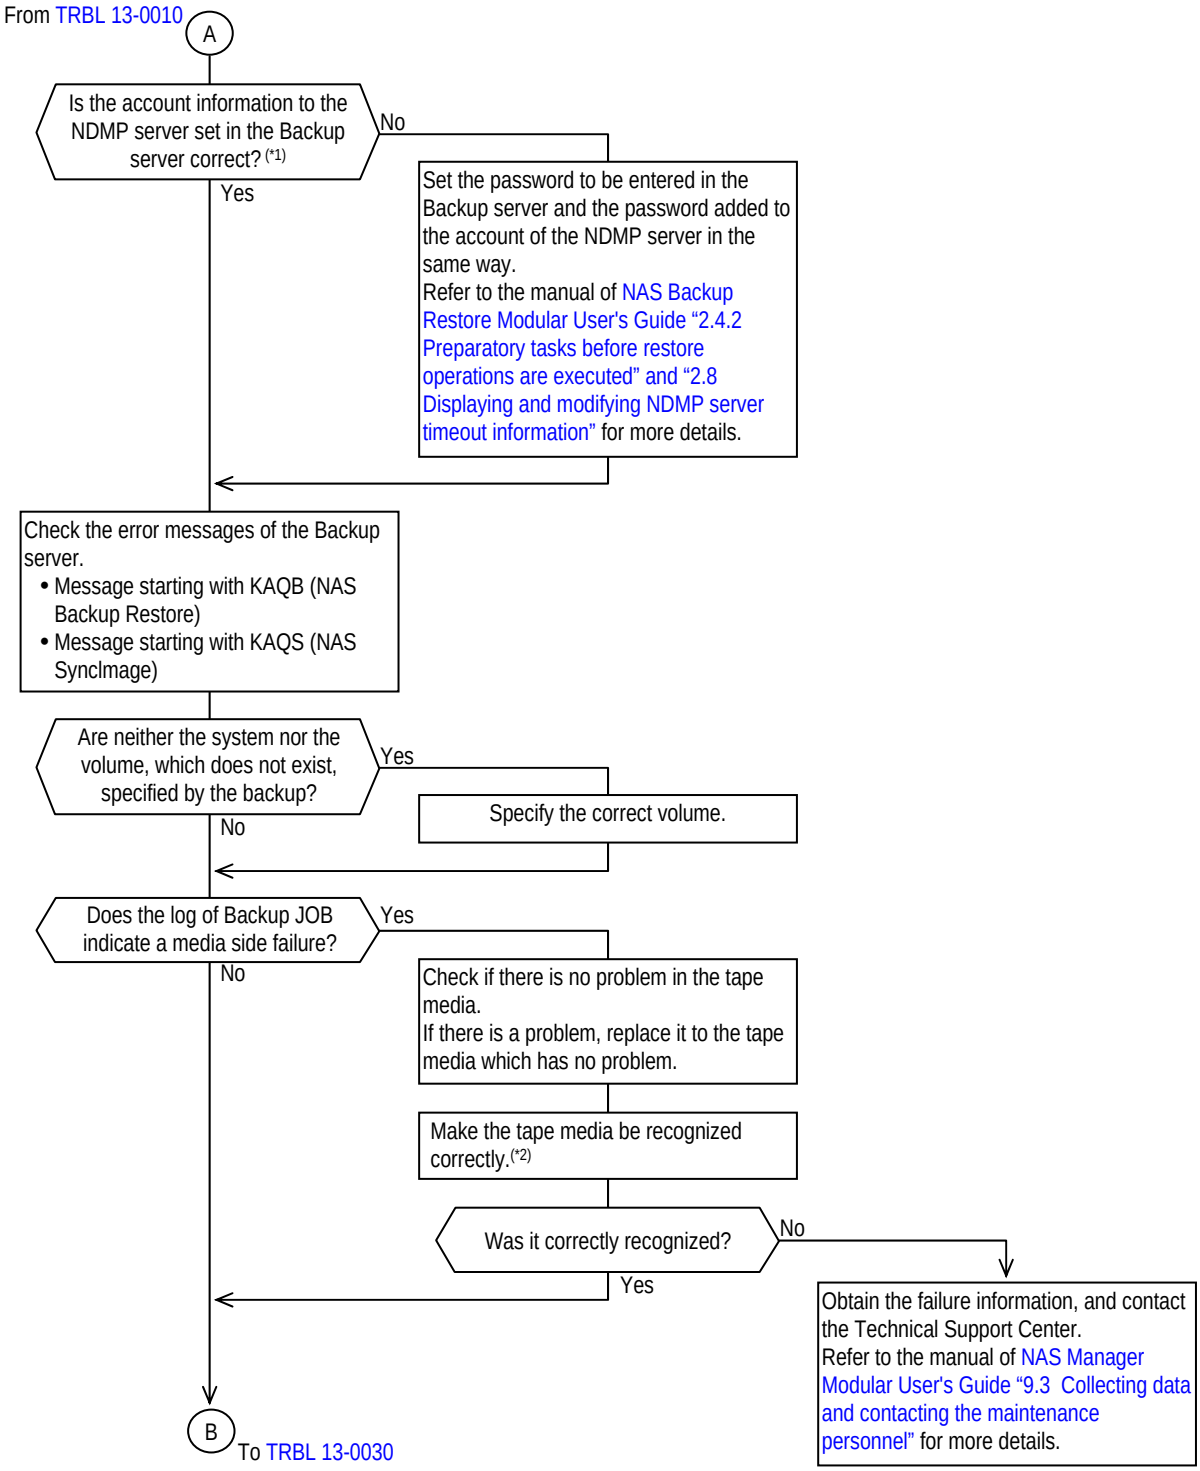


Figure 13.1.1 Configuration Diagram

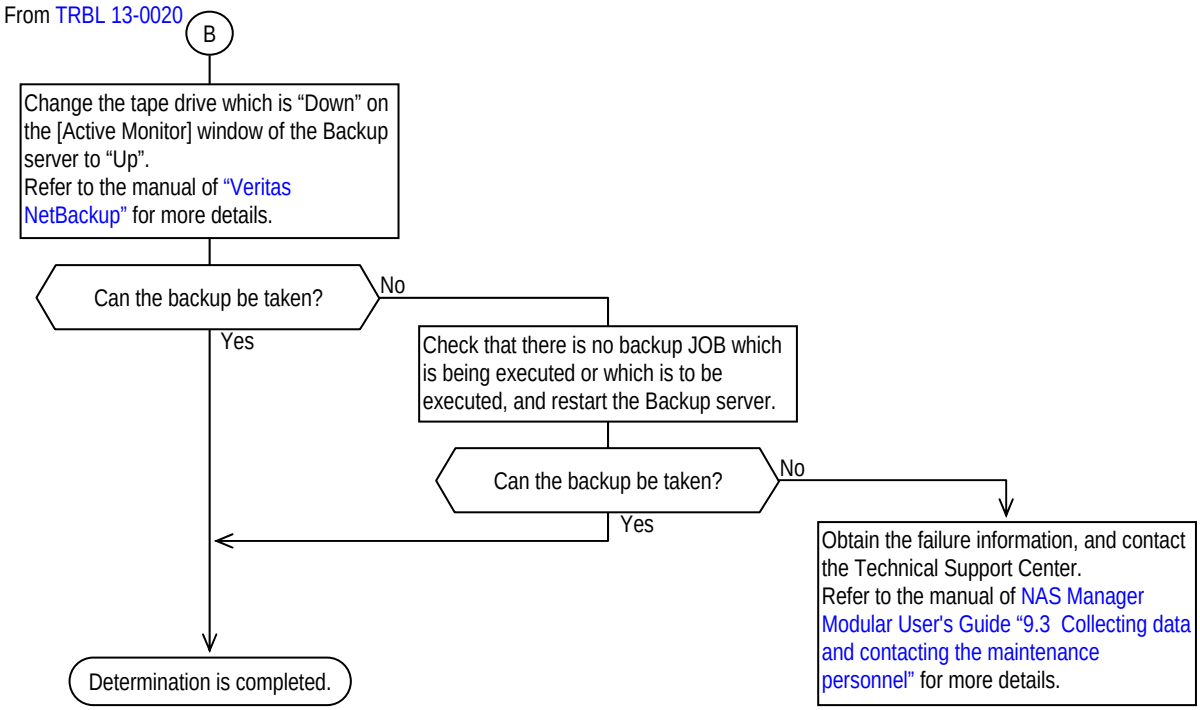
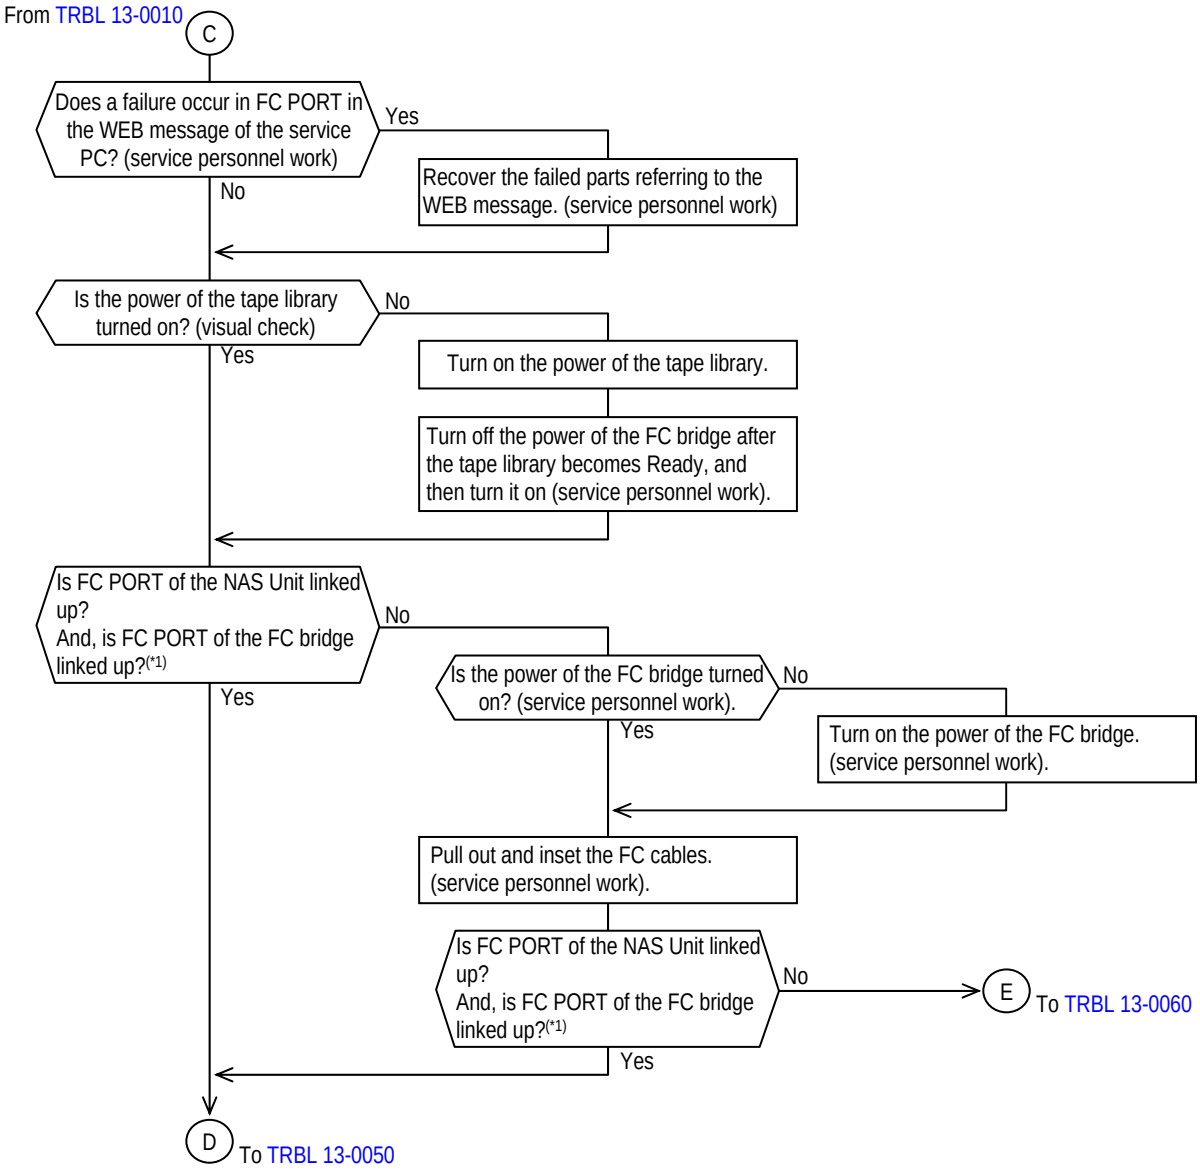
Request a customer or an SE from the service personnel to check the following determination procedure and perform the work together. However, the service personnel must perform the parts described as “service personnel work” in the flow.

Copyright © 2006, Hitachi, Ltd.



Copyright © 2006, Hitachi, Ltd.



*1 : The account information is correct if "set_ndmp_attr-verify<NDMP server name>" is executed in the CLI operation of NetBackup and "Login was successful" is displayed.

*2 : Select [Update volume configuration] of [Robot Inventory] registered in the Backup server (Veritas NetBackup), and click the [Start] button.

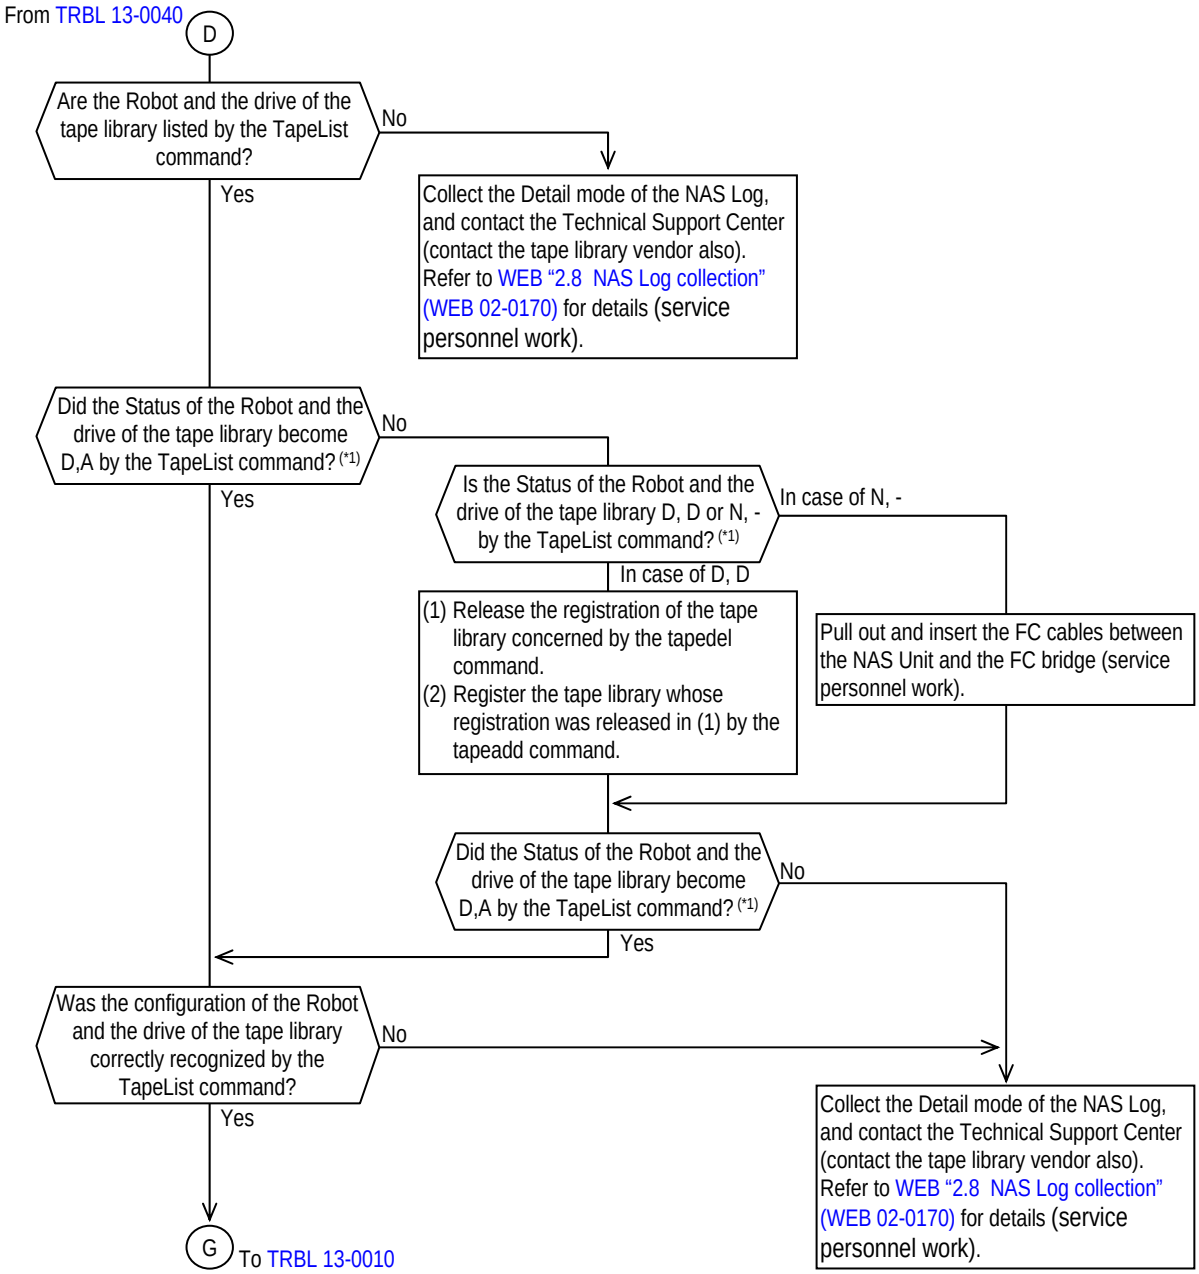
Copyright © 2006, Hitachi, Ltd.

Copyright © 2006, Hitachi, Ltd.

*1 : The conditions that the FC link is normal are (1) and (2) as shown below.

(1) The LED on FC PORT of the FC bridge lights up.

(2) FC PORT links up from the following (refer to the NAS Manager Modular User's Guide).



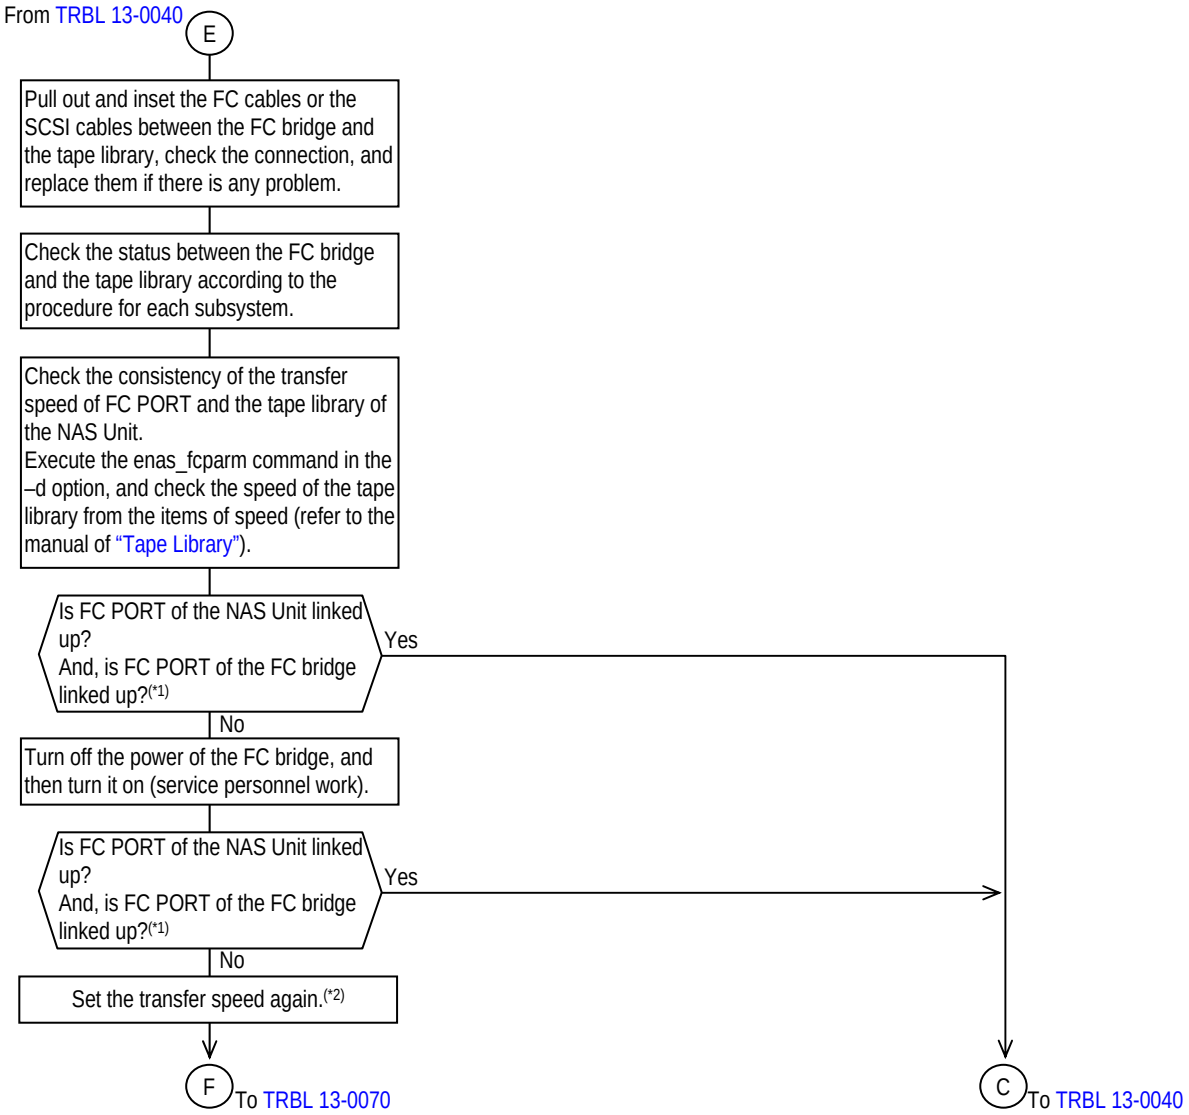
(a) "List of RAS Information (List of Message)" is displayed from [Main Menu] ⇒ [RAS Management]

(b) Check the most recent one whose "Message ID" is the following.

KAQG35060-I: Connection of the FC port linked up.

KAQG35061-W: Connection of the FC port linked down.

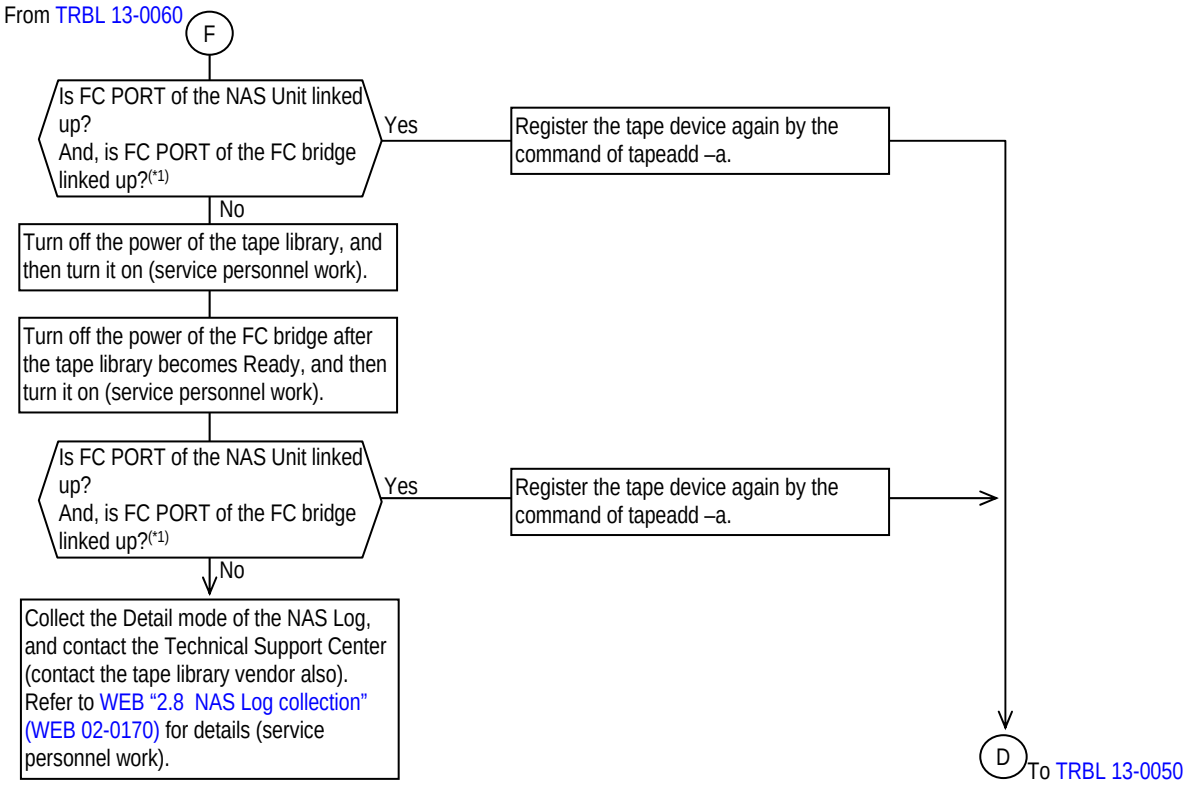
Copyright © 2006, Hitachi, Ltd.



*1 : Check the "Status" part of the following list.

It is correct if each subsystem is visible and the Status becomes D,A.

```
nasroot@D710001515:~$ sudo tapelist
Mar 23 11:58:56 KAQB11500-I tapelist command execution has started.
Mar 23 11:58:56 KAQB12225-I The list of tape device information will now be displayed.
LUN Model          Type             Status Path
--------------------------------------------------------------------------------
  0 L40            Medium Changer   D,A    /dev/enas/100000e00202d78e/sg00
  1 Ultrium 2-SCSI Sequential-Access D,A   /dev/enas/100000e00202d78e/nst01
  2 Ultrium 2-SCSI Sequential-Access D,A   /dev/enas/100000e00202d78e/nst02
  3 Ultrium 2-SCSI Sequential-Access D,A   /dev/enas/100000e00202d78e/nst03
  4 Ultrium 2-SCSI Sequential-Access D,A   /dev/enas/100000e00202d78e/nst04
Mar 23 11:58:56 KAQB11501-I tapelist command has finished.
nasroot@D710001515:~$
```



Copyright © 2006, Hitachi, Ltd.

*1 : The conditions that the FC link is normal are (1) and (2) as shown below.
(1) The LED on FC PORT of the FC bridge lights up.
(2) FC PORT links up from the following (refer to the NAS Manager Modular User's Guide).
(a) "List of RAS Information (List of Message)" is displayed from [Main Menu] ⇒ [RAS Management]
(b) Check the most recent one whose "Message ID" is the following.
KAQG35060-I: Connection of the FC port linked up.
KAQG35061-W: Connection of the FC port linked down.

*2 : Perform the input to the NAS Manager Modular by ssh.
(1) Delete all the registered tape drives by the tapedel command.
(2) Revise the speed setting of FC PORT to 2Gb/s by the enas_fcparm –s 2 command, and restart FC PORT.
When the speed of the tape is 1Gb/s in the above-mentioned, it is enas_fcparm –s 1.
(3) Check if the speed setting was reflected by the command of enas_fcparm -d.

Chapter 1. Before Starting Trouble Analysis

A message reports the contents of the failures detected during the operation.
The failures detected during operation after the main switch of this unit is turned on and the state of the unit are reported.
The failed part of the failure in the Fibre Channel of the drive interface is on the PATH or the Loop.

① The following messages are indicated.
- CUDG detected message ··· : 018××××× (“Chapter 2. CUDG Detected Messages” (MSG 02-0000))
- Failure messages ····· : H××××· (“Chapter 3. Failure Messages” (MSG 03-0000))
- Progress messages ····· : I××××· (“Chapter 4. Progress Message” (MSG 04-0000))
- Flash detected messages··· : R××××· (“Chapter 5. Flash Detected Messages” (MSG 05-0000))
- Warning messages····· : W××××· (“Chapter 6. Warning Messages” (MSG 06-0000))
- WEB messages ····· : (“Chapter 7. Web Error Messages” (MSG 07-0000))
- Storage Navigator Modular messages : (“Chapter 8.Storage Navigator Modular Error Messages” (MSG 08-0000))
- Sense Data····· : (“Chapter 9.Failure Analysis by Sense Data” (MSG 09-0000))
- ACE Tool Error Message ···· : (“Chapter 10. ACE Tool Error Message” (MSG 10-0000))

② Message text : Message text is indicated.

③ Description : Contents of failure are described concretely.

④ Collection of errors

	Collect the error	
	Simple Trace	

Simple trace · : Collect Simple Trace (Troubleshooting “7.3 Collecting simple trace” (TRBL 07-0040))

CTL Trace ···· : Collect CTL Alarm Trace (Troubleshooting “7.4 Collecting CTL Alarm Trace” (TRBL 07-0080))

Full Dump····· : Collect Full Dump (Troubleshooting “7.5 Collecting Full Dump” (TRBL 07-0130))

NAS Log ····· : Collect NAS Log (Troubleshooting “7.6 NAS Log collection” (TRBL 07-0230))

NAS Dump ···· : Collect NAS Dump (Troubleshooting “7.7 NAS Dump collection” (TRBL 07-0280))

Space····· : Does not need to be collected.

Copyright © 2005, Hitachi, Ltd.

⑤ Recovery methods ‥ : How to recover from failure is indicated.
①,②… ･: Recovery method number.
When "-" is written here, no recovery operation is required.
When another message other than this message is displayed, execute that trouble analysis also.
Because the status where the array subsystem is being started is in the middle of the transition to the status of the subsystem power turned on (Ready status) from the status of the subsystem power turned off, do not perform the recovery work which affects the operation of the array subsystem while the array subsystem is being started.
Also, the setting function or the reference function using the Storage Navigator Modular cannot be executed to the array subsystem which is being started.

⑥ Reference page‥ : No. of page in which the recovery methods are described.

1.1 Failed parts of the internal Fibre Channel

The failed parts of the internal Fibre Channel of DF700 are classified into the path and loop. The respective configurations of these items are shown below.

- In the case of RKM/RKAJ (or RKA)

*1: The Disk Drive #0 and the Disk Drive #0' is the same Disk Drive (the Disk Drive #1 to #14 and the Disk Drive #1' to #14' are also the same).

*2: The sequence of the Disk Drives is described in order of the signal of the Fibre Channel Loop on the Disk Drive side flowing, and it is not necessarily corresponding to the physical arrangement.

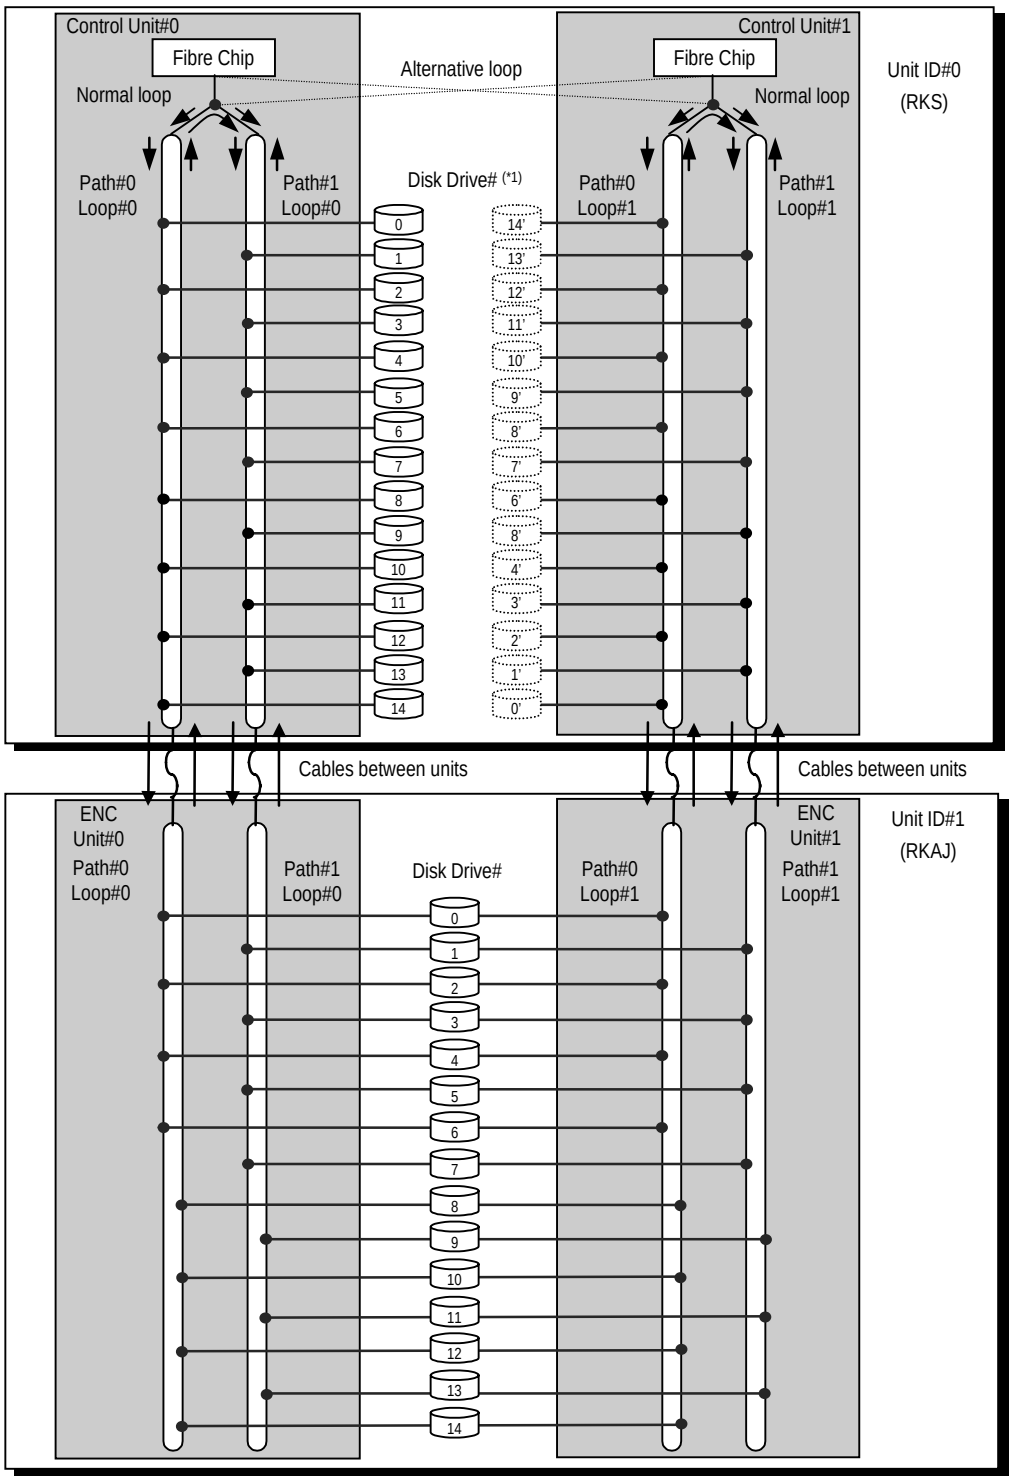
Copyright © 2005, 2006, Hitachi, Ltd.

RKM (RKM + RKAJ) has four loops at the back end, which have the following names.

- Path#0, Loop#0
- Path#1, Loop#0
- Path#0, Loop#1
- Path#1, Loop#1

The paths and loops have the following meanings.

Path



Path	Meaning
Path#0	2 Fibre lines connected to Disk Drive of even number
Path#1	2 Fibre lines connected to Disk Drive of odd number

Loop

Loop	Meaning
Loop#0	2 Fibre lines on Control Unit #0 and ENC Unit #0
Loop#1	2 Fibre lines on Control Unit #1 and ENC Unit #1

Copyright © 2005, Hitachi, Ltd.

- In the case of RKS/RKAJ

*1: The Disk Drive #0 and the Disk Drive #0' is the same Disk Drive (the Disk Drive #1 to #14 and the Disk Drive #1' to #14' are also the same).

*2: The sequence of the Disk Drives is described in order of the signal of the Fibre Channel Loop on the Disk Drive side flowing, and it is not necessarily corresponding to the physical arrangement.

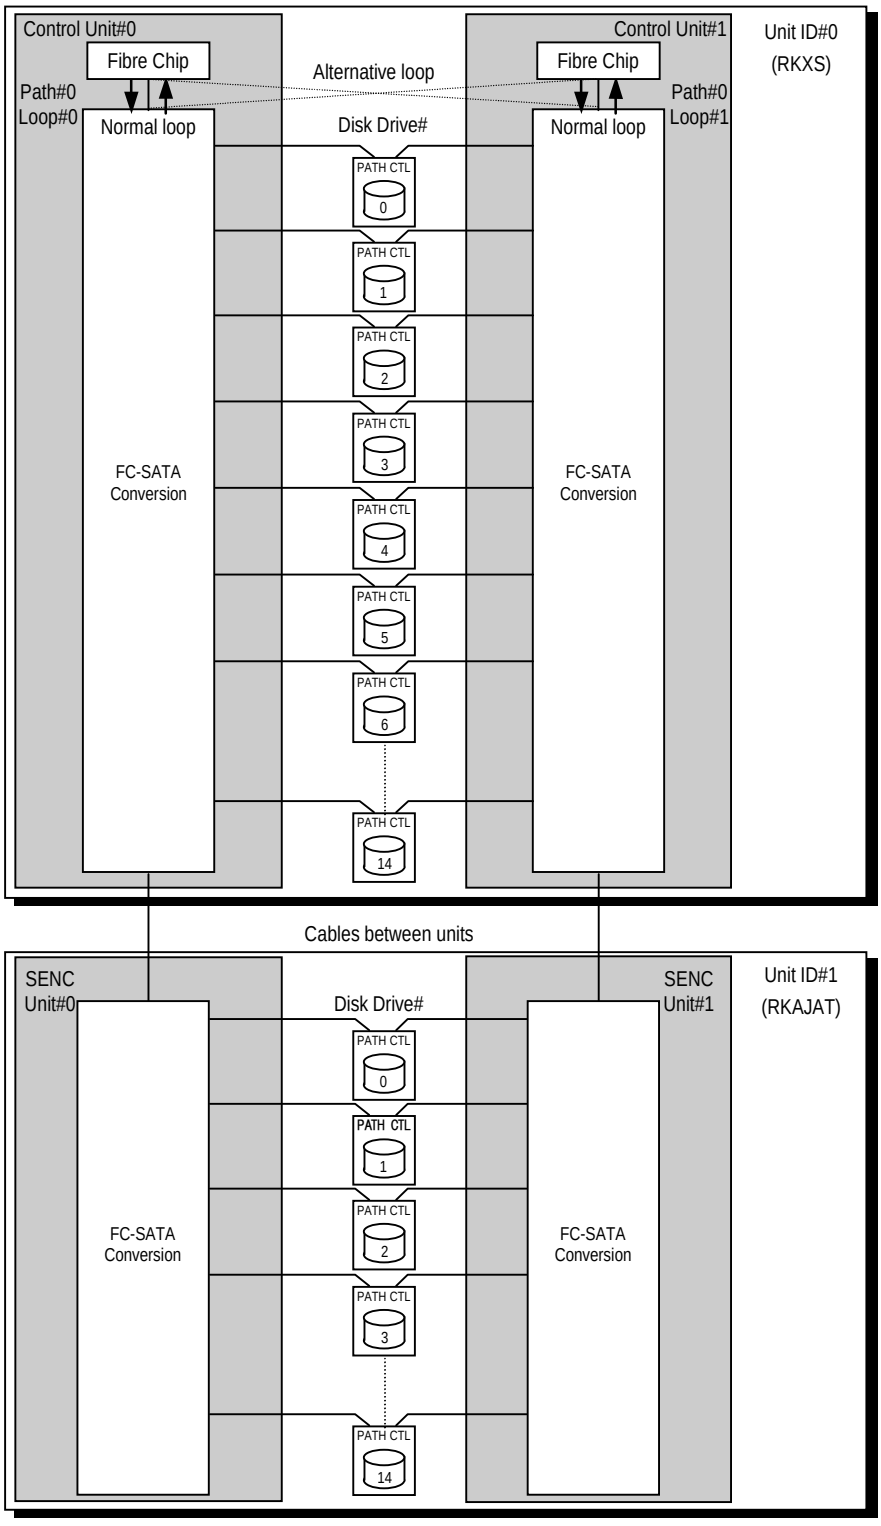
Copyright © 2005, 2006, Hitachi, Ltd.

RKS (RKS + RKAJ) has two loops at the back end, which have the following names.

- Path#0, Loop#0
- Path#1, Loop#0
- Path#0, Loop#1
- Path#1, Loop#1

The paths and loops have the following meanings.

Path



Path	Meaning
Path#0	2 Fibre lines connected to Disk Drive of even number
Path#1	2 Fibre lines connected to Disk Drive of odd number

Loop

Loop	Meaning
Loop#0	2 Fibre lines on Control Unit #0
Loop#1	2 Fibre lines on Control Unit #1

Copyright © 2005, 2006, Hitachi, Ltd.

- In the case of RKXS/RKAJAT

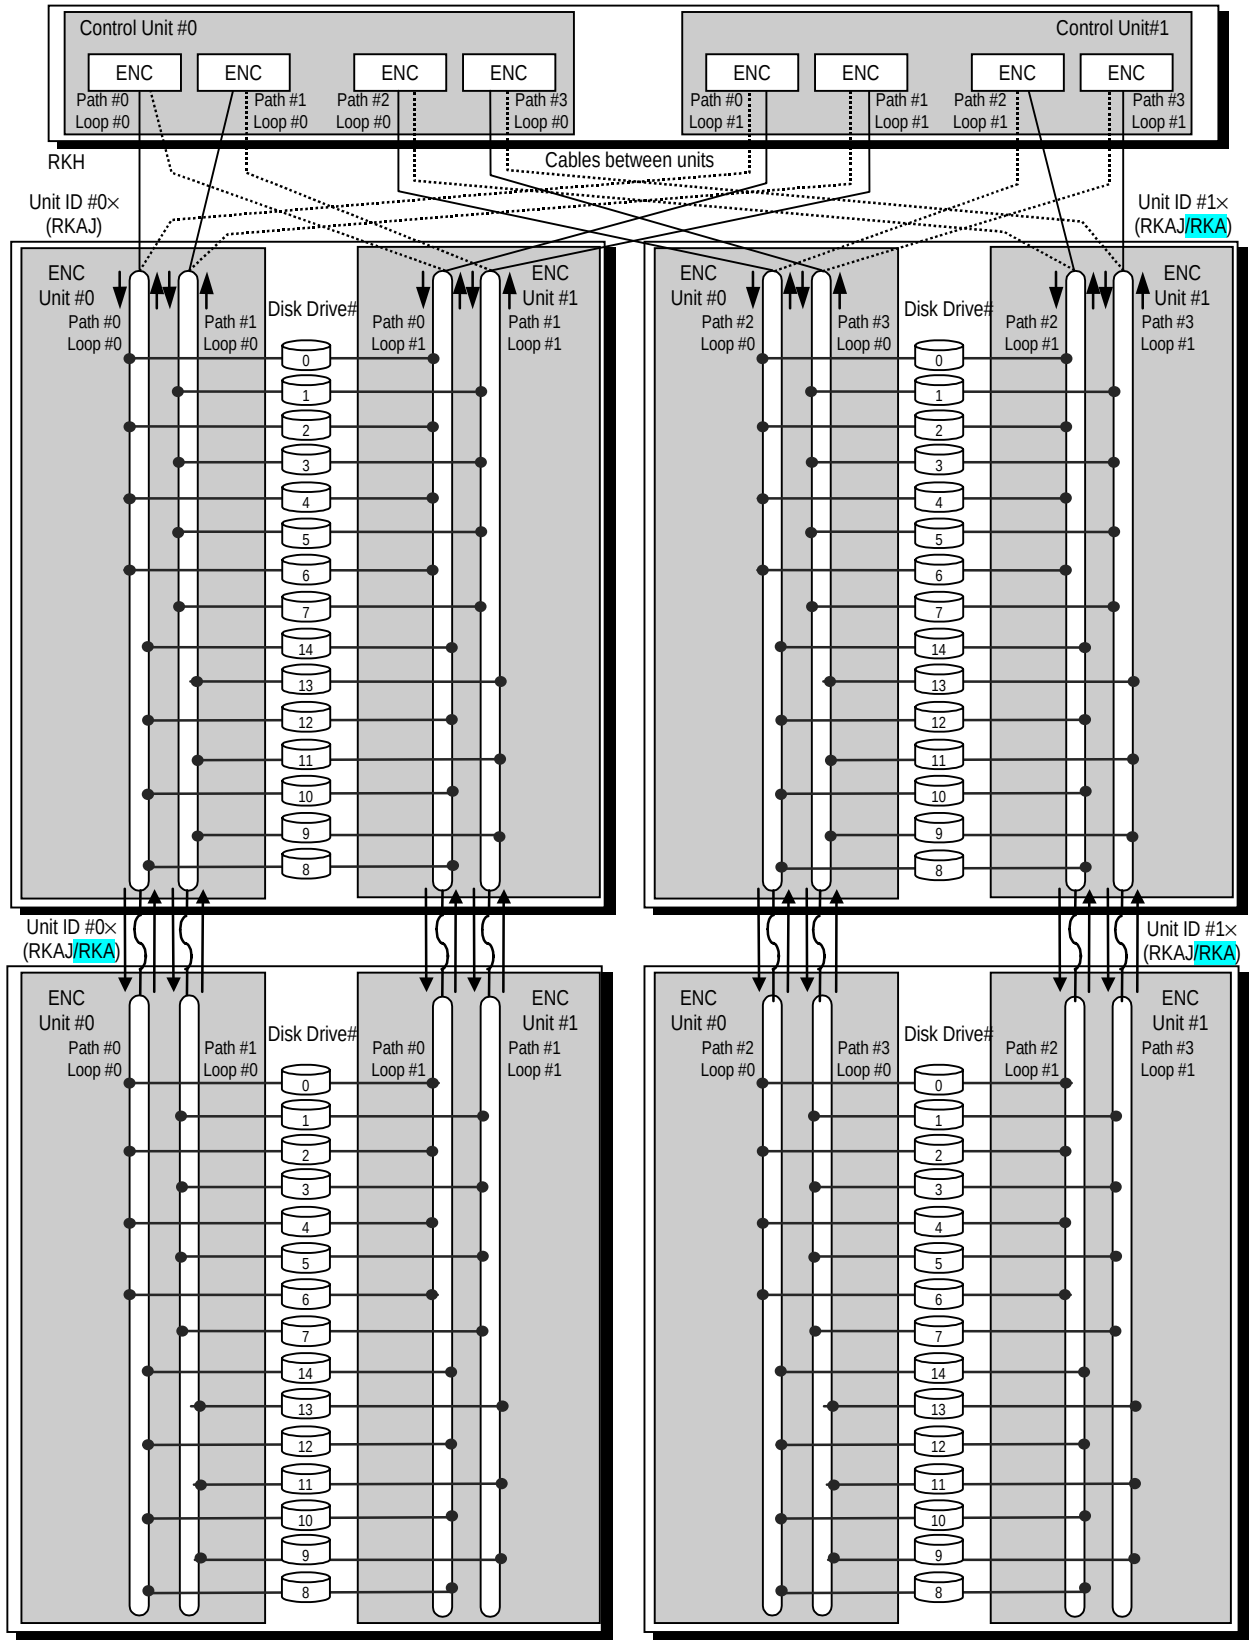
Copyright © 2005, 2006, Hitachi, Ltd.

RKXS (RKXS + RKAJAT) or RKAJAT has two loops at the back end, which have the following names.

- Path# 0, Loop#0
- Path# 0, Loop#1

The paths and loops have the following meanings.

Path



Path	Meaning
Path# 0	A Fibre line connected to the FC-SATA converter

Loop

Loop	Meaning
Loop# 0	A Fibre line on the Control Unit #0 and SENC Unit #0 (through which the FC-SATA converter is connected to the Fibre line)
Loop# 1	A Fibre line on the Control Unit #1 and SENC Unit #1 (through which the FC-SATA converter is connected to the Fibre line)

Copyright © 2005, Hitachi, Ltd.

- In the case of RKH/RKAJ (or RKA)

*1: The sequence of the Disk Drives is described in order of the signal of the Fibre Channel Loop on the Disk Drive side flowing, and it is not necessarily corresponding to the physical arrangement.

Copyright © 2005, 2006, Hitachi, Ltd.

RKAJ, RKAJAT has two loops at the back end, which have the following names.

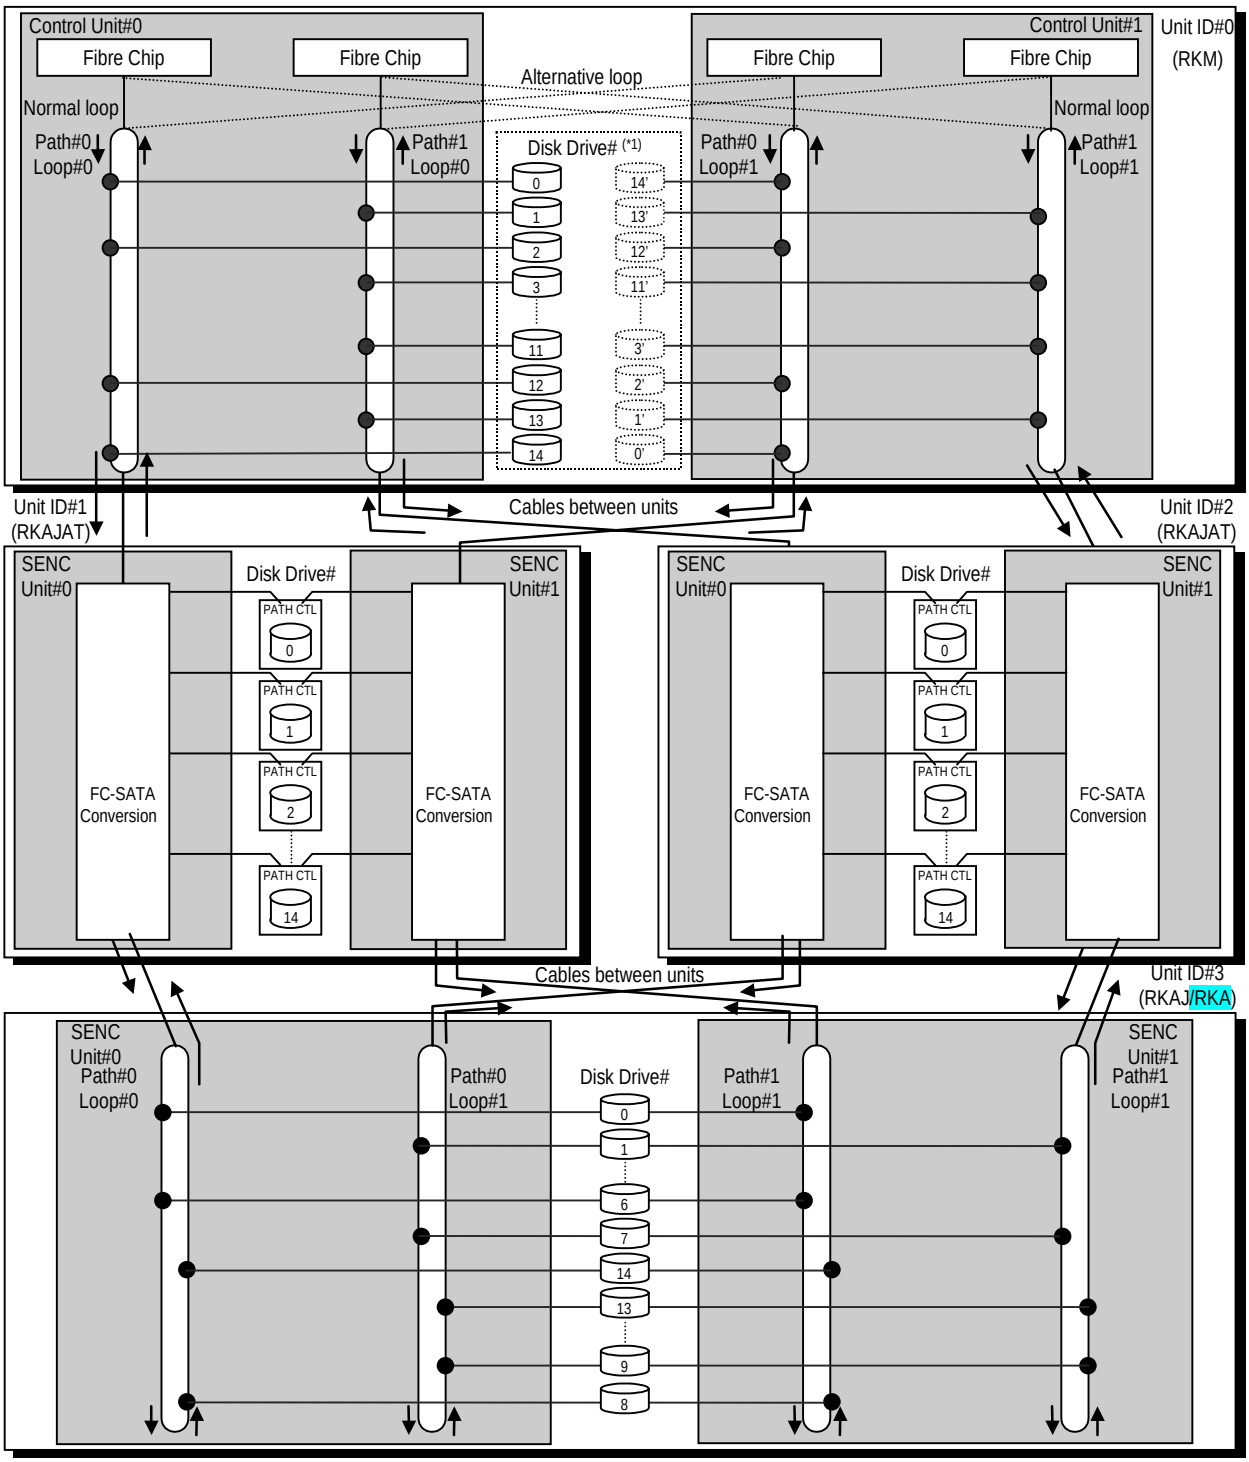
- Path#0, Loop#0
- Path#1, Loop#0
- Path#2, Loop#0
- Path#3, Loop#0
- Path#0, Loop#1
- Path#1, Loop#1
- Path#2, Loop#1
- Path#3, Loop#1

The paths and loops have the following meanings.

Path

Path	Meaning
Path#0	Two Fibre lines connected to Disk Drives with even numbers on the device ID #0x side
Path#1	Two Fibre lines connected to Disk Drives with odd numbers on the device ID #0x side
Path#2	Two Fibre lines connected to Disk Drives with even numbers on the device ID #1x side
Path#3	Two Fibre lines connected to Disk Drives with odd numbers on the device ID #1x side

Loop



Loop	Meaning
Loop#0	Four Fibre lines on the Control Unit #0, ENC Unit #0, and SENC Unit #0.
Loop#1	Four Fibre lines on the Control Unit #1, ENC Unit #1, and SENC Unit #1.

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

- A case where the RKM+RKAJATs+RKAJs (or RKAs) are connected

*1: The sequence of the Disk Drives is described in order of the signal of the Fibre Channel Loop on the Disk Drive side flowing, and it is not necessarily corresponding to the physical arrangement.

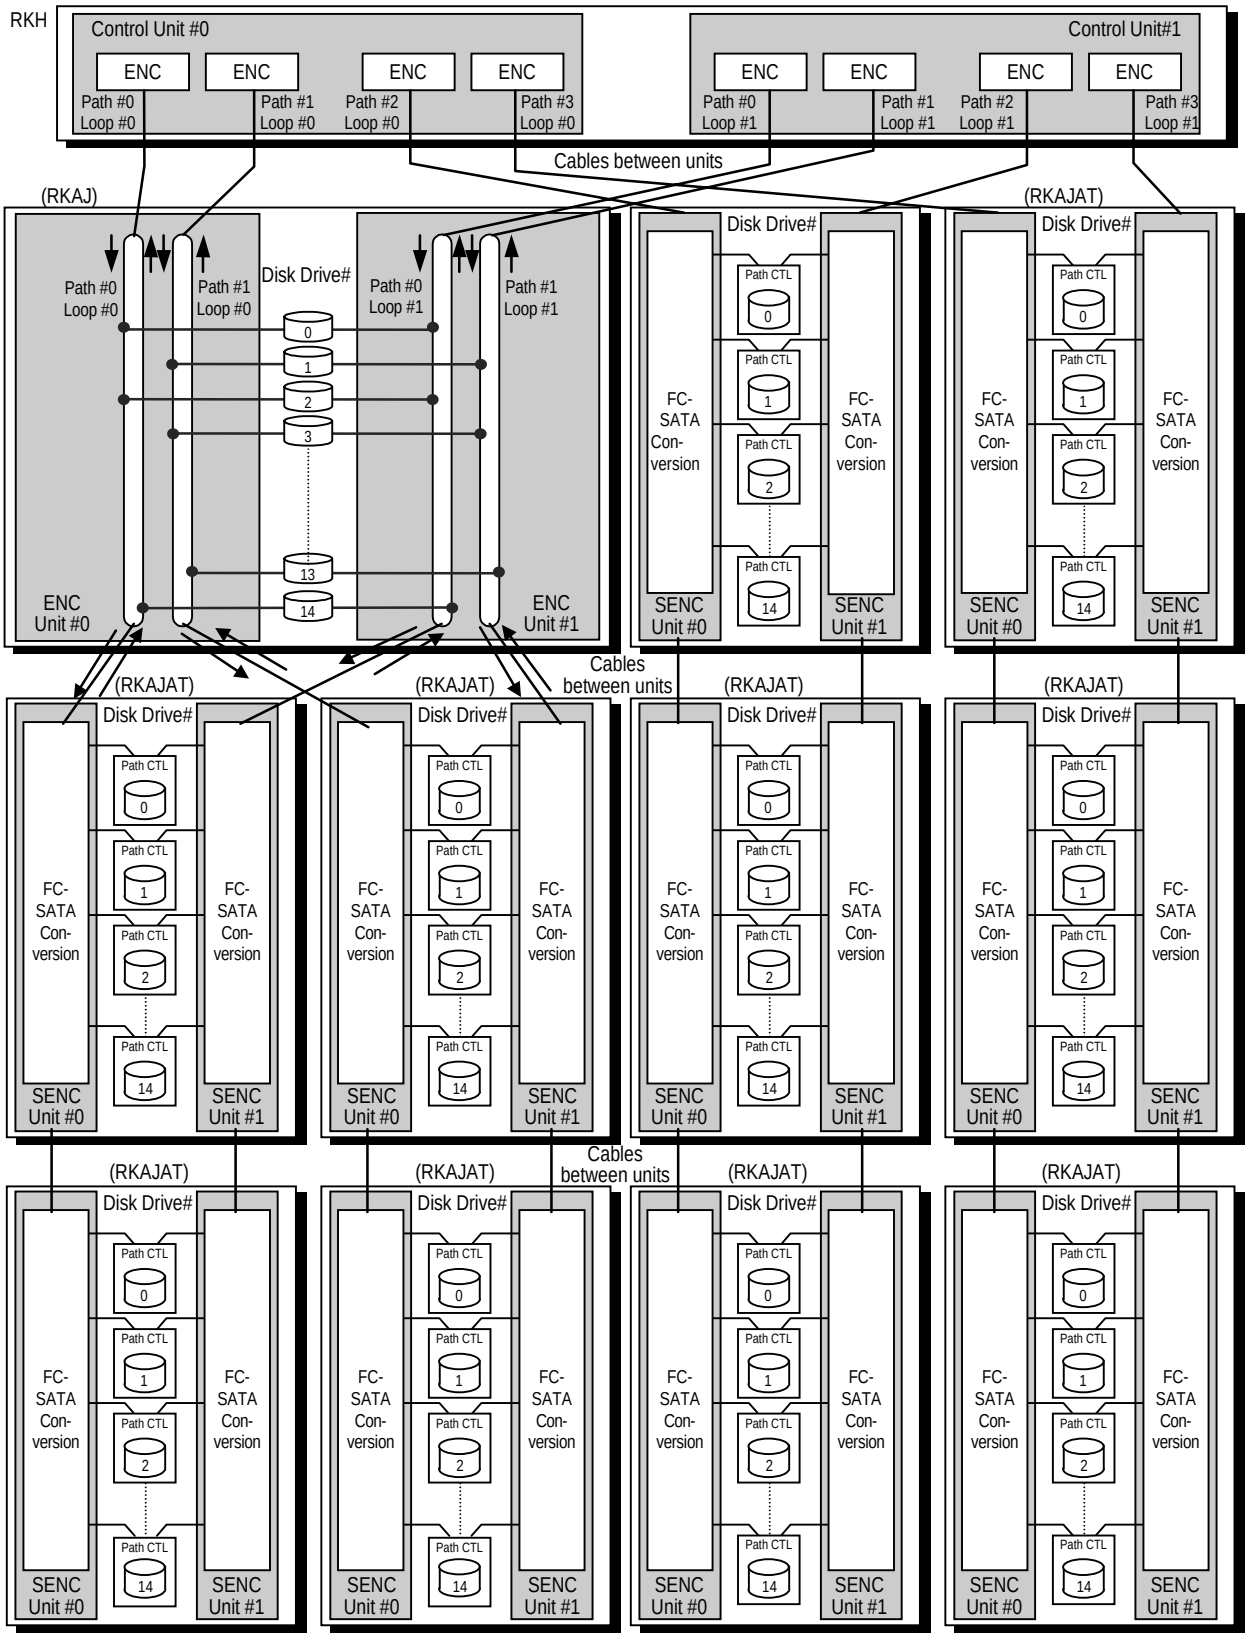
Copyright © 2005, 2006, Hitachi, Ltd.

RKM, RKAJ, RKAJAT has four loops at the back end, which have the following names.

- Path#0, Loop#0
- Path#1, Loop#0
- Path#0, Loop#1
- Path#1, Loop#1

The paths and loops have the following meanings.

Path



Path	Meaning
Path#0	Two Fibre lines connected to Disk Drives with even numbers, or two Fibre lines connected to the FC-SATA converter on the device ID #2x side in the case of a connection to the RKAJAT.
Path#1	Two Fibre lines connected to Disk Drives with odd numbers, or two Fibre lines connected to the FC-SATA converter on the device ID #3x side in the case of a connection to the RKAJAT.

Loop

Loop	Meaning
Loop#0	Two Fibre lines on the Control Unit #0, ENC Unit #0, and SENC Unit #0. (In the case of the RKAJAT, the FC-SATA converter is connected to the Fibre lines.)
Loop#1	Two Fibre lines on the Control Unit #1, ENC Unit #1, and SENC Unit #1. (In the case of the RKAJAT, the FC-SATA converter is connected to the Fibre lines.)

Copyright © 2005, Hitachi, Ltd.

- A case where the RKH+RKAJs+RKAJATs are connected

*1: The sequence of the Disk Drives is described in order of the signal of the Fibre Channel Loop on the Disk Drive side flowing, and it is not necessarily corresponding to the physical arrangement.

Copyright © 2005, 2006, Hitachi, Ltd.

RKAJ, RKAJAT has two loops at the back end, which have the following names.

- Path#0, Loop#0
- Path#1, Loop#0
- Path#2, Loop#0
- Path#3, Loop#0
- Path#0, Loop#1
- Path#1, Loop#1
- Path#2, Loop#1
- Path#3, Loop#1

The paths and loops have the following meanings.

Path

Path	Meaning
Path#0	Two Fibre lines connected to Disk Drives with even numbers on the device ID #0x side, or two Fibre lines connected to the FC-SATA converter on the device ID #2x side in the case of a connection to the RKAJAT.
Path#1	Two Fibre lines connected to Disk Drives with odd numbers on the device ID #0x side, or two Fibre lines connected to the FC-SATA converter on the device ID #3x side in the case of a connection to the RKAJAT.
Path#2	Two Fibre lines connected to Disk Drives with even numbers on the device ID #1x side, or two Fibre lines connected to the FC-SATA converter on the device ID #4x side in the case of a connection to the RKAJAT.
Path#3	Two Fibre lines connected to Disk Drives with odd numbers on the device ID #1x side, or two Fibre lines connected to the FC-SATA converter on the device ID #5x side in the case of a connection to the RKAJAT.

Loop

Loop	Meaning
Loop#0	Four Fibre lines on the Control Unit #0, ENC Unit #0, and SENC Unit #0. (In the case of the RKAJAT, the FC-SATA converter is connected to the Fibre lines.)
Loop#1	Four Fibre lines on the Control Unit #1, ENC Unit #1, and SENC Unit #1. (In the case of the RKAJAT, the FC-SATA converter is connected to the Fibre lines.)

01812101	CSDS 4byte data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the 4byte R/W test of the local memory (CSDS).	Full Dump	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
01823001	Bridge SRAM data line error [OWN_CTL]	Inconsistency between the write and read data was detected in the data line test of the SRAM in the Bridge.	Full Dump	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
01823002	Bridge SRAM address line error [OWN_CTL]	Inconsistency between the write and read data was detected in the address line test of the SRAM in the Bridge.	Full Dump		
01823003	Bridge SRAM address line error [OWN_CTL]	Inconsistency between the write and read data was detected in the address line test of the SRAM in the Bridge.	Full Dump		
01823004	Bridge SRAM address line error [OWN_CTL]	Inconsistency between the write and read data was detected in the address line test of the SRAM in the Bridge.	Full Dump		
01823005	Bridge SRAM ECC circuit error [OWN_CTL]	The ECC error could not be detected in the ECC circuit test of the SRAM in the Bridge.	Full Dump		
01823006	Bridge SRAM 4byte data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the 4byte R/W test of the SRAM in the Bridge.	Full Dump		
01823007	Bridge SRAM 2byte data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the 2byte R/W test of the SRAM in the Bridge.	Full Dump		
01823008	Bridge SRAM 1byte data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the 1byte R/W test of the SRAM in the Bridge.	Full Dump		
01824001	TWSI CTL number information error [OWN_CTL]	The CTL number information that was got via the TWSI (Two Wired Serial Interface) was incorrect.	Full Dump		
01824002	TWSI unit type information error [OWN_CTL]	The Unit type information that was got via the TWSI (Two Wired Serial Interface) was incorrect.	Full Dump		
01824003	TWSI host I/F type information error [OWN_CTL]	The Interface Board information that was got via the TWSI (Two Wired Serial Interface) was incorrect.	Full Dump

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
01824010	TWSI CACHE#0 information error [OWN_CTL]	Getting of information on the cache memory of the DIMM slot #0 via the TWSI (Two Wired Serial Interface) was attempted, but the getting failed.	Full Dump	① Check whether a cache memory is installed in the cache slot #0 of the Control Unit whose CALM LED is on. If it is not installed, install a cache memory in the cache slot #0.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
01824011	TWSI CACHE#1 information error [OWN_CTL]	Getting of information on the cache memory of the DIMM slot #1 via the TWSI (Two Wired Serial Interface) was attempted, but the getting failed.	Full Dump	② When the cache memory is installed firmly, replace it. If not, install it firmly in the cache memory slot.	
				③ If not recovered, replace the Control Unit.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
01825101	IDMA data transfer error [OWN_CTL]	A transfer failed in the IDMA transfer test.	Full Dump	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
01825102	IDMA data transfer time out [OWN_CTL]	A time-out of transfer occurred in the IDMA transfer test.	Full Dump		
01825103	IDMA data compare error [OWN_CTL]	Data that was transferred in the IDMA transfer test was inconsistent with the test data of the sender.	Full Dump	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
01826101	LAN register data compare error [OWN_CTL]	Inconsistency between write and read data was detected in the R/W test of the LAN register.	Full Dump		
01826102	LAN register data compare error [OWN_CTL]	Inconsistency between write and read data was detected in the R/W test of the LAN register.	Full Dump		
01826201	LAN loop back transfer time out [OWN_CTL]	A transfer failed in the LAN loop back transfer test.	Full Dump		
01826202	LAN loop back transfer status error [OWN_CTL]	A time-out of transfer occurred in the LAN loop back transfer test.	Full Dump		
01826203	LAN loop back transfer data compare error [OWN_CTL]	Data that was transferred in the LAN loop back transfer test was inconsistent with the test data of the sender.	Full Dump		
01831101	MCTL register data compare error [OWN_CTL]	Inconsistency between write and read data was detected in the R/W test of the MCTL register in the data transfer control LSI.	Full Dump		
01831102	MCTL register data compare error [OWN_CTL]	Inconsistency between write and read data was detected in the R/W test of the MCTL register in the data transfer control LSI.	Full Dump		
01831103	MCTL status error [OWN_CTL]	An illegal error status occurred in the R/W test of the MCTL register in the data transfer control LSI.	Full Dump

01833101	MCTL CTC CH0 stop [OWN_CTL]	The CTC CH0 was out of operation in the MCTL CTC CH0 test in the data transfer control LSI.	Full Dump	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
01833201	MCTL CTC CH0 count error [OWN_CTL]	The CTC CH0 count was incorrect in a test of the MCTL CTC CH0 in the data transfer control LSI.	Full Dump	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
01833202	MCTL CTC CH0 parity error [OWN_CTL]	A parity error of the CTC CH0 occurred in a test of the MCTL CTC CH0 in the data transfer control LSI.	Full Dump		
01833203	MCTL CTC CH0 count check timeout error [OWN_CTL]	The CTC CH0 count was incorrect in a test of the MCTL CTC CH0 in the data transfer control LSI.	Full Dump		
01833501	MCTL CTC CH1 count error [OWN_CTL]	The CTC CH1 count was incorrect in a test of the MCTL CTC CH1 in the data transfer control LSI.	Full Dump		
01833502	MCTL CTC CH1 parity error [OWN_CTL]	A parity error of the CTC CH1 occurred in a test of the MCTL CTC CH1 in the data transfer control LSI.	Full Dump		
01833503	MCTL CTC CH1 count check timeout error [OWN_CTL]	The CTC CH1 count was incorrect in a test of the MCTL CTC CH1 in the data transfer control LSI.	Full Dump		
01834101	MCTL error force NG [OWN_CTL]	The Read Only Register Write Error did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump		
01834102	MCTL error force NG [OWN_CTL]	The MPCTL1 Input Data Parity Error did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump		
01834103	MCTL error force NG [OWN_CTL]	The INVDIN Input Data Parity Error did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump		
01834104	MCTL error force NG [OWN_CTL]	The MPCTL1 CTCCH0 Parity Error did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump		
01834105	MCTL error force NG [OWN_CTL]	The CTCCH1 Parity Error Test did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump

01834106	MCTL error force NG [OWN_CTL]	The MPCTL1 WCDGCNT Parity Error did not occurred in the MCTL force test in the data transfer control LSI.	Full Dump	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
01835101	Backend path#0 control error [OWN_CTL]	The setting of the Path #0 was not reflected on the TWSI (Two Wired Serial Interface) GPI0 in the backend path control test.	Full Dump	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
01835102	Backend path#1 control error [OWN_CTL]	The setting of the Path #1 was not reflected on the TWSI (Two Wired Serial Interface) GPI0 in the backend path control test.	Full Dump		
01835103	Backend path#2 control error [OWN_CTL]	The setting of the Path #2 was not reflected on the TWSI (Two Wired Serial Interface) GPI0 in the backend path control test.	Full Dump		
01835104	Backend path#3 control error [OWN_CTL]	The setting of the Path #3 was not reflected on the TWSI (Two Wired Serial Interface) GPI0 in the backend path control test.	Full Dump		
01844101	DCTL register data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the system register R/W test of the data transfer control LSI (DCTL).	Full Dump		
01844102	DCTL register data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the system register R/W test of the data transfer control LSI (DCTL).	Full Dump		
01844103	DCTL status error [OWN_CTL]	An illegal error status occurred in the system register R/W test of the data transfer control LSI (DCTL).	Full Dump		
01844201	DCTL register data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the own system dual register R/W test of the data transfer control LSI (DCTL).	Full Dump		
01844202	DCTL register data compare error [OWN_CTL]	Inconsistency between the write and read data was detected in the own system dual register R/W test of the data transfer control LSI (DCTL).	Full Dump		
01844203	DCTL status error [OWN_CTL]	An illegal error status occurred in the own system dual register R/W test of the data transfer control LSI (DCTL).	Full Dump

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
01xxxxB4	DFPC#0 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the DFPC #0. x : Diagnostic item code	Full Dump	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
	DFPC#1 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the DFPC #1. x : Diagnostic item code	Full Dump	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
	DFPC#2 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the DFPC #2. x : Diagnostic item code	Full Dump		
	DFPC#3 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the DFPC #3. x : Diagnostic item code	Full Dump		
	HFPC#S1 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the HFPC #S1. x : Diagnostic item code	Full Dump		
	HFPC#0 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the HFPC #0. x : Diagnostic item code	Full Dump	① When "W0100x CTL alarm" is displayed following this message, replace the FC Interface Board #0 of the Control Unit pointed out in the message.	Replacement "2.2.7 Replacing Interface Board" (REP 02-0660)
	HFPC#1 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the HFPC #1. x : Diagnostic item code	Full Dump	② In a case other than ①, replace the FC Interface Board #0 of the Control Unit whose CALM LED is on.	
				③ If not recovered, replace Control Unit.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
	HFPC#2 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the HFPC #2. x : Diagnostic item code	Full Dump	① When "W0100x CTL alarm" is displayed following this message, replace the FC Interface Board #1 of the Control Unit pointed out in the message.	Replacement "2.2.7 Replacing Interface Board" (REP 02-0660)
	HFPC#3 loop initialize error [OWN_CTL]	The expected Frame Manager Status could not be got in the loop initialize of the HFPC #3. x : Diagnostic item code	Full Dump	② In a case other than ①, replace the FC Interface Board #1 of the Control Unit whose CALM LED is on.	
				③ If not recovered, replace Control Unit.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

Chapter 3. Failure Messages

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
H00200	MCTL data parity error [DP3] [REG80000014, Bit15]	A parity error was detected in data bits 31 to 24 during readout from the M-CTL register.	CTL Alarm Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H00300	MCTL data parity error [DP2] [REG80000014, Bit14]	A parity error was detected in data bits 23 to 16 during readout from the M-CTL register.	CTL Alarm Trace		
H00400	MCTL data parity error [DP1] [REG80000014, Bit13]	A parity error was detected in data bits 15 to 08 during readout from the M-CTL register.	CTL Alarm Trace		
H00500	MCTL data parity error [DP0] [REG80000014, Bit12]	A parity error was detected in data bits 07 to 00 during readout from the M-CTL register.	CTL Alarm Trace		
H00600	MCTL REG access error [RDRGWR] [REG80000014, Bit11]	A writing was done on the read-only register of the M-CTL.	CTL Alarm Trace		
H00700	CTC parity error (CH-0) [REG80000014, Bit5]	A parity error was detected in the timer CH0 of the M-CTL	Simple Trace		
H00800	CTC parity error (CH-1) [REG80000014, Bit4]	A parity error was detected in the timer CH1 of the M-CTL	Simple Trace		
H00900	Watchdog-timer counter parity error [REG80000014, Bit0]	A parity error occurred in the counter for the watchdog timer.	Simple Trace		
H10N0x	DCTL PPCI data parity error [REG8200127C, Bit31] (CTL-x)	The parity error was detected in the DCTL (PPCI). x : Control Unit # (0-1)	Full Dump		
H10P00	DCTL PPCI system error [REG8200127C, Bit30]	A system error was detected in the DCTL (PPCI).	Simple Trace		
H10Q00	DCTL PPCI master abort [REG8200127C, Bit29]	A master abortion was received in the DCTL (PPCI).	Simple Trace		
H10R00	DCTL PPCI received target abort [REG8200127C, Bit28]	A target abortion was received in the DCTL (PPCI).	Simple Trace		
H10S00	DCTL PPCI signaled target abort [REG8200127C, Bit27]	The target abortion was executed in the DCTL (PPCI).	Simple Trace

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
H10T00	DCTL PPCI PERR detected [REG8200127C, Bit24]	The data buffer controller LSI (D-CTL) asserted or received at the PERR when the bus master was used. (PPCIERR)	Simple Trace	①When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
H10U0x	DCTL PPCI ADR parity error [REG8200127C, Bit23] (CTL-x)	An address parity error was detected in the DCTL. (PPCIERR) x : Control Unit # (0-1)	Full Dump	②Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H10V00	DCTL PPCI data read parity error [REG8200127C, Bit22]	A parity error was detected in the DCTL in the data read from the data FIFO. (PPCIERR)	Simple Trace		
H10W00	DCTL PPCI CMD parity error [REG8200127C, Bit21]	A parity error was detected in the DCTL (PPCI) when the ADR/CMD was read from the CMD buffer.	Simple Trace	①Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H10X00	DCTL PPCI CNT parity error [REG8200127C, Bit20]	A parity error was detected in the DCTL (PPCI) during counting by the FIFO control counter.	Simple Trace		
H10Y00	DCTL PPCI target data response time-out [REG8200127C, Bit19]	A data response time-out of a target was detected in the DCTL (PPCI) in the case of the DCTL master.	Simple Trace		
H11000	DCTL H0PCI parity error [REG82001280, Bit31]	The parity error was detected in the DCTL (H#0).	Simple Trace		
H11100	DCTL H0PCI system error [REG82001280, Bit30]	A system error was detected in the DCTL (H#0).	Simple Trace		
H11200	DCTL H0PCI master abort [REG82001280, Bit29]	A master abortion was received in the DCTL (H#0).	Simple Trace		
H11300	DCTL H0PCI received target abort [REG82001280, Bit28]	A target abortion was received in the DCTL (H#0).	Simple Trace		
H11400	DCTL H0PCI signaled target abort [REG82001280, Bit27]	The target abortion was executed in the DCTL (H#0).	Simple Trace		
H11500	DCTL H0PCI PERR detected [REG82001228, Bit24]	The data buffer controller LSI (D-CTL) asserted or received at the PERR when the bus master was used. (H#0)	Simple Trace		
H11600	DCTL H0PCI ADR parity error [REG82001280, Bit23]	An address parity error was detected in the DCTL (H#0).	Simple Trace		
H11700	DCTL H0PCI DRD parity error [REG82001280, Bit22]	A parity error was detected in the DCTL (H#0) in the data read from the data FIFO.	Simple Trace

H42A00	DUAL I/F address parity error [EXT/MP] [REG82001820, Bit0]	When each port accessed a register of the other one of the dual Control Unit, the data buffer controller LSI (D-CTL) detected a parity error in the address phase.	CTL Alarm Trace	① Replace the Control Unit whose CALM LED is on. ② If not recovered, replace the other Control Unit. (The replacement cannot be done when the subsystem power is on.) ③ If not recovered yet, call the Technical Support Center for coping with troubles.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390) –
H42B00	DUAL I/F CACHE address over [EXT/DMA] [REG82001838, Bit18]	The D-CTL detected a margin error when it acquired data from the other one of the dual Control Unit.	CTL Alarm Trace		
H42C00	DUAL I/F read data parity error [EXT/MP] [REG82001838, Bit19]	A data parity error was detected when the MP read from a certain part in another system.	CTL Alarm Trace		
H42D00	DUAL I/F ECC correction error [EXT/MP] [REG82001838, Bit28]	An ECC_COR error was detected when the MP read from a certain part in another system.	CTL Alarm Trace		
H42E00	DUAL I/F ECC uncorrectable error [EXT/MP] [REG82001838, Bit24]	An ECC_UNCORRE error was detected when the MP read from a certain part in another system.	CTL Alarm Trace		
H42F00	DUAL I/F write parity error [EXT/MP] [REG82001838, Bit31]	A parity error was detected in write data when the MP wrote on a certain part in another system.	CTL Alarm Trace		
H42G00	DUAL I/F ECC write parity error [EXT/MP] [REG82001838, Bit30]	An ECC write parity error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42H00	DUAL I/F ECC GEN error [EXT/MP] [REG82001838, Bit29]	An ECC_GEN error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42I00	DUAL I/F CACHE address parity error [EXT/MP] [REG82001838, Bit27]	A cache address parity error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42J00	DUAL I/F WLEN parity error [EXT/MP] [REG82001838, Bit26]	A WLEN parity error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42K00	DUAL I/F counter parity error [EXT/MP] [REG82001838, Bit21]	A counter parity error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42L00	DUAL I/F CACHE address over [EXT/MP] [REG82001838, Bit25]	A cache address over error was detected when the MP wrote on the cache in another system.	CTL Alarm Trace		
H42N00	DUAL I/F error [MDTDCHK] [REG82001228, Bit17]	An error was detected when the MP accessed another system.	CTL Alarm Trace

H44000	DUAL I/F CACHE address parity error [EXT/HP#02] [REG82001828, Bit27]	A cache address parity error was detected during a writing onto a cache of another system performed via the HP #02.	CTL Alarm Trace	① Maintain it according to "W0100x CTL alarm" displayed after this message.	"Chapter 6. Warning Messages" (MSG 06-0000)
H44100	DUAL I/F CACHE address parity error [EXT/HP#03] [REG82001828, Bit11]	A cache address parity error was detected during a writing onto a cache of another system performed via the HP #03.	CTL Alarm Trace		
H44200	DUAL I/F WLEN parity error [EXT/HP#02] [REG82001828, Bit26]	A WLEN parity error was detected during a writing onto a cache of another system performed via the HP #02.	CTL Alarm Trace		
H44300	DUAL I/F WLEN parity error [EXT/HP#03] [REG82001828, Bit10]	A WLEN parity error was detected during a writing onto a cache of another system performed via the HP #03.	CTL Alarm Trace		
H44400	DUAL I/F CNT parity error [EXT/HP#02] [REG82001828, Bit21]	A CNT parity error was detected during a writing onto a cache of another system performed via the HP #02.	CTL Alarm Trace		
H44500	DUAL I/F CNT parity error [EXT/HP#03] [REG82001828, Bit5]	A CNT parity error was detected during a writing onto a cache of another system performed via the HP #03.	CTL Alarm Trace		
H44600	DUAL I/F address over [EXT/HP#02] [REG82001828, Bit25]	A cache address over error was detected during a writing onto a cache of another system performed via the HP #02.	CTL Alarm Trace	① Maintain it according to "W0100x CTL alarm" displayed after this message.	"Chapter 6. Warning Messages" (MSG 06-0000)
H44700	DUAL I/F address over [EXT/HP#03] [REG82001828, Bit9]	A cache address over error was detected during a writing onto a cache of another system performed via the HP #03.	CTL Alarm Trace	② If not recovered, replace the other Control Unit. (The replacement cannot be done when the subsystem power is on.)	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H44800	DUAL I/F ready error [INT/MP] [REG82001454, Bit21]	The EXT_IORDY became 0.	CTL Alarm Trace	① Replace the Control Unit whose CALM LED is on. ② When the CALM LED does not light up, check the WEB message, and replace the Control Unit displayed in the message.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H44900	DUAL I/F write ready error [INT/HP#00] [REG82001454, Bit21]	A ready time-out was detected in the HP #00 when the DCTL of the other system was reset.	CTL Alarm Trace

H90210	CTL failure	The Control Unit was blocked	CTL Alarm Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
H90320	Watch-dog time-out	A watchdog time-out occurred.	CTL Alarm Trace	① Because it is possible that the cache memory has become out of order, replace it according to a judgment to be made through the following operation. Make the operation mode Maintenance mode and connect Storage Navigator Modular to the subsystem. Display the cache memory failure statistical information by selecting the Cache Memory tab on the "Statistical Information" panel displayed in the "Array System View" window through the sequential selections of "Tool" and "Statistical Information" in the window. Then get the total number of occurrence of correctable errors. • When the accumulated occurrence number of correctable errors is not "0": Replace the Control Unit of which CALM LED lights on and the Cache memory on the Control Unit concerned. • When the accumulated occurrence number of correctable errors is "0": Replace the Control Unit of which CALM LED lights on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390) Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
H90330	Connection unit excess	The number of connected units exceeded limit.	CTL Alarm Trace	① Check that five or more units are not connected.	–
H90400	Obstacle is detected by two or more SENC	Failures were detected in the two or more SENCs.		① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

HD5G00	DCTL hard error [OTH ER CTL]	An error occurred in the Control Unit in the other system during the DMA process for the Control Unit restoration.	CTL Alarm Trace	①When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
HD5F00	DCTL hard error [OWN CTL]	An error occurred in the Control Unit in the own system during the DMA process for the Control Unit restoration.	CTL Alarm Trace	②Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HE0100	Backend down [All Loop NG]	Backend blockage: The subsystem cannot be controlled/monitored since usable LOOP is unavailable in the subsystem.	CTL Alarm Trace	①1. Check if the ENCs #0 and #1 of the subsystem concerned are installed accurately.	–
				2. When an alarm has been issued to the subsystem, refer to Troubleshooting Chapter 6 "Details of Recovery Procedures".	Troubleshooting "Chapter 6. Details of Recovery Methods" (TRBL 06-0000)
				3. If any of the ENCs #0 and #1 of the subsystem concerned is blocked, replace the ENC Unit and restart the subsystem.	Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)
HE020x	Backend down [NO SES-HDU BKW] (Unit-x)	The back end was blocked : Since there are no usable SES Disk Drives in the unit, the unit cannot be the unit cannot be controlled or monitored. x : Unit ID# (0-14)	CTL Alarm Trace	①1. Check if the subsystem identification switches of all the RKAJs are set as "M" for the RKH/RKM of the Basic Chassis and "S" for the RKS.	Installation "3.4.7 (1-3) Setting the subsystem identification switch" (INST 03-0521)
HE02HH	Backend down [NO SES-HDU BKW] (Unit-x)	The back end was blocked : Since there are no usable SES Disk Drives in the unit, the unit cannot be the unit cannot be controlled or monitored. x : Unit ID# (0-29)	CTL Alarm Trace	2. When the setting of the subsystem identification switch is incorrect, turn off the main switch, and then turn off all the AC Input Power Switches.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)
				3. Set the subsystem identification switch correctly again.	Installation "3.4.7 (1-3) Setting the subsystem identification switch" (INST 03-0521)
				4. Turn on the power of the subsystem again.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)

HJ3800	Backend down [Path switch status error] (Unit-x, ENC-y)	Abnormality of the chassis mode setting was detected. x : Unit ID # (1-14) y : ENC Unit # (0-1)	Simple Trace	①1. Check if the subsystem identification switches of all the RKAJs are set as "M" for the RKH/RKM of the Basic Chassis and "S" for the RKS.	Installation "3.4.7 (1-3) Setting the subsystem identification switch" (INST 03-0521)
				2. When the setting of the subsystem identification switch is incorrect, turn off the main switch, and then turn off all the AC Input Power Switches.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)
				3. Set the subsystem identification switch correctly again.	Installation "3.4.7 (1-3) Setting the subsystem identification switch" (INST 03-0521)
				4. Turn on the power of the subsystem again.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)
				②1. If it is not recovered, replace the ENC Unit displayed in this message after turning off the main switch and turning off all the AC Input Power Switches.	Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)
				2. Turn on the power of the subsystem again.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)
				③1. If it is not recovered yet, replace the additional subsystem displayed in this message after turning off the main switch and turning off all the AC Input Power Switches.	Replacement "2.2.12 Replacing Additional Chassis of Rack Mount Style" (REP 02-0990)
				2. Turn on the power of the subsystem again.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)
HJ3900	Backend down [Unit type error] (Unit-x, ENC-y)	Abnormality of the connected chassis was detected. x : Unit ID # (1-14) y : ENC Unit # (0-1)	Simple Trace	①1. Replace it to the chassis that can connect the Unit concerned.	Replacement "2.2.12 Replacing Additional Chassis of Rack Mount Style" (REP 02-0990)
				2. Start up the subsystem again.	Installation "1.7.1 Subsystem power on" (INST 01-0290)

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
HJ3Axy	Unsupported CACHE detected (CTL-x, CACHE-y)	It was detected that the unsupported Cache memory is installed. x : Control Unit # (0-1) y : Cache memory slot # (0-3)	Simple Trace	① Replace the memory to be installed in the Control Unit to the Cache memory in 1G bytes.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
HJ3Bxy	Microprogram error [MAP]	Logical illegality was detected in the microprogram (intermediate LU mapping management). x : Optional code y : Optional code	CTL Alarm Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② When the ALARM LED (red) on the front side of the Basic Chassis lights up, replace the Control Unit whose CALM LED lights up.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HJ3Cxy	Microprogram error [LMG]	Logical illegality was detected in the microprogram (Modular Volume Migration management). x : Optional code y : Optional code	CTL Alarm Trace		
HL0000	Other CTL workQPanic	The processing became unable to be continued because a capacity of the task control queue became full.	CTL Alarm Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HL010x	Machine check occurred (CTL-x) [200]	Machine check occurred. (Internal bus parity error, ECC error.) x : Control Unit # (0-1)	CTL Alarm Trace	① There is no problem when the CALM LED does not light up because the internal retry processing was executed in the Control Unit.	–
				② When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				③ Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HN0000	NAS-DMA forced stop failed	The forced interruption of the NAS-DMA transfer failed.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HN0100	NAS-DMA error (NAS-0, SPL, NNC-CACHE)	After the NAS-DMA failure (NAS#0 special transfer, Transfer direction: From NNC (NAS Unit) to cache memory of the Control Unit), both Control Units of the dual system were forced to be detached by the debug option.	Full Dump	① Collect Full Dump from the Control Unit indicated by "W0100x CTL alarm" which is displayed after this message.	Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130)
HN0200	NAS-DMA error (NAS-0, SPL, CACHE-NNC)	After the NAS-DMA failure (NAS#0 special transfer, Transfer direction: From cache memory of the Control Unit to NNC (NAS Unit)), both Control Units of the dual system were forced to be detached by the debug option.	Full Dump

HNA10x	Host transfer NAS-DMA error (CTL-x, NNC-y)	A DMA hardware error occurred in the NAS data transfer. x : Control Unit # (0-1) y : NNC (NAS Unit) # (0-3)	CTL Alarm Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
HNA20x	PCDG error [CTL] (CTL-x)	A hardware error of the Control Unit was detected in the PCDG process. x : Control Unit # (0-1)	Simple Trace	② When the ALARM LED (red) on the front side of the Basic Chassis lights up, replace the Control Unit whose CALM LED lights up.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HNA30x	PCDG error [NAS IF Board, CTL] (CTL-x)	A hardware error that occurred between the NAS Interface Board and Control Unit was detected in the PCDG process during a boot of the NNC (NAS Unit). x : Control Unit # (0-1)	Simple Trace	① 1. Check if the CTRL cable connecting the NNC (NAS Unit) and the NAS Interface Board displayed in this message is connected firmly.	–
				2. When it is not connected firmly, connect the CTRL cable firmly again.	–
				3. Restart the NAS OS.	Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320)
				4. Replace the Control Unit displayed in the message and the NAS Interface Board installed in it.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390) Replacement "2.2.7 Replacing Interface Board" (REP 02-0660)
HNA4xy	PCDG error [NNC, PCI Express, NAS IF Board] (CTL-x, NNC-y)	The hardware error of the PCI-Express protocol was detected between the NNC (NAS Unit) and the NAS Interface Board by the PCDG processing during NNC (NAS Unit) starting. x : Control Unit # (0-1) y : NNC (NAS Unit) # (0-3)	Simple Trace	① 1. Check if the PCI-Express cable connecting the NNC (NAS Unit) and the NAS Interface Board displayed in this message is connected firmly.	–
				2. When it is not connected firmly, connect the PCI-Express cable firmly again.	–
				3. Restart the NAS OS.	Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320)
				② If not recovered, replace the NAS Chassis displayed in the message.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120)

HSA000	DFPC error detect [SYSTEM DOWN]	The PDEV time-out occurred frequently in the screening or self heat-run system	Full Dump	① Execute full dumps from all the Control Units and contact the department for coping with troubles.	Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130)
HZ0200	Sink error	When the Down mode was set for the RAM in order to perform a debug, a command was detected that was not executed at all during the specified period (three seconds in default).	CTL Alarm Trace	① Get a trace of the Control Unit detachment.	Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080)
HZ0300	Not enough Cache memory to use QuickShadow function	The capacity of the cache memory is not sufficient to use the Copy-on write SnapShot function.	CTL Alarm Trace	① Enlarge the capacities of cache memories of the both Control Units to those sufficient for the higher grade model.	Addition/Subtraction/ Relocation "1.4.4 Adding a Cache Unit" (ADD 01-0380)
HZ040x	BRG DRAM internal data path parity error detected [REGF10014D0, Bit2] (CTL-x)	The Dunit internal data path parity error was detected. x : Control Unit # (0-1)	Full Dump	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HZ050x	BRG SRAM double bit ECC error detected [REGF1000388, Bit1] (CTL-x)	The SRAM two-bit ECC error was detected. x : Control Unit # (0-1)	Full Dump		
HZ060x	BRG DRAM double bit ECC error detected [REGF10014D0, Bit1] (CTL-x)	The DRAM two-bit ECC error was detected. x : Control Unit # (0-1)	Full Dump		
HZ0700	BRG DRAM single bit ECC threshold expired [REGF10014D0, Bit0]	The number of the DRAM single bit ECC errors reached the threshold value.	Simple Trace	–	–
HZ0A00	BRG SRAM single bit ECC error threshold expired [REGF1000388, Bit0]	The number of the SRAM single bit ECC errors reached the threshold value.	CTL AlarmTrace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HZ0B0x	CTL recovery failed [TWSI ERR] (CTL-x)	The recovery of the Control Unit failed not because of the TWSI failure of the Control Unit inserted during the recovery of it performed while the subsystem power is on but because of the TWSI failure of the other Control Unit. x : Control Unit # (0-1)	Simple Trace	① Replace not the inserted Control Unit but the other Control Unit. (The replacement cannot be done when the subsystem power is on.)	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

HZ0J00	TWSI access error [Configuration register write, XX-YY-AA-BB]	A writing error occurred in the TWSI initialization (setting of the TWSI-GPIO I/O attribute) at the time of the subsystem boot. XX : Register ID number (0 to 0x45) of the access to which via the TWSI was attempted YY : Sequence number (2 to 7) of the step in which an error occurred during the access via the TWSI AA : Expected termination status in the case of access via the TWSI BB : Actual termination status in the case of access via the TWSI	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HZ0K00	TWSI access error [Polarity inversion register write, XX-YY-AA-BB]	A write error occurred in the TWSI initialization (setting of the TWSI-GPIO polarity inversion) at the time of the subsystem start. XX : Register ID number (0 to 0x45) of the access to which via the TWSI was attempted YY : Sequence number (2 to 7) of the step in which an error occurred during the access via the TWSI AA : Expected termination status in the case of access via the TWSI BB : Actual termination status in the case of access via the TWSI	Simple Trace		
HZ0Lxx	DSC detected IOLIST error	An illegal transition status of the I/O request list queue was detected by the I/O execution control.	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
HZ0M00	DM-LU write failed	When the deliberate shutdown was performed, writing to the DM-LU failed owing to a trouble such as a drive error.	CTL Alarm Trace	① 1. Reboot the subsystem and replace the Disk Drive pointed out in the message, "HDU alarm".	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
				2. Perform the deliberate shutdown again.	–

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
HZ0N0x	Kernel processing error (CTL-x)	The Kernel of the Control Unit's OS stopped illegally. x : Control Unit # (0-1)	CTL Alarm Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HZ0Pxx	Cache capacity reduced although Cache Partition Manager enable	The cache memory capacity was reduced though Cache Partition Manager was valid (causing detachment of the both Control Units). x : The original cache memory capacity per Control Unit (G bytes) (01-08)	Simple Trace	① 1. Return the cache memory capacity to the original one.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
				2. Reboot the disk array unit.	Installation "1.7.1 Subsystem power on" (INST 01-0290)
HZ0Q00	DCTL micro access error [PNDIRECTEN] [REG82001D8C, Bit30]	Logical illegality was detected because it tried to execute the direct memory access without turning on the PNDIRECTEN bit.	CTL Alarm Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
HZ0R00	DCTL micro access error [NPDIRECTEN] [REG82001D8C, Bit26]	Logical illegality was detected because it tried to execute the direct memory access without turning on the NPDIRECTEN bit.	CTL Alarm Trace		
HZ0S00	Not enough Cache memory to use Cache Partition Manager	The Cache capacity to use Cache Partition Manager was insufficient due to the upgrade of the model.	Simple Trace	① Add the Cache memory in the capacity to be able to upgrade the model.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
HZ0T00	Changing to Single Mode failed as Cache Partition Manager is enable	The system start attribute was changed although the Cache partition management function was effective.	Simple Trace	① Restore the system start attribute.	System Parameter "4.2 (1) Setting Boot Options" (SYSPR 04-0040)
	Changing to Dual Active Mode failed as Cache Partition Manager is enable			② Restart the subsystem.	Installation "1.7 Power On/Off Procedure" (INST 01-0290)

Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
I304HH	HDU spin up failed (Unit-x, HDU-y)	An insertion of a Disk Drive failed because of a Disk Drive failure. x : Unit ID # (0-29) y : Disk Drive # (0-14)			

*1 : If this message is issued frequently, it is suspected that one of the following cases have occurred.

- Symptom : Spin-up operation repeats interruption and restart because of contention with the RAID Manager command in the case where the ShadowImage in-system replication function is used.
  Corrective action : Contact the system manager. If RAID Manager command is issued by polling in a short period, check the manual and change the value to be appropriate.
- Symptom : A spin up operation repeats an interruption and restart because LU switchings occur frequently.
  Corrective action : Check the setting of the owner right to the LU and change it so that the LU switching does not occur owing to an I/O command issued by a host.

I5390x	The CTL type different from the other CTL was detected (CTL-0 xxxx, CTL-1 yyyy)	It was detected that the Control Units of the RKH and the RKHE were mixed. The Control Units to be installed in the AMS1000 must be unified to the Control Units of the RKH or the RKHE. xxxx, yyyy : Indicates either of the RKH or the RKHE.	Simple Trace	① There is no problem if this message is displayed before “I0010x CTL recovered” after replacing one Control Unit by the upgrade from the RKH to the RKHE. Perform the upgrade work continuously.	–
				② The Control Unit displayed as “RKH” in the message is a Control Unit of the RKH if this message is displayed before “I0010x CTL recovered” or “I10000 Subsystem is ready” after replacing the second Control Unit by the upgrade from the RKH to the RKHE. Replace the Control Unit to a Control Unit of “RKHE”.	Replacement “2.2.5 Replacing Control Unit” (REP 02-0390)
				③ The Control Unit displayed as “RKHE” in the message is a Control Unit of the RKHE if this message is displayed before “I0010x CTL recovered” or “I10000 Subsystem is ready” after replacing the second Control Unit to return the configuration of the Control Unit to the RKH by the upgrade from the RKH to the RKHE. Replace the Control Unit to a Control Unit of “RKH”.	Replacement “2.2.5 Replacing Control Unit” (REP 02-0390)
				④ The model name of the replaced Control Unit is different from the other Control Unit if this message is displayed before “I0010x CTL recovered” or “I1000 Subsystem is ready” after replacing the Control Unit in the status that the upgrade from the RKH to the RKHE is not performed. Replace the other Control Unit to the Control Unit of a correct model name so that both Control Units to be installed are Control Units of the RKHE or the RKH.	Replacement “2.2.5 Replacing Control Unit” (REP 02-0390)

I5470x	PCDG error [Fibre Channel Card] (NNC-x, Extension Slot-y)	A hardware error of Fibre Channel Card of NNC (NAS Unit) was detected while starting NNC (NAS Unit). x : NNC (NAS Unit) # (0-3) y : Extension Slot # (2-3)	Simple Trace	① Replace the Fibre Channel Card installed in Extension Slot displayed in the message of NNC (NAS Unit).	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)
I548xy	PCDG error [PS] (NNC-x, PS-y)	A hardware error in the Power Unit of NNC (NAS Unit) was detected while starting NNC (NAS Unit). NNC (NAS Unit) is blocked when the Power Unit breaks down and there is no Power Unit that operates normally. When two Power Units are installed in NNC (NAS Unit), and if one of the Power Units breaks down but the other operates normally, NNC (NAS Unit) is partly blocked. x : NNC (NAS Unit) # (0-3) y : PS # (0-1)	Simple Trace	① Replace the Power Unit displayed in the message of NNC (NAS Unit).	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)
I549xy	PCDG error [FAN] (NNC-x, FAN-y)	A hardware error of the FAN Assembly of NNC (NAS Unit) was detected while starting NNC (NAS Unit). When one FAN breaks down, NNC (NAS Unit) is partly blocked. When two or more FANs break down, NNC (NAS Unit) is blocked. x : NNC (NAS Unit) # (0-3) y : FAN # (0-2)	Simple Trace	① Replace the FAN Assembly displayed in the message of NNC (NAS Unit).	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)
I54A0x	PCDG error [mis-configuration of Extension Card] (NNC-x)	It was detected that one or more Extension Cards are installed in another Extension Slots even though the Extension Slots to be installed are decided according to the types of the Extension Cards. x : NNC (NAS Unit) # (0-3)	Simple Trace	① Install the Extension Card, which is installed in NNC (NAS Unit) displayed in the message, in the correct Extension Slot again.	–
I54B00	PCDG error [Host Connector] (NNC-x, y)	A hardware error of the Host Connector of NNC (NAS Unit) was detected while starting NNC (NAS Unit). x : NNC (NAS Unit) # (0-3) y : Failed part	Simple Trace	① Replace the Host Connector displayed in the message of NNC (NAS Unit).	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)

I70200	Backend down [Unit type error] (Unit-x, ENC-y)	Abnormality of the connected frame was detected. x : Unit ID # (1-14) y : ENC Unit # (0-1)	Simpel Trace	① Replace the frame having the unit number concerned with a connectable frame and restart the new frame.	Replacement "2.2.12 Replacing Additional Chassis of Rack Mount Style" (REP 02-0990)
I70300	Unit type error (Unit-x, ENC-y)	A unsupported subsystem was detected during addition of a Additional Chassis that was made in the state in which the subsystem power was on. x : Unit ID # (1-29) y : ENC Unit/SENC Unit # (0-1)	Simpel Trace	① 1. After "I8040x Unit ADD FAIL" or "I804HH Unit ADD FAIL" was displayed, check the unit ID# displayed in the message, and perform Addition/Subtraction/ Relocation "1.3.1 Work immediately after abnormal termination".	Addition/Subtraction/ Relocation "1.3.1 Work immediately after abnormal termination" (ADD 01-0110)
				2. Replace the frame having the Unit ID# concerned with a connectable frame.	–
				3. Execute the addition of the Additional Chassis again for the Additional Chassis which the addition is not completed.	Addition/Subtraction/ Relocation "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)
I70400	CTL recovery failed [DESKEW is not completed]	Though the Control Unit not blocked attempted to adjust the data input timing when it was sending/receiving data to/from an inserted Control Unit, the adjustment was not completed within the time limit. [Failure in the bus between the CTLs]	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
I70500	CTL recovery failed [SLV ERR]	When the Control Unit not blocked was adjusting the data input timing while it was sending/receiving data to/from the inserted Control Unit, it received an error report from the inserted Control Unit. [Failure in the bus between the CTLs]	Simple Trace		
I70600	CTL recovery failed [MRGN ERR]	After the inserted Control Unit adjusted the data input timing while it was sending/receiving data to/from a Control Unit not blocked, the Control Unit not blocked detected a margin error. [Failure in the bus between the CTLs]	Simple Trace

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
I70700	CTL recovery failed [SEQ ERR]	When the Control Unit not blocked was adjusting the data input timing while it was sending/receiving data to/from the inserted Control Unit, it detected a sequence error. [Failure in the bus between the CTLs]	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
I70800	CTL recovery failed [DCNT ERR]	When the inserted Control Unit was adjusting the data input timing while it was sending/receiving data to/from a Control Unit not blocked, the Control Unit not blocked detected a failure in the delay counter. [Failure in the bus between the CTLs]	Simple Trace		
I70900	Unsupported unit is connected [RKA] (Unit-x)	Though addition of the RKA was attempted, the addition that was made in the state in which the subsystem power was on failed because the subsystem concerned did not support the RKA. x : Unit ID # (1-29)	Simple Trace	① 1. After "I8040x Unit ADD FAIL" or "I804HH Unit ADD FAIL" was displayed, check the unit ID# displayed in the message, and perform Addition/Subtraction/ Relocation "1.3.1 Work immediately after abnormal termination".	Addition/Subtraction/ Relocation "1.3.1 Work immediately after abnormal termination" (ADD 01-0110)
I70A00	Unsupported unit is connected [RKAAT] (Unit-x)	Though addition of the RKAAT was attempted, the addition that was made in the state in which the subsystem power was on failed because the subsystem concerned did not support the RKAAT. x : Unit ID # (1-29)	Simple Trace	2. Replace the subsystem (RKAJ or RKAJAT) to be added.	–
				3. Execute the addition of the Additional Chassis again for the Additional Chassis which the addition is not completed.	Addition/Subtraction/ Relocation "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)
I8000x	Unit ADD start (Unit-x)	The processing of the addition of the Additional Chassis with the subsystem power turned on started. x : Unit ID # (1-14)		–	–
I800HH	Unit ADD start (Unit-x)	The processing of the addition of the Additional Chassis with the subsystem power turned on started. x : Unit ID # (1-29)		–	–
I8010x	Unit ADD start (Loop-x)	The addition of the loop of the Additional Chassis started. x : Loop # (0-1)		–	–

IB1E00	Remote option disable [TrueCopy Extended Distance]	It detected that the TrueCopy Extended Distance license of the remote side subsystem is locked. [path blockade factor].	Simple Trace	①Unlock the TrueCopy Extended Distance license of the remote side subsystem.	–
IB1F00	PSUE occurred [Snapshot] (CTG-x, MU-y)	The "pairsplit-mscas" command was not completed because "pairsplit" in the pair of Copy-on-write SnapShot of the remote side subsystem could not be executed due to the internal processing waiting of the remote disk subsystem. [PSUE factor of the pair of Copy-on-write SnapShot] x : Consistency Group # (0-63) y : Mirroring # of Copy-on-write SnapShot (0-13)	Simple Trace	①Release the Copy-on-write SnapShot pair cascaded to the S-Vol of the pair of TrueCopy Extended Distance by indicating "pairsplit-mscas", and form the pair again.	–
IB1G00	Pair status changed by the error (CTG-x)	The pair of TrueCopy Extended Distance changed in the abnormal status because a failure occurred. x : Consistency Group # (0-15)	Simple Trace	①When the message code "IB1M00 The change of the remote pair status failed" is displayed immediately before it, perform the maintenance according to the message.	–
IB1H00	Pair status changed by no available data pool (CTG-x)	The pair of TrueCopy Extended Distance changed in the abnormal status because the usage rate of the data pool exceeded the threshold value. x : Consistency Group # (0-15)	Simple Trace	②Remove the failure which changed it in the abnormal status for the pair of TrueCopy Extended Distance in the consistency group referring to "RAID Manager System Administrator Guide".	"RAID Manager System Administrator Guide"
				③Reform the pair of TrueCopy Extended Distance. The method of the pair reformation differs depending on the status of the pair.	–
				④Execute the resynchronization for the pair which changed to PSUE and PFUS. Or form the pair again after releasing it. Reform the pair after releasing it for the pair which changed to PSUS (R/W impossible).	–

Chapter 5. Flash Detected Messages

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R00200	MCTL data parity error [DP3] [REG80000014, Bit15]	A parity error was detected in data bits 31 to 24 during a readout from the M-CTL internal register.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R00300	MCTL data parity error [DP2] [REG80000014, Bit14]	A parity error was detected in data bits 23 to 16 during a readout from the M-CTL internal register.	Simple Trace		
R00400	MCTL data parity error [DP1] [REG80000014, Bit13]	A parity error was detected in data bits 15 to 08 during a readout from the M-CTL internal register.	Simple Trace		
R00500	MCTL data parity error [DP0] [REG80000014, Bit12]	A parity error was detected in data bits 07 to 00 during a readout from the M-CTL internal register.	Simple Trace		
R00600	MCTL REG access error [RDRGWR] [REG80000014, Bit11]	A writing was attempted on the read-only register of the M-CTL internal register.	Simple Trace		
R00700	CTC parity error (CH-0) [REG80000014, Bit5]	A parity error occurred in the timer CH0.	Simple Trace		
R00800	CTC parity error (CH-1) [REG80000014, Bit4]	A parity error occurred in the timer CH1.	Simple Trace		
R00900	Watchdog-timer counter parity error [REG80000014, Bit0]	A parity error occurred in the counter for the watchdog timer.	Simple Trace		
R100yy	FPC is not detected (CTL-x)	The detection of the FPC failed. x : Control Unit# (0-1) y : Chip error code (y:z) = (01 : Path-0) (02 : Path-1) (03 : Path-0/1) (04 : Path-2) (05 : Path-0/2) (06 : Path-1/2) (07 : Path-0/1/2) (08 : Path-3) (09 : Path-0/3) (0A : Path-1/3) (0B : Path-0/1/3) (0C : Path-2/3) (0D : Path-0/2/3) (0E : Path-1/2/3) (0F : Path-0/1/2/3) (10 : Port-0A) (11 : Path-0/PortA)	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message. ② Replace the Control Unit of which the CALM LED lights on except for ①.	"Chapter 6. Warning Messages" (MSG 06-0000) Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

Copyright © 2005, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R20000	DCTL byte write error [REG82001238, Bit27]	A writing done beyond the 4-byte boundary was detected.	Simple Trace	① When "W0100x CTL alarm" is displayed following this message, take recovery actions according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
				② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20100	DCTL data read parity error [REG82001238, Bit23]	A data parity error was detected during an output from the data buffer to the PCI bus.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20300	DCTL address over [MPU] [REG82001238, Bit21]	A CADROV was detected when the MPU accessed the cache.	Simple Trace		
R20400	DCTL address parity error [MPU] [REG82001238, Bit20]	An address parity error was detected in the transfer address received by the cache.	Simple Trace		
R20500	DCTL LEN parity error [REG82001238, Bit19]	An LEN parity error was detected in the transfer word length received by the cache.	Simple Trace		
R20600	DCTL address over [DMA] [REG82001238, Bit18]	The Cache address over was detected when any of H_Port, D_Port, DMA #0 or MDMA of the data transfer control LSI accessed the Cache.	Simple Trace		
R20700	DCTL dummy area access error [REG82001238, Bit17]	Access, which was done to the access restricted area in the area for 4-byte dummy data addition of the cache, was detected.	Simple Trace		
R20800	DCTL REF counter parity error [REG82001238, Bit1]	A parity error was detected in the counter for the cache memory refreshment timing.	Simple Trace		
R20900	DCTL PPCI parity error [REG8200127C, Bit31]	A parity error was detected.	Simple Trace		
R20A00	DCTL PPCI system error [REG8200127C, Bit30]	An assertion of a system error was detected.	Simple Trace		
R20B00	DCTL PPCI master abort [REG8200127C, Bit29]	A master abortion was executed.	Simple Trace		
R20C00	DCTL PPCI received target abort [REG8200127C, Bit28]	A target abortion was received.	Simple Trace		
R20D00	DCTL PPCI signaled target abort [REG8200127C, Bit27]	A target abortion was executed.	Simple Trace

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R20E00	DCTL PPCI PERR assert or reception [REG8200127C, Bit24]	The data buffer controller LSI (D-CTL) asserted or received at the PERR when the bus master was used.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20F00	DCTL PPCI ADR parity error [REG8200127C, Bit23]	An address parity error was detected.	Simple Trace		
R20G00	DCTL PPCI DRD parity error [REG8200127C, Bit22]	A parity error was detected in the data read from the data FIFO.	Simple Trace		
R20H00	DCTL PPCI CMD parity error [REG8200127C, Bit21]	A parity error was detected when the ADR/CMD was read from the CMD buffer.	Simple Trace		
R20I00	DCTL PPCI CNT parity error [REG8200127C, Bit20]	A parity error was detected during counting by the FIFO control counter.	Simple Trace		
R20J00	DCTL PPCI target data response time-out [REG8200127C, Bit19]	A data response time-out (caused by 216 times of access) of a target was detected in the case of the DCTL master.	Simple Trace		
R20K00	DCTL PPCI target illegal termination [REG8200127C, Bit18]	An illegal termination of a target was detected in the case of the DCTL master. (The DEVSEL and STOP were negated at the same time in the data phase.)	Simple Trace		
R20L00	DUAL I/F DUAL_IORDY error [REG82001428, Bit29]	A failure in the impedance adjustment circuit in the self system. (DUAL_IORDY)	Full Dump		
R20M00	DCTL CACHE uncorrectable ERR [REG82001439, Bit29] (CTL-x, CACHE-y)	During a reading from the cache, the ECC error of two or more bits occurred in the two cache memory boards (MP). x : Control Unit# (0-1) y : Cache memory slot# (0,1,2,3,*) (* means the detection of all.)	Simple Trace	① Replace the Cache Unit. ② If not recovered, replace the above Control Unit.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540) Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20N00	Hard register error [A_CTLIN]	The error is A_CTLIN=1 (The Control Unit of the other system is not installed.) of the I2C GPIO#1 register and it is also EXT_IORDY=1 (Impedance adjustment in the other system was completed.) of the impedance adjustment_1 register.	Full Dump	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20P00	Vector registration failure [KEYINT]	The vector registration of the KEYINTSTS interrupt failed.	Full Dump		
R20Q00	Vector registration failure [OFFREQ]	The vector registration of the OFFREQ interrupt failed.	Full Dump		

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R20R00	Vector registration failure [DCTLERR]	The vector registration of the DCTLERR interrupt failed.	Full Dump	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R20S00	Vector registration failure [DRAMERR]	The vector registration of the DRAMERR interrupt failed.	Full Dump		
R20T00	Vector registration failure [SRAMERR]	The vector registration of the SRAMERR interrupt failed.	Full Dump		
R20U00	Vector registration failure [PCI0ERR]	The vector registration of the PCI0ERR interrupt failed.	Full Dump		
R20V00	Vector registration failure [PCI1ERR]	The vector registration of the PCI1ERR interrupt failed.	Full Dump		
R20W00	Vector registration failure [CPUERR]	The vector registration of the CPUERR interrupt failed.	Full Dump		
R20Y00	DCTL D0PCI unexpected SPC detected [REG82001288, Bit12]	The invalid split completion message was detected (D #0).	Simple Trace		
R20Z00	DCTL D0PCI SPS error message [REG82001288, Bit13]	The split completion message that informs of an occurrence of an error was detected (D #0).	Simple Trace		
R21000	DCTL D0PCI split completion time-out [REG82001288, Bit14]	The data buffer controller LSI (D-CTL) detected time-out of waiting for the split completion (D #0).	Simple Trace		
R21100	DCTL D0PCI master ADB disconnection error [REG82001288, Bit18]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it received the split completion message (D #0).	Simple Trace		
R21200	DCTL D0PCI SPC ADB error [REG82001288, Bit15]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it was a PCI slave (D #0).	Simple Trace		
R21300	DCTL D0PCI data response time-out [REG82001288, Bit19]	Data response time-out of the target was detected at the time of the DCTL master.	Simple Trace		
R21400	DCTL D0PCI counter parity error [REG82001288, Bit20]	A parity error was detected when the FIFO counter was counting.	Simple Trace		
R21500	DCTL D0PCI command parity error [REG82001288, Bit21]	A parity error was detected when an address/command was read from the command buffer.	Simple Trace		
R21600	DCTL D0PCI data parity error [REG82001288, Bit22]	A parity error was detected in the data that was read from the data FIFO.	Simple Trace		

Copyright © 2005, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R21700	DCTL D0PCI address parity error [REG82001288, Bit23]	A parity error of an address was detected.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R21800	DCTL D0PCI PERR detected [REG82001288, Bit24]	The PERR was asserted at the time of the bus master.	Simple Trace		
R21900	DCTL D0PCI single target abort [REG82001288, Bit27]	The target abort was executed.	Simple Trace		
R21A00	DCTL D0PCI target abort received [REG82001288, Bit28]	The target abort was received.	Simple Trace		
R21B00	DCTL D0PCI master abort [REG82001288, Bit29]	The master abort was executed.	Simple Trace		
R21C00	DCTL D0PCI system error [REG82001288, Bit29]	An assert of the SERR was detected.	Simple Trace		
R21D00	DCTL D0PCI parity error [REG82001288, Bit29]	A parity error was detected.	Simple Trace		
R21E00	DCTL PPCI ADB error [REG8200127C, Bit18]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it was a PCI slave.	Simple Trace		
R21F00	DCTL PPCI SPC ADB error [REG8200127C, Bit15]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it received the split completion message.	Simple Trace		
R21G00	DCTL PPCI SPC time-out [REG8200127C, Bit14]	The data buffer controller LSI (D-CTL) detected time-out of waiting for the split completion.	Simple Trace		
R21H00	DCTL PPCI SPC error message [REG8200127C, Bit13]	The split completion message that informs of an occurrence of an error was detected.	Simple Trace		
R21J00	DCTL PPCI unexpected SPC detected [REG8200127C, Bit12]	The invalid split completion message was detected	Simple Trace		
R21K00	DCTL CBUF SELCNT parity error [REG82001238, Bit14]	A parity error was detected in the counter for the output pointer of a buffer for writing to the cache	Simple Trace		

Copyright © 2005, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R21L00	DCTL PBUF SELCNT parity error [REG82001238, Bit14]	A parity error was detected in the counter for the input pointer of a buffer for writing to the cache	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R21M00	DCTL DBUF byte write error [REG82001238, Bit16]	Writing to the outside of the 4-byte boundary was detected in the ByteCnt in the PCI attribute	Simple Trace		
R21N00	DCTL register wait counter parity error [REG82001238, Bit13]	A parity error was detected in the counter of the waiting time of the SEQ for writing to the register	Simple Trace		
R21P00	DCTL RCTL error [REG82001238, Bit25]	No response with the RCTL (CACHE-IF) signal, which showed a read response, was made to the cache controller.	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
R21Q00	DCTL RCTL error [REG82001238, Bit24]	No response with the RCLK (CACHE-IF) signal, which was a clock signal for taking in the read data, was made to the cache controller.	Simple Trace	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R21R00	DCTL D1PCI unexpected SPC detected [REG8200128C, Bit12]	The invalid split completion message was detected.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R21S00	DCTL D1PCI SPC error message [REG8200128C, Bit13]	The split completion message that informs of an occurrence of an error was detected.	Simple Trace		
R21T00	DCTL D1PCI SPC time-out [REG8200128C, Bit14]	Time-out of the split completion response was detected.	Simple Trace		
R21U00	DCTL D1PCI SPC ADB error [REG8200128C, Bit15]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it received the split completion message.	Simple Trace		
R21V00	DCTL D1PCI master ADB disconnection error [REG8200128C, Bit18]	The data buffer controller LSI (D-CTL) detected that the PCI transfer was disconnected at an address other than the ADB (allowable disconnect boundary) when it was a PCI slave.	Simple Trace		
R21W00	DCTL D1PCI data response time-out [REG8200128C, Bit19]	Data response time-out of the target was detected at the time of the DCTL master.	Simple Trace		
R21Y00	DCTL D1PCI counter parity error [REG8200128C, Bit20]	A parity error was detected when the FIFO counter was counting.	Simple Trace		

Copyright © 2005, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R21Z00	DCTL D1PCI command parity error [REG8200128C, Bit21]	A parity error was detected when an address/command was read from the command buffer.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R22000	DCTL D1PCI data read parity error [REG8200128C, Bit22]	A parity error was detected in the data that was read from the data FIFO.	Simple Trace		
R22100	DCTL D1PCI address parity error [REG8200128C, Bit23]	A parity error of an address was detected.	Simple Trace		
R22200	DCTL D1PCI PERR detected [REG8200128C, Bit24]	The data buffer controller LSI (D-CTL) asserted or received at the PERR when the bus master was used.	Simple Trace		
R22300	DCTL D1PCI signal target abort [REG8200128C, Bit27]	The target abort was executed.	Simple Trace		
R22400	DCTL D1PCI received target abort [REG8200128C, Bit28]	The target abort was received.	Simple Trace		
R22500	DCTL D1PCI master abort [REG8200128C, Bit29]	The master abort was executed.	Simple Trace		
R22600	DCTL D1PCI system error [REG8200128C, Bit30]	An assert of the SERR was detected.	Simple Trace		
R22700	DCTL D1PCI data parity error [REG8200128C, Bit31]	A parity error was detected.	Simple Trace		
R30000	DCTL ECC write parity error [REG82001238, Bit31]	A parity error was detected in the ECC adding part during a writing on the cache.	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
R30100	DCTL ECC generate error [REG82001238, Bit30]	An ECC generation error was detected in the ECC adding part during a writing on the cache.	Simple Trace	② Replace the Control Unit of which the CALM LED lights on except for ①.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R302xy	DCTL CACHE uncorrectable ERR [REG82001238, Bit29] (CTL-x, CACHE-y)	During a reading from the cache, an EC error of two or more bits occurred in a single cache memory board. x : Control Unit # (0-1) y : Cache memory slot # (0,1,2,3,*) (* means the detection of all.)	Simple Trace	① Replace the Cache Unit.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
				② If not recovered, replace the above Control Unit.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

R51200	BRG PCI0 master generated target abort for split completion [REGF1001D58, Bit7]	The PCI master generated the target abort for the split completion.	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
R51300	BRG PCI0 slave SPC transaction terminated with an abort [REGF1001D58, Bit23]	The PCI slave terminated the transaction with the target abort.	Simple Trace	② When the ALARM LED (red) on the front side of the Basic Chassis lights up, replace the Control Unit whose CALM LED lights up.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R51400	BRG PCI0 slave reached the retry counter limit [REGF1001D58, Bit22]	The excess of the threshold value of the retry counter occurred in the PCI slave when generation of the split completion was attempted.	Simple Trace		
R51500	BRG PCI0 slave as a completer detected target abort [REGF1001D58, Bit18]	The PCI slave detected the target abort as a Completer.	Simple Trace		
R51600	BRG PCI0 slave generated master abort as a completer [REGF1001D58, Bit16]	The master abort occurred in the PCI slave as a Completer.	Simple Trace		
R51700	BRG PCI0 master received message error [REGF1001D58, Bit14]	The PCI master received a message error.	Simple Trace		
R51800	BRG PCI0 master received incorrect split completion [REGF1001D58, Bit3]	The PCI master received the Split Completion with a size (number of bytes) that does not meet the requirement.	Simple Trace		
R51900	BRG PCI0 master split completion discard timer expired [REGF1001D58, Bit12]	The time when the PCI master discards the Split Completion has come.	Simple Trace		
R51A00	BRG PCI0 transaction generated while master is disabled [REGF1001D58, Bit10]	The PCI transaction was generated while the master PCI was disabled.	Simple Trace		
R51B00	BRG PCI0 internal data path error in the PCI interface [REGF1001D58, Bit0]	An internal data path error was detected in the PCI interface.	Simple Trace		
R51C00	BRG PCI0 DWORD boundary error [REGF1001D58, Bit4]	An issue of an I/O instruction beyond the DWORD boundary was attempted.	Simple Trace		
R51D00	BRG PCI1 internal data path error in the PCI interface [REGF1001DD8, Bit0]	The CPU-PCI bridge detected an internal data path error in the PCI1 interface.	Simple Trace

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
R51E00	BRG PCI1 the PCI slave detected bad write data parity [REGF1001DD8, Bit1]	The PCI slave detected an illegal parity of the write data.	Simple Trace	① When "W0100x CTL alarm" is displayed after this message, maintain it according to the message.	"Chapter 6. Warning Messages" (MSG 06-0000)
R51F00	BRG PCI1 PERR response to read data driven by PCI slave [REGF1001DD8, Bit2]	The CPU-PCI bridge detected the PERR response to the read data that the PCI slave transferred.	Simple Trace	② When the ALARM LED (red) on the front side of the Basic Chassis lights up, replace the Control Unit whose CALM LED lights up.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
R51G00	BRG PCI1 DWORD boundary error [REGF1001DD8, Bit4]	The CPU-PCI bridge detected the I/O which exceeds the DWORD boundary.	Simple Trace		
R51H00	BRG PCI1 PERR response to write data driven by the PCI master [REGF1001DD8, Bit5]	The CPU-PCI bridge detected the PERR response to the write data that the PCI master transferred.	Simple Trace		
R51J00	BRG PCI1 bad data parity detected during the PCI master read [REGF1001DD8, Bit6]	The CPU-PCI bridge detected an illegal parity of the data while the PCI master read the data.	Simple Trace		
R51K00	BRG PCI1 master generated target abort for split completion [REGF1001DD8, Bit7]	The PCI master generated the target abort as split completion.	Simple Trace		
R51L00	BRG PCI1 the PCI master generated master abort [REGF1001DD8, Bit8]	The PCI master generated the master abort.	Simple Trace		
R51M00	BRG PCI1 the PCI master detected target abort [REGF1001DD8, Bit9]	The PCI master detected the target abort.	Simple Trace		
R51N00	BRG PCI1 transaction generated while master is disabled [REGF1001DD8, Bit10]	The PCI transfer occurred while the PCI master is disabled.	Simple Trace		
R51P00	BRG PCI1 the PCI master reached retry counter limit [REGF1001DD8, Bit11]	The retry of the PCI master exceeded the threshold value of the retry counter.	Simple Trace		
R51Q00	BRG PCI1 master split completion discard timer expired [REGF1001DD8, Bit12]	The time when the PCI master is waiting for split completion reached at the split completion cancellation time.	Simple Trace		
R51R00	BRG PCI1 master received incorrect split completion [REGF1001DD8, Bit13]	The PCI master received split completion of the number of bytes which does not suit the demand.	Simple Trace

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
RBC000	No drive available	There is not a Disk Drive to install.	Simple Trace	① Check if the subsystem of the unit ID #0 is the RKAJ for the AMS1000. If it is not so, install the subsystem again so that the subsystem of the unit ID #0 may become the RKAJ. ② Replace the Disk Drives #0 to #4 of the subsystem of the unit ID #0 one at a time.	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
RBC10x	Drive block size error (Unit-0, HDU-x)	The value of the block size of the capacity data reported from the Disk Drive was other than the specified value. x : Disk Drive# (0-4)		① Replace the Disk Drive. Check the model name of the Disk Drive or the drive firmware revision.	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050) Replacement "1.1.3 Procedure for making sure of model name and drive firmware of Disk Drive" (REP 01-0100)
RBC20x	Unknown drive (Unit-0, HDU-x)	The value of the logical block address of the capacity data reported from the Disk Drive was equal to or less than the size of the system area. x : Disk Drive# (0-4)			
RBC2HH	Unknown drive (Unit-0, HDU-x)	The value of the logical block address of the capacity data reported from the Disk Drive was equal to or less than the size of the system area. x : Disk Drive# (0-4)			
RBE00x	Flash memory write error (FM-x)	Writing in the flash memory failed. x : Chip information that caused the error (0=FM1-0, 1=FM1-1, 2=FM both chips)	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
RBE100	Flash memory SUM check error	A sum check error is detected in the flash memory.	Full Dump		
RBE200	Flash program update error	When the FM microprogram which failed in maintenance of the flash version is updated, its version is not matched to the version of the main microprogram.		① Perform the installation upgrade. ② If not recovered, replace the Control Unit whose CALM LED is on.	For Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000) Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
RBE300	Flash program update start	Updating of the FM1 flash program was started by the latest REV maintenance function of the flash program.		–	–

Copyright © 2006, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
RBE301	Flash program update end	Updating of the FM1 flash program was started by the latest REV maintenance function of flash program.		–	–
RBE500	Initial setup error by LU access restriction	The Initial setup failed because access to the LU was restricted.	Simple Trace	① The Initial setup is impossible. To update the microprogram, do it by means of the update installation.	–
RBE600	Config clear restart error by LU access restriction	The Config clear restart failed because access to the LU was restricted.	Simple Trace	① The Config clear restart is impossible. To reboot, specify the TakeOver (takeover reboot).	–
RBE900	Upgrade failed [the installed microprogram is incorrect]	The upgrade failed because the microprogram, installation of which was attempted, was incorrect.	Simple Trace	① Select the unified version directory, whose version is a unified version same as that of the microprogram of the lower grade model, and install the microprogram in the subsystem of the higher grade model for the purpose of upgrade.	For Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
RBEA00	Downgrade failed [the installed microprogram is incorrect]	The Downgrade failed because the microprogram, installation of which was attempted, was incorrect.	Simple Trace	① Select the unified version directory, whose version is a unified version of the microprogram of the higher grade model already installed, and install the microprogram in the subsystem of the higher grade model for the purpose of update.	
RBED00	System HDU spin up failed [unsupported Unit is connected Unit-00]	The type of the system drive is illegal. (The Unit #0 is not the FC disk array unit.)	Simple Trace	① Assign an FC disk array unit to the Unit #0, or make sure of the rule of the connection.	–
RBEG00	Download failed [unsupported Unit is connected]	The startup failed because the microprogram did not support the S-ATA disk array unit.	Simple Trace	① Install the microprogram that supports the S-ATA disk array unit after changing the mode to Maintenance, or start up the subsystem after removing the S-ATA disk array unit from the configuration.	For Installation "Chapter 3. Installing Rackmount Model" (INST 03-0000), Addition/Subtraction/ Relocation "Chapter 1. Adding Optional Components" (ADD 01-0000)

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
RBEN00	Installation of the other CTL detected on install mode	The start-up could not be made because the FM mode was the installation mode (for emergency) at the time of the installation of a Control Unit of the other system.	Full Dump	①When the FM MODE is the installation mode, pull out the JP and make the start-up again.	–
				②If not recovered, replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
RBEP00	Bad LBA in START70X.DAT	Invalid write LBA by the content of the upload file was detected.	Simple Trace	①Reinstall the microprogram after acquiring the microprogram because abnormality was detected in the START70X.DAT file.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
RBEQ00	Down grade install NG [Going to Maintenance Mode procedure is abnormal]	The downgrade installation of the microprogram cannot be performed because it entered the maintenance mode before the subsystem starts.	Simple Trace	①1. Start the subsystem by clicking [Go to Normal Mode] in the menu frame on WEB.	Installation "1.7.1 Subsystem power on" (INST 01-0290)
				2. Install the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
RBER00	Down grade install NG [RAID6 RGs exist.]	Because the RAID group of RAID 6 exists, the downgrade cannot be performed to the microprogram which does not support RAID 6.	Simple Trace	①1. Start the subsystem by clicking [Go to Normal Mode] in the menu frame on WEB.	Installation "1.7.1 Subsystem power on" (INST 01-0290)
				2. Delete the RAID group of RAID 6.	System Parameter "[Procedure ②-D]Deleting RAID group" (SYSPR 03-0100)
				3. Change it to the maintenance mode.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
				4. Perform the downgrade installation of the microprogram again.	WEB "3.3.1 Microprogram" (WEB 03-0280
RBES00	Down grade install NG [FLASH program revision mismatch]	Because the FLASH Micro version is not consistent between the Control Units, the microprogram downgrade installation cannot be performed.	Simple Trace	①1. Start the subsystem by clicking [Go to Normal Mode] in the menu frame on WEB.	Installation "1.7.1 Subsystem power on" (INST 01-0290)
				2. Install the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)

Chapter 6. Warning Messages

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
W0100x	CTL alarm (CTL-x)	The Control Unit was regressed (It had a failure or was not connected), or a failure was detected in the Control Unit of another system during the initial setting operation. x : Control Unit # (0-1)	CTL Alarm Trace	① When "I19000 Online micro-update completed" is displayed before this message, it shows that no Control Unit failure has occurred.	–
				② When the ALARM LED is lit, take a recovery action according to in Troubleshooting "6.1.1 System down".	Troubleshooting "6.1.1 System down" (TRBL 06-0020)
				③ Take the recovery actions according to the messages listed in Troubleshooting "4.5 The Priority Error Messages when "W0100x CTL alarm" is displayed".	Troubleshooting "4.5 The Priority Error Messages when "W0100x CTL alarm" is displayed" (TRBL 04-0180)
				④ If only "H90210 CTL failure" is displayed besides this message, connect the Control Unit on which the CALM LED is illuminating to the Web, and follow the recovery instruction message displayed on the Web.	–
				⑤ Replace the Control Unit whose CALM LED is on. However, go to ⑥ for the Control Unit which is connected to the NNC (NAS Unit).	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
				⑥ Replace the Control Unit whose CALM LED is on.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #19)" (NAS 07-0120)
W02000	Other CTL removed	A shutdown occurred in MPU on the Control Unit of another system.	Simple Trace	① Replace the Control Unit whose CALM LED is on.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

Copyright © 2005, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
W03000	Battery alarm	Abnormal battery voltage or a failure in the battery charging circuit was detected.		① Check that the Disk Drives executing the spin-up command are all spin-up, and then remove the inserted Backup Battery Unit (ASSY) from the chassis once and insert it again after 20 seconds or more passed. (*1) ② Replace the Backup Battery Unit. (*2)	Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)
W0300x	Battery alarm (Battery-x)	Abnormal battery voltage or a failure in the battery charging circuit was detected. x : Backup Battery Unit # (0-3)			
W03100	Battery removed	A Backup Battery Unit has been removed from an subsystem.		① Attach a Backup Battery Unit to a subsystem.	Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)
W0310x	Battery removed (Battery-x)	A Backup Battery Unit has been removed from an array unit. x : Backup Battery Unit # (0-3)			
W03200	Battery SW OFF	The switch of a Backup Battery Unit has been set to OFF.		① Set the switch of a Backup Battery Unit to ON.	–
W0320x	Battery SW OFF (Battery-x)	The switch of a Backup Battery Unit has been set to OFF. x : Backup Battery Unit # (0-1)			
W03300	Battery Thermal alarm	The battery thermal failed.		① Replace the Backup Battery Unit.	Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)
W0330x	Battery Thermal alarm (Battery-x)	The battery thermal failed. x : Backup Battery Unit # (0-3)			
W0340x	Battery back up circuit alarm (CTL-x)	The battery backup circuit failed. x : Control Unit # (0-1)		① When any one of the following messages is displayed, follow the recovery procedure given by it. • W03000 Battery alarm • W0300x Battery alarm • W03100 Battery removed • W0310x Battery removed • W03200 Battery SW OFF • W0320x Battery SW OFF • W03300 Battery Thermal alarm • W0330x Battery Thermal alarm	–
				② If only "W0340x Battery back up circuit alarm" is displayed, replace a Control Unit that has the number "x".	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)

*1 : If the part was replaced at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the part may not recover normally.

*2 : If this massage is displayed and the ALARM LED on the Battery Unit (ASSY) lights on, be sure to replace the Battery Unit (it cannot be recharged).

(Add cache memory.) y=1 : Perform maintenance described in message code “W0D0x0 CACHE alarm”. To resume the LU cache resident function after recovering from a cache failure, turn off and then on an array unit. y=2 : Perform maintenance described in message code “W0100x CTL alarm”. y=3 : Perform maintenance described in message code“W03000 Battery alarm”, “W0300x Battery alarm”, “W03100 Battery removed”,. “W0310x Battery removed”,. “W03200 Battery SW OFF”, “W0320x Battery SW OFF”, “W03300 Battery Thermal alarm” and “W0330x Battery Thermal alarm”. y=4 : Perform maintenance described in message code“W0340x Battery back up circuit alarm”. y=5 : Perform maintenance described in message code “W41100 PIN over”.	–
W4500x	Online micro-update executing (CTL-x)	The microprogram of a Control Unit has not been replaced with the power turned on. x : Control Unit # (0-1) This message is indicated to warn that microprogram of a Control Unit is being replaced with the power turned on. If replacement of the microprogram is finished, this warning disappears.		–	–

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text	Description	Collect the error	Recovery methods	Reference page
W4600x	Online micro-update started (CTL-x)	The Control Unit was blocked falsely to replace the microprogram with the power turned on, or the Control Unit of another system was blocked falsely. x : Control Unit # (0-1)		–	–
W4700x	Serial number error [WWN] (CTL-x)	WWW could not be set since the serial number of the subsystem was set incorrectly. x : Control Unit # (0-1)		① Check if the serial number of the subsystem is set correctly.	System Parameter "4.2 Setting the subsystem configuration information" (SYSPR 04-0020)
W48000	Forced parity correction LU is detected	An LU, which required the forced parity correction, was detected.		① Refer to Troubleshooting "6.1.3 The failure occurred immediately after being ready (Forced parity correction)".	Troubleshooting "6.1.3 The failure occurred immediately after being ready (Forced parity correction)" (TRBL 06-0060)
W48100	Uncorrectable forced parity correction LU is detected	An LU, the forced restoration for which by means of parity could not be continued, was detected.		① Check the LU information using the Storage Navigator Modular. ② Have the LU, the forced restoration for which by means of parity cannot be continued, skip the restoration by issuing an instruction to skip the restoration using the Storage Navigator Modular.(*1) The warning is removed after all the LUs, the forced restoration for which by means of parity cannot be continued, receive an instruction to skip the restoration.	–
W49000	Forced parity correction LU is detected by HDU alarm	Drive detachment occurred in a RAID group whose RAID level was 6 and an LU, which was in the forced parity correction status of Unrestored 1, was detected.		① Refer to Troubleshooting "6.1.3 The failure occurred immediately after being ready (Forced parity correction)". ② Select whether to execute the forced parity correction or skip it after any of the following messages was displayed. • I007xy HDU recovered • I007HH HDU recovered • I009xy Spare HDU recovered • I009HH Spare HDU recovered	Troubleshooting "6.1.3 The failure occurred immediately after being ready (Forced parity correction)" (TRBL 06-0060) Troubleshooting "6.1.3 < Procedure given in windows >" (TRBL 06-0250)

*1 : When there is an LU which is not executing the forced parity correction, the dynamic sparing is suppressed and the data recovery is always executed by the correction copy. Also, the copy back from the Spare Disk Drive does not operate. In this case, perform the "Skip" instruction for all the LUs that the LU status is "Uncorrected 2" after the data recovery to the Spare Disk Drive. The dynamic sparing and the copy back can be executed now by this operation.

Chapter 7. Web Error Messages

7.1 Web error messages (Uploading Function)

Message code	Message text	Description	Recovery methods	Reference page
-	Abnormal End AT xxxx ******** Upload System Error	The number of areas is other than either of one and two.	①Make sure of the system to be installed and execute the installation again. (The START600. DAT is illegal.)	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
-	Abnormal End Bad Block ID	The block ID is illegal.	①Make sure of the system to be installed and execute the installation again.	
-	Abnormal End Bad LBA In START70H.DAT 0x******** xxxx	LBA is abnormal at the storage destination by the illegal content of "START70H.DAT".	①Check the upload system, and install it again. (START70H.DAT may have been broken).	
-	Abnormal End Bad LBA In START70M.DAT 0x******** xxxx	LBA is abnormal at the storage destination by the illegal content of "START70M.DAT".	①Check the upload system, and install it again. (START70M.DAT may have been broken).	
-	Abnormal End Bad LBA In START70S.DAT 0x******** xxxx	LBA is abnormal at the storage destination by the illegal content of "START70S.DAT".	①Check the upload system, and install it again. (START70S.DAT may have been broken).	
-	Abnormal End Bad LBA In START70X.DAT 0x******** xxxx	LBA is abnormal at the storage destination by the illegal content of "START70X.DAT".	①Check the upload system, and install it again. (START70X.DAT may have been broken).	
-	Abnormal End Check sum error detected in all system drives	Check sum error was detected in all the system drives while the update installation of the microprogram is performed.	①1. Turn off the main switch, and turn on the main switch again after 20 seconds or more passed. 2. Change it to the maintenance mode after the RDY LED (green) lights up or "RB8400 Download failed" is displayed in the Information Message on WEB, and the subsystem goes down. 3. Perform the update installation of the microprogram again. ②If this failure still occurs even if ① is repeated three times, execute the new installation.	– WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000) Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
-	Abnormal End Config Clear Restart Error by LU Access Restriction	Config clear restart failed due to the LU access restriction.	①Config clear restart cannot be done. Select Take Over from Configuration Clear Mode and restart(*1).	–
-	Abnormal End Downgrade Failed (The Installed Microprogram is Incorrect) Uploaded Microprogram Revision:XXXX/X Installed Microprogram Revision:XXXX/X	The downgrade in the DF700M/H chassis failed.	①Install the DF700S/M microprogram whose system revision is the same as that of the microprogram in the Disk Drive.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Message code	Message text	Description	Recovery methods	Reference page
-	Abnormal End Down Grade Check NG	Although the version down of the microprogram was attempted, the update installation terminated abnormally because Down Grade Check was not Disable.	①Change the setting of the downgrade check to Disable, and then updating installation of the microprogram again.	WEB "3.3 Setup" (WEB 03-0280)
-	Abnormal End Down Grade Install NG (Account Authentication Feature is Installed)	The update installation of the microprogram of the revision which is not supporting Account Authentication cannot be performed because the priced option of Account Authentication is unlocked.	①1. Check that the revision of the microprogram to be installed is the revision to be originally installed.	–
			2. When the micorprogram to be installed is wrong, perform the update installation of the microprogram to be originally installed again	WEB "3.3.1 Microprogram" (WEB 03-0280)
			②1. Return the subsystem to the normal mode by clicking the [Go to Normal Mode] button in the menu frame of the maintenance mode window on WEB.	WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440)
			2. Check that the "I10000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.	–
			3. Lock the priced option of the Account Authentication function referring to Account Authentication User's Guide "3.2 Un-installation".	Account Authentication User's Guide "3.2 Un-installation"
			4. Change it to the maintenance mode.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
			5. Click [Others] in the menu frame of the maintenance mode window on WEB.	WEB "3.6 Other" (WEB 03-0430)
			6. Set [Down Grade Check] of the [Others] window to "Disable".	
			7. Execute the upgrade installation (version downgrade) of the microprogram again.	WEB "3.3.1 Microprogram" (WEB 03-0280)
			8. Click "To Maintenance Mode Top" of the "Microprogram Setup" window on WEB.	
			9. Return the subsystem to the normal mode by clicking the [Go to Normal Mode] button in the menu frame of the maintenance mode window on WEB.	WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440)
			10. Check that the "I10000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text	Description	Recovery methods	Reference page
-	Abnormal End Down Grade Install NG (Cache Partition with Size of 64KB or more is Defined)	It cannot be installed in the microprogram which is not supporting the Cache partition of 64 Kbytes or more because the Cache partition of 64 Kbytes or more is used.	①1. Click [Go to Normal Mode] of the menu frame in the WEB window, and start the subsystem.	–
			2. Change the Cache partition of 64 Kbytes or more to 16Kbytes or less, or delete it following the procedure of "Cache Partition Manager User's Guide".	"Cache Partition Manager User's Guide"
			3. Change it to the maintenance mode.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
			4. Execute the downgrade installation of the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
-	Abnormal End Down Grade Install NG (FLASH Program Revision Mismatch)	The downgrade installation of the microprogram cannot be performed because the FLASH microprogram versions are not matched between the Control Units.	①Click [Go to Normal Mode] of the menu frame in the WEB window, and start the subsystem.	–
			②Check that the subsystem becomes Ready, and execute the downgrade installation of the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
-	Abnormal End Down Grade Install NG (Going to Maintenance Mode Procedure is Abnormal.)	The downgrade installation of the microprogram cannot be performed because it is changed to the maintenance mode while the subsystem is starting.		
-	Abnormal End Down Grade Install NG (iSCSI Target(s) or CHAP User(s) is not Initialized)	The update installation of the microprogram whose revision is not supporting the extension of the iSCSI connection host number cannot be performed because the Traget other than Target #0 of the iSCSI is defined, CHAP User is defined, or Target #0 is not initialized.	①1. Click [Go to Normal Mode] of the menu frame in the WEB window, and start the subsystem.	–
			2. Check that the "I10000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.	–
			3. Perform the update installation of the microprogram whose version is to be downgraded referring to Microprogram "1.7 Procedure of the version downgrade of the microprogram".	Microprogram "1.7 Procedure of the version downgrade of the microprogram" (MICRO 01-0290) Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)

-	Abnormal End Down Grade Install NG (LU with Stripe Size 64KB Other Than Exist.)	It cannot be installed in the microprogram which is not supporting the LU of the stripe size other than 64 Kbytes because the LU of the stripe size other than 64 Kbytes exists.	① 1. Click [Go to Normal Mode] of the menu frame in the WEB window, and start the subsystem.	–
			2. Delete the LU of the stripe size other than 64 Kbytes once, and create the LU of 64 Kbytes again.	System Parameter "3.3 Setting of LU" (SYSPR 03-0140)
			3. Change it to the maintenance mode.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
			4. Execute the downgrade installation of the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
-	Abnormal End Down grade install NG [Modular Volume Migration feature is installed]	The update installation cannot be performed for the microprogram of the revision which is not supporting the Modular Volume Migration function because the priced option of the Modular Volume Migration function is unlocked.	① 1. Return the subsystem to the normal mode by clicking the [Go to Normal Mode] button in the menu frame of the maintenance mode window on WEB.	WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440)
			2. Check that the "I10000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.	–
			3. Lock the priced option of the Modular Volume Migration function referring to Modular Volume Migration User's Guide "3.1.2 Uninstalling Volume Migration".	Modular Volume Migration User's Guide "3.1.2 Uninstalling Volume Migration"
			4. Change it to the maintenance mode.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
			5. Click [Others] in the menu frame of the maintenance mode window on WEB.	WEB "3.6 Other" (WEB 03-0430)
			6. Set [Down Grade Check] of the [Others] window to "Disable".	
			7. Execute the upgrade installation (version downgrade) of the microprogram again.	WEB "3.3.1 Microprogram" (WEB 03-0280)
			8. Click "To Maintenance Mode Top" of the "Microprogram Setup" window on WEB.	WEB "3.3.1 Microprogram" (WEB 03-0280)
			9. Return the subsystem to the normal mode by clicking the [Go to Normal Mode] button in the menu frame of the maintenance mode window on WEB.	WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440)
			10. Check that the "I10000 Subsystem is ready" is displayed in the Information Message of the normal mode window on WEB.	–

Message code	Message text	Description	Recovery methods	Reference page
1009	Please. Retry Again.	The subsystem stands ready to start the microprogram installation.	① Install the microprogram over again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
1010	Please. Retry Again on Other CTL.	Have the controller in another system re-execute the process.	① Have the controller in another system re-execute the process.	–
1011	Please Confirm Information Message.	Make sure of the information message.	① Make sure of the information message.	–
1200	The Java Plug-in version in use is not supported. Confirm the Java Plug-in version.	Java Applet was activated with Java Plug-in of a version not supported.	① Activate Java Applet again after making sure of the version of Java Plug-in currently used.	–
1202	A path to the Microprogram isn't being input. Specify a path.	The path to the microprogram to be installed is not specified.	① Specify the path to the microprogram.	–
1204	A specified file doesn't exist. Confirm elements of designation.	The specified file does not exist.	① Make sure that the path to the directory of the microprogram to be installed is specified correctly.	–
1206	A specified path is not a normal file. Specify a file.	A file other than the normal file was specified when the normal file must be specified.	① Check if the specification is correct.	–
1207	A specified path is not a directory. Specify a directory.	A file other than the directory file was specified when the directory file must be specified.		
1210	A specified file is not possible to read. Confirm the condition of the file.	The specified file cannot be read.	① Make sure of a status of the specified file.	—
1212	Access to the specified file was rejected. Confirm the setup of the security policy.	Access to the specified file was rejected according to the security policy.	① Set up the service PC again.	–
1213	Access to the specified directory was rejected. Confirm the setup of the security policy.	Access to the specified directory was rejected according to the security policy.		
1214	An error occurred during the file I/O. Confirm the status of the specified file.	An error occurred during an I/O operation to/from the specified file.	① Make sure of a status of the specified file.	–
1215	A runtime permission wrong matter occurred. Confirm the setup of the security policy.	A request for access to the java.lang.RuntimePermission object was rejected.	① Set up the service PC again.	–
1216	Access to the property information was rejected. Confirm the setup of the security policy.	A request for access to the java.util.OropertyPermission object was rejected.		
1217	A security wrong matter occurred. Confirm the setup of the security policy.	A security trouble occurred.

Message code	Message text	Description	Recovery methods	Reference page
1218	An invalid response was received from the subsystem. Confirm the subsystem status and the LAN environment, and then try again.	Communication with the subsystem failed.	①Make sure of the subsystem status and the LAN environment, and then retry.	–
1219	An error occurred during the communication with the subsystem. Confirm the subsystem status and the LAN environment.	An error occurred during the communication with the subsystem.	①Make sure of the subsystem status and the LAN environment, press the Software Reset button, and retry.	–
1220	A path to the Utility Program isn't being input. Specify a path.	The path to the utility program to be installed is not specified.	①Specify the path to the utility program.	–
1221	A path to the Utility Parameter Files isn't being input. Specify a path.	The path to the parameter file to be installed is not specified.	①Specify the path to the utility parameter file.	–
1222	A path to the Drive Firmware Program isn't being input. Specify a path.	The path to the drive firmware program to be installed is not specified.	①Specify the path to the drive firmware program.	–
1223	A HTTPClient library isn't found. Confirm the execution environment.	The HITTPClient library is not found.	①Activate the browser again after setting up the service PC, and then re-execute the microprogram installation.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
1224	A path to the ENC Microprogram isn't being input. Specify a path.	The path to the ENC microprogram to be installed is not specified.	①Specify the path to the ENC microprogram.	–
2000	File upload was cancelled.	The installation of the file was interrupted (artificially).	①Re-execute the installation after activating the browser again.	–
2001	Microprogram installation was cancelled.	The installation of the microprogram was interrupted (artificially).	①Re-execute the microprogram installation after activating the browser again.	–

7.3 Web error messages (Web Control Management)

Message code	Message text	Description	Recovery methods	Reference page
-	Booting. Please Retry Again.	A boot is in progress.	①Retry after making sure of the subsystem status.	–
-	CTL Alarm.	CTL detachment	①Replacing the Control Unit.	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
-	Executing [Simple Trace]	The simple trace is being executed.	①Retry after making sure of the subsystem status.	–
-	"Invalid machine status."	Illegal status	①Restart the subsystem.	–
-	Invalid Parameter.	When the restriction placed on inputting is not followed.	①Reset the parameter.	–
-	Not Ready	When the drive separating function exclusive check and the trace collection check are abnormal.	①Retry after making sure of the subsystem status.	–
-	Subsystem is Executing Other Event. [OWN]	The process is being executed in the self system.	①Retry after making sure of the subsystem status.	–
-	"Web Task" is executing other request.	The Web task is executing another request.	①Retry after making sure of the subsystem status.	–
-	Web Task Booting..	The Web task is being booted.	①Retry after making sure of the subsystem status.	–
-	Web Task Down!	The Web task cannot be executed.	①Restart the subsystem.	–
1003	Cannot Upload File.	Write error of the RAM disk	①Perform the operation over again from the software reset.	–
1004	System is Other Boot Up Mode.	Inconsistency of statuses of Applet and the subsystem (Example: The subsystem has started an installation of drive firmware, whereas Applet is loading the utility.)	①Reload the page.	–
			②If the correct page is not displayed, perform the operation over again from the software reset.	–
1005	Booting. Please Retry Again.	The subsystem is being started up.	①Operate over again after waiting for a while.	–
1006	System is Executing Other Event.	The subsystem is already executing the process.	①Make sure of the information message or reload the page.	–
1007	System is Executing Main Process.	The utility is being processed. The drive firmware is being replaced.	①Reload the page.	–
1008	System is Down.	The subsystem cannot execute the process (it has gone down).	①Perform the operation over again from the software reset.	–
1009	Please. Retry Again.	The subsystem stands ready to start the microprogram installation.	①Install the microprogram over again.	–
1010	Please. Retry Again on Other CTL.	Have the CTL in another system re-execute the process.	①Have the controller in another system re-execute the process.	–
1011	Please Confirm Information Message.	Make sure of the information message.	①Make sure of the information message.	–

7.4 Web error messages (NAS Log)

Message code	Message text	Description	Recovery methods	Reference page
-	Not Ready(*1)	The subsystem is not Ready.	①Wait until the subsystem becomes Ready.	-
-	The NAS log download is already executing. Wait a while, and then try again.	The NAS Log collection is being executed.	①Wait until the collection processing of the NAS Log is completed.	-
-	NAS Log collection was interrupted.	The NAS Log collection was canceled.	①Press the [OK] button, and close the sub window.	-
-	(*2)	The NNC (NAS Unit) terminated abnormally.	①Perform the maintenance according to the contents of the message. (The details of the contents of the message are shown by the NNC (NAS Unit).)	-
-	NAS Log collection is being executed.	It terminated abnormally because the NAS Log is being downloaded.	①Wait until the download of the NAS Log file is completed.	-
-	The NAS Log download was interrupted because a timeout occurred during program processing.	A time-out occurred at normal time.	①Check the Information Message if the NNC (NAS Unit) has no abnormality.	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100)
-		A time-out occurred at cancellation.		
-	NAS Log collection is already finished.	The NAS Log collection was completed.	①Press the [OK] button, and close the sub window.	-
-	The NAS Log download was interrupted because a timeout occurred during program processing.	A time-out occurred in a part of the processing in process of the download processing by the NAS Log collection processing.	①Execute the NAS Log collection again. ②If the above-mentioned ① failed, request the collection of All Log from the NAS Manager Modular to the system administrator.	-
-	The NAS Log download was interrupted for some reason.	A mismatch occurred in the one-time password or the internal setting parameter in process of the download processing by the NAS Log collection processing.	①Check the NAS Log collection processing procedure, and execute the NAS Log collection again. ②If the above-mentioned ① failed, request the collection of All Log from the NAS Manager Modular to the system administrator.	-
-	The NAS Log download failed because an execution error occurred during program processing.	An internal error occurred in process of the download processing by the NAS Log collection processing.	①Execute the NAS Log collection again. ②If the above-mentioned ① failed, request the collection of All Log from the NAS Manager Modular to the system administrator.	-

*1 : When an invalid argument was specified in the URL to the CGI program, or when an undefined value is returned from the progress rate acquisition function, "Not Ready" is displayed as well as the simple trace.

*2 : The text of the message changes according to the error factor.

7.5 Web error messages (NAS Dump)

Message code	Message text	Description	Recovery methods	Reference page
-	Do you collect the “NAS Dump”?	Is “NAS Dump” collected?	①It transits by pressing the [OK] or [Cancel] on the window.	-
-	Collection of the NAS Dump might take up to 90 minutes. This processing will be forced to stop the NAS OS immediately, regardless of the NAS OS processing. Are you sure you want to continue the processing?	The acquisition of the NAS Dump takes a maximum of ninety minutes. Also, when this processing is executed, the NAS OS is forcibly terminated regardless of the status of the NAS OS. Is the processing continued?	①It transits by pressing the [OK] or [Cancel] on the window.	-
-	Collection of the NAS Dump is in process (NNC-x)	The NAS Dump collection is currently processing. x : NNC (NAS Unit) # (0-3)	①It transits by pressing the [OK] on the window.	-
-	The collection operation for the NAS Dump was rejected. The collection of the NAS Dump has been in process already.	The operation of the NAS Dump collection was rejected. The NAS Dump collection has already executed	①It transits by pressing the [OK] on the window.	-
-	Please select the NNC number to cancel collection of the NAS Dump.	Select the NNC (NAS Unit) number, and cancel the NAS Dump collection.	①It transits by pressing the [Set] or [Cancel] on the window.	-
-	Do you cancel collection of the "NAS Dump"?	Is the “NAS Dump” collection canceled?	①It transits by pressing the [OK] or [Cancel] on the window.	-
-	The collection of the NAS Dump was canceled (NNC-x)	The NAS Dump collection was canceled. x : NNC (NAS Unit) # (0-3)	①It transits by pressing the [OK] on the window.	-
-	The cancel operation for collection of the NAS Dump was rejected. The collection of the NAS Dump is not running.	The interruption operation for the NAS Dump collection was rejected. The NAS Dump collection is not being executed.	①It transits by pressing the [OK] on the window.	-
-	Password entry complete.	The password registration was completed.	①It transits by pressing the [OK] on the window.	-
-	Invalid value! Please re-enter password.	It is an invalid value. Enter the password again.	①The window is closed by pressing [OK] on the window.	-
-	Wrong old password. Please re-enter "NAS Dump".	It is the wrong old password. Enter “Old Password” again.	①It transits by pressing the [OK] on the window.	-
-	Wrong new password or re-enter new password. Please re-enter "New Password" and "Re-enter New Password".	It is the wrong new password or the reentered password. Enter “New Password” and “Re-enter New Password” again.	①It transits by pressing the [OK] on the window.	-
-	The current password setting will be cleared and will return to default password it this reset operation is executed.	When this reset operation is executed, the current password setting is cleared and returned to the default password.	①It transits by pressing the [Rest] or [To Normal Mode top] on the window.	-
-	Do you reset the password?	Is the password reset?	①It transits by pressing the [OK] or [Cancel] on the window.	-

Copyright © 2006, Hitachi, Ltd.

Message code	Message text	Description	Recovery methods	Reference page
-	The password reset operation was completed.	The password reset operation was completed.	① It transits by pressing the [To Normal Mode top] on the window.	-
-	Not Ready(*1)	It is not ready.	① Wait until the subsystem becomes Ready.	-

*1 : As an indication factor of Not Ready, it is displayed when the status of the NNC (NAS Unit) has not decided, or when an invalid argument to the CGI is specified, and the like. It is unified by the NAS Log collection function and the same message.

Chapter 8. Storage Navigator Modular Error Messages

Table 8.1 Storage Navigator Modular error messages

Message code	Message text/Recovery methods
DMEA000001	Busy status was reported from the subsystem. Please retry after waiting for a while.
DMEA000002	The Queue Full status was reported from the subsystem. Please retry after waiting for a while.
DMEA000003	LU0 is reserved by another host. Please retry after the reservation is canceled.
DMEA000004	An error was detected in the data received from the subsystem. Confirm the subsystem status and the LAN environment, and then try again.
DMEA000005	An error occurred while communicating with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.
DMEA000006	Failed to connect with the subsystem. Confirm the subsystem status and the LAN environment, and then try again.
DMEA000007	An invalid response was received from the subsystem. Confirm the subsystem status and the LAN environment, and then try again.
DMEA000008	An unexpected error was reported from the subsystem. Please retry after waiting for a while.
DMEA00000A	The CHECK CONDITION status was reported from the subsystem, but the details could not be acquired. Please retry after waiting for a while.
DMEA00000B	Failed to transfer data. Confirm the subsystem status and the LAN environment, and then try again.
DMEA00000C	Failed to issue the SCSI command. Confirm the subsystem status and the LAN environment, and then try again.
DMEA00000D	Insufficient memory. Terminate other programs and then try again.
DMEA00000E	An internal program error occurred. Wait for a while and then try again. If the problem cannot be solved, contact the maintenance personnel.
DMEA000201	The specified user ID or password is incorrect.
DMEA001000	The information file for the subsystem cannot be opened. Confirm the execution environment.
DMEA001001	The information file for the subsystem is invalid. Confirm the execution environment.
DMEA001002	The specified subsystem name is already registered. Specify another name.
DMEA001003	The specified subsystem name is not registered.
DMEA001004	The registered information does not match the status of the subsystem. Correct the information and then try again.
DMEA001005	The number of registered subsystems has reached the maximum. Delete unnecessary information and then try again.
DMEA001006	Invalid parameter.
DMEA001007	The specified controller is incorrect.
DMEA001008	Failed to open the specified file. Confirm the file name and then try again.
DMEA001009	The contents of the file are invalid. Confirm the file and then try again.
DMEA00100A	Failed to connect with the server. Confirm the registered information and the LAN environment, and then try again.
DMEA00100B	The password is not specified.
DMEA00100C	The password is corrupted. Delete the password file and then try again.
DMEA00100D	The specified logical unit is not defined. Specify a defined logical unit.
DMEA00100E	Formatting failed. Confirm the subsystem status and the LAN environment, and then try again.
DMEA00100F	The file for e-mail setting contains an error.
DMEA001010	The e-mail information is not set up.
DMEA001011	The parameter for e-mail setting is invalid.
DMEA001012	An error was detected while connecting to the mail server. Confirm the mail server and then try again.
DMEA001013	An internal program error occurred. Wait for a while and then try again. If the problem cannot be solved, contact the maintenance personnel.
DMEA001014	The connection type is invalid.
DMEA001015	The microprogram revision is not supported. Confirm the subsystem status.
DMEA001016	Failed to start the specified application program. Confirm the path to the specified application and the operational environment.

Copyright © 2005, Hitachi, Ltd.

Message code	Message text/Recovery methods
DMEA001017	An error occurred during the file I/O. Please check the permission and available capacity.
DMEA001018	The specified directory path is invalid. Please specify a right directory path.
DMEA001019	The process cannot be performed because the microprogram on the subsystem does not support the function.
DMEA001020	Could not finish replacing the micro program. Please see if there are any alarms or warnings in the subsystem.
DMEA001021	The number of groups reached the maximum. Specify an already registered group or delete an unnecessary group and try again.
DMEA001022	Hardware error occurred. Confirm the subsystem.
DMEA001023	The process cannot be performed because the current subsystem does not support the function.
DMEA001024	Environment variable: STONAVM_HOME is not defined. Specify STONAVM_HOME.
DMEA001025	The controller in charge of the LU is not registered. Register the controller and then try again.
DMEA001026	The specified information does not match the configuration of the subsystem. Confirm the configuration information.
DMEA001027	The JRE (Java Runtime Environment) version in use is not supported. Confirm the JRE version.
DMEA001028	Failed to restart the subsystem.
DMEA001029	Environment variable: STONAVM_HOME does not match. Confirm STONAVM_HOME.
DMEA00102A	The JRE (Java Runtime Environment) version in use is not supported. Confirm the JRE version.
DMEA00102B	The process cannot be performed because the current controller in charge of the specified LU is different. Retry from the current controller for the LU.
DMEA001030	The parameter for System Startup Attribute or the item name is invalid.
DMEA001031	The parameter for Spare Disk or the item name is invalid.
DMEA001032	The parameter for Host Connection Mode or the item name is invalid.
DMEA001033	The parameter for Serial Number or the item name is invalid.
DMEA001034	The parameter for Drive Capacity or the item name is invalid.
DMEA001035	The parameter for Option 1 or the item name is invalid.
DMEA001036	The parameter for Option 2 or the item name is invalid.
DMEA001037	The parameter for Data Striping Size or the item name is invalid.
DMEA001038	The parameter for Buzzer or the item name is invalid.
DMEA001039	The parameter for LU Size Report to the Host or the item name is invalid.
DMEA00103A	The parameter for SCSI Reset/LIP Mode for all Ports or the item name is invalid.
DMEA00103B	The parameter for Operation if the Processor failures Occurs or the item name is invalid.
DMEA00103C	The parameter for INQUIRY Information or the item name is invalid.
DMEA00103D	The parameter for Cache Mode or the item name is invalid.
DMEA00103E	The parameter for Target ID or the item name is invalid.
DMEA00103F	The parameter for Port Type or the item name is invalid.
DMEA001040	The parameter for ROM Pseudo-response command processing or the item name is invalid.
DMEA001041	The parameter for Save Data Pointer response or the item name is invalid.
DMEA001042	The parameter for Controller Identifier or the item name is invalid.
DMEA001044	The parameter for Write & Verify Execution Mode or the item name is invalid.
DMEA001045	The parameter for LAN CONST or the item name is invalid.
DMEA001046	The parameter for SYNC CONTROL or the item name is invalid.
DMEA001047	There is no file header.
DMEA001048	The present drive configuration for the subsystem cannot support the drive configuration information of the specified file.
DMEA001049	The RAID configuration data is invalid.
DMEA00104A	The LU configuration data is invalid.
DMEA00104B	The drive configuration data is invalid.
DMEA00104D	The password length is invalid. Use 12 or fewer characters.
DMEA00104E	The process failed because the function is disabled.
DMEA00104F	Failed to obtain the controller failure dump information. Retry after 10 minutes.
DMEA001050	The parameter for Web Title or the item name is invalid.

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text/Recovery methods
DMEA001051	The parameter for Delay Planned Shutdown or the item name is invalid.
DMEA001052	The additional information file cannot be opened. Confirm the execution environment.
DMEA001053	The additional information file is invalid. Confirm the execution environment.
DMEA001054	The mail additional information length is invalid.
DMEA001055	The number of registered mail additional information reached the maximum. Delete unnecessary information and then try again.
DMEA001056	An e-mail information cannot be saved. Please check the permission and available capacity of the install directory.
DMEA001070	This program is not installed correctly.
DMEA001071	The function cannot be executed because the LU has already been reserved.
DMEA001072	The specified path name is over 250 characters.
DMEA001073	Failed to create a log directory. Confirm the execution environment.
DMEA001074	The specified path name is incorrect.
DMEA001075	The specified path does not exist, or no effective files exist under the specified path.
DMEA001076	The micro program in the specified path does not exist. Please confirm whether the micro program is stored in the path or the specified path is right.
DMEA001077	Failed to create a micro file directory. Confirm the execution environment.
DMEA001078	The specified key was not found. Confirm the file and then try again.
DMEA001079	Cannot use this function for the specified device.
DMEA00107A	The micro program replacement of the specified controller cannot be performed. Please replace the micro program of the other controller first.
DMEA00107B	The micro program cannot be read. Please check the permission and available capacity of the install directory.
DMEA00107C	The micro program is not read.
DMEA001080	Cannot set the LU mapping in case of mapping mode is off.
DMEA001081	Failed to get drive information.
DMEA001083	The parameter for PortOption or the item name is invalid.
DMEA001084	The parameter for HostGroupInformation or the item name is invalid.
DMEA001085	The parameter for HostGroupOption or the item name is invalid.
DMEA001086	The parameter for LuMapping or the item name is invalid.
DMEA001087	The parameter for FibreSecurityInformation or the item name is invalid.
DMEA001088	The parameter for Common Information or the item name is invalid.
DMEA001089	Failed to set up a Mapping Mode. Confirm the setting file and then try again.
DMEA001090	The CTL Header is invalid.
DMEA001091	The PORT Header is invalid.
DMEA001092	Illegal option set.
DMEA001093	The function cannot be used because it is not installed, locked, or disabled.
DMEA001094	The specified host group is already defined. Confirm the name or number, and specify a new host group.
DMEA001095	The specified host group is not defined. Confirm the name or number, and specify a defined host group.
DMEA001096	The host group security on the specified port is set on disable. Set host group security to enable and then try again.
DMEA001097	The function cannot be executed because host group 0 is specified. Specify other than host group 0 and try again.
DMEA001098	The specified host group name or WWN name is invalid. Confirm the name and try again.
DMEA001099	The specified host group number is invalid. Confirm the number and try again.
DMEA001100	The specified node name is invalid. Confirm the name and try again.
DMEA001101	The specified port name is invalid. Confirm the name and try again.
DMEA001102	The parameter for LUN Manager Information or the item name is invalid.
DMEA001103	The same host group name exists in a port. Confirm the setting file and then try again.
DMEA001104	The same WWN name exists in a port. Confirm the setting file and then try again.
DMEA001105	The same port name exists in a port. Confirm the setting file and then try again.
DMEA001106	The same host group number exists in a port. Confirm the setting file and then try again.

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text/Recovery methods
DMEA001107	The information of the host group number 0 is not in a setting file. Confirm the information on the host group number 0 for every port and then try again.
DMEA001108	The specified Web Title is invalid. Confirm the Web Title and try again.
DMEA001109	In the installed micro program revision, a setup of the Read Frame Min 128 Byte Mode cannot be performed. Please update to the micro program which can set up the Read Frame Min 128 Byte Mode.
DMEA00110A	The process cannot be performed because the micro program on the subsystem does not support the function.
DMEA00110B	There is no parameter to change the data pool information.
DMEA00110C	The specified RAID groups and logical units cannot be created because the drive type is different.
DMEA00110D	The parameter for Options or the item name is invalid.
DMEA00110E	The process cannot be performed because the specified RAID level is not supported.
DMEA00110F	The system LU configuration data is invalid.
DMEA00112C	In the installed micro program revision, a setup of the HostSystemConfiguration cannot be performed. Please update to the micro program which can set up the HostSystemConfiguration.
DMEA00112D	The parameter for HostSystemConfiguration or the item name is invalid.
DMEA00112E	The process cannot be performed because the attribute is not Read/Write. Please change the attribute to Read/Write and then try again.
DMEA00112F	The specified LU is not set retention term. Confirm the LU status.
DMEA001130	The specified RAID group is already defined. Specify a new RAID group.
DMEA001131	The specified RAID group is not defined. Specify a defined RAID group.
DMEA001132	Failed to create a file. Confirm the execution environment.
DMEA001133	The file cannot be outputted. Because the performance statistics acquisition failed.
DMEA001134	The retention term cannot be shortened. Specify the retention term is equal to or more than current value and try again.
DMEA001135	The ENC micro program download and replacement cannot be performed in the single-controller system.
DMEA001136	The directory for storing the ENC micro program cannot be created. Please check the permission of the install directory.
DMEA001137	The ENC micro program cannot be read. Please check the permission and available capacity of the install directory.
DMEA001138	The ENC micro program is not read.
DMEA001139	The ENC micro program of the specified subsystem is not read.
DMEA001140	The ENC micro program in the specified path does not exist. Please confirm whether the ENC micro program is stored in the path or the specified path is right.
DMEA001141	The ENC micro program cannot be read. Please confirm the file and then try again.
DMEA001142	The contents of the ENC micro program are invalid. Please confirm the file and then try again.
DMEA001143	Incorrect character in the group name.
DMEA001144	Incorrect character in the array unit name.
DMEA001145	The character length of the array unit name or group name is incorrect.
DMEA001146	The specified path name of the directory for storing the management file is over 250 characters, or there is not sufficient memory. Please specify the pass name of 250 or less characters, or terminate other programs and then try again.
DMEA001147	The directory for storing the management file cannot be created. Please check the permission and available capacity of the directory.
DMEA001148	The specified path name for storing the management file is over 250 characters. Please specify the pass name of 250 or less characters and then try again.
DMEA001149	Failed to write the management file. Please check the permission and available capacity of the directory.
DMEA00114A	Failed to open the management file. Confirm the file name and then try again.
DMEA00114B	The contents of the management file are invalid. Confirm the file and then try again.
DMEA00114C	The specified path name for the file is over 250 characters. Please specify the pass name of 250 or less characters and then try again.
DMEA00114D	Failed to write the file. Please check the permission and available capacity of the directory.
DMEA00114E	Failed to open the file. Confirm the file name and then try again.
DMEA001110	The user LU configuration data is invalid.

DMEA001150	The specified time of output CSV file is incorrect.
DMEA001151	The specified path name for storing the CSV file is over 250 characters. Please specify the pass name of 250 or less characters and then try again.
DMEA001152	Failed to write the CSV file. Please check the permission and available capacity of the directory.
DMEA001153	Failed to open the CSV file. Confirm the file name and then try again.
DMEA001154	The specified path name of the directory for storing the CSV file is over 250 characters, or there is not sufficient memory. Please specify the pass name of 250 or less characters, or terminate other programs and then try again.
DMEA001155	The specified path name for the management file is over 250 characters. Please specify the pass name of 250 or less characters and then try again.
DMEA001156	The specified path name of the deletion file is over 250 characters. Please specify the pass name of 250 or less characters and then try again.
DMEA001157	The monitoring data cannot be read because the data version is new. Confirm the version of this program and then try again.
DMEA001158	The specified number of output CSV file is incorrect.
DMEA001159	The process cannot be performed because the mapping guard LU exists.
DMEA00115A	Failed to open the management file. Confirm the file name and then try again.
DMEA00115B	The contents of the management file are invalid. Confirm the file and then try again.
DMEA00115C	Failed to connection. Confirm the connection and then try again.
DMEA00115D	A response without subsystem was received. Confirm the connection and then try again.
DMEA00115E	The process cannot be performed because there is not free area in the specified RAID group.
DMEA001160	The logical unit cannot be defined in the specified area.
DMEA001161	The process cannot be performed because the logical unit is already defined in the first area of the specified RAID group.
DMEA001162	The process cannot be performed because there is not free area in the specified area.
DMEA001163	The value received from the subsystem is invalid.
DMEA001164	The specified IP address is incorrect. Please specify a right IP address.
DMEA001165	The specified subnet mask is incorrect. Please specify a right subnet mask.
DMEA001166	The specified default gateway address is incorrect. Please specify a right default gateway address.
DMEA001167	The information can not be set because the Environment Setting File is over 4096 Bytes. Please confirm the specified file.
DMEA001168	The information can not be set because the Array Unit Name Setting File is over 255 Bytes. Please confirm the specified file.
DMEA001169	The process cannot be performed because the term of the temporary key or emergency key is expired.
DMEA001170	The character length of the serial number is incorrect.
DMEA001171	The contents of the license key file are invalid. Please confirm the file and then try again.
DMEA001172	The contents of the license key file are invalid. Please confirm the file and then try again.
DMEA001173	The process cannot be performed because the number of license key is over 50. Please confirm the file and then try again.
DMEA001175	Could not finish replacing the micro program. Please see if there are any alarms or warnings in the subsystem.
DMEA001176	The process cannot be performed because NNC is physically unequipped. Confirm the NNC status and try again.
DMEA001177	The specified NNC cannot be performed because it is physically unequipped or unconnectable. Please confirm the NNC status and try again.
DMEA001178	The specified application program does not exist. Please confirm whether the specified application program is stored.
DMEA001179	Failed to start the specified application program. Confirm the path to the specified application and the operational environment.
DMEA00117A	The contents of the NNC BIOS firmware are invalid. Please confirm the file and then try again.
DMEA00117B	The NNC BIOS firmware is not read.
DMEA00117C	The directory for storing the NNC BIOS firmware cannot be created. Please check the permission of the install directory.
DMEA00117D	The NNC BIOS firmware in the specified path does not exist. Please confirm whether the NNC BIOS firmware is stored in the path or the specified path is right.
DMEA00117E	The NNC BIOS firmware cannot be read. Please check the permission and available capacity of the install directory.
DMEA00117F	The process cannot be performed because Fibre Channel Port is physically unequipped. Confirm the subsystem status and try again.

DMEA001180	The process cannot be performed because the same address is specified as the NTP server 1 and the NTP server 2. Specify the different address and try again.
DMEA001181	The process cannot be performed because the controller of the NNC is not registered. Register the controller of the NNC and then try again.
DMEA001182	The process cannot be performed because the connection with controller of the NNC failed. Confirm the subsystem status and the LAN environment, and then try again.
DMEA001183	The function cannot be executed because some port is invalid or unequipped. Please confirm the subsystem.
DMEA001184	The process cannot be performed because the port is not connected to the maintenance port. Please confirm the port of connection and try again.
DMEA001185	The process cannot be performed because the port is not connected to the management LAN. Please confirm the port of connection and try again.
DMEA001186	The process cannot be performed because iSCSI port is physically unequipped. Please confirm the subsystem status and try again.
DMEA001187	The specified target is already defined. Please confirm the name or number and specify a new target.
DMEA001188	The specified target is not defined. Please confirm the name or number and specify a defined target.
DMEA001189	The function cannot be executed because Target 0 is specified. Please specify other than target 0 and try again.
DMEA001190	The specified alias is invalid. Please confirm alias and try again.
DMEA001191	The specified initiator name is invalid. Please confirm initiator name and try again.
DMEA001192	The specified iSCSI name is invalid. Please confirm iSCSI name and try again.
DMEA001193	The specified user name is invalid. Please confirm user name and try again.
DMEA001194	The specified secret is invalid. Please confirm secret and try again.
DMEA001195	The parameter for Port or the item name is invalid.
DMEA001196	The specified KeepAliveTimer value is invalid. Confirm the value and try again.
DMEA001197	The parameter for iSCSIPortInformation or the item name is invalid.
DMEA001198	The parameter for iSNS Information or the item name is invalid.
DMEA001199	The specified Port number is invalid. Confirm the number and try again.
DMEA00119A	The specified Target number is invalid. Confirm the number and try again.
DMEA00119B	The parameter for TargetInformation or the item name is invalid.
DMEA00119C	The same Target number exists in a port. Confirm the setting file and then try again.
DMEA00119D	The parameter for Target Security or the item name is invalid.
DMEA00119E	The parameter for Initiator or the item name is invalid.
DMEA00119F	There is no file version.
DMEA0011A0	There is no start separator.
DMEA0011A1	The user name is invalid.
DMEA0011A2	The secret is invalid.
DMEA0011A3	The alias is invalid.
DMEA0011A4	The number of target is invalid.
DMEA0011A5	There is no end separator.
DMEA0011A6	There is no port separator.
DMEA0011A7	The information of the target number 0 is not in a setting file. Confirm the information on the target number 0 for every port and then try again.
DMEA0011A8	The same alias exists in a port. Confirm the setting file and then try again.
DMEA0011A9	The same iSCSI Name exists in a port. Confirm the setting file and then try again.
DMEA0011AA	The same Initiator Name exists in a port. Confirm the setting file and then try again.
DMEA0011AB	The specified MTU value is invalid. Confirm the value and try again.
DMEA0011AC	The file version is invalid.
DMEA0011AD	The user name reach the maximum.
DMEA0011AE	The target is not defined.

DMEA0011B1	The specified path name for storing the log file is over 255 characters. Please specify the pass name of 255 or less characters and then try again.
DMEA0011B2	The path name for storing the log file is over 255 characters. Please specify the pass name and then try again.
DMEA0011B3	Failed to write the log file. Please check the permission and available capacity of the directory.
DMEA0011B4	The internal log is empty.
DMEA0011B5	The User LAN Parameter Header is invalid.
DMEA0011B6	The CTL Parameter Header is invalid.
DMEA0011B7	The parameter for User LAN Parameter or the item name is invalid.
DMEA0011B8	The Maintenance LAN Parameter Header is invalid.
DMEA0011B9	The parameter for Maintenance LAN Parameter or the item name is invalid.
DMEA0011BA	The process cannot be performed because NNC is equipped. Please confirm the port type and try again.
DMEA0011BB	The process cannot be performed because the DHCP setting is different between the subsystem and input file. Please confirm the DHCP setting and try again.
DMEA0011BC	The process cannot be performed because the DHCP is enabled. Please set the DHCP to disable and try again.
DMEA0011BD	The process cannot be performed because the User LAN port of subsystem is being used by other applications. Refer to [netstat.inf] file in the directory where Storage Navigator Modular is installed, close applications using User LAN port of subsystem, and then try again.
DMEA0011BE	The process cannot be performed because the owner ID is different. Please split the pair using the application that created the pair.
DMEA002000	Rebooting might have failed, because an error occurred while communicating with the subsystem. Please confirm that the subsystem was rebooted by referring the Information Message of WEB. When not rebooted yet, please reboot once again(*1).
DMEA002001	The specified password is invalid. Please confirm the password and try again.
DMEA002002	The process cannot be performed because account is disabled. Please confirm the account status and try again.

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

DMEC002000	Cannot write the directory specified STONAVM_HOME.
DMEC002003	Essential option/parameter not enough.
DMEC002006	No entry.
DMEC002015	No information displayed.
DMEC002016	Illegal option set.
DMEC002017	Cannot execute the command for the array unit of current microprogram revision.
DMEC002018	Could not execute the function, because the array unit does not support the password protection function.
DMEC002019	No array units registered for error alert.
DMEC002020	Cannot add Send to address, because 20 addresses are already defined.
DMEC002021	The function cannot be executed because option is locked, or disabled.
DMEC002022	The function cannot be executed because the target mode of connected controller is not M-TID,M-LUN.
DMEC002023	The additional information was not registered to the specified subsystem.
DMEC002024	The specified RAID group cannot be deleted because it contains an already defined LU.
DMEC002025	Cannot delete the logical unit, because no logical units defined.
DMEC002026	Failed to open the manual file.
DMEC002027	The specified drive is not defined.
DMEC002028	Cannot use this command for the specified device.
DMEC002029	Cannot use this function for the specified device of this configuration.
DMEC002030	The function cannot be executed because mapping mode is off.
DMEC002031	Insufficient memory. Terminate other programs and then try again.
DMEC002032	The specified port is not available because its host group security is disabled. Enable the host group security and try again.
DMEC002033	The specified host group is already defined. Try with another name or number.
DMEC002034	The specified host group is not defined. Confirm the name or number, and specify a defined host group.
DMEC002035	The specified WWN name is already defined. Specify a new WWN name.
DMEC002036	The specified WWN is not defined. Specify a defined WWN.
DMEC002037	The specified WWN is already assigned to a host group. Specify a WWN that is not assigned to any of the host groups.
DMEC002038	The specified WWN is not assigned to any of the host groups. Specify a WWN that is already assigned to a host group.
DMEC002039	The number of registered WWNs reached the maximum. Delete unnecessary information and then try again.
DMEC002040	The number of registered host group reached the maximum. Delete unnecessary information and then try again.
DMEC002041	The specified WWN has not been logged in. Specify a WWN that is logged in.
DMEC002042	The function cannot be executed because host group 0 is specified. Specify except host group 0 and try again.
DMEC002043	The specified port name is already defined. Specify a new port name.
DMEC002044	No option entry.
DMEC002045	The number of defined logical unit reached the maximum. Delete unnecessary logical units and then try again.
DMEC002046	The specified logical unit capacity is not reallocated.
DMEC002047	The specified logical unit number is already defined. Specify a new logical unit.
DMEC002048	The specified logical unit is not defined. Specify a defined logical unit.
DMEC002049	The function cannot be executed because the password protection function is enabled.
DMEC002050	The function cannot be executed because the format mode is not queue.
DMEC002051	The specified logical unit(s) contain sub logical unit. Confirm the logical unit status and try again.
DMEC002052	The specified logical unit(s) contain invalid logical unit. Confirm the logical unit status and try again.
DMEC002053	The information on the specified logical unit cannot be displayed.
DMEC002054	The number of logical units have reached the maximum. Delete unnecessary logical units and then try again.
DMEC002055	The specified logical unit is not a Snapshot image. Specify a Snapshot image.
DMEC002056	The process cannot be performed because the number of logical units in the data pool reached the maximum. Delete unnecessary logical units and then try again.
DMEC002057	The data pool cannot be used. Please restart(*1) the subsystem.
DMEC002058	The process cannot be performed because no logical units is in the data pool. Add a logical unit to the data pool and try again.
DMEC002059	When changing the attribute to Read/Write, the retention term cannot be specified.

DMEC002060	The process cannot be performed because there are some uncorrected logical units. Start or skip parity correction and try again.
DMEC002061	Cannot execute the option for the array unit of current micro program revision.
DMEC002062	The specified logical unit number is already defined as a command device. Specify another logical unit number.
DMEC002063	The command device is not registered. Register the command device and try again.
DMEC002065	The specified logical unit number is not defined as a command device. Specify a logical unit that is already defined to a command device.
DMEC002066	The Cache Residency function cannot be used because it is not installed, locked, or disabled.
DMEC002067	The specified RAID group is not defined. Specify a defined RAID group.
DMEC002068	The logical unit cannot be created because there is not free area in the specified RAID group.
DMEC002069	The logical unit cannot be created because the specified area does not exist. Confirm the free area of the RAID group, and try again.
DMEC002070	The number of registered subsystems has reached the maximum. Delete unnecessary information and then try again.
DMEC002071	The number of spare drives reach the maximum. Confirm the specified spare drives, and try again.
DMEC002072	The number of DM-LU have reached the maximum. Release unnecessary DM-LU and then try again.
DMEC002073	The specified logical unit number is not defined as a DM-LU. Specify a logical unit that is already defined to a DM-LU.
DMEC002074	The specified logical unit is not Main logical unit. Specify a Main logical unit.
DMEC002075	The manual file of specified command is not found.
DMEC002076	The number of spare drives have reached the maximum. Delete unnecessary spare drives and then try again.
DMEC002077	The logical units are undefined. Please confirm logical units definition and try again.
DMEC002078	The RAID groups are undefined. Please confirm RAID groups definition and try again.
DMEC002079	The number of cache partition have reached the maximum. Delete unnecessary cache partition and then try again.
DMEC002080	The CTL0 cannot be specified because the cache partition to set up is not deleted. When specifying the CTL0, please restart(*1) and then try again.
DMEC002081	The CTL1 cannot be specified because the cache partition to set up is not deleted. When specifying the CTL1, please restart(*1) and then try again.
DMEC002083	Specify the option is equal to or more than 1.
DMEC002084	Cannot execute the command for the array unit of current micro program revision.
DMEC002086	The process cannot be performed because the time zone does not have daylight saving time. Please confirm the time zone.
DMEC002087	The process cannot be performed because NNC is unequipped. Please confirm the port status and try again.
DMEC002088	The process cannot be performed because all ports are used for NAS. Please confirm the port type and try again.
DMEC002089	The process cannot be performed because fibre channel port is unequipped. Please confirm the port status and try again.
DMEC002090	The specified port is NAS port. Please confirm the port type and try again.
DMEC002091	The specified port is not fibre channel port. Please confirm the port type and try again.
DMEC002092	The host address cannot be changed. Please specify the same host address as a setting value.
DMEC002093	The process cannot be performed because the port is not connected the user port. Please confirm the port of connection and try again.
DMEC002094	The process cannot be performed because the specified H-LUN or LUN is already setted the user LU. Please confirm the setting of user LU and try again.
DMEC002095	The process cannot be performed because the specified H-LUN or LUN is not setted the user LU or is already setted the another user LU. Please confirm the setting of user LU and try again.
DMEC002096	The port is unequipped. Confirm the port status and try again.
DMEC002097	Cannot specify the parameter for this array unit.
DMEC002098	Cannot execute the option for the array unit of current micro program revision.
DMEC002099	The function cannot be executed because some port is invalid or unequipped. Please confirm the subsystem.

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

DMED050003	The process cannot be performed because the specified LU is receiving the Write command continuously from the host. Wait for a while and then try again.
DMED050004	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMED050005	The process cannot be performed because the partition of necessary conditions for LU changing does not exist. Please confirm the partition definition and try again.
DMED050006	The process cannot be performed because the directory configuration is changing. Please wait for a while and then try again.
DMED050007	The process cannot be performed because the LU change is in progress. Please wait for a while and then try again.
DMED050008	The process cannot be performed because the LU change is in progress. Please wait for a while and then try again.
DMED050009	The LU change could not be performed.
DMED05000A	The process cannot be performed because the controller is detached. Please recover the controller status and then try again.
DMED070002	The specified IP address is incorrect. Please specify a right IP address.
DMED070006	When the ShadowImage pair of a S-VOL Switch status exists the ShadowImage I/O Switch Mode cannot be disabled. Please retry after solving the error.
DMED070007	The configuration of single or dual controller system cannot be changed because Cache Partition Manager is enabled. Please change Cache Partition Manager to de-installed or disabled and try again.
DMED070008	The process cannot be performed because the specified port number is outside the effective range. Please confirm the port number.
DMED070009	The port number of other controller cannot be set up. Please confirm the controller number.
DMED080001	The data pool cannot be used. Please restart(*1) the subsystem.
DMED080002	The process cannot be performed because the logical unit under restoration. Wait for a while and try again.
DMED080003	The process cannot be performed because the logical unit added to the data pool is not specified.
DMED080004	The process cannot be performed because the same logical unit number has been specified more than twice. Confirm the logical unit number and try again.
DMED080005	The specified logical unit number is outside of the effective range. Specify the logical unit number within the range and try again.
DMED080006	The process cannot be performed because the specified logical unit is neither in normal nor in regressed state. Specify the logical unit of normal or regressed state and try again.
DMED080007	The process cannot be performed because the RAID level or HDU combination of the specified logical unit is not supported. Confirm the RAID level and the HDU combination currently supported and try again.
DMED080008	The process cannot be performed because the number of logical units in the data pool reached the maximum. Delete the logical units in the data pool and then try again.
DMED080009	The process cannot be performed because the specified logical unit is a unified LU. Separate the unified LU and try again.
DMED08000A	The process cannot be performed because the specified logical unit is a part of ShadowImage pair. Cancel the ShadowImage pair and try again.
DMED08000B	The process cannot be performed because the specified logical unit is a part of TrueCopy pair. Cancel the TrueCopy pair and try again.
DMED08000C	The process cannot be performed because the specified logical unit is a command device. Cancel the command device and try again.
DMED08000D	The process cannot be performed because the specified logical unit has been invalidated. Restore the logical unit and try again.
DMED08000E	The process cannot be performed because the specified logical unit is a part of Snapshot pair. Cancel the Snapshot pair and try again.
DMED08000F	The process cannot be performed because the specified logical unit is defined as a Snapshot image. Specify another logical unit and try again.

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

DMED080010	The process cannot be performed because the specified logical unit is added to a data pool. Specify another logical unit and try again.
DMED080012	The process cannot be performed because the owner controller is different between the specified logical unit and the data pool. Confirm the logical unit owner controller and try again.
DMED080013	The process cannot be performed because the specified logical unit has been receiving the Write command continuously from the hosts. Wait for a while and then try again.
DMED080014	The process cannot be performed because other logical unit is changing the Default Controller. Wait for a while and then try again.
DMED080015	The process cannot be performed because the specified logical unit is in the PIN exceeded state. Restore PIN data and try again.
DMED080016	The process cannot be performed because the specified logical unit is not enough for sufficient cache blocks. Specify another logical unit and try again.
DMED080017	The process cannot be performed because no logical units in data pool.
DMED080018	The process cannot be performed because the Snapshot pair exists in the specified data pool. Cancel the Snapshot pair and try again.
DMED080019	The process cannot be performed because data pool deleted is not specified.
DMED08001A	The process cannot be performed because the threshold of usage rate in the data pool is not specified.
DMED08001B	The specified threshold is outside of the effective range. Specify the value of effective range and try again.
DMED08001C	The process cannot be performed because the specified logical unit is capacity equal to or less than 2GB. Specify the logical unit of bigger capacity than 2GB and try again.
DMED08001D	The process cannot be performed because S-VOL mode of the specified logical unit is disabled. Set S-VOL mode to enable then try again.
DMED08001F	The number of specified logical units is over 64. Please specify the logical units in 64 or less.
DMED080020	The process cannot be performed because the drive type of specified logical unit is different from the data pool. Please confirm the drive type and try again.
DMED080021	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMED080022	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMED080023	The logical units in the data pool cannot be mixed with ones in Unit0 or in the latter units.
DMED080024	The process cannot be performed because DM-LU is not defined. Please define DM-LU and then try again.
DMED080025	The process cannot be performed because the specified logical unit is reserved for cache partition modification. Please specify another logical unit and try again.
DMED090001	The logical unit number of specified P-VOL is outside of the effective range. Specify the logical unit number of effective range and try again.
DMED090003	The logical unit number of specified Snapshot image is outside of the effective range. Specify the logical unit number of effective range and try again.
DMED090004	The process cannot be performed because the logical unit number of the Snapshot image created or deleted is not specified.
DMED090005	The process cannot be performed because the same logical unit number has been specified as a Snapshot image more than twice. Confirm the logical unit number and try again.
DMED090006	The process cannot be performed because the specified logical unit of the P-VOL is neither in normal nor in regressed state. Specify the logical unit of normal or regressed state and try again.
DMED090007	The process cannot be performed because no logical unit exists in the data pool by the side of the controller of specified P-VOL. Add the logical unit to the data pool and try again.
DMED090008	The process cannot be performed because the RAID level or HDU combination of the specified logical unit differs from the logical unit is not supported. Confirm the RAID level and the HDU combination currently supported and try again.
DMED090009	The process cannot be performed because the number of created Snapshot Image for the specified P-VOL has reached its maximum. Delete unnecessary Snapshot Image and try again.
DMED09000A	The logical unit number has already been defined. Specify a new number.
DMED09000B	The process cannot be performed because the specified P-VOL is a unified LU. Separate the unified LU and try again.

DMED09000C	The process cannot be performed because the specified P-VOL is a part of ShadowImage pair. Cancel the ShadowImage pair and try again.
DMED09000D	The process cannot be performed because the specified P-VOL is a part of TrueCopy pair. Cancel the TrueCopy pair and try again.
DMED09000E	The process cannot be performed because the specified P-VOL is a part of Snapshot pair. Cancel the Snapshot pair and try again.
DMED09000F	The process cannot be performed because the specified P-VOL is a command device. Cancel the command device and try again.
DMED090010	The process cannot be performed because the specified P-VOL is invalid. Restore the LU and try again.
DMED090011	The process cannot be performed because the specified P-VOL has already been added to a data pool. Specify another LU number and try again.
DMED090012	The process cannot be performed because the specified P-VOL is not enough for sufficient cache capacity. Check cache capacity and try again.
DMED090013	The process cannot be performed because the HDU combination of the specified P-VOL differs from registered logical units to the data pool. Confirm the HDU combination and try again.
DMED090014	The process cannot be performed because the specified P-VOL has been receiving the Write command continuously from the hosts. Wait for a while and then try again.
DMED090015	The process cannot be performed because other logical unit is changing the Default Controller. Wait for a while and then try again.
DMED090016	The process cannot be performed because the specified P-VOL is in the PIN exceeded state. Restore PIN data and try again.
DMED090017	The process cannot be performed because the specified P-VOL is not defined. Specify a defined logical unit and try again.
DMED090018	The process cannot be performed because the specified Snapshot image has been creating the pair. Cancel the Snapshot pair and try again.
DMED090019	The process cannot be performed because P-VOL is under deletion. Wait for a while and then try again.
DMED09001A	The process cannot be performed because the specified set of P-VOL and Snapshot image is not a pair. Confirm the pair status and try again.
DMED09001B	The process cannot be performed because the number of Snapshot pair reached the maximum. Delete unnecessary Snapshot pair(s) and try again.
DMED09001C	The process cannot be performed because the unified LU is composed of 17 or more sub logical units. Specify another logical unit and try again.
DMED09001D	The process cannot be performed because the unified LU contains a sub logical unit whose size is less than 1GB. Specify another logical unit and try again.
DMED09001E	The process cannot be performed because a management area of Snapshot is shortage. Delete unnecessary Snapshot pair(s) and try again.
DMED09001F	The process cannot be performed because the drive type of specified logical unit is different from the V-VOL. Please confirm the drive type and try again.
DMED090020	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMED090021	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMED090022	The process cannot be performed because the specified Snapshot image is a part of TrueCopy pair. Cancel the TrueCopy pair and try again.
DMED090023	The process cannot be performed because the specified Snapshot image is a part of Hi-Copy pair. Cancel the Hi-Copy pair and try again.
DMED090024	The process cannot be performed because the P-VOL of specified Snapshot image is reserved for cache partition modification. Please retry after cache partition modification is completed.
DMED0A0001	The process cannot be performed because the specified LU is invalid. Restore the LU and try again.
DMED0A0002	The process cannot be performed because the specified LU is a Sub LU of the unifying LUs. Separate the unified LU and try again.

DMED0A0003	The process cannot be performed because the specified LU is S-VOL of ShadowImage. Specify another logical unit and try again.
DMED0A0004	The process cannot be performed because the specified LU is S-VOL of TrueCopy. Specify another logical unit and try again.
DMED0A0005	The process cannot be performed because the specified LU is Snapshot image. Specify another logical unit and try again.
DMED0A0006	The process cannot be performed in the retention term. The retention term expires and try again.
DMED0A0007	The process cannot be performed because ShadowImage is in progress. Please wait a moment and then try again.
DMED0A0008	The process cannot be performed because SnapShot is in progress. Please wait a moment and then try again.
DMED0A0009	The retention term cannot be shortened. Specify the retention term is equal to or more than current value and try again.
DMED0A000A	The process cannot be performed because expiration lock is enabled. Set expiration lock to disable and try again.
DMED0A000B	The process cannot be performed because the status of ShadowImage pair is not SMPL or PSUS. Please retry after changing the status of pair.
DMED0A000C	The process cannot be performed because the status of TrueCopy pair is not SMPL or PSUS. Please retry after changing the status of pair.
DMED0A000D	The process cannot be performed because the status of Snapshot pair is not PSUS. Please retry after changing the status of pair.
DMED0B0001	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED0C0001	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED0C0002	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED0C0003	The unification cannot be performed because the drive type is different. Please confirm the drive type and try again.
DMED0C0004	The logical unit in Unit0 cannot be unified with the latter units.
DMED0C0005	The process cannot be performed because the unified LU reached the maximum.
DMED0C0006	The unification cannot be performed because the cache partition is different. Please confirm the cache partition of the specified logical unit.
DMED0C0007	The process cannot be performed because the specified logical unit is reserved for cache partition modification. Please retry after changing the cache partition, or specify another logical unit.
DMED0D0001	The process cannot be performed because the access level is set up to ReadOnly or Protect. Please change the attribute to Read/Write, and try again.
DMED0D0002	The process cannot be performed because the temporary key cannot be used for the next 180 days after it is locked or expired.
DMED0D0003	The specified function has already been unlocked.
DMED0E0001	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED0F0001	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED0F0002	The process cannot be performed because the drives of Unit0 and the latter units are contained within the range of the specified RAID group.
DMED0F0003	The process cannot be performed because the non-supported drive on this subsystem are contained within the range of the specified RAID group.
DMED0F0005	The process cannot be performed because the number of drive is incorrect. Please confirm the mounted drive and try again.
DMED0F0007	The number of defined RAID group reached the maximum. Delete unnecessary RAID groups and then try again.
DMED100001	The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.
DMED100002	The process cannot be performed because the RAID level of the specified logical unit is not supported. Confirm the RAID level currently supported and try again.
DMED100003	The process cannot be performed because the specified logical unit is a unified LU. Separate the unified LU and try again, or please execute online/offline formatting.

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text/Recovery methods
DMED100004	The process cannot be performed because the specified logical unit is extended and not formatted. Please execute online/offline formatting.
DMED100005	The preparations of quick formatting are incomplete. Please retry after waiting for a while.
DMED100006	The process cannot be performed because the specified logical unit contain an un-mounted drive or a blocked drive. Confirm the drive status and try again.
DMED100007	Format of the logical unit cannot be performed under drive blockage mode. Please turn off the drive blockade mode system parameter.
DMED110001	The mapping mode cannot be changed because the mapping guard LU exists.
DMED110002	The mapping information cannot be changed because the mapping guard LU exists.
DMED120001	The specified drive cannot be defined as a spare drive because it is not supported on this subsystem.
DMED130001	The process cannot be performed because the specified remote path is not set up.
DMED130002	The process cannot be performed because the specified port is iSCSI port. Please confirm the port type and try again.
DMED130004	The process cannot be performed because the specified Timeout Period is outside the effective range. Please confirm the Timeout Period and try again.
DMED140001	The process cannot be performed because the term of the temporary key or emergency key is expired.
DMED140002	The process cannot be performed because the DM-LU has already been set. Please cancel the DM-LU and try again.
DMED150001	The process cannot be performed because the cache partition is not initial status. Please change the cache partition to initial status and try again.
DMED150004	The process cannot be performed because the cache partition is less than minimum size. Please confirm the cache partition size and try again.
DMED150005	The process cannot be performed because the PIN is exceeded state. Please restore PIN data and try again.
DMED150006	The segment size of cache partition (0 or 1) cannot be changed.
DMED150007	The process cannot be performed because ShadowImage is in use. Please cancel the ShadowImage pair and try again.
DMED150009	The process cannot be performed because SnapShot is in use. Please cancel the SnapShot pair and try again.
DMED15000B	The process cannot be performed because process of Write command from the hosts is not completed. Please wait for a while and then try again, or delete the logical unit.
DMED15000C	The function cannot be executed because a Cache Residency LU or a reserved one exists. Disable the LU, and then try again.
DMED15000D	The specified segment size is incorrect. Please confirm the segment size and try again.
DMED15000E	The process cannot be performed because the LU change is in progress. Please wait a moment and try again.
DMED15000F	The specified cache partition number is incorrect. Please confirm the cache partition number and try again.
DMED150010	The controller of current cache partition cannot be changed. Please delete the cache partition, and set up again.
DMED150011	The process cannot be performed because the total size of cache partition is over the cache capacity. Please confirm the cache partition size and try again.
DMED150012	The cache partition with which the logical unit is set up, or the cache partition of 0 or 1 cannot be deleted. Please confirm the cache partition number.
DMED150013	The process cannot be performed because the specified cache partition is not defined. Please specify a defined cache partition and try again.
DMED150014	The process cannot be performed because the stripe size of logical unit is not 64KB. Please delete the logical unit and try again.
DMED150015	The process cannot be performed because the specified logical unit is a part of pair(TCE). Please cancel the pair(TCE) and try again.
DMED160002	The process cannot be performed because the specified logical unit is a Sub LU of the unifying LUs. Please separate the unified LU and try again.
DMED160011	The logical unit cannot be allocated the specified cache partition. Please specify another cache partition number and try again.
DMED160012	The process cannot be performed because the Cache Partition Manager is not installed, locked, or disabled.
DMED160013	The process cannot be performed because the specified logical unit is Snapshot image. Please specify another logical unit number and try again.

DMEN03565W	A NAS dump is being acquired.
DMEN03569W	It takes a maximum of x minutes to acquire a NAS dump. Do you want to acquire it?
DMEN03570W	The NAS dump acquisition will now be stopped. Is this OK?
DMEN03571W	Are you sure you want to reset the NNC?
DMEN03578W	The list of installed products cannot be displayed because the NAS OS has stopped.
DMEN03583W	This is the first NAS OS installation for this subsystem, so the NAS Cluster Management LU will be forcibly initialized. Is this OK ?
DMEN03588E	The entry (x) is invalid.
DMEN03592W	Storage Navigator Modular is less than Ver.5.00.
	X cannot be changed because the cluster has not been defined.
	Storage Navigator Modular is Ver.5.00 or more.
	X could not be changed because a cluster configuration is already defined.
DMEN03596E	An error occurred on the NAS OS. (code = x) A NAS dump is being acquired. Contact the Support Center.
DMEN03597W	Storage Navigator Modular is less than Ver.5.00.
	The specified product is a patch version. This product cannot be installed because a regular or corrected version of the product is not installed.
	Storage Navigator Modular is Ver.5.00 or more.
	The specified product is a patch. This product cannot be installed because a regular or corrected version of the product is not installed.
DMEN03598W	If you continue this processing, the NAS OS will immediately be forcibly stopped regardless of the NAS OS status. Do you want to continue this processing ?
DMEN03599W	Contact the system administrator to check whether a related service has switched to an alternative node or the service has stopped. Do you want to continue the processing ?
DMEN03609W	The cluster status could not be acquired. Click [Cancel], and then retry this operation. If this message appears again, click [OK] to forcibly continue the processing. [OK]: Continues the processing. [Cancel]: Cancels the processing.
DMEN03610W	The relevant node is operating. Switch the service to an alternative node, and then contact the system administrator to stop the relevant node. To forcibly continue the processing, click [OK]. [OK]: Continues the processing. [Cancel]: Cancels the processing.
DMEN03611W	If this operation continues, a cluster system might be affected. Do you still want to continue the processing?
DMEN03612W	To execute a new installation, stop all of the NAS OSs that configure the cluster. However, if the NAS OS LU is being recovered, the NAS OSs do not need to be stopped. Do you want to continue the installation?
DMEN03617W	To use this function, at least one NNC, which has the NAS OS version x or later installed, must be running.
DMEN03618W	The NAS OS version could not be checked. The NAS OS version of the specified x might be earlier than 04-00 or a communication error might have occurred. Check the NAS OS version from 'Program Install' to determine whether a communication error has occurred or the version is old.
DMEN03633W	There is no saved data in the specified x.
DMEN03634W	There is no saved data for the NAS Cluster Management LU.

DMEN04015W	You are attempting to install certain products only. Is this OK? (We recommend that all products be selected.) [OK]: Executes installation [Cancel]: Cancels installation
DMEN04016E	Internal subsystem status is under maintenance(x). No maintenance can be performed now.
DMEN04017E	The configuration information could not be acquired. Wait a while, and then try again.
DMEN04018E	An error occurred while downloading the x dump file. Make sure of the following, and then try again: (1) The FTP service is running. (2) The account for logging in to the FTP service has been correctly set up. (3) There is sufficient free space in the drive to which the file will be downloaded.
DMEN04019E	After the node on which the OS is being installed completes the installation, re-install the OS.
DMEN04020W	This operation will delete the data collected the previous time. To continue processing, click OK. [OK]: Continues processing. [Cancel]: Cancels processing.

DMES052400	Please retry.
DMES052500	The process cannot be performed because the LU is undefined or cannot be recognized from a host.
DMES052580	Failed to allocate LU. Confirm the specified value.
DMES052581	The RAID group is not defined. Please specify an existing RAID group.
DMES052583	The Cache Residency function cannot be enabled.
DMES052584	The last LBA in the RAID group defined at RAID1+0 full mapping does not match the current value.
DMES052590	The LU non-owner controller received an LU replacement command (for TRESPASS mode only).
DMES0525A0	Please retry.
DMES052600	The process failed due to an invalid parameter. Confirm the specified value.
DMES052601	The process failed due to an unsupported parameter. Confirm the specified value.
DMES052602	The process failed due to an invalid parameter. Confirm the specified value.
DMES052604	It failed in release of Persistent Reservation because the type of the Persistent Reserve command was different.
DMES055504	It is impossible to register over 32 LU Reservation Keys.
DMES058C01	Please retry.
DMES059401	Please retry.
DMES059510	The process cannot be performed because the microprogram is being replaced.
DMES059511	The process cannot be performed because the SVP is being replaced.
DMES059520	The specified function cannot be performed because the subsystem is in an incorrect status for execution. Please confirm there are no alarms/warnings in the subsystem, or the configuration is changed.
DMES059530	The specified User ID is not registered.
DMES059531	Could not execute the function, because another user is already logged in.
DMES059532	The specified User ID is already registered.
DMES059533	Failed in registration, because 20 users have already been registered.
DMES059534	Specified password is not confirmed.
DMES059535	Another user already logged in.
DMES059536	The function cannot be used because it is not installed, locked, or disabled.
DMES059537	The function cannot be executed because you haven't logged in.
DMES059540	A spare disk is defined within the range of the specified RAID group. Please specify the range which does not contain a spare disk.
DMES059541	The drive capacity of RAID group is invalid, or the RAID group capacity is too large.
DMES059542	The specified drive cannot be used as a spare drive.
DMES059543	The number of spare drives has reached the maximum.
DMES059544	The specified drive is already defined as a spare drive, or is already being used in the RAID group.
DMES059545	The specified drive capacity is smaller than that of the RAID group.
DMES059546	The specified drive is not defined as a spare drive.
DMES059547	The specified spare drive cannot be released because it is in use.
DMES059548	The specified function has already been unlocked.
DMES059549	The specified function has already been locked.
DMES05954A	Invalid key code.
DMES05954B	The RAID group cannot be defined because the drive is not mounted, or a blocked drive exists.
DMES05954C	The specified drive cannot be defined as a spare drive because it is not mounted or is in blocked status.
DMES05954D	The process cannot be performed because the target mode is not M-TID, M-LUN.
DMES05954E	The process cannot be performed because the addition of target information required but changed or deleted information exist.
DMES059550	The function cannot be executed because of write prohibition.
DMES059551	The function cannot be executed because concealment mode is enabled.
DMES059552	The function cannot be executed because the coupling LU or command device exists.
DMES059554	The function cannot be executed because the command device is not registered.

Message code	Message text/Recovery methods
DMES059555	The function cannot be executed because the stripe size is not 64KB.
DMES059558	The process cannot be performed because the specified LU is a unified LU, or unified LUs exist.
DMES059559	The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.
DMES05955A	The unification cannot be performed because the controllers in charge of the LUs do not match.
DMES05955B	The unification cannot be performed because the controller in charge of LU is reserved to be changed. Cancel the reservation and then try again.
DMES05955C	The LU of RAID0 cannot be unified. Specify an LU which the RAID level is not RAID0.
DMES05955D	The unification cannot be performed because the size of the unified LU will exceed 4294967295 blocks.
DMES05955E	The separation cannot be performed because the specified LU is not a unified LU. Specify a unified LU and then try again.
DMES059560	The process cannot be performed because the target mode is not M-TID, M-LUN.
DMES059561	The process cannot be performed because the target mode is M-TID, M-LUN, but target information have already been set.
DMES059562	The unification cannot be performed because the specified Sub LU is a unified LU. Specify a non-unified LU for Sub LU and then try again.
DMES059563	The unification or separation cannot be performed because the specified LU is a Sub LU. Specify a Main LU (unified LU) and then try again.
DMES059564	LU0 cannot be specified as a Sub LU. Specify an LU other than LU0 for Sub LU and then try again.
DMES059565	The unification (LU concatenation) cannot be performed because the status of the LU is not normal (a disk might have failed). Specify an LU where the status is normal, and then try again.
DMES059566	The process cannot be performed because the LU number is over max LU number. Specify a number under max LU number and then try again.
DMES059568	The specified RAID group cannot be deleted because it contains LU0, and Lus exists in other RAID groups.
DMES059569	The specified LU cannot be deleted because it is not the last defined LU.
DMES05956A	Cannot define the specified LU because LU0 is not yet defined. Define LU0 first, and then try again.
DMES059571	Failed to set the path. Please confirm the conditions required for a path setup are met.
DMES059572	Failed to delete the path. Please confirm the conditions required for path deletion are met.
DMES059573	The option which cannot be specified at the same time is unlocked.
DMES059574	The process cannot be performed because TrueCopy is in progress.
DMES059575	The option cannot be locked or disabled because the path has already been set.
DMES059577	The process cannot be performed because the pair creation is in progress.
DMES05957A	The process cannot be performed because the status of pair is suspend. Please retry after solving the error.
DMES05957B	The process cannot be performed under 'pair' status. Please retry after splitting the pair.
DMES05957C	The process cannot be performed because the pair has been created in other subsystem.
DMES05957D	The process cannot be performed because the subsystem is over the inflow threshold.
DMES05957E	The process cannot be performed because the status of ShadowImage pair is incorrect.
DMES05957F	The option cannot be unlocked because it is in use in the fibre channel subsystem.
DMES059580	The process cannot be performed because the RAID Manager is doing a conflicting process. Please wait a moment and then try again.
DMES059590	The process cannot be performed because the subsystem is for the exclusive use of 128 Lus.
DMES059591	The process cannot be performed because the number of ShadowImage pairs reached the maximum.
DMES059596	Please retry.
DMES059600	The process cannot be performed. Wait for a while and then try again.
DMES059601	The specified host group number is invalid.
DMES059602	The process cannot be performed because the specified option is a fee-basis option.
DMES059603	The process cannot be performed because the specified size of LU is over max LU size.
DMES059606	The specified LU is invalid. Specify a valid LU and try again.
DMES059607	The function cannot be executed because the pair LU already exists.
DMES05960A	The function cannot be executed because there already exists logical units added to the data pool.
DMES059612	The process cannot be performed because quick formatting is now occurring. Retry after quick formatting is completed.

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text/Recovery methods
DMES059615	The process cannot be performed because the specified logical unit is a part of Snapshot pair. Cancel the Snapshot pair and try again.
DMES059617	The process cannot be performed because the specified RAID level is not supported. Specify the RAID level currently supported and try again.
DMES05961A	The process cannot be performed because parity correction is not completed. Please try again, after It is completed.
DMES05961D	The RAID group cannot be created because the different drives are specified within the range of a RAID group. Please confirm the drive type and try again.
DMES05961E	One internal LUN cannot be mapped to two or more host LUN in a port. Please confirm the mapping information and try again.
DMES05961F	The function cannot be executed because the Hi-Copy pair LU already exists. Cancel the Hi-Copy pair and try again.
DMES05EA03	Failed to download the micro program. Please confirm the combination of the specified micro program and the subsystem.
DMES05EA04	Failed to replace the microprogram. Confirm the subsystem.
DMES05EA10	An error was detected in micro program downgrade check. Please retry by using another micro program.
DMES05EA12	It is impossible to change from the 128LU version micro program to the 64LU version micro program.
DMES05EA15	The micro program cannot be downgraded because the Random Simple Buffer Size 0% Mode is enabled. Please set the Random Simple Buffer Size 0% Mode to disable then try again.
DMES05EA16	The micro program cannot be downgraded on this current spare drive configuration. Please release all spare drives then try again.
DMES05EA17	The micro program cannot be downgraded because the units are intermixed. Please remove the AT units then try again.
DMES05EA18	The micro program cannot be downgraded because the ShadowImage I/O Switch Mode is enabled. Please set the ShadowImage I/O Switch Mode to disable then try again
DMES05EA19	The micro program cannot be downgraded because SnapShot and Cache Residency are unlocked together or not restarted the subsystem after locked. Please lock either option and restart(*1) the subsystem, and then try again.
DMES05EA1A	Cannot download, because the micro program does not match to this subsystem. Please retry by using another micro program.
DMES05EA1B	The micro program cannot be downgraded because the RAID group of RAID6 exists. Please retry after deleting it or by using another micro program.
DMES05EA1C	The micro program cannot be downgraded because the non-supported units are connected. Please retry after removing the units or by using another micro program.
DMES05EA1D	The micro program cannot be downgraded because the non-supported cache is connected. Please retry after removing the cache or by using another micro program.
DMES05EA1E	The process cannot be performed because the NNC connected to the specified controller is not shutdown status. Please shutdown the NNC and try again.
DMES05EA1F	The process cannot be performed because the NNC is not shutdown status. Please shutdown the NNC and try again.
DMES05EA20	The subsystem cannot be restarted.
DMES05EA30	The ENC micro program download and replacement cannot be performed because there is an error in the loop. Please retry after solving the error.
DMES05EA31	The process cannot be performed because the ENC micro program is being replaced. Please retry after replacement completes.
DMES05EA32	Failed to download the ENC micro program. Please confirm the combination of the specified ENC micro program and the subsystem.
DMES05EA33	The ENC micro program of this revision cannot be downloaded. Please retry by using another ENC micro program.
DMES05EA34	The sum check error of the ENC micro program occurred. Please retry by using another ENC micro program.
DMES05EA35	The ENC micro program is not downloaded. Please try again after downloading.
DMES05EA36	Failed to replace the ENC micro program. Please confirm the subsystem.
DMES05EA40	The process cannot be performed because the Automatic Download is enabled. Please set the Automatic Download to disable then try again.
DMES05EA41	The process cannot be performed because the ENC micro program is being replaced. Please retry after replacement completes.
DMES05EB04	The FDD on the subsystem could not be diagnosed because the FDD is in use.

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Chapter 9. Failure Analysis by Sense Data

In case of Fibre Channel, when an error occurs Sense Data is stored in Payload of FCP_RSP and transferred to Host Computer.

9.1 Details of sense code

The details of Sense Code are shown below.

Sense key	Sense code	Description	Recovery methods	Reference page
0/5	00 00	There is no valid additional sense information.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
4	01 00	The INDEX signal cannot be detected. The SECTOR signal cannot be detected.		
1/4	02 00	Seek operation in the Disk Drive cannot be executed correctly.		
4	03 00	A Write Fault was detected in the Disk Drive.		
2	04 00	The LU connected cannot execute a command because LUs are being formatted.	This is not failure. If this error code frequently appears, collect Simple trace and request the Technical Support Center to analyze the failure.	
2	04 01	The Disk Drive will soon become ready although it is currently not ready.		
2	04 02	The Disk Drive is currently not ready; it has not been spun-up.		
2	04 03	The host I/O cannot be executed because the Disk Drive is spin-down with the Power Saving function.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	
2	04 04	The logical unit is currently not ready. (It is executing the formatting command.)	This is not failure. If this error code frequently appears, collect Simple trace and request the Technical Support Center to analyze the failure.	
2	04 84	A sequential shutdown is in progress.		
2	05 00	An error occurred in the drive interface in the logical unit.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	
1/4	06 00	The positioning to Track 0 failed.		
4	07 00	Two or more Disk Drives were selected at the same time.		
4	08 00	An error occurred in the drive interface in the logical unit.		
4	08 01	A time-out error occurred in the drive interface in the logical unit.		
1/4	08 02	A parity error occurred in the drive interface in the logical unit.		
1/4	09 00	A track positioning failed.		
3	0C 02	An automatic allocation was executed against the write error but failed.		
3	0C FF	Write processing time exceeded Recovery Time Limit, write processing was terminated.		
3	10 00	A CRC error occurred in the ID field.		

Copyright © 2005, 2006, Hitachi, Ltd.

Sense key	Sense code	Description	Recovery methods	Reference page
3	11 00	An error occurred in the data field.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
3	11 01	Reading of the data field was retried but the error was not recovered. (An error correction was not applied.)		
3	11 02	The read error in the data field could not be corrected by means of the ECC.		
3	11 04	An automatic reallocation was executed against the recoverable error but failed		
3	11 FF	Read or Verify processing time exceeded Recovery Time Limit, read or verify processing was terminated.		
3	12 00	The address mark of the ID field could not be detected.		
1/3	13 00	The address mark of the data field could not be detected.		
1/3	14 01	The block with the identical ID field could not be detected.		
1/4	15 01	A seek error occurred.		
1/4	15 02	The seek operation terminated normally but the head was positioned at an address not intended.		
1	17 00	The error was recovered by a retry.	This is not failure. If this error code frequently appears, collect Simple trace and request the Technical Support Center to analyze the failure.	
1	17 01	The error was recovered by a retry (without a head offset).		
1	17 02	The error was recovered by a retry with a head offset in the positive direction.		
1	17 03	The error was recovered by a retry with a head offset in the negative direction.		
1	18 00	The error was recovered by the ECC (without a retry).		
1	18 01	The error was recovered by the ECC applied in a retry.		
1	18 02	Data was recovered by an automatic reallocation.		
1/3	19 02	An error occurred during an access to the Primary (P) list.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	
1/3	19 03	An error occurred during an access to the Grown (G) list.		
5	1A 00	The parameter list length is illegal.		
4	1B 00	A synchronous data transfer error occurred in a data transfer.		
3	1C 01	The positioning to the Primary (P) list failed.		
3	1C 02	The positioning to the Primary (P) list failed.		
3	1D 00	A data compare error occurred during write or read buffer verify processing.

B	43 00	The operation cannot be continued because the message was rejected or an error occurred in the Message phase.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
4	44 00	A hardware or firmware error was detected in the Controller during the command execution.		
4	44 00	A abnormal end of the Formatting job generated by the read command was detected.		
4	44 00	A abnormal end of the Formatting job generated by the write command was detected.		
4	44 A0	No sector to be reassigned cannot be detected.		
B	45 00	A Select/ Reselect time-over was detected. An invalid selection was detected.		
B	47 00	A Fibre Channel bus on CRC error occurred.		
B	48 00	The Initiator Detected Error message was received from the initiator.		
B	49 00	• An invalid message was detected.		
		• The communication via a LAN was not done normally because of a LAN failure.		
B	4A 00	An error occurred during accepting of the command.		
B	4B 00	An error occurred during data transfer.		
4	4C 00	A loading of a microcode or parameter failed when starting up the controller.		
B	4E 00	• Two commands with no tag was issued to the same I-T-L. • Commands with and without tags were issued to the same I-T-L. (When this code is reported, all the commands queuing for the I-T-L concerned are cleared.)		
5	55 04	A registration of 32 or more Reservation Keys in an LU was attempted.		
1	5B 00	An exceptional log in the Disk Drive was detected.		
1	5B 02	The log counter in the Disk Drive reached its maximum value.		
1	5B 03	All log list codes in the Disk Drive were used up.		
1/6	5C 02	A synchronous withdrawal failure or an off-synchronization after a passing synchronization was detected.	–	–

Sense key	Sense code	Description	Recovery methods	Reference page
5	95 49	A locking instruction was given to the drive which was already locked.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
5	95 4A	The pricing key code is invalid.		
5	95 4B	The RAID group cannot be set because the uninstalled or blocked Disk Drive is included in the specified Disk Drive.	Select the installed Disk Drive, and set the RAID group. Or, set the RAID group again after replacing the blocked Disk Drive.	System Parameter "Chapter 3. Setting the RAID/LU/Spare Disk" (SYSPR 03-0000) Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
5	95 4D	The process cannot be performed because the target mode is mode is not M-TID, M-LUN. (Mapping mode)	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
5	95 4E	The process cannot be performed because the target information are changed or deleted.		
5/7	95 50	Command not execute for write prohibition.		
5	95 51	Command not execute for concealment mode.		
5	95 52	Command not execute for coupling LU or Command Device exist.		
5	95 53	Ap distinction number is full.		
5	95 54	Command response can not be done because command device is not set.		
5	95 56	The command cannot be executed because a failure occurred during the reverse resynchronization or the I/O switch operation.		
5	95 57	• (LU Size Non-Rounding mode is off) A pair cannot be formed because the primary and secondary LU sizes (host LU size = rounded LU size) are not the same. • (LU Size Non-Rounding mode is on) A pair cannot be formed because the primary and secondary LU sizes (either or both of the host LU sizes and rounded LU sizes) are not the same.		
5	95 58	The command cannot be issued because LU unification is in progress.		
5	95 59	LU unification, a dissolution of LU unification, or a separation of a final LU could not be done because an internal LU to have been used for the operation above was a Turbo LU or a reserved Turbo LU.		
5	95 5A	The LU unification could not be done because Controllers that control LUs to be unified were not the same.		

Copyright © 2005, 2006, Hitachi, Ltd.

Sense key	Sense code	Description	Recovery methods	Reference page
5	95 5B	The LU unification could not be done because a Controller that controls the LUs to be unified was being changed.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
5	95 5C	The LU unification could not be done because a RAID level of the LUs to be unified was RAID 0.		
5	95 5D	The LU unification could not be done because an LU size after the unification would be larger than 2 Tbytes.		
5	95 5E	A dissolution of LU unification or a separation of a final LU could not be done because the LU concerned was not a unified LU.		
5	95 62	The LU unification could not be done because a unified LU was selected as a Sub LU to be unified.		
5	95 63	LU unification, a dissolution of a unified LU or a separation of a final LU could not be done because a Sub LU had been selected.		
5	95 64	The LU unification could not be done because the LU #0 was selected as the Sub LU.		
7	95 65	The LU unification could not be done because an LU status was other than normal or regression.		
5	95 66	The LU unification could not be done because the number of the internal LU that configures the unified LU exceeded 2047.		
5	95 67	LU unification, a dissolution of an LU unification, or a expansion of a final LU could not be done because the LU unifying function (enhancing function) was not validated.		
5	95 69	The final LU could not be deleted because it was not specified.		
5	95 6B	Because the differential bit could not be assigned, the pair forming command of the MRCF-Lite could not be executed.		
5	95 71	The path could not be set.		
5	95 72	The path could not be deleted.		
5	95 73	Since a function that cannot coexist with the function was being used in the system, the key for the extra-cost option could not be open.		
5	95 74	The command could not be executed because the remote copy function was being used.		
5	95 75	The command could not be executed because the path was already defined.		
5	95 76	The pair operation command from RAID Manager could not be executed.		
5	95 77	The command (host or Storage Navigator Modular) could not be executed because the pair was being generated.		
7	95 78	The host command could not be executed because data copy was on progress.		

Copyright © 2005, Hitachi, Ltd.

Sense key	Sense code	Description	Recovery methods	Reference page
5	95 79	The host command could not be executed because the primary volume was write-protected.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting “7.3 Collecting simple trace” (TRBL 07-0040)
5	95 7A	The host command could not be executed because the pair status is PSUE (suspended due to failure).		
5	95 7B	The command could not be executed between the devices because the pair status was invalid.		
5	95 7C	The command could not be executed between the devices because the remote device was already paired with another device.		
5	95 7D	The command issued by a DF to another DF cannot be executed because the limit of the inflow has been exceeded.		
5	95 7E	The command issued by a DF to another DF cannot be executed because a status of the pair formed by the ShadowImage in-system replication is invalid.		
5	95 80	The command cannot be executed because the command from RAID Manager is being received.		
B	95 81	Any further processing cannot be executed because the SEL command is received consecutively.	Execute it again after waiting for a while.	–
5	95 91	The setting of or reference to the pairs, number of which exceeds the allowable maximum value, was attempted.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting “7.3 Collecting simple trace” (TRBL 07-0040)
7	95 95	The write command could not be executed because the fence level was data.		
5	95 96	The read command could not be executed because the concealment mode was turned on for the remote copy function.		
7	95 97	The write command could not be executed because the secondary volume was in the paired status in the remote copy function.		
7	95 98	The write command could not be executed due to the restriction on the secondary volume access in the remote copy function.		
4	95 99	The pair status transited to PSUE because the write command failed duplicate write.		
2	95 9A	The vendor unique command cannot be executed in order to avoid a deadlock owing to a duplex writing.		
2	95 9B	The read/write command cannot be executed because the read access mode is “Enable” when the fence level is "data."		
5	96 00	Storage Navigator Modular command sequence error (Another command is being executed in the disk array subsystem.)		
5	96 01	The setting was made for a host group other than 0.

5	96 1A	The execution was impossible because the restoration for the LU by means of parity was undone, undone 2, in progress, or on standby.	Issue an instruction to make or skip the parity correction using the Storage Navigator Modular and retry after the restoration for the LU by means of parity is completed or skipped.	Troubleshooting "< Procedure given in windows >" (TRBL 06-0250)
7	96 1B	A command was issued to an inaccessible area while the forced parity correction, which was made with the subsystem power turned on, was in progress.	Execute the forced parity correction or skip it.	
5	96 1C	The ShadowImage in-system replication pair operation could not be executed.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
5	96 1D	The RG (RAID group) could not be defined because the specified RG included both of the FC and SATA drives.	Make sure of the operation and try again.	–
B	96 1E	A response with a notification that the status had been changed to special PSUE was made during execution of the R/W command.	Retry the execution of the command.	–
5	96 1F	It cannot be executed due to the Hi-Copy pair.	Execute it again after releasing the Hi-Copy pair.	–
5	96 20	The Hi-Copy operation cannot be executed.	Check the status of the subsystem on the other side.	–
1	96 25	The priced option of "Modular Volume Migration" became enabled from disabled.	–	–
1	96 26	The priced option of "Modular Volume Migration" became disabled from enabled.	–	–
1	96 27	The locked priced-option of "Modular Volume Migration was unlocked.	–	–
1	96 28	The priced option of "Modular Volume Migration", which was unlocked and enabled, was locked.	–	–
1	96 29	A copy of the Modular Volume Migration started from the RAID Manager but it could not be executed.	–	–
4	97 00	A copy job of Copy-on-write SnapShot terminated abnormally.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
4	97 01	A restoration job of Copy-on-write SnapShot terminated abnormally.		
4	97 02	The status of the Copy-on-write SnapShot pair was changed to PSUE.		
4	97 03	The status of the Copy-on-write SnapShot pair was changed to PSUE because the restoration failed.		
4	99 00	Data in the cache cannot be written on the drive in a synchronized cache.		
5	99 01	The command (R.M command) was issued to the remote subsystem by the command of the RAID Manager, but the time-out of the retry of the command occurred.	Execute it again after waiting for a while.	
4	9A 01	The DMA (DRR) hardware error was detected during a diagnosis of Disk Drives.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)

Sense key	Sense code	Description	Recovery methods	Reference page
5	9F FF	A sense key and sense code to be used exclusively for responding to Storage Navigator Modular and RAID Manager.	Take a recovery action referring to "9.2List of detail codes of sense code (05/9FFF)".	"9.2 List of detail codes of sense code (05/9FFF)" (MSG 09-0190)
4	A0 00	A failure occurred in the cache circuit.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
B	A1 00	An invalid boundary error occurred during DMA transfer.		
B	C0 00	A time-out occurred during an internal processing or data transfer.		
B	C0 01	A time-out occurred during a data transfer between a host computer.		
B	C0 02	A time-out occurred during communication between the Controllers.		
B	C0 03	A time-out occurred during a data transfer between a host computer.		
B	C0 04	A time-out of the Formatting job generated by the read command was detected.		
B	C0 04	A time-out of the Formatting job generated by the write command was detected.		
B	C0 05	The command was terminated abnormally due to another Control Unit failure.		
B	C0 06	A segment securing waiting time-out occurred.	–	–
B	C0 0A	A CRC error occurred during a data transfer between a host computer.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
B	C1 00	The cache necessary for the formatting cannot be assigned.		
B	C2 00	The system current drive was changed		
B	DA 00	The new data recovery request cannot be accepted because another Disk Drive is being recovered		
6	E0 00	The Cache battery voltage decreased.	–	–
6	E2 00	FAN STOP		
4	E4 00	The system area overflowed(*1). (Pinned data management area)	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
6	E5 00	Abnormality of the power supply section occurred.	–	–
6	E5 01	The DC voltage decreased.		
6	EA 00	There was a Disk Drive on which the take-over information could not be written.		
4	EA 01	The program size which the write buffer received was larger than that of the program area.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
4	EA 02	The take-over information size which the write buffer received was larger than that of the take-over information of the system.		

*1 : In the case where WAR = 1 in the Mode Select command when reporting the sense code to a host, Sense key: 4/ Code: "F8 04_H" are also reported.

Sense key	Sense code	Description	Recovery methods	Reference page
5	EA 03	A microprogram download error was detected.	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
5	EA 04	An error was detected when the hot replacement of the microprogram was directed.		
1	EA 05	A microprogram installation is in the state in which it has been partially completed.		
4	EA 10	An error in the microprogram downgrade check.		
5	EA 13	An error in the microprogram upgrade check.		
5	EA 15	A downgrade was made though a specification for the random simple buffer size as 0% was validated.		
5	EA 16	Downgrade of the microprogram was performed when 16 or more Spare Disk Drives were used.	Reduce the number of the spare disk drives to 15 or less.	–
5	EA 17	Downgrade of the microprogram was performed when the FC and SATA disk array units coexisted.	Make the system configuration have the FC disk array unit only. (A configuration with the SATA disk array unit only is not supported.)	–
5	EA 1A	A system version check error occurred in the microprogram download.	Use the microprogram corresponding to the subsystem and do the update installation of the microprogram again.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
5	EA 1B	Because RAID 6 is defined, the downgrade to lower than microprogram version 0720 cannot be performed.	Delete RAID 6 when downgrading to lower than microprogram version 0720.	–
5	EA 1C	Because the DF700 chassis is connected, the downgrade to lower than microprogram version 0720 cannot be performed.	Remove the DF700 chassis when downgrading to lower than microprogram version 0720.	–
5	EA 1D	Because 2 G bytes DIMM is installed, the downgrade to lower than microprogram version 0720 cannot be performed.	Remove 2 G bytes DIMM when downloading to lower than microprogram version 0720.	–
5	EA 1E	Because the NAS OS is operating, the microprogram cannot be replaced by the update installation.	Replace the microprogram after stopping the NAS OS.	Microprogram "Chapter 1. Installation of Microprogram" (MICRO 01-0000)
5	EA 1F	Because the NAS OS is operating, the command with the reboot of the Control Unit cannot be executed.	Execute the operation again after stopping all NAS OS.	–
5	EA 30	The online ENC firmware downloading or online ENC firmware replacement cannot be executed because of the loop trouble or the Single mode.	Execute the online ENC firmware downloading or online ENC firmware replacement after the loop trouble is solved.	–
5	EA 31	The command cannot be executed because the online ENC firmware replacement is in progress.	Execute the command after the online ENC firmware replacement is completed.	–
5	EA 32	The online ENC firmware downloading cannot be done.	Execute the online ENC firmware downloading again.	–
5	EA 33	A revision check error of the online ENC firmware downloading occurred.	Check the revision of the ENC firmware again and re-execute the online ENC firmware downloading.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Sense key	Sense code	Description	Recovery methods	Reference page
5	EA 34	A sum check error of the online ENC firmware downloading occurred.	Check the ENC firmware again and re-execute the online ENC firmware downloading.	–
5	EA 35	The online ENC firmware replacement cannot be made because the online ENC firmware downloading has not been done yet.	Make the online firmware replacement after executing the online ENC firmware downloading.	–
5	EA 36	The parameter of the online ENC firmware replacement is incorrect.	Make the online ENC firmware replacement again.	–
5	EA 40	Since the automatic ENC microprogram download function is enabled, the command cannot be executed.	Disable the option and execute the command again.	–
5	EA 41	Since the automatic ENC microprogram download is executing, the command cannot be executed.	Execute the command at the time of the automatic download.	–
5	EB 10	The information on the traceability cannot be set.	–	–
4	F4 00	The cache module was blocked because a Cache memory error occurred.	Replace the Cache Unit.	Replacement “2.2.6 Replacing Cache Unit” (REP 02-0540)
4	F6 10	A Disk Drive emerged in which the number of recovered mechanical errors exceeded the threshold value(*1).	Replace the Disk Drive.	Replacement “2.2.1 Replacing Disk Drive” (REP 02-0050)
4	F6 11	A Disk Drive emerged in which the number of unrecovered mechanical errors exceeded the threshold value(*1).		
4	F6 20	A Disk Drive emerged in which the number of recovered medium errors exceeded the threshold value(*1).		
4	F6 21	A Disk Drive emerged in which the number of unrecovered medium errors exceeded the threshold value(*1).		
4	F6 30	A Disk Drive emerged in which the number of recovered R/W errors exceeded the threshold value(*1).		
4	F6 31	A Disk Drive emerged in which the number of unrecovered R/W errors exceeded the threshold value(*1).		
4	F6 40	A Disk Drive emerged in which the number of recovered interface errors exceeded the threshold value(*1).		
4	F6 41	A Disk Drive emerged in which the number of unrecovered interface errors exceeded the threshold value(*1).		
4	F6 50	A Disk Drive emerged in which the number of recovered hardware errors exceeded the threshold value(*1).		
4	F6 51	A Disk Drive emerged in which the number of unrecovered hardware errors exceeded the threshold value(*1).		

*1 : In the case where WAR = 1 in the Mode Select command when reporting the sense code to a host, Sense key: 4/ Code: “F8 04_H” are also reported.

Sense key	Sense code	Description	Recovery methods	Reference page
4	F8 08	UPS failure	Specify a part to be replaced by checking the log message of the subsystem. When the UPS is connected, take a recovery action referring the UPS manual. (If a sense code, "FB F2", is displayed at the same time, take an action following the recovery procedure corresponding to it first.)	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100) Replacement "2.1 Locations of Replacement Components" (REP 02-0000)
4	F8 09	Battery backup circuit failure	Specify a part to be replaced by checking the log message of the subsystem and replace the Backup Battery Unit.	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100) Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)
4	F8 0A	ENC blockade	Specify a part to be replaced by checking the log message of the subsystem and replace the ENC Unit.	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100) Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)
4	F8 0B	Loop failure	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)
4	F8 0C	A path detachment occurred.	Replace the LOOP.	
4	F8 0D	SATA Drive failure (regression)	Specify a part to be replaced by checking the log message of the subsystem and replace the Disk Drive.	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100) Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
4	F8 0E	SENC failure	Specify a part to be replaced by checking the log message of the subsystem and replace the ENC Unit/SENC Unit.	Troubleshooting "4.3 Confirm log messages" (TRBL 04-0100) Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)
4	F8 F0	The controller of another system was blocked(*1).	Get the CTL alarm trace of the detached Control Unit and replace the Control Unit.	Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080) Refer to Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
4	F8 F1	Host connector failure	Collect Simple trace and request the Technical Support Center to analyze the failure and take a measure.	Troubleshooting "7.3 Collecting simple trace" (TRBL 07-0040)

*1 : The sense code is reported to the host only when WAR = 1 in the Mode Select command (page35$_H$).

9.2 List of detail codes of sense code (05/9FFF)

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
010001	DMED010001: The same host group name exists in a port. Confirm the host group name and then try again.	Check if the host group name that has been entered is correct.	–
010002	DMED010002: The same WWN name exists in a port. Confirm the WWN name and then try again.	Check if the WWN nickname that has been entered is correct.	–
010003	DMED010003: WWN cannot be assigned to an undefined host group. Specify a defined host group and try again.	Check if the host group name to which the WWN has been assigned is actually the same as that to which you want to assign the WWN.	–
010004	DMED010004: The function cannot be executed because host group security on some port is set to enabled. Set host group security to disable on all ports and try again.	Disable the host group security of the LUN Manager function for all ports, and then lock or disable the LUN Manager function.	–
010005	DMED010005: The process cannot be performed because the target security on some port is set to enabled. Please set the target security to disable on all ports and try again.	Lock the LUN Manager function or disable the status after disabling all the Enable/Disable flags of the LUN Manager per iSCSI port in the LUN Manager function.	–
010006	DMED010006: The process cannot be performed because the specified name is default name of host group 0. Please confirm the name and try again.	Give the name other than G000 to the host group 1 or later.	–
020001	DMED020001: The value of Dirty Data Opportunity is outside the effective range. Specify the value in the effective range and try again.	Specify the trigger for de-staging dirty data as one of integers ranging from 1 to 50 and smaller than a trigger for stopping the de-staging of the dirty data.	–
020002	DMED020002: The value of Dirty Data Stop Opportunity is outside the effective range. Specify the value in the effective range and try again.	Specify the trigger for stopping the de-staging of dirty data as one of integers ranging from 0 to 49 and larger than a trigger for de-staging the dirty data.	–
020003	DMED020003: The value of Dirty Data Opportunity is equal to or less than value of Dirty Data Stop Opportunity. Specify the value and try again.	Specify the trigger for de-staging dirty data as an integer larger than the trigger for stopping the de-staging of the dirty data.	–
020004	DMED020004: Prefetch Starting Opportunity is outside the effective range. Specify the value of effective range and try again.	Specify the trigger for starting the pre-fetch as one of integers ranging from 0 to 100.	–
020005	DMED020005: LU number is outside the effective range. Specify the LU number of effective range and try again.	Specify the default LUN of the performance tuning parameter as one of integers ranging from 0 to 2047.	–
020006	DMED020006: Reserved Random Simple Buffer Size is outside the effective range. Specify the value of effective range and try again.	Specify the size of the Reserved Random Simple Buffer as one of integers ranging from 0 to 100.	–
020007	DMED020007: The process failed due to an invalid parameter of Random Simple Buffer Size 0% Mode. Confirm the specified parameter.	Specify the size within the effective range.	–
020008	DMED020008: Prefetch Count is outside the effective range. Specify the value in the effective range and try again.	Specify the size within the effective range.	–
020009	DMED020009: Prefetch Size is outside the effective range. Specify the value in the effective range and try again.	Specify the size within the effective range.	–
02000A	DMED02000A: The process failed due to an invalid parameter of Next Prefetch Opportunity Mode. Confirm the specified parameter.	Specify the size within the effective range.	–

Copyright © 2005, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
020010	DMED020010: Count of Judgment Sequential is outside the effective range. Specify the value in the effective range and try again.	Specify a value that falls within a valid range.	–
020011	DMED020011: Prefetch Size of Base is outside the effective range. Specify the value in the effective range and try again.	Specify a value that falls within a valid range.	–
020012	DMED020012: Prefetch Size of Fixed is outside the effective range. Specify the value in the effective range and try again.	Specify a value that falls within a valid range.	–
040001	DMED040001: The specified LUs contain Sub LU. Confirm the LU status and try again.	When formatting the unified LU, specify the Main LU.	–
050001	DMED050001: The process cannot be performed, because the specified LU is having PIN data or is in a PIN exceeded state. Restore PIN data and try again.	The processing cannot be executed because PIN exists or the number of PIN segments exceeded the PIN threshold value. Execute the processing again after deleting the PIN segments of the specified LUs.	–
050002	MED050002: The process cannot be performed because cache segment is insufficient. Wait for a while and then try again.	Perform the same operation again after waiting for a while.	–
050003	DMED050003: The process cannot be performed because the specified LU is receiving the Write command continuously from the host. Wait for a while and then try again.	Perform the same operation again after waiting for a while.	–
050004	DMED050004: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Retry after eliminating the Turbo or reserved Turbo LU.	–
050005	DMED050005: The process cannot be performed because the partition of necessary conditions for LU changing does not exist. Please confirm the partition definition and try again.	Check the partition number that was specified. Check if the capacity of the specified partition is larger than that of the LU. Check if the segment size is the same. Retry after eliminating the pinned segment of the specified LU or the partition to which the switching was made referring to Troubleshooting “Chapter 6 Details of Recovery Procedures”.	Troubleshooting “Chapter 6. Details of Recovery Methods” (TRBL 06-0000)
050006	DMED050006: The process cannot be performed because the directory configuration is changing. Please wait for a while and then try again.	Perform the operation again after determining the Cache partition change (the re-start-up).	–
050007	DMED050007: The process cannot be performed because the LU change is in progress. Please wait for a while and then try again.	Perform the operation again.	–
050008	DMED050008: The process cannot be performed because the LU change is in progress. Please wait for a while and then try again.	Perform the operation again	–
050009	DMED050009: The LU change could not be performed.	Perform the same operation again after waiting for a while.	–
05000A	DMED05000A: The process cannot be performed because the controller is detached. Please recover the controller status and then try again.	Perform the operation again	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
070002	DMED700002: The specified IP address is incorrect. Please specify a right IP address	Set a correct IP address.	–
070006	DMED070006: When the ShadowImage pair of a S-VOL Switch status exists the ShadowImage I/O Switch Mode cannot be disabled. Please retry after solving the error.	Turn off the ShadowImage I/O Switching mode after the pair in the special PSUE status disappears.	–
070007	DMED070007: The configuration of single or dual controller system cannot be changed because Cache Partition Manager is enabled. Please change Cache Partition Manager to de-installed or disabled and try again.	Perform the operation after invalidating or locking the of Cache Partition Manager which is an onerous option.	–
070008	DMED070008: The process cannot be performed because the specified port number is outside the effective range. Please confirm the port number.	Specify the correct (enable) TCP/IP port number.	–
070009	DMED070009: The port number of other controller cannot be set up. Please confirm the controller number.	Connect it to the Control Unit side which wants to be updated, and execute it again.	–
080001	DMED080001: The data pool cannot be used. Please restart the subsystem.	Restart(*1) the disk array subsystem.	–
080005	DMED080005: The specified logical unit number is outside of the effective range. Specify the logical unit number within the range and try again.	Specify an integer within the range of 0 to 2047 for the number of the LU to be assigned to the data pool.	–
080006	DMED080006: The process cannot be performed because the specified logical unit is neither in normal nor in regressed state. Specify the logical unit of normal or regressed state and try again.	The status of the specified LU is neither normal nor regressed. Correct the status of the specified LU, and then assign the LU to the data pool.	–
080007	DMED080007: The process cannot be performed because the RAID level or HDU combination of the specified logical unit is not supported. Confirm the RAID level and the HDU combination currently supported and try again.	Make sure of the RAID level of the specified LU and assign an LU, whose RAID level is other than RAID 0, to the data pool.	–
080008	DMED080008: The process cannot be performed because the number of logical units in the data pool reached the maximum. Delete the logical units in the data pool and then try again.	The 64 LUs have been assigned to the data pool. Make the assignment over again after canceling the assignment of all the LUs to the data pool.	–
080009	DMED080009: The process cannot be performed because the specified logical unit is a unified LU. Separate the unified LU and try again.	Dissolve the unification of the specified LU, and then assign the LU to the data port.	–
08000A	DMED08000A: The process cannot be performed because the specified logical unit is a part of ShadowImage pair. Cancel the ShadowImage pair and try again.	Split the specified LU from the ShadowImage in-system replication pair, and then assign it to the data pool.	–
08000B	DMED08000B: The process cannot be performed because the specified logical unit is a part of TrueCopy pair. Cancel the TrueCopy pair and try again.	Split the specified LU from the TrueCopy remote replication or TrueCopy Extended Distance pair, and then assign it to the data pool.	–
08000C	DMED08000C: The process cannot be performed because the specified logical unit is a command device. Cancel the command device and try	Release the specified LU from the command device, and then assign it to the data pool.	–
08000D	DMED08000D: The process cannot be performed because the specified logical unit has been invalidated. Restore the logical unit and try again.	Restoration the specified LU, and then assign it to the data pool.	–

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
08000E	DMED08000E: The process cannot be performed because the specified logical unit is a part of Snapshot pair. Cancel the SnapShot pair and try again.	Split the specified LU from the Copy-on-write SnapShot pair, and then assign it to the data pool.	–
080010	DMED080010: The process cannot be performed because the specified logical unit is added to a data pool. Specify another logical unit and try again.	The specified LU has already been assigned to the data pool. Check the LU structure.	–
080012	DMED080012: The process cannot be performed because the owner controller is different between the specified logical unit and the data pool. Confirm the logical unit owner controller and try again.	Change the controller that controls the specified LU, and then assign the LU to the data pool again.	–
080016	DMED080016: The process cannot be performed because the specified logical unit is not enough for sufficient cache blocks. Specify another logical unit and try again.	The size of the specified LU is too large. Check the LU structure and specify an LU whose size is appropriate and enables the LU to be assigned to the data pool.	–
080017	DMED080017: The process cannot be performed because no logical units in data pool.	Check if the specified data pool is the one from which you want to eliminate all the Lus. Also check whether all the Lus have already been eliminated from it or not.	–
080018	DMED080018: The process cannot be performed because the Snapshot pair exists in the specified data pool. Cancel the Snapshot pair and try again.	Perform the elimination after eliminating all the Snapshot images.	–
08001B	DMED08001B: The specified threshold is outside of the effective range. Specify the value of effective range and try again.	Specify the threshold value for the data pool as an integer within a range of 50 to 80 %.	–
08001D	DMED08001D: The process cannot be performed because S-VOL mode of the specified logical unit is disabled. Set S-VOL mode to enable then try again.	Invalidate the S-Vol disable mode and make the setting again.	–
08001F	DMED08001F: The number of specified logical units is over 64. Please specify the logical units in 64 or less.	Specify Lus less than the maximum number 64 of the pool Lus.	–
080020	DMED080020: The process cannot be performed because the drive type of specified logical unit is different from the data pool. Please confirm the drive type and try again.	Specify the LU on the drive of the same type and execute it again.	–
080021	DMED080021: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Release the Turbo LU of the LU specified for the pool LU, and execute it again.	–
080022	DMED080022: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Release the Turbo LU of the LU specified for the pool LU, and execute it again.	–
080024	DMED080024: The process cannot be performed because DM-LU is not defined. Please define DM-LU and then try again.	Retry after setting the DM-LU.	–
080025	DMED080025: The process cannot be performed because the specified logical unit is reserved for cache partition modification. Please specify another logical unit and try again.	Retry after settling the cache partition change (rebooting the subsystem).	–

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
090001	DMED090001: The logical unit number of specified P-VOL is outside of the effective range. Specify the logical unit number of effective range and try again.	Specify the LUN for the P-VOL as an integer within a range of 0 to 2047.	–
090003	DMED090003: The logical unit number of specified Snapshot image is outside of the effective range. Specify the logical unit number of effective range and try again.	Specify the LUN for the Snapshot image as an integer within a range of 0 to 2047.	–
090006	DMED090006: The process cannot be performed because the specified logical unit of the P-VOL is neither in normal nor in regressed state. Specify the logical unit of normal or regressed state and try again.	A status of the LU assigned to the P-VOL is neither normal or regressed. Correct the status of the LU, and then assign the LU to the P-VOL.	–
090007	DMED090007: The process cannot be performed because no logical unit exists in the data pool by the side of the controller of specified P-VOL. Add the logical unit to the data pool and try again.	Set the Snapshot image again after changing the Controller that controls the LU assigned to the P-VOL.	–
090008	DMED090008: The process cannot be performed because the RAID level or HDU combination of the specified logical unit differs from the logical unit is not supported. Confirm the RAID level and the HDU combination currently supported and try again.	Check the RAID level of the LU assigned to a P-Vol and specify an LU whose RAID level is other than RAID 0.	–
090009	DMED090009: The process cannot be performed because the number of created Snapshot Image for the specified P-VOL has reached its maximum. Delete unnecessary Snapshot Image and try again.	Check the structure of the Snapshot images, eliminate unnecessary ones of Snapshot images, and then retry.	–
09000A	DMED09000A: The logical unit number has already been defined. Specify a new number.	The specified LUN already exists. Check the LU structure, and set the Snapshot image.	–
09000B	DMED09000B: The process cannot be performed because the specified P-VOL is a unified LU. Separate the unified LU and try again.	Dissolve the unification of the LU assigned to the P-VOL, and then set the Snapshot image.	–
09000C	DMED09000C: The process cannot be performed because the specified P-VOL is a part of ShadowImage pair. Cancel the ShadowImage pair and try again.	Split the LU assigned to the P-VOL from the ShadowImage in-system replication pair, and then set the Snapshot image.	–
09000E	DMED09000E: The process cannot be performed because the specified P-VOL is a part of Snapshot pair. Cancel the Copy-on-write Snapshot pair and try again.	Split the LU assigned to the P-VOL from the Snapshot pair, and then set the Snapshot image.	–
09000F	DMED09000F: The process cannot be performed because the specified P-VOL is a command device. Cancel the command device and try again.	Release the LU assigned to the P-VOL from the command device, and then set the Snapshot image.	–
090010	DMED090010: The process cannot be performed because the specified P-VOL is invalid. Restore the LU and try again.	Set the Snapshot image after restoring the LU assigned to the P-VOL.	–
090011	DMED090011: The process cannot be performed because the specified P-VOL has already been added to a data pool. Specify another LU number and try again.	Check the LU structure and specify an LU that has not been assigned to the data pool as the P-VOL.	–
090012	DMED090012: The process cannot be performed because the specified P-VOL is not enough for sufficient cache capacity. Check cache capacity and try again.	A size of the LU assigned to the P-VOL is too large. Check the LU structure and specify an LU whose size is appropriate and enables the LU to be assigned to the P-VOL.	–
090018	DMED090018: The process cannot be performed because the specified Snapshot image has been creating the pair. Cancel the SnapShot pair and try again.	Split the pair of the specified Snapshot image, and then perform the elimination again.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
090019	DMED090019: The process cannot be performed because P-VOL is under deletion. Wait for a while and then try again.	Eliminate the Snapshot image again after waiting for a while.	–
09001B	DMED09001B: The process cannot be performed because the number of Snapshot pair reached the maximum. Delete unnecessary Snapshot pair(s) and try again.	Check the number of pairs (number of P-Vols), dissolve unnecessary pairs, and set the Snapshot image again.	–
09001C	DMED09001C: The process cannot be performed because the unified LU is composed of 17 or more sub logical units. Specify another logical unit and try again.	Specify a unified LU number of whose sub-LUs is 16 or less.	–
09001D	DMED09001D: The process cannot be performed because the unified LU contains a sub logical unit whose size is under 1GB.	Specify a unified LU consisting of main and sub-LUs whose respective size is 1 Gbyte or larger.	–
09001E	DMED09001E: The process cannot be performed because a management area of Snapshot is shortage. Delete unnecessary Snapshot pair(s) and try again.	Delete V-VOL after performing pairsplit-S when VOL, which is using the differential bit map, is a Copy-on-write SnapShot pair. Perform pairsplit-S when VOL, which is using the differential bit map, is ShadowImage in-system replication, TrueCopy remote replication or TrueCopy Extended Distance.	–
090020	DMED090020: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Release the Turbo LU of the LU specified for the P-VOL, and execute it again.	–
090021	DMED090021: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Release the Turbo LU of the LU specified for the P-VOL, and execute it again.	–
090022	DMED090022: The process cannot be performed because the specified Snapshot image is a part of TrueCopy pair. Cancel the TrueCopy pair and try again.	Execute it again after canceling the TrueCopy remote replication or TrueCopy Extended Distance pair.	–
090024	DMED090024: The process cannot be performed because the P-VOL of specified Snapshot image is reserved for cache partition modification. Please retry after cache partition modification is completed.	Retry after settling the cache partition change (rebooting the subsystem).	–
0A0001	DMED0A0001: The process cannot be performed because the specified LU is invalid. Restore the LU and try again.	Specify a correct (valid) LU.	–
0A0002	DMED0A0002: The process cannot be performed because the specified LU is a Sub LU of the unifying LUs. Separate the unified LU and try again.	Specify a correct (valid) LU.	–
0A0003	DMED0A0003: The process cannot be performed because the specified LU is S-VOL of ShadowImage. Specify another logical unit and try again.	Specify a correct (valid) LU.	–
0A0004	DMED0A0004: The process cannot be performed because the specified LU is S-VOL of TrueCopy. Specify another logical unit and try again.	Specify a correct (valid) LU.	–
0A0005	DMED0A0005: The process cannot be performed because the specified LU is Snapshot image. Specify another logical unit and try again.	Specify a correct (valid) LU.	–
0A0006	DMED0A0006: The process cannot be performed in the retention term. The retention term expires and try again.	Make the setting of the access level again after canceling the setting of the retention period.	–
0A0007	DMED0A0007: The process cannot be performed because ShadowImage is in progress. Please wait a moment and then try again.	Make the setting of the access level again after the reverse resynchronization is completed.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
0A0008	DMED0A0008: The process cannot be performed because Snapshot is in progress. Please wait a moment and then try again.	Make the setting of the access level again after the restore is completed.	–
0A0009	DMED0A0009 : The retention term cannot be shortened. Specify the retention term is equal to or more than current value and try again.	Make the setting of the access level again after specifying the correct retention period.	–
0A000A	DMED0A000A : The process cannot be performed because expiration lock is enabled. Set expiration lock to disable and try again.	Make the setting of the access level again after invalidating the Audit Lock.	–
0A000B	DMED0A000B: The process cannot be performed because the status of ShadowImage pair is not SMPL or PSUS. Please retry after changing the status of pair.	Specify the correct (enable) LU.	–
0A000C	DMED0A000C: The process cannot be performed because the status of TrueCopy pair is not SMPL or PSUS. Please retry after changing the status of pair.	Specify the correct (enable) LU.	–
0A000D	DMED0A000D: The process cannot be performed because the status of Snapshot pair is not PSUS. Please retry after changing the status of pair.	Specify the correct (enable) LU.	–
0B0001	DMED0B0001: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Make the Command device registration again after changing the access level to the normal mode.	–
0C0001	DMED0C0001: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Make the integration of LU again after changing the access level to the normal mode.	–
0C0002	DMED0C0002: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Make the separation of LU again after changing the access level to the normal mode.	–
0C0003	DMED0C0003: The unification cannot be performed because the drive type is different. Please confirm the drive type and try again.	Specify the LU on the drive of the same type and execute it again.	–
0C0005	DMED0C0005: The process cannot be performed because the unified LU reached the maximum.	The number of unified LUs cannot be more the 128.	–
0C0006	DMED0C0006: The unification cannot be performed because the cache partition is different. Please confirm the cache partition of the specified logical unit.	LUs that belongs to different partitions cannot be unified.	–
0C0007	DMED0C0007: The process cannot be performed because the specified logical unit is reserved for cache partition modification. Please retry after changing the cache partition, or specify another logical unit.	Perform the operation after fixing a partition to which the logical unit belongs.	–
0D0001	DMED0D0001: The process cannot be performed because the access level is set up to ReadOnly or Protect. Please change the attribute to Read/Write, and try again.	Make the setting of Priced Optional Features again after changing the access level to the normal mode.	–

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
0D0002	DMED0D0002: The process cannot be performed because the temporary key cannot be used for the next 180 days after it is locked or expired.	Retry 180 days later.	–
0D0003	DMED0D0003: The specified function has already been unlocked.	The unlocking cannot be done with the temporary key.	–
0E0001	DMED0E0001: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Retry after changing the access level to the normal mode.	–
0F0001	DMED0F0001: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Make the delete of RAID group again after changing the access level to the normal mode.	–
0F0002	DMED0F0002: The process cannot be performed because the drives of Unit0 and the latter units are contained within the range of the specified RAID group.	Execute again by specifying the drive of the same type.	–
0F0003	DMED0F0003: The process cannot be performed because the non-supported drive on this subsystem are contained within the range of the specified RAID group.	Specify the drive for the subsystem concerned.	–
0F0004	DMED0F0004: The function cannot be used because it is not installed, locked, or disabled.	Retry after opening or unlocking the key of RAID 6.	–
0F0005	DMED0F0005: The process cannot be performed because the number of drive is incorrect. Please confirm the mounted drive and try again.	Retry after specifying the RAID width as the number of installed drives.	–
0F0006	DMED0F0006: The RAID group is already defined in the specified drive. Please specify another drive and try again.	Retry after specifying a number of a drive for which a RAID group has not been defined.	–
0F0007	DMED0F0007: The number of defined RAID group reached the maximum. Delete unnecessary RAID groups and then try again.	No more RAID groups can be defined because the number of defined RAID groups has reached the maximum.	–
100001	DMED100001: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	Retry after changing the access level to the normal mode.	–
100005	DMED100005:The preparations of quick formatting are incomplete. Please retry after waiting for a while.	Retry after waiting for a while.	–
100006	DMED100006: The process cannot be performed because the specified logical unit contain an un-mounted drive or a blocked drive. Confirm the drive status and try again.	Execute the quick format after installing or normalizing the drive in the RAID Group belonging to the specified LU.	–
100007	DMED100007: Format of the logical unit cannot be performed under drive blockage mode. Please turn off the drive blockade mode system parameter.	Execute the quick format after turning off the drive blockade mode of the system parameter.	–
110001	DMED100001: The mapping mode cannot be changed because the mapping guard LU exists.	When changing the mapping mode to OFF, take all the LU mapping guards OFF.	–
110002	DMED100002: The mapping information cannot be changed because the mapping guard LU exists.	Change the LU mapping after the LU mapping guard is taken OFF.	–
120001	DMED120001: The specified drive cannot be defined as a spare drive because it is not supported on this subsystem.	Specify the drive for the subsystem concerned.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
130001	DMED130001: The process cannot be performed because the path is not set up.	Set the time-out value after the path is defined.	–
130002	DMED130002: The process cannot be performed because the specified port is iSCSI port. Please confirm the port type and try again.	Specify the FC port.	–
130004	DMED130004: The process cannot be performed because the specified Timeout Period is outside the effective range. Please confirm the Timeout Period and try again.	Check the other's serial number of the subsystem and set a time-out value within the support range.	–
140001	MED140001: The process cannot be performed because the term of the temporary key or emergency key is expired.	Unlock with the permanent key.	–
140002	DMED140002: The process cannot be performed because the DM-LU has already been set. Please cancel the DM-LU and try again.	Retry after specifying an LU other than the DM-LU.	–
150001	DMED150001: The process cannot be performed because the cache partition is not initial status. Please change the cache partition to initial status and try again.	Retry after returning the partition into the initial status.	–
150004	DMED150004: The process cannot be performed because the cache partition is less than minimum size. Please confirm the cache partition size and try again.	Change the partition size to an appropriate one.	–
150005	MED150005: The process cannot be performed because the PIN is exceeded state. Please restore PIN data and try again.	Retry after eliminating a pinned segment of the specified LU referring to Troubleshooting "6.1.11 A failure occurred during operation : Case 1 (PIN over)".	Troubleshooting "6.1.11 A failure occurred during operation : Case 1 (PIN over)" (TRBL 06-0550)
150006	DMED150006: The segment size of cache partition (0 or 1) cannot be changed.	A segment size of the master partition cannot be changed.	–
150007	DMED150007: The process cannot be performed because ShadowImage is in use. Please cancel the ShadowImage pair and try again.	Retry after dissolving the pair.	–
150009	DMED150009: The process cannot be performed because SnapShot is in use. Please cancel the SnapShot pair and try again.	Retry after dissolving the pair.	–
15000B	DMED15000B: The process cannot be performed because process of Write command from the hosts is not completed. Please wait for a while and then try again, or delete the logical unit.	Retry after eliminating the unwritten LU(s).	–
15000C	DMED15000C: The function cannot be executed because a Cache Residency LU or a reserved one exists. Disable the LU, and then try again.	Cancel the specification of the LU residence.	–
15000D	DMED15000D: The specified segment size is incorrect. Please confirm the segment size and try again.	Check the specified segment size.	–
15000E	DMED15000E: The process cannot be performed because the LU change is in progress. Please wait a moment and try again.	Retry after the change of the LU unit is completed.	–
15000F	DMED15000F: The specified cache partition number is incorrect. Please confirm the cache partition number and try again.	Specify Dir 0 for the partition #0 and Dir 1 for the partition #1.	–
150010	DMED150010: The controller of current cache partition cannot be changed. Please delete the cache partition, and set up again.	Define the LU again after eliminating it.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
150011	DMED150011: The process cannot be performed because the total size of cache partition is over the cache capacity. Please confirm the cache partition size and try again.	Change the partition size to an appropriate one.	–
150012	DMED150012: The cache partition with which the logical unit is set up, or the cache partition of 0 or 1 cannot be deleted. Please confirm the cache partition number.	Change the partition size to an appropriate one.	–
150013	DMED150013: The process cannot be performed because the specified cache partition is not defined. Please specify a defined cache partition and try again.	Specify a partition that exists.	–
150014	DMED150014: The process cannot be performed because the stripe size of logical unit is not 64KB. Please delete the logical unit and try again.	Execute it again after deleting the LU concerned.	–
150015	DMED150015: The process cannot be performed because the specified logical unit is a part of pair(TCE). Please cancel the pair(TCE) and try again.	Retry after dissolving the pair.	–
160002	DMED160002: The process cannot be performed because the specified logical unit is a Sub LU of the unifying LUs. Please separate the unified LU and try again.	A partition to which a sub-LU of a unified LU belongs cannot be changed.	–
160011	DMED160011: The logical unit cannot be allocated the specified cache partition. Please specify another cache partition number and try again.	Check a number of the specified partition. A capacity of the partition is smaller than that of the LU.	–
160012	DMED160012: The process cannot be performed because the Cache Partition Manager is not installed, locked, or disabled.	Execute it again after unlocking the PP.	–
160014	DMED160014: The process cannot be performed because the specified cache partition is not defined. Please confirm the cache partition and try again.	Specify the enable partition.	–
160015	DMED160015: The process cannot be performed because Cache Partition Manager is not installed, locked, or disabled. Please install Cache Partition Manager and try again.	Execute it again after unlocking the PP.	–
160016	DMED160016: The process cannot be performed because the specified cache partition is not defined. Please confirm the cache partition and try again.	Specify the enable partition.	–
160017	DMED160017: The process cannot be performed because the specified cache partition is set to the different controller. Please confirm the cache partition and try again.	Match the directory number.	–
160018	DMED160018: The process cannot be performed because the combination of stripe size and segment size does not match. Please confirm the stripe size or the cache partition, and try again.	Change it to the partition to which the stripe size or the segment size adapts.	–
160019	DMED160019: The process cannot be performed because the specified cache partition size is insufficient. Please confirm the cache partition and try again.	Change it to the partition whose partition size is sufficient.	–
16001E	DMED16001E: The process cannot be performed because the pair cache partition and the cache partition are set to the same controller. Please confirm the cache partition and try again.	Change the directory number.	–
16001F	DMED16001F: The process cannot be performed because the segment size does not match. Please confirm the segment size of cache partition and try again.	Change it to the partition whose segment size is equal.	–

Copyright © 2005, 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
160020	DMED160020: The process cannot be performed because the specified cache partition size is insufficient. Please confirm the cache partition and try again.	Change it to the partition whose partition size is sufficient.	–
160021	DMED160021: The process cannot be performed because the LU change is in progress. Please wait for a while and then try again.	Execute it again after completing the LU unit switching.	–
160022	DMED160022: The process cannot be performed because PIN data exists. Please restore PIN data and try again.	Execute it again after deleting the PIN segment of the specified LU referring to "Troubleshooting Chapter 6 Details of Recovery Methods".	Troubleshooting "Chapter 6. Details of Recovery Methods" (TRBL 06-0000)
170001	DMED170001: The process cannot be performed because the specified logical unit is capacity less than 5GB. Specify the logical unit is equal to or more than 5GB and try again.	Specify an LU whose capacity is 5 Gbytes or larger.	–
170002	DMED170002: The process cannot be performed because the specified logical unit is RAID level 0. Specify another logical unit and try again.	Retry after specifying an LU whose RAID level is other than RAID 0.	–
170003	DMED170003: The process cannot be performed because the specified logical unit is neither in normal nor in regressed state. Specify the logical unit of normal or regressed state and try again.	Set the specified LU as an object of the differential control after relieving it of command device.	–
170004	DMED170004: The process cannot be performed because the specified logical unit is a unified LU. Separate the unified LU and try again.	Specify an LU other than a unified LU.	–
170005	DMED170005: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Specify an LU other than a Turbo LU (reserved Turbo LU).	–
170006	DMED170006: The process cannot be performed because the specified logical unit is a command device. Cancel the command device and try again.	Specify an LU that is not a command device.	–
180001	DMED180001: The specified logical unit cannot be set as Cache Residency LU because its cache partition is not 0 or 1. Please try again after changing a cache partition into 0 or 1, or specify the logical unit of the cache partition 0 or 1.	Retry after specifying an LU that belongs to the master partition or changing the specified LU to the master partition.	–
190001	DMED190001: The specified IP address is incorrect. Please specify a correct IP address.	Specify a correct IP address.	–
190002	DMED190002: The same IP address as the management LAN cannot be set up. Please specify a correct IP address.	Specify a correct IP address.	–
190003	DMED190003: The process cannot be performed because NNC or subsystem is in progress. Please wait a moment and then try again.	Make the setting again after waiting for a while.	–
190004	DMED190004: The same IP address as the maintenance LAN cannot be set up. Please specify a correct IP address.	Specify a correct IP address.	–
190005	DMED190005: The process cannot be performed because the controller is detached. Please recover the controller status and then try again.	Execute the process again after restoring the Control Unit of the other system.	–
190006	DMED190006: The process cannot be performed because NNC or subsystem is in progress. Please wait a moment and then try again.	Make the setting again after waiting for a while.	–
190007	DMED190007: The process cannot be performed because subsystem is in progress. Please wait a moment and then try again.	Make the setting again after waiting for a while.	–

190008	DMED190008: The same IP address as the NNC LAN cannot be set up. Please specify a correct IP address.	Specify a correct IP address.	–
190011	DMED190011: The process cannot be performed because the maintenance LAN automatic change mode is enabled. Please set this mode to disable and try again.	Turn off the "Maintenance Port IP Address Automatic Change Mode", and execute it again.	System Parameter "4.2 Setting the subsystem configuration information (3) Setting of LAN" (SYPR 04-0090)
1A0001	DMED1A0001: The process cannot be performed because NNC is not connected. Please connect NNC and try again.	Check the Interface Board.	–
1A0002	DMED1A0002: The specified logical unit is not defined. Please specify a defined logical unit.	Specify an LU that has been defined.	–
1A0003	DMED1A0003: The process cannot be performed because the specified logical unit is less than minimum size of System LU. Please confirm the logical unit size and try again.	Specify an LU whose size is larger than the minimum indispensable size to the system LU.	–
1A0004	DMED1A0004: The process cannot be performed because the specified logical unit is already assigned. Please specify a logical unit that is not assigned and try again.	Specify an LU that has not been mapped.	–
1A0005	DMED1A0005: The process cannot be performed because the specified logical unit is S-VOL of ShadowImage. Please specify another logical unit and try again.	Specify an LU other than the S-VOL of the ShadowImage in-system replication.	–
1A0006	DMED1A0006: The process cannot be performed because the specified logical unit is S-VOL of TrueCopy. Please specify another logical unit and try again.	Specify an LU other than the S-VOL of the TrueCopy remote replication or TrueCopy Extended Distance.	–
1A0007	DMED1A0007: The process cannot be performed because the specified logical unit is defined as a Snapshot image. Please specify another logical unit and try again.	Specify an LU other than the V-VOL of the Copy-on-write SnapShot.	–
1A0008	DMED1A0008: The process cannot be performed because the specified logical unit is added to a data pool. Please specify another logical unit and try again.	Specify an LU other than the POOL of the Copy-on-write SnapShot.	–
1A0009	DMED1A0009: The process cannot be performed because the specified logical unit is a Sub LU of the unifying LUs. Please specify another logical unit and try again.	Specify an LU other than the sub-LU of a unified LU.	–
1A000A	DMED1A000A: The process cannot be performed because the specified logical unit is the mapping guard LU. Please specify another logical unit and try again.	Specify an LU that is not guarded from the mapping.	–
1A000B	DMED1A000B: The process cannot be performed because the specified logical unit is a command device. Please specify another logical unit and try again.	Specify an LU other than the command device.	–
1A000C	DMED1A000C: The specified logical unit is not defined as a command device. Please specify a logical unit that is already defined to a command device.	For the system LU, HLU5, specify an LU other than the command device.	–
1A000D	DMED1A000D: The process cannot be performed because NAS OS is in progress. Please confirm NAS OS status and then try again.	Check the status of the NAS OS.	–
1A000E	DMED1A000E: The process cannot be performed because the specified logical unit is DM-LU. Please specify another logical unit and try again.	Specify an LU other than the DM-LU.	–

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
1A000F	DMED1A000F: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write, and set S-VOL mode to enable. When the mode is set up, please reset the mode using RAID Manager. And try again.	For the system LU, specify an LU whose access level is the normal mode.	–
1A0010	DMED1A0010: The process cannot be performed because all ports are used for NAS. Please confirm the port type.	Check the Interface Board.	–
1A0020	DMED1A0020: The process cannot be performed because System LU exists.	Specify an LU other than the system LU.	–
1A0021	DMED1A0021: The process cannot be performed because User LU exists.	Specify an LU other than the user LU.	–
1A0022	DMED1A0022: The process cannot be performed because the specified logical unit is System LU. Please release System LU and try again.	Perform an LU unification/dissolution after removing the LU from being the system LU.	–
1A0023	DMED1A0023: The process cannot be performed because the specified logical unit is User LU. Please specify another logical unit and try again.	Specify an LU other than the user LU for the sub-LU.	–
1A0024	DMED1A0024: The process cannot be performed because NAS OS is in progress. Please confirm NAS OS status and then try again.	Check the status of the NAS OS.	–
1A0025	DMED1A0025: The process cannot be performed because NAS OS is in progress. Please confirm NAS OS status and then try again.	Check the status of the NAS OS.	–
1A0026	DMED1A0026: The specified port is used for NAS. Please specify another port.	Specify an LU other than the NAS Port.	–
1A0027	DMED1A0027: The unification cannot be performed because the stripe size does not match. Please confirm the stripe size of logical unit and try again.	Specify the LU of the same stripe size.	–
1A0028	DMED1A0028: The process cannot be performed because the specified logical unit is P-VOL or V-VOL of SnapShot. Please specify another logical unit and try again.	Specify the LU other than the P-VOL or the V-VOL of the Copy-on-write SnapShot.	–
1A0029	DMED1A0029: The process cannot be performed because the access level is set up. Please change the attribute to Read/Write. When the mode is set up, please reset the mode using RAID Manager. And try again.	Specify the LU of the normal mode and S-VOL Disable of the access level for the user LU.	–
1A002A	DMED1A002A: The process cannot be performed because the specified logical unit is being used as ShadowImage pair with more than 2 S-VOL. Please delete S-VOL and make the pair into one-to-one relation, or cancel the pair, and then try again.	Execute it again after setting the number of mirrors of the S-VOL to 1.	–
1A0030	DMED1A0030: The Command Device(secondary) cannot set to the NNCtype1.	Check the types of the NAS heads.	–
1A0031	DMED1A0031: The Working Area for Dump cannot set to this NNCtype2.	Check the types of the NAS heads.	–
1A0032	DMED1A0032: The process cannot be performed because the Command Device is not set by system LU. Please set the Command Device and try again.	Check the setting status of the NAS Command Device, and then set the NAS Command Device (secondary).	–
1A0033	DMED1A0033: The process cannot be performed because the Command Device(secondary) is set by system LU. Please release the Command Device(secondary) and try again.	Release it from the NAS Command Device (secondary).	–

1F002D	DMED1F002D: The specified password does not match. Please confirm the password.	Check the password before the change.	–
1F002E	DMED1F002E: The account reached the maximum. Please delete unnecessary account and try again.	Check the account information.	–
1F002F	DMED1F002F: The specified password length is less than minimum. Please confirm the password length.	Check the number of characters of the set password.	–
1F0030	DMED1F0030: Password Protection and Account Authentication cannot be used together.	The option which cannot be effective at the same time with the specified option is already effective. Execute it again after locking or invalidating.	–
1F0031	DMED1F0031: Account Authentication cannot be installed or be enabled, because NNC is equipped. Please change the subsystem into Fibre or iSCSI configuration, and try again.	Execute it again after making the subsystem the FC or iSCSI configuration.	–
1F0040	The process cannot be performed because the term of the temporary key or emergency key is expired.	Check the pair status.	–
1F0041	The process cannot be performed because the ShadowImage pair is contained.	Check the pair status.	–
1F0042	The process cannot be performed because the TrueCopy pair is contained.	Check the pair status.	–
1F0043	The process cannot be performed because the TrueCopy Extended Distance pair is contained.	Check the pair status.	–
1F0044	The process cannot be performed because the SnapShot pair is contained.	Check the pair status.	–
1F0045	The process cannot be performed because the Volume Migration pair is contained.	Check the pair status.	–
1F0048	The process cannot be performed because formatting is now occurring. Please try again after it is completed.	Execute it again after completing the quick format.	–
1F0049	The process cannot be performed because parity correction is not completed. Please try again after it is completed.	Execute it again after the parity correction.	–
1F004A	The process cannot be performed because the data pool is contained. Please delete the data pool and try again.	Release the pool LU and execute it again.	–
1F004B	The process cannot be performed because the DM-LU is contained. Please cancel the DM-LU and try again.	Release the DM-LU and execute it again.	–
1F004C	The process cannot be performed because the command device is contained. Please cancel the command device and try again.	Release the command device LU and execute it again.	–
1F004D	The process cannot be performed because the system LU is contained. Please cancel the system LU and try again.	Release the NAS system LU and execute it again.	–
1F004E	The process cannot be performed because the LU change is in progress. Please try again after it is completed.	Execute it again after completing the LU unit switching.	–
1F0051	The process cannot be performed because the system drives is contained.	Check the specified RAID Group.	–
1F0052	The process cannot be performed because the write uncompleted LU is contained. Please recover and then try again.	Execute it again after the recovery according to the maintenance procedure of the incomplete write.	Troubleshooting “6.1.15 A failure occurred during operation : Case 5 (Incomplete writing)” (TRBL 06-1110)

1F0053	The process cannot be performed because the RAID groups in state of Power Saving are existing. Please spin up the RAID groups and try again.	Make it in the normal status and execute it again.	–
1F0054	The process cannot be performed because the RAID groups in state of Power Saving are existing. Please spin up the RAID groups and try again.	Make it in the normal status and execute it again.	–
1F0055	The process cannot be performed because the RAID groups in state of Power Saving are existing. Please spin up the RAID groups and try again.	Make it in the normal status and execute it again.	–
1F0056	The process cannot be performed because the RAID groups in state of Power Saving are existing. Please wait for a while and try again.	Execute it again after it becomes the normal status.	–
1F0057	The specified RAID group is not defined. Please specify a defined RAID group.	Check the specified RAID Group.	–
1F0058	The process cannot be performed because the drive recovery is in progress. Please try again after it is completed.	Make it in the normal status and execute it again.	–
1F0059	The process cannot be performed because the health checking is in progress. Please try again after it is completed.	Make it in the normal status and execute it again.	–
1F005A	The process cannot be performed because the user LU is contained. Please cancel the user LU and try again.	Release the NAS user LU and execute it again.	–
1F005B	The process cannot be performed because the SES drives is contained.	Check the specified RAID Group.	–
200002	DMED200002: This function is unsupported in the single-controller system	Review the system configuration.	–
200003	DMED200003: SnapShot cannot be installed because Cache Partition Manager is enabled. Please change Cache Partition Manager to de-installed or disabled and try again.	Execute it again after locking or invalidating the key of the Cache partition.	Addition/Subtraction/ Relocation “1.4.4 Adding a Cache Unit” (ADD 01-0380)
200004	DMED200004: Cache Partition Manager cannot be installed because the subsystem is not restarted(*1) after SnapShot is installed. Please restart the subsystem, and then try again.	Retry after executing a reboot.	–
200005	DMED200005: The option cannot be installed or enabled because cache memory size is 512MB or less. Please increase the cache memory and then try again.	Make the Cache capacity more than 512 M bytes.	Addition/Subtraction/ Relocation “1.4.4 Adding a Cache Unit” (ADD 01-0380)
200011	DMED200011: The process cannot be performed because the specified logical unit is not the reserve LU. Please specify the reserve LU and try again.	Specify the reserved LU.	–
200012	DMED200012: The process cannot be performed because the specified logical unit is the reserve LU. Please delete the reserve LU or specify another logical unit and try again.	Specify the normal LU.	–
200013	DMED200013: The process cannot be performed because the capacity is different between the specified P-VOL and S-VOL. Please specify the logical unit of the same capacity and try again.	Specify the P-VOL and the S-VOL of the same size.	–

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
200014	DMED200014: The process cannot be performed because the owner controller is different between the specified P-VOL and S-VOL. Please specify the logical unit of the same owner controller and try again.	Specify the P-VOL and the S-VOL of the same owner DIR.	–
200015	DMED200015: The process cannot be performed the specified P-VOL and S-VOL have same logical unit number. Please specify the different logical unit number.	Specify different LUs for the P-VOL and the S-VOL.	–
200016	DMED200016: The process cannot be performed because the Volume Migration pair reached the maximum. Please cancel or split the unnecessary Volume Migration pair and try again.	Execute it again after releasing the unnecessary Volume Migration or the SI pair.	–
200017	DMED200017: The process cannot be performed because the specified P-VOL and S-VOL belong to the same RAID group. Please specify the logical units of different RAID group.	Specify the P-VOL and the S-VOL which belong to different RAID Groups.	–
200018	DMED200018: The specified pair cannot be canceled because the pair status is not waiting or copying.	Execute the Volume Migration suspension instruction while the pair status is waiting or migrating.	–
200019	DMED200019: The specified pair cannot be split because the pair status is not completed or error.	Execute the Volume Migration pair release instruction while the pair status is completed or failed.	–
20001A	DMED20001A: The process cannot be performed because the specified P-VOL and S-VOL are not in pairs. Please specify the P-VOL and S-VOL in pairs and try again.	Specify the P-VOL and the S-VOL which create the same pair.	–
20001B	DMED20001B: The process cannot be performed because the reserve LU reached the maximum. Please delete the unnecessary reserve LU and try again.	Execute it again after deleting the reserved LU.	–
20001C	DMED20001C: The process cannot be performed because the specified logical unit is the S-VOL of the Volume Migration pair. Please specify another logical unit and try again.	Specify the LU other than the S-VOL.	–
20001D	DMED20001D: The process cannot be performed because the specified logical unit is not the reserve LU. Please specify the reserve LU and try again.	Specify the reserved LU.	–
20001E	DMED20001E: The process cannot be performed because the P-VOL or S-VOL of the Volume Migration pair is contained. Please split the pair and try again.	Specify the LU which is not creating the Volume Migration pair (P-VOL/S-VOL).	–
20001F	DMED20001F: The process cannot be performed because the reserve LU is contained. Please delete the reserve LU and try again.	Specify the LU other than the reserved LU.	–
200020	DMED200020: The process cannot be performed because the P-VOL or S-VOL of the Volume Migration pair or the reserve LU is contained. Please split the pair or delete the reserve LU and try again.	Release the Volume Migration pair or the reserved LU.	–
200021	DMED200021: The process cannot be performed because the owner ID is different. Please cancel the pair using the application that created the pair.	Check the owner ID and execute it again from the owner ID concerned.	–
200022	DMED200022: The process cannot be performed because the owner ID is different. Please split the pair using the application that created the pair.	Check SNM or the owner ID and execute it again from the owner ID concerned.	–
200023	DMED200023: The process cannot be performed because the specified owner ID is not supported.	Execute it again from SNM or HiCommand.	–

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
200024	DMED200024: The process cannot be performed because the reserve LU exists. Please delete the reserve LU and try again.	Execute it again after deleting the LU in the reserved status.	–
200025	DMED200025: The process cannot be performed because the Volume Migration pair exists. Please cancel or split the pair and try again.	Execute it again after releasing the LU in the pair status.	–
200026	DMED200026: The process cannot be performed because the specified logical unit is reserved for cache partition modification. Please restart the subsystem and then try again(*1).	Execute it again after determining (restarting) the Cache partition change.	–
200027	DMED200027: The process cannot be performed because a management area is shortage. Please delete the unnecessary pair(s) and try again.	When the VOL using the differential bit map is the SnapShot pair, delete the V-VOL after performing pairsplit –S. When the VOL using the differential bit map is ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Volume Migration, perform the pair release from RAID Manager using pairsplit –S or from SNM.	–
200028	DMED200028: The process cannot be performed because the specified logical unit is not the Volume Migration pair. Please specify another logical unit and try again.	Specify the Volume Migration pair and execute it again.	–
200029	DMED200029: The process cannot be performed because the specified logical unit is Volume Migration pair and is copying. Please retry after copy is completed.	Execute it again after completing the copy of Volume Migration.	–
20002A	DMED20002A: The copy pace of specified pair cannot be changed because the pair status is not waiting or copying.	Execute it while the pair status of the Volume Migration pair is waiting or migrating.	–
20002B	DMED20002B: The process cannot be performed because the specified owner ID is not supported.	The copy priority change instruction of the Volume Migration pair is only supported by SNM. Execute the change of the copy priority from SNM.	–
20002C	DMED20002C: The process cannot be performed because the specified logical unit is not the P-VOL or S-VOL of the Volume Migration pair. Please specify the P-VOL or S-VOL of the Volume Migration pair and try again.	Specify the P-VOL or S-VOL of the Volume Migration pair and execute it again.	–
300001	DMED300001: The serial number or equipment ID cannot be changed because the path and pair information does not exist.	Serial number or device ID changes are not required.	–
300002	DMED300002: The serial number or equipment ID cannot be changed because the path and pair information does not exist.	Serial number or device ID changes are not required.	–
300005	DMED300005: The specified serial number or equipment ID is incorrect. Please specify it in 0-9.	Specify the range between zero and nine.	–
300006	DMED300006: The specified serial number is incorrect. Please specify a right serial number.	Specify the serial number for the other system.	–
300007	DMED300007: The specified serial number is incorrect. Please specify a right serial number.	Specify the serial number for the other system.	–

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
300008	DMED300008: 0 is specified as 6 figures of low order of the serial number. Please specify a right serial number.	Specify the serial number for the other system.	–
300009	DMED300009: The same serial number as a self subsystem is specified. Please specify the serial number of connected subsystem.	Specify the serial number for the other system.	–
30000A	DMED30000A: The same equipment ID as a self subsystem is specified. Please specify the equipment ID of connected subsystem.	Specify the equipment ID for the other system.	–
30000B	DMED30000B: The process cannot be performed because the fibre channel port is not equipped. Please confirm the port type and try again.	Check the subsystem environment.	–
3B0011	DMED3B0011: The micro program cannot be downgraded because the interface board of iSCSI is equipped. Please change the interface boards to fibre channel and try again.	Execute it again after changing the Interface Board to the FC Interface Board.	–
3B0012	DMED3B0012: The micro program cannot be downgraded because the segment size of 64KB or more is set up. Please confirm the cache partition and try again.	Execute it again after checking the configuration of the Cache partition.	–
3B0013	DMED3B0013: The micro program cannot be downgraded because the stripe size other than 64KB is set up. Please confirm the stripe size of logical unit and try again.	Execute it again after checking the configuration of the stripe size.	–
3B0014	DMED3B0014: The micro program cannot be downgraded because TrueCopy Extended Distance is installed. Please change TrueCopy Extended Distance to de-installed and try again.	Execute it again in the status that the TrueCopy Extended Distance function is not used.	–
3B0015	DMED3B0015: The micro program cannot be downgraded because the subsystem is not restarted after the option using data pool is unlocked or enabled. Please restart the subsystem and then try again.	Execute the downgrade again after restarting(*1) the subsystem.	–
3B0016	DMED3B0016: The micro program cannot be downgraded because the target(s) or CHAP user(s) is not initialized. Please initialize the target(s) and CHAP user(s) and try again.	Execute it again after outputting the port configuration information and initializing all the iSCSI targets and the CHAP users referring to the manual.	–
3B0018	DMED3B0018: The micro program cannot be downgraded because the pair with MU number other than 0 exists in S-VOL of ShadowImage. Please cancel the pair with MU number other than 0 and try again.	Execute it again after releasing the pairs whose MU number of the S-VOL of ShadowImage in-system replication is other than 0.	–
3B0019	DMED3B0019: The micro program cannot be downgraded because the pair with MU number of 14 or more exists in Snapshot image. Please cancel the pair with MU number of 14 or more and try again.	Execute it again after releasing the pairs whose MU number of the V-VOL of Copy-on-write SnapShot is 14 or more.	–
3B001A	DMED3B001A: The micro program cannot be downgraded because P-VOL with 15 or more Snapshot image exists. Please delete Snapshot image to 14 or less, and try again.	Execute it again after deleting the V-VOL so that the V-VOLs for one P-VOL of Copy-on-write SnapShot are within 14.	–
3B001B	DMED3B001B: The micro program cannot be downgraded because the user LU is being used as the pair of TrueCopy or TrueCopy Extended Distance. Please cancel the pair and try again.	Execute it again after releasing the NAS user LU pairs of the pairs of TrueCopy remote replication or TrueCopy Extended Distance.	–

*1 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
3B001C	DMED3B001C: The micro program cannot be downgraded because the migrated logical unit exists. Please migrate again.	Make the different intermediate LU number and the internal LU number to the same value by executing Volume Migration again.	–
3B001D	DMED3B001D: The micro program cannot be downgraded because Volume Migration is installed. Please de-install the option and try again.	Lock the priced option of Volume Migration.	–
3B001E	DMED3B001E: The micro program cannot be downgraded because TrueCopy is unlocked. Please lock the option and try again.	Lock the priced option of TrueCopy remote replication.	–
3B001F	DMED3B001F: The micro program cannot be downgraded because Account Authentication is installed. Please de-install the option and try again.	Lock the account authentication priced option.	–
3B0020	DMED3B0020: The micro program cannot be downgraded because Power Saving is installed. Please de-install the option and try again.	Lock the priced option of the Power Saving function.	–
400001	DMED400001: The process cannot be performed because the specified logical units contain an unformatted LU. Confirm the logical unit status and try again.	None (No forced parity correction is required.)	–
400002	DMED400002: The process cannot be performed because the specified logical units contain V-VOL of Snapshot. Confirm the logical unit status and try again.	Retry it specifying a POOL LU.	–
400003	DMED400003: The process cannot be performed because some logical units are under quick formatting. Confirm the logical unit status and try again.	None (No forced parity correction is required.)	–
400004	DMED400004: The process cannot be performed because the specified logical units contain a Sub LU of the unifying LUs. Confirm the logical unit status and try again.	Instruct again to make a parity correction specifying a parent LU of a unified LU.	–
400006	DMED400006: The specified LUs contain regressed LU. Confirm the LU status and try again.	Issue an instruction to make the parity correction after the drive is recovered.	–
400007	DMED400007: The process cannot be performed because ShadowImage, TrueCopy, or Snapshot is in progress. Please wait a moment and then try again.	Instruct again to make a parity correction after forming and resynchronizing a pair.	–
400008	DMED400008: The operation of 'start' or 'skip', and 'cancel' is specified at the same time. Confirm the operation and try again.	Give instructions to restore, skip, and abort separately.	–
400009	DMED400009: The process cannot be performed because the specified logical units contain an undefined LU. Confirm the logical unit status and try again.	Retry it specifying a correct LU.	–
400011	DMED400011: The process cannot be performed because parity correction is not completed. Please try again, after it is completed.	As to an LU for which the parity correction is being made or standing by, instruct to wait for the completion of the restoration or abort the restoration. As to an LU the restoration for which by means of parity is undone or undone 2, instruct to skip the restoration or make the parity correction and wait for completion of the restoration. Retry after performing the operation above.	–
400012	DMED400012: The process cannot be performed because parity correction is not executed or is aborted. Please try again, after it is completed.	Instruct to skip the restoration or make the parity correction and wait for completion of the restoration.	–

Copyright © 2006, Hitachi, Ltd.

Detail code	Storage Navigator Modular indication	Recovery methods	Reference page
400013	DMED400013: The process cannot be performed because parity correction is not completed. Please try again, after it is completed.	Issue an instruction to make or skip the parity correction and wait for completion of the restoration. Retry after performing the operation above.	–
400014	DMED400014: The process cannot be performed because parity correction is not completed. Please try again, after it is completed.	Issue an instruction to make or skip the parity correction and wait for completion of the restoration. Retry after performing the operation above.	–
400015	DMED400015: The process cannot be performed because parity correction is not executed or is aborted. Please try again, after it is completed.	Issue an instruction to make or skip the parity correction and wait for completion of the restoration. Retry after performing the operation above.	–
400021	DMED400021: The 'cancel' operation cannot be specified to the uncorrected logical units. Confirm the parity correction status and try again.	Instruct to make a parity correction or skip the restoration.	–
400022	DMED400022: The 'start' operation cannot be specified to the aborted logical units. Confirm the parity correction status and try again.	None (Only a skip can be instructed.)	–
400023	DMED400023: The 'cancel' operation cannot be specified to the aborted logical units. Confirm the parity correction status and try again.	None (Only a skip can be instructed.)	–
400024	DMED400024: The 'start' operation cannot be specified to the correcting logical units. Confirm the parity correction status and try again.	Instruct again to make the parity correction after an instruction to abort has been given.	–
400025	DMED400025: The 'skip' operation cannot be specified to the correcting logical units. Confirm the parity correction status and try again.	Give an instruction to abort.	–
400026	DMED400026: The 'start' operation cannot be specified to the waiting logical units. Confirm the parity correction status and try again.	Instruct again to make the parity correction after an instruction to abort has been given.	–
400027	DMED400027: The 'skip' operation cannot be specified to the waiting logical units. Confirm the parity correction status and try again.	Instruct again to make the parity correction after an instruction to abort has been given.	–
400028	DMED400028: The 'cancel' operation cannot be specified to the skipped logical units. Confirm the parity correction status and try again.	None (No instruction to abort is required.)	–
400029	DMED400029: The 'cancel' operation cannot be specified to the corrected logical units. Confirm the parity correction status and try again.	None (No instruction to abort is required.)	–
500001	DMED500001: The command device is not registered. Please register the command device and try again.	Set up the command device.	–
600001	DMED600001: The process cannot be performed because the specified LU is a Cache Residency LU or a reserved one. Disable the LU, and then try again.	Specify the correct (enable) LU.	–
700001	DMED700001: The specified logical unit is not defined. Specify a defined logical unit.	Specify the correct (enable) LU.	–
700002	DMED700002: The process cannot be performed because the status of pair is SMPL. Confirm the LU status and try again.	Specify the correct (enable) LU.	–

800002	DMED800002: A parameter error occurred. Please confirm the specified parameter.	Contact the Technical Support Center.	–
800004	DMED800004: The specified NNC number is not NAS port. Please confirm the port type.	Check if the NAS interface has been set.	–
800005	DMED800005: The process cannot be performed because BIOS is being updated. The updating is completed, then try again.	Wait until the update of the BIOS is completed.	–
800006	DMED800006: The process cannot be performed because NAS OS is not ready or booting, or it is not in shutdown process. Please confirm NAS OS status and then try again.	Wait until the NNC (NAS Unit) becomes the operation status.	–
800007	DMED: The process cannot be performed because BIOS is being updated. The updating is completed, then try again.	Wait until the update of the BIOS is completed.	–
800008	DMED800008: The process cannot be performed because the install of the NAS OS is not completed. Please try again after install is completed.	When the NAS OS is being installed, wait until the installation is completed. If it is after the installation of the NAS OS failed, reinstall it, and execute it again after the installation is completed.	–
800009	DMED800009: The process cannot be performed because the alternative NNC is not active. Please confirm NNC status and try again.	Wait until the other node will be in the ACTIVE status.	–
800011	DMED800011: The process cannot be performed because NAS OS is loading. Please stop NAS OS, then try again.	Retry after stopping the NNC (NAS Unit).	–
800013	DMED800013: The process cannot be performed because NAS OS is in shutdown process. Shutdown process is completed, then try again.	Retry after waiting for completion of the shutdown.	–
800014	DMED800014: The process cannot be performed because NAS dump is being collected. The collection is completed, then try again.	Retry after waiting for the completion of the NAS Dump collection.	–
800015	DMED800015: The process cannot be performed because System LU is not defined. Please define System LU and then try again.	Retry after defining the system LU.	–
800016	DMED800016: The time out occurred during install. Please turn off NNC breaker and turn on it, then try again.	① Turn off the AC Input Power Switch of the NNC (NAS Unit). ② Retry after turning it on again.	–
800017	DMED800017: The time out occurred during install. Please turn off NNC breaker and turn on it, then try again.	① Turn off the breaker of the NNC (NAS Unit). ② Retry after turning it on again.	–
800019	DMED800019: The process cannot be performed because NAS OS is not in stopped state. Please stop NAS OS, then try again.	Retry after stopping the NNC (NAS Unit).	–
80001A	DMED80001A: The process cannot be performed because BIOS is being updated. The updating is completed, then try again.	Wait until the update of the BIOS is completed.	–
80001B	DMED80001B: The process cannot be performed because NAS OS is detached. Please recover NAS OS status and then try again.	Retry after releasing the OS from the detachment.	–
800020	DMED800020: The specified IP address is incorrect. Please specify a correct IP address.	Specify a correct IP address.	–
800021	DMED800021: The specified number is incorrect. Please specify a correct number.	Specify the number of the time zone correctly.	–
800022	DMED800022: The specified MTU is incorrect. Please specify a correct MTU.	Specify the correct MTU.	–

Copyright © 2006, Hitachi, Ltd.

Chapter 10. ACE Tool Error Message

No.	Message	Description	Recovery methods
101	Saved as X successfully.	The saving of the configuration information file succeeded. x : File name	–
102	It has not been saved.	The saving of the configuration information file failed, or it was canceled.	Check the free capacity in the PC in which the file is to be saved and retry the saving.
103	Please select a proper file name.	The reading of the configuration information file failed.	Check the specification of the file and retry the saving.
104	Loaded from X successfully.	The reading of the configuration information file succeeded. x : File name	–
105	It has not been loaded.	The reading of the configuration information file failed, or it was canceled.	Check the specification of the file and retry the saving.
106	The format of this file is different.	The reading of the configuration information file failed.	
107	X already exists. Does it overwrite?	The reading of the configuration information file failed. x : File name	
111	This model is not supported.	The model not supported was read.	
301	Please be sure to input one or more numerical values into Fibre Unit.	In the window for entering the number of the disk units, zero was entered as the number of the Fibre disk units.	Change the number to one or more and make the entry again.
302	It exceeds the maximum number of Units.	In the window for entering the number of the disk units, a number larger than the maximum allowable one was entered.	Make the number of the disk units smaller than the maximum allowable one and make the entry again.
304	One or more Units on the PATH0 are skipped.	Disk units were set for Path 0 leaving an empty space for one or more disk units.	Set the disk units in regular order starting from the bottom without leaving an empty space.
305	One or more Units on the PATH1 are skipped.	Disk units were set for Path 1 leaving an empty space for one or more disk units.	
306	More Units to PATH1 than PATH0 are installed.	More disk units were set for Path 1 than those for Path 0.	Check if the setting is correct.
307	Two or more Units to PATH0 than PATH1 are installed.	The disk units set for Path 1 were more than those set for Path 0 by two or more.	
308	It exceeds the number of Units which can be carried on a rack.	When the physical configuration was derived from the logical configuration, disk units more than those mountable on a rack were set.	Check if the number of the disk units on each rack is correct.
309	It is carried on the RackX exceeding the number of maximum Units.	When the logical configuration was derived from the physical configuration, disk units more than those mountable on a rack were set. x : Rack number (1 - 3)	
310	Please install SATA Unit by two Units.	The FC disk units were set on and under the one SATA disk unit.	When setting the FC disk units on and under the SATA disk unit(s), set the two SATA disk units.
311	It exceeds the number of Units which can be carried on a physical rack.	When the number of the disk units was entered, the number was larger than the maximum allowable one.	Check if the setting is correct.

Chapter 11. List of the NAS BIOS POST Codes and the Subcodes

The POST (Power-On-Self-Test) codes of the NAS BIOS and the subcodes are the error codes to output what processing was executed when the failure occurred for the troubleshooting of the failures that occurs at the time of the NAS BIOS operation.
The codes are shown in order according to the starting sequence of the NAS Unit as follows.

No.	POST code	Sub code	Description
1	0000h	0000h	NAS Boot Start
2	0087h	00E0h	PCI Status Clear
3	0087h	00E1h	Initializing the doorbell resister (NNC (NAS Unit) ⇒ DF)
4	0087h	00E5h	PCI Minimun Config (NNC (NAS Unit) ⇒ DF)
5	0087h	00E3h	Waiting for receiving the kick mode instruction doorbell (DF ⇒ NNC (NAS Unit))
6	0087h	00E4h	Clearing the kick mode instruction doorbell (NNC (NAS Unit) ⇒ DF)
7	0038h	0001h	Checking the installation memory specifications (size and spec)
8	0038h	0002h	Initializing the CPU
9	0038h	0004h	Memory Test
10	0038h	0005h	Initializing the Super I/O
11	0038h	00D2h	Acquiring the maintenance LAN port MAC address
12	0098h	00C1h	PCI Full Config (NNC (NAS Unit) ⇒ DF)
13	0098h	00C4h	Setting the chip set custom (DF ⇒ NNC (NAS Unit))
14	0098h	00FFh	Completing the PCI initialization. The CUDG processing is not performed in the second boot.
15	0098h	0083h	Issuing the CUDG_LOAD doorbell (NNC (NAS Unit) ⇒ DF)
16	0098h	0084h	Waiting for clearing the CUDG_LOAD doorbell. The DMA transfer of the PCDG is performed between them. (DF ⇒ NNC (NAS Unit))
17	0098h	0085h	Waiting for receiving the CUDG_READY doorbell (DF ⇒ NNC (NAS Unit))
18	0098h	0086h	Clearing the CUDG_READY doorbell (NNC (NAS Unit) ⇒ DF)
19	0098h	0089h	Starting the CUDG execution
20	0098h	008Ah	Completing the CUDG execution
21	0098h	00FFh	Completing the CUDG processing and executing the NNC (NAS Unit) reset
22	00xxh	00C6h	Initializing the Disk Command Queue
23	00xxh	00C7h	Issuing the Com Enable doorbell (NNC (NAS Unit) ⇒ DF)
24	00xxh	00C8h	Waiting for receiving the Com Enable Reply doorbell (DF ⇒ NNC (NAS Unit))
25	0013h	00C9h	Issuing the Disk Reset command
26	0013h	00CAh	Issuing the Read Capacity (LU0) command
27	0013h	00CBh	Issuing the Read Capacity (LU1) command
28	00xxh	00CDh	Storing the RTC (Time setting)
29	00xxh	00CEh	Performing the initial setting of the environment monitoring IC
30	00C0h	00FFh	Issuing the BIOS completion notification doorbell (NNC (NAS Unit) ⇒ DF)

Failure factor codes	Factors of the abnormal termination	Recovery method	Reference page
1026	The LU executing the Modular Volume Migration was blocked. Or one Disk Drive which configures the LU executing the Modular Volume Migration was blocked in the case other than RAID 6, two were blocked in the case of RAID 6, and another one became a Disk Drive failure among the Disk Drives which configure the same RAID Group, so that R/W to the LU became difficult.	①-1. Check if the LU of the P-VOL or the S-VOL is blocked (two Disk Drives which configure the LU are blocked in the case other than RAID 6 and three are blocked in the case of RAID 6).	–
		①-2. When the LU of the P-VOL or the S-VOL was blocked, recover the LU to "Formatted Logical Unit" referring to Troubleshooting "6.1.13 A failure occurred during operation: Case 3 (LU blockade)".	Troubleshooting "6.1.13 A failure occurred during operation: Case 3 (LU blockade)" (TRBL 06-0590)
		②-1. Check that one Disk Drive which configures the LU of the P-VOL or the S-VOL is blocked in the case other than RAID 6 and two are blocked in the case of RAID 6, and another one becomes a Disk Drive failure "I301xy (or I301HH, I301AT) HDU error" among the Disk Drives which configure the same RAID Group.	–
		②-2. Recover the failure of the Disk Drive referring to Troubleshooting "6.1.9 Data recovery does not terminate normally: Case 2 (Disk Drive failure)".	Troubleshooting "6.1.9 Data recovery does not terminate normally: Case 2 (Disk Drive failure)" (TRBL 06-0520)
1027	The data of the DM-LU could not be read because the Disk Drive was blocked at the time of the subsystem start.	①-1. Check that "I6EL00 DM-LU read failed" is displayed in the Information Message on WEB.	–
		①-2. Remove the cause that the reading of the DM-LU fails according to the recovery method of the message code "I6EL00 DM-LU read failed".	"Chapter 4. Progress Message" (MSG 04-0000)
1028	Because the Disk Drive which configures the LU was blocked after executing the Modular Volume Migration for the LU during the execution of the forced parity correction, the status of the forced parity correction changed to "Uncorrected 1" or "Uncorrected 2".	①-1. Check that the status of the LU of the P-VOL or the S-VOL is "Uncorrected and Drive Detached" or "Correction Aborted" from the Storage Navigator Modular.	–
		①-2. Recover the consistency of the parity of the LU or execute the restoration of the user data corresponding to the status of the LU checked in ①-1 referring to Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >".	Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >" (TRBL 06-0100)
1793	Because the Disk Drive which configures the LU was blocked after executing the Modular Volume Migration for the LU during the execution of the forced parity correction, the status of the forced parity correction changed to "Uncorrected 1" or "Uncorrected 2".	①-1. Check that the status of the LU of the P-VOL or the S-VOL is "Uncorrected and Drive Detached" or "Correction Aborted" from the Storage Navigator Modular.	–
		①-2. Recover the consistency of the parity of the LU or execute the restoration of the user data corresponding to the status of the LU checked in ①-1 referring to Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >".	Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >" (TRBL 06-0100)

Copyright © 2006, Hitachi, Ltd.

Failure factor codes	Factors of the abnormal termination	Recovery method	Reference page
1794	Because only the number that PIN in the LU was near the threshold was detected after executing the Modular Volume Migration for the LU during the execution of the forced parity correction, the forced parity correction was cancelled.	① 1. Check that "I1GH00 (or I1GJ00, I1GK00) Forced parity correction stopped by too many PINs" is displayed in the Information Message on WEB.	–
		2. Recover the PIN over, recover the consistency of the parity of the LU or restore the user data referring to Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >" and Troubleshooting "6.1.3 The failure occurred immediately after being ready [Recovery method-4] Pin over occurred during the forced parity correction".	Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >" (TRBL 06-0100) Troubleshooting "6.1.3 The failure occurred immediately after being ready [Recovery method-4] Pin over occurred during the forced parity correction" (TRBL 06-0190)
1795	The incomplete write was detected after executing the Modular Volume Migration for the LU executing the forced parity correction.	① 1. Check that "I1GE00 Forced parity correction is stopped [Too many Unreadable PINs" is displayed in the Information Message on WEB.	–
		2. Recover the incomplete write, recover the consistency of the parity of the LU or restore the user data referring to Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >"" and Troubleshooting "6.1.3 The failure occurred immediately after being ready [Recovery method-5] Incomplete write occurred during the forced parity correction".	Troubleshooting "6.1.3 The failure occurred immediately after being ready < Forced Parity Collection Maintenance Flow >" (TRBL 06-0100) Troubleshooting "6.1.3 The failure occurred immediately after being ready [Recovery method-5] Incomplete write occurred during the forced parity correction" (TRBL 06-0210)
2049	The internal processing to switch the owner right of the LU between the Control Unit operated during the execution of the Modular Volume Migration, but the internal processing timed out because the load of I/O to the LU was heavy.	① The cause that the executing Modular Volume Migration terminated abnormally is because the internal processing timed out the heavy load of I/O to the LU of the pair. There is no failed part.	–
		② If the Modular Volume Migration repeatedly terminates abnormally due to this factor, execute the Modular Volume Migration to the LU before releasing the pair when the load of I/O to the LU of the pair becomes light.	–

Chapter 1. Before Starting Maintenance Work

This chapter explains procedures for replacing parts which is specified as maintenance parts and identified as failed parts through troubleshooting, etc..

1.1 Before Starting Maintenance Work

1.1.1 Cautionary Notes

(1) Note at the time of the unpacking

- Unpack it indoor.
  Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
- Work on the unpacking in the place where a rapid difference of temperature does not occur.
  It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

(2) Perform the powering on/off operation correctly.

The power supplying condition applicable to the parts replacement varies depending on the part to be replaced. The powering on/off procedure also varies depending on the power supplying condition.

Perform the powering on/off operation following the procedure specified for each part replacement work. It is feared that user data is lost if the powering on/off operation is not done following the procedure correctly.

Since the power supplying system is duplicated, operate AC Power Unit Switch of the both systems when turning on/off the Power Unit.

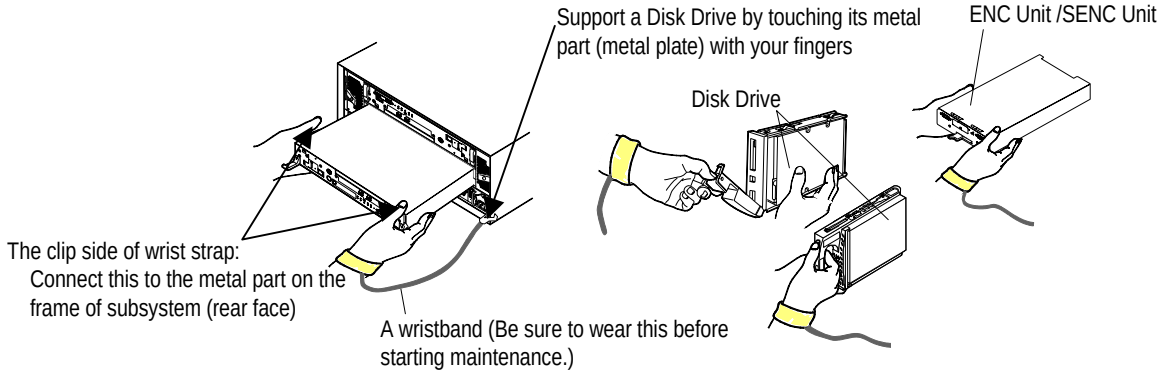
⚠ CAUTION

- Do not disassemble or remodel parts for maintenance. Otherwise, a failure or a serious accident may be caused. Be sure to replace parts in units of formally defined maintenance part.
- When replacing the power supply, do it in haste after preparing a replacement power supply and arranging cables, etc. so that they do not disturb the replacement.

⚠ CAUTION

- When doing a hot replacement of a part, do not wear metallic accessories or a watch so as to avoid an electric shock. Be careful not to touch any of live parts with a screwdriver, etc.

Copyright © 2005, 2006, Hitachi, Ltd.



(3) Notes when Unpacking, Installing or Removing the Parts

For installing or removing the parts, do not apply any shock as the precise parts are installed. Be sure to wear a wrist strap connected to the chassis frame before starting the work and do not take it off until it is finished.

For installing the Disk Drive, Control Unit, ENC Unit, or SENC Unit, support it as touching the metal part at the side with the fingers of the hand that wears a wrist strap.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate

(4) Notes on cable routing

(a) Handling of cables placed on the installation floor

- Protect the cables, which cannot be accommodated by the subsystem and thus laid on the floor or cross a passage, with the cable protection duct.
- For cables that relay between the subsystems, lay them on the floor and do not leave them from the floor.

(b) Handling of under floor cables when the subsystem is installed on the free access floor.

- Give extra lengths to cables routed under the floor and do not make them float in the air.

(c) Routing method

- Give a room for routing as earthquake and the like are considered.
- Give a room for routing not to disturb the part replacement for maintenance.
- Make the AC cables apart from each other and when they should be adjacent, do not make them in parallel but make them cross at right angle.
- When using a cable protection duct, be careful not to damage or cut cables by catching them.

(d) Hold the connector to insert or pull out a cable. If the cable part is pulled, it may cause a failure.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) For connecting the FC I/F cable or the FC (ENC) cable, bend it with a long radius (not less than 30mm) and do not give the load to the cable and the connector.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Note on restarting

When restarting the subsystem, turn off the main switch (after the POWER LED lights off), and then turn on the main switch after waiting for one minute or more.

If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS. If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

(6) Note on completing the work

Close all the external covers when the work is completed.
(The cover is to maintain the performance of the subsystem (radio wave noise suppression and others), so that be sure to keep all the external covers closed to operate the subsystem normally.)

(7) Backup user data.

Backup user data in the subsystem by the operation on the host computer side.

(8) When replacing a Disk Drive, Control Unit, Cache Unit, Interface Board, Backup Battery Unit, an ENC Unit/SENC Unit, a Fan Assembly, and an Power Unit while an array unit is powered on, replace those units 20 seconds or more after their respective failed units are removed.

(9) When replacing the Disk Drive, Control Unit, Cache Unit, Interface Board, Backup Battery Unit, ENC Unit/SENC Unit, Fan Assembly, and Power Unit while the subsystem power is turned on, complete the replacement within five minutes. Otherwise, a powering off (subsystem down) may occur because of an abnormal temperature rise. Perform the part replacement in haste.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) When the Power Unit and another module fail at the same time, replace the Power Unit first, duplicate the power supply again, and then replace the module. Otherwise, a powering off (subsystem down) may occur because of an abnormal temperature rise.

Copyright © 2005, 2006, Hitachi, Ltd.

(11) When inserting a component, do it completely to the end and quickly. If the insertion is made incompletely or extremely slowly, it is possible that the recovery from the error fails.

(12) When an allowable time limit for part replacement is specified in the replacement procedure, observe the time limit.

(13) With only the main switch power off, BS power supply is supplied. In this situation, do not leave the components removed from the subsystem for a long time. Because of an abnormal temperature, the power supply alarm can be given.

(14) Do not make the maintenance work when the READY LED (green) on the front of the Basic Chassis is blinking at high speed. When it is high-speed blinking, the ENC/SENC firmware is being downloaded. Perform the maintenance work after checking that the READY LED (green) on the front of the Basic Chassis lights up after waiting for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of RKH).

(15) When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the maintenance work. While this WARNING LED (orange) is blinking at high speed, the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the maintenance work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up in the maximum of 30 to 85 minutes.

(16) Back end LOOP automatic operation diagnosis is being executed, and interrupt the maintenance work even of the diagnosis end, please when "I5Y000 Obstacle HDU search start" is displayed on "Information Message" of WEB. Please restart the maintenance work after confirming diagnosis end message (I5Y100 Obstacle HDU search end). Please execute the maintenance work according to the instruction when an abnormal device and another trouble message have been generated the diagnosis and after the diagnosis ends.

(17) When the buzzer sound rumbles in the maintenance work, back end LOOP automatic operation diagnosis might be executed by another trouble occurrence. Please reconfirm the state of the disk array device (device LED and WEB, etc.) after the maintenance work is temporarily interrupted, and it waits for one minute or more.

(18) Notes while the array subsystem is being started
Because the status where the array subsystem is being started is in the middle of the transition to the status of the subsystem power turned on (Ready status) from the status of the subsystem power turned off, do not replace the parts while the array subsystem is being started.
Replace the parts after the array subsystem become the Ready status.

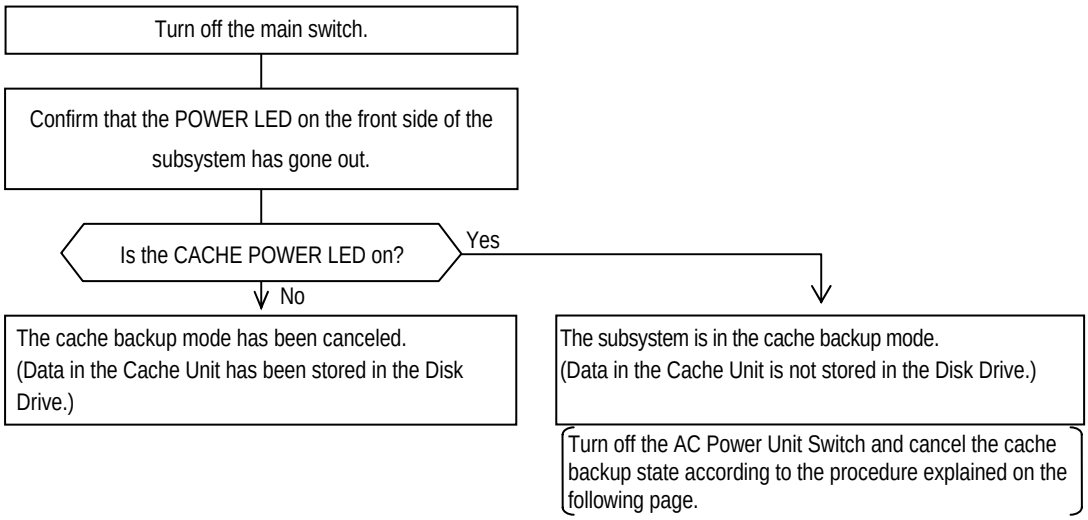
1.1.2 Checking cache memory in the back-up state

Before turning off the power, be sure to check the state of the cache memory backup, and perform the work in the state that the cache backup mode is canceled.

The Cache memory installed in the subsystem is controlled with a write-after method.
When the power is turned off, the subsystem automatically writes data in the Cache Unit left unwritten onto the Disk Drive. This operation is called a destaging.
When process is completed, the POWER LED goes out and the power supplied to each section installed is turned off.
However, when the destaging cannot be completed when the power is turned off owing to the unexpected power failure or by the operation of the circuit breaker, the Cache Unit enters the cache backup mode in which the power is supplied by the battery to secure the data.
If the backup is not done normally, configuration information may be lost and user data may be destroyed.

- Confirming state of the Cache Unit backup
  You can confirm whether the subsystem is in the cache backup state by viewing the indication of the CACHE POWER LED (green) on the Control Unit.
  The state of the cache backup can be confirmed in the following procedure. The location of components referred to in the flow chart is shown in "Figure 1.1.3 Indication Name (Basic subsystem)" (REP 01-0051), "Figure 1.1.3.1 Indication Name (Additional subsystem)" (REP 01-0052), "Figure 1.1.4 Indication Name (Floor Model)" (REP 01-0060), and "Figure 1.1.4.1 Indication Name (Floor Model)" (REP 01-0061).



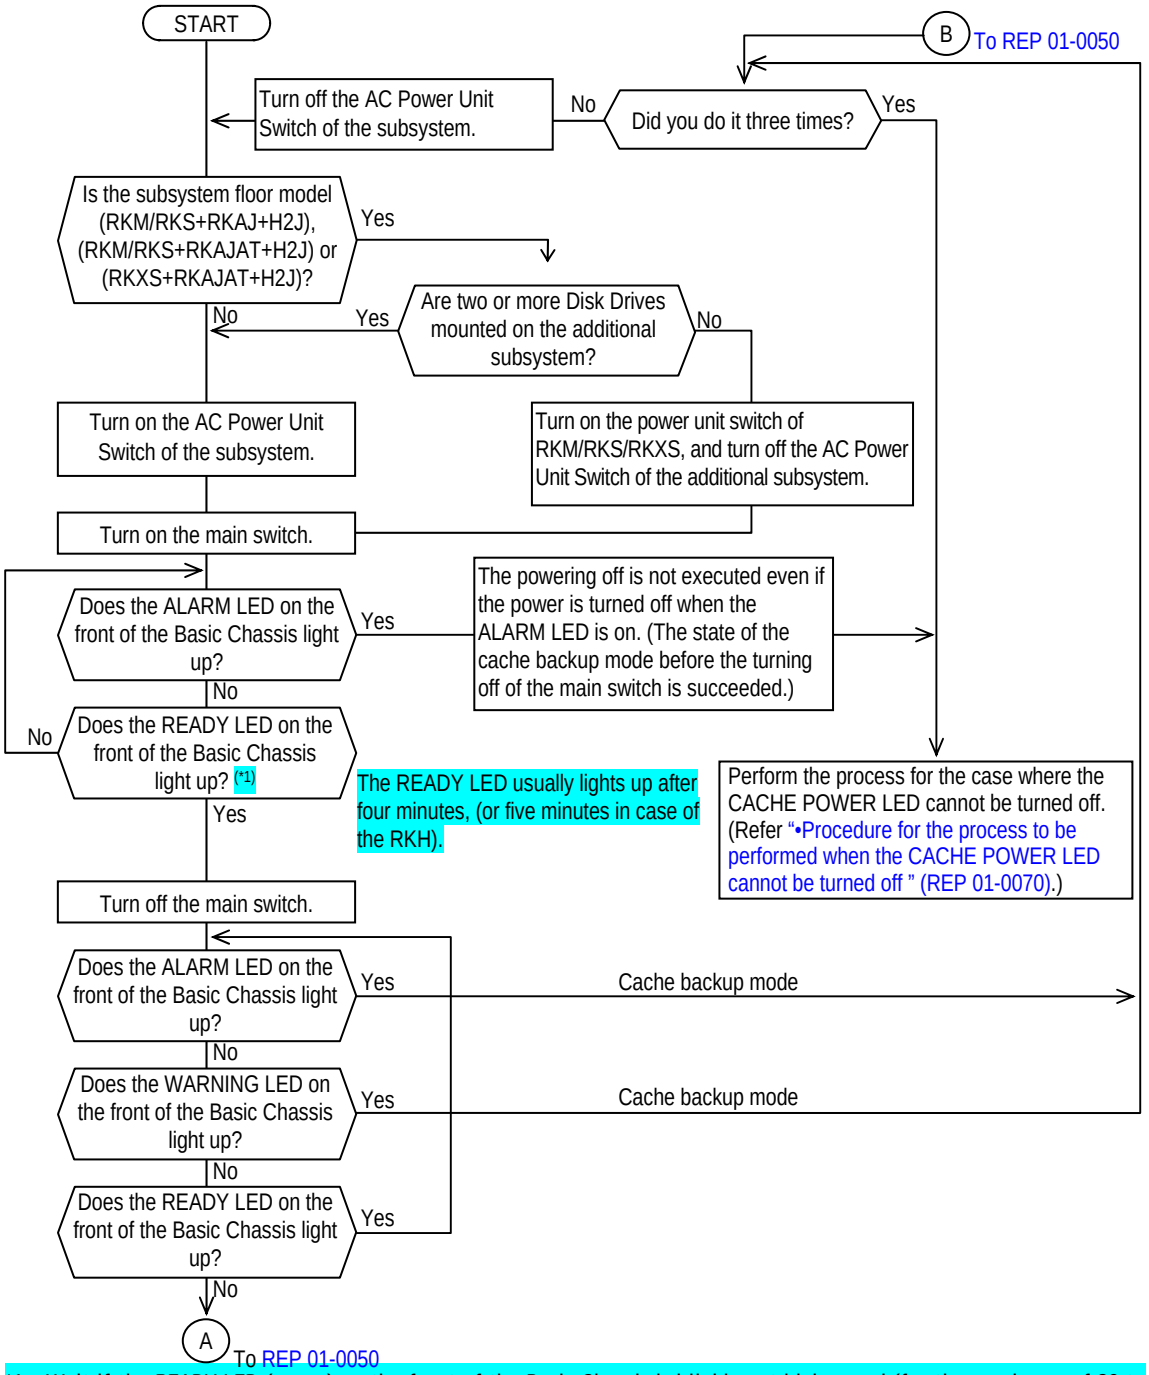


Figure 1.1.1 Procedure for Confirming State of Cache Backup

Copyright © 2005, 2006, Hitachi, Ltd.

- Procedure for canceling the cache backup state of the Cache memory
  Follow the powering off procedure shown below to cancel the cache backup state of the Cache memory. The location of components referred to in the flow chart is shown in "Figure 1.1.3 Indication Name (Basic subsystem)" (REP 01-0051), "Figure 1.1.3.1 Indication Name (Additional subsystem)" (REP 01-0052), "Figure 1.1.4 Indication Name (Floor Model)" (REP 01-0060), and "Figure 1.1.4.1 Indication Name (Floor Model)" (REP 01-0061).

*1 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

- Procedure for the process to be performed when the CACHE POWER LED cannot be turned off
  - ■ Items to be informed or asked the customer before starting the work
    - Inform that user data in the cache memory will be lost owing to the replacement of the Cache memory.
    - Ask whether backup data exists or not.
    - Ask whether it is permitted to erase user data entirely and restore it using user's backup data.
    - Inform that data recovery and verification will be required.
  - ■ Effect

    User data in the Cache memory which has not been written onto the Disk Drive will be lost owing to the replacement of the Controller.
  - ■ Processing procedures

    Either of the two procedures is used; a procedure using the forced parity correction(‡1) or that in which the data is entirely erased once, and then recovered.

    (1) Procedure using the forced parity correction

    It takes long times at the longest from start to completion of the process to execute the forcible parity correction.

    For a standard time required for the forced parity correction, refer to Troubleshooting "< Standard time required for the forced parity correction >" (TRBL 06-0400).

‡1 : A process to ensure the Disk Drive data consistency which has been lost owing to a loss of cache data. It cannot recover the data unwritten onto the Disk Drive completely when an error occurs, therefore, verification of user data and restoration of backup data are necessary.

Copyright © 2005, Hitachi, Ltd.

(2) Procedure not using the forced parity correction
When the forced parity correction takes a long time depending on the system configuration, it is faster to restore data using the backup data after erasing and resetting configuration information than to do it by executing the procedure in (1).

NOTE : When not performing Forced Parity Correction, be sure to format the LU. (Refer to System Parameter "[Procedure ③-F] Formatting LU" (SYSPR 03-0280))
If formatting is not performed, parity consistency is lost and data inconsistency may occur.

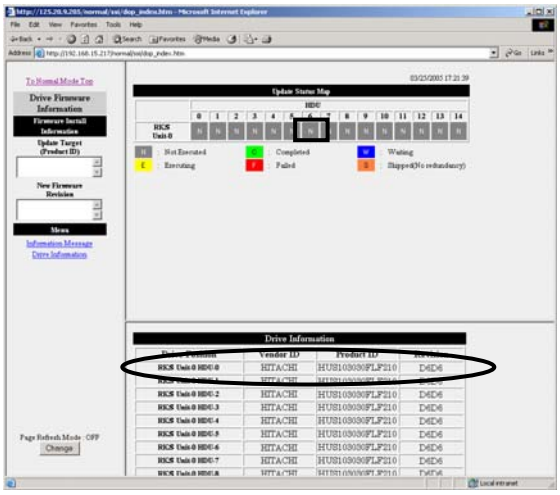
1.1.3 Procedure for making sure of model name and drive firmware of Disk Drive

When it is required to make sure of a model name and/or drive firmware of the Disk Drive in the case of Disk Drive replacement, etc., make sure of them following the procedure shown below.

(1) Displaying the reference window
To display the reference window, enter "http://(IP address)/drvfirm" in the [Address] of the WEB browser.
In the case of the dual system configuration, enter an IP address of any one of the control units. When the connection is made, the following window is displayed.
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].



(2) Displaying the list of model names and drive firmware revisions of Disk Drives click [Drive Information] in the [Menu] of the [Drive Firmware Information].

List of model names and drive firmware revisions of the Disk Drives.
Product ID : Disk Drive Model name.
Revision : Drive firmware revision.

Copyright © 2005, Hitachi, Ltd.

(3) Making sure of a model name and drive firmware revision of the Disk Drive concerned
Since information on the Disk Drive concerned is displayed at the top of the list when the position of the Disk Drive concerned is clicked, make sure of the model name and drive firmware revision of the Disk Drive concerned. (The following figure shows an example in which HDU-6 are selected.)

When the two or more Disk Drives concern, make sure of the necessary information by clicking each position of them.

Chapter 2. Parts Replacement

2.1 Locations of Replacement Components

Floor model is installed on the floor in combination with the dedicated kit to RKM/RKS/RKXS, RKM/RKS+RKAJ, and RKXS+RKAJAT.
The RKAJAT has no floor model.

Check the installed parts and the power supply status at the time of replacement in Table 2.1.1 and replace the parts.

Table 2.1.1 Locations of the parts to be replaced and power supply status

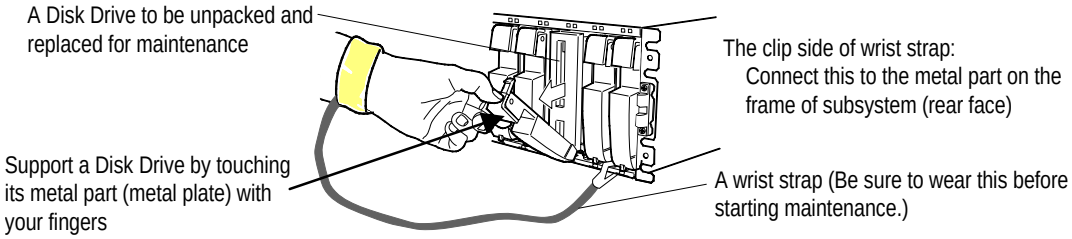
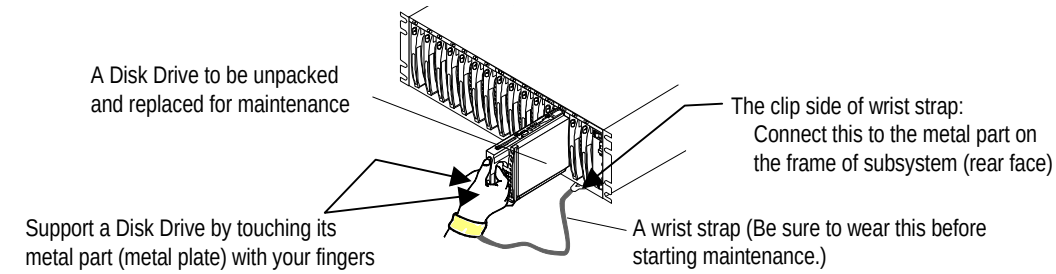
2.2 Replacement of Components

The parts replacements here are illustrated using a rackmount model. For floor model, install each part in the vertical position.



Where to install a component is shown in "2.1 Locations of Replacement Components" (REP 02-0000).

2.2.1 Replacing Disk Drive



The replacement procedure for the Disk Drive differs depending on the spare disk setting, RAID configuration, data recovery setting mode, or the spare drive operation mode (‡1) (variable or fixed).
Perform the replacement following the procedure shown below.
The Disk Drive is a precision machine that may have troubles because of electrostatic discharge. Be sure to put on the wristband before star Sting work in order to protect Disk Drives from electrostatic discharge.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

- In the case of RKM/RKS/RKXS/RKAJ/RKAJAT/RKAJATL

- In the case of RKA

Copyright © 2005, 2006, Hitachi, Ltd.

‡1 : Spare Drive : Set whether to make the Copy backless function enable or disable. (Refer to Theory “4.6 (3) Operation after replacing the failed Disk Drive” (THEO 04-0240).)

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Locations and numbers of Disk Drives

The installation position of a Disk Drive is specified in the combination of a device number (device ID) and a Disk Drive number.

Set #0 for the device ID of RKM/RKS/RKXS and set the device ID of additional subsystem as follows.

Set the device ID of the RKAJ/RKA as #0x for PATH#0, #1 and #1x for PATH#2, #3.

Set #2x for the device ID of RKAJAT connected to PATH #0, set #3x for the device ID of RKAJAT connected to PATH #1, set #4x for the device ID of RKAJAT connected to PATH #2 and set #5x for the device ID of RKAJAT connected to PATH #3.

Set #2x for the device ID of RKAJAT/RKAJATL to be connected to RKXS.

There is no device ID for the RKH.

NOTE : Set x in ascending order in PATH #0 and #1 without the distinction of RKAJ/RKAJAT/RKAJATL/RKA.

For details of the device ID setting, refer to Installation "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).

Set the subsystem identification switch for the RKAJ.

When the basic subsystem to be connected is the RKH/RKM, set it in the M side, and when it is the RKS, set it in the S side.

The Disk Drive number is #0 to #14 from the left sequentially seen sideways (for the floor model, it is #0 to #14 from the bottom).

(1) Replacing Disk Drive

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.
- For the system Disk Drives (The Disk Drives #0 to #4 of the RKM/RKS/RKXS or the Disk Drives #0 to #4 of the RKAJ corresponding to the unit ID#0 connected to the RKH) regardless of the data Disk Drives, the Spare Drives and the Disk Drives which do not configure the RAID group, do not remove the Disk Drives #0 and #1 at the same time with the subsystem power turned on.
  There is a possibility of downing the subsystem if removing them.
- When only two Disk Drives (the Disk Drives #0 and #1) are installed in the RKM/RKS or the RKAJ corresponding to the unit ID#0 connected to the RKH, do not remove these two at the same time.
  Be careful of the subsystem down if removing them.
- For RKXS in which only three Disk Drives (Disk Drive #0 to #2) are installed, do not remove these three at the same time. Be careful that the subsystem may go down if they are removed.

NOTE : • Back end LOOP automatic operation diagnosis is being executed, and interrupt the maintenance work even of the diagnosis end, please when "I5Y000 Obstacle HDU search start" is displayed on "Information Message" of WEB. Please restart the maintenance work after confirming diagnosis end message (I5Y100 Obstacle HDU search end). Please execute the maintenance work according to the instruction when an abnormal device and another trouble message have been generated the diagnosis and after the diagnosis ends.

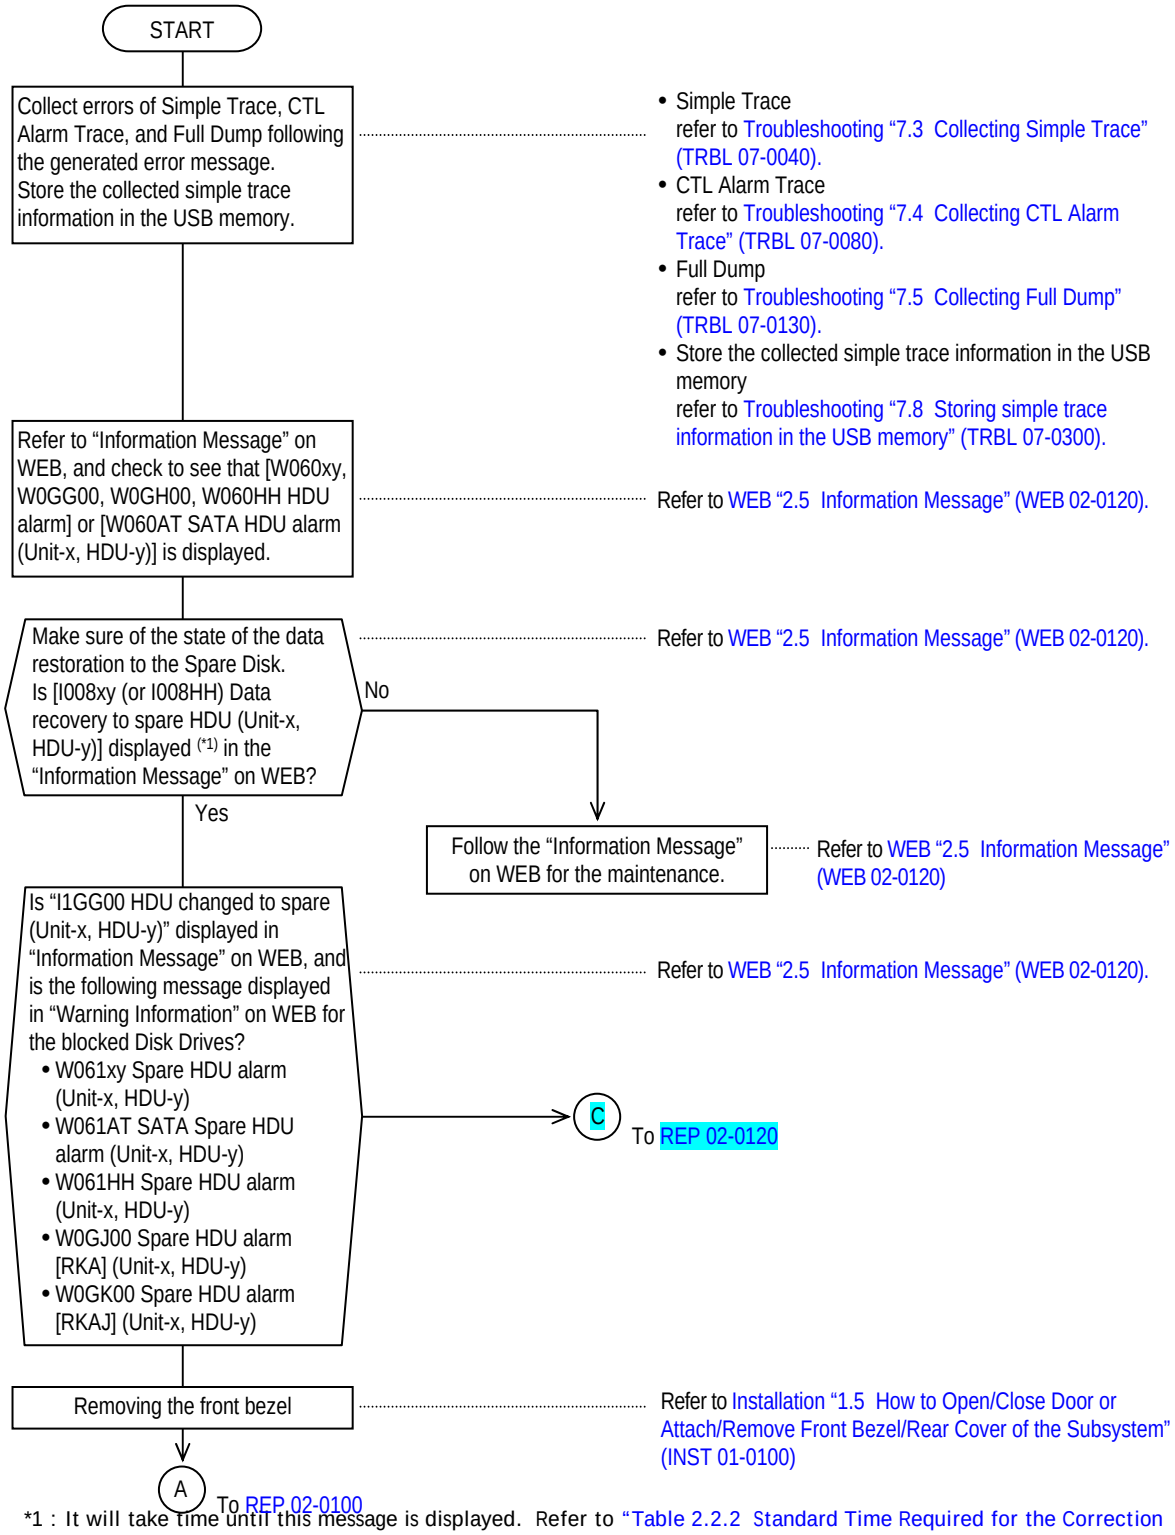
• When the buzzer sound rumbles in the maintenance work, back end LOOP automatic operation diagnosis might be executed by another trouble occurrence. Please reconfirm the state of the disk array device (device LED and WEB, etc.) after the maintenance work is temporarily interrupted, and it waits for one minute or more.

Copyright © 2005, 2006, Hitachi, Ltd.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restrictions	RAID level		Reference section
1	Replacement with the power turned on (hot replacement)	1. Replaceable only while power is on 2. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 3. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 4. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	The Spare Disk is set	RAID 0(*1) RAID 1, RAID 5, RAID 6, and RAID 1+0	When the red (ALARM) LED on the disk drive to be replaced is on. See "(a-1) When the red (ALARM) LED on the Disk Drive to be replaced is on." (REP 02-0090). When the red (ALARM) LED on the disk drive to be replaced is off. See "(a-2) When the red (ALARM) LED on the Disk Drive to be replaced is off." (REP 02-0130).
			The Spare Disk is not set or there is no Spare Disk that can be used	RAID 0(*1)	See "(b-3) Replacement of Disk Drive under RAID 0 configuration" (REP 02-0180).
				RAID 1, RAID 5, RAID 6, and RAID 1+0	When the red (ALARM) LED on the disk drive to be replaced is on. See "(b-1) Replacing Disk Drive in RAID 1, 5, 6, or 1+0 configuration (When the red (ALARM) LED is on)" (REP 02-0150). When the red (ALARM) LED on the disk drive to be replaced is off. See "(b-2) Replacing a Disk Drive in the RAID 1, 5, 6, or RAID 1+0 configuration " (REP 02-0170).
2	Replacement with the power turned off	Not applicable			—

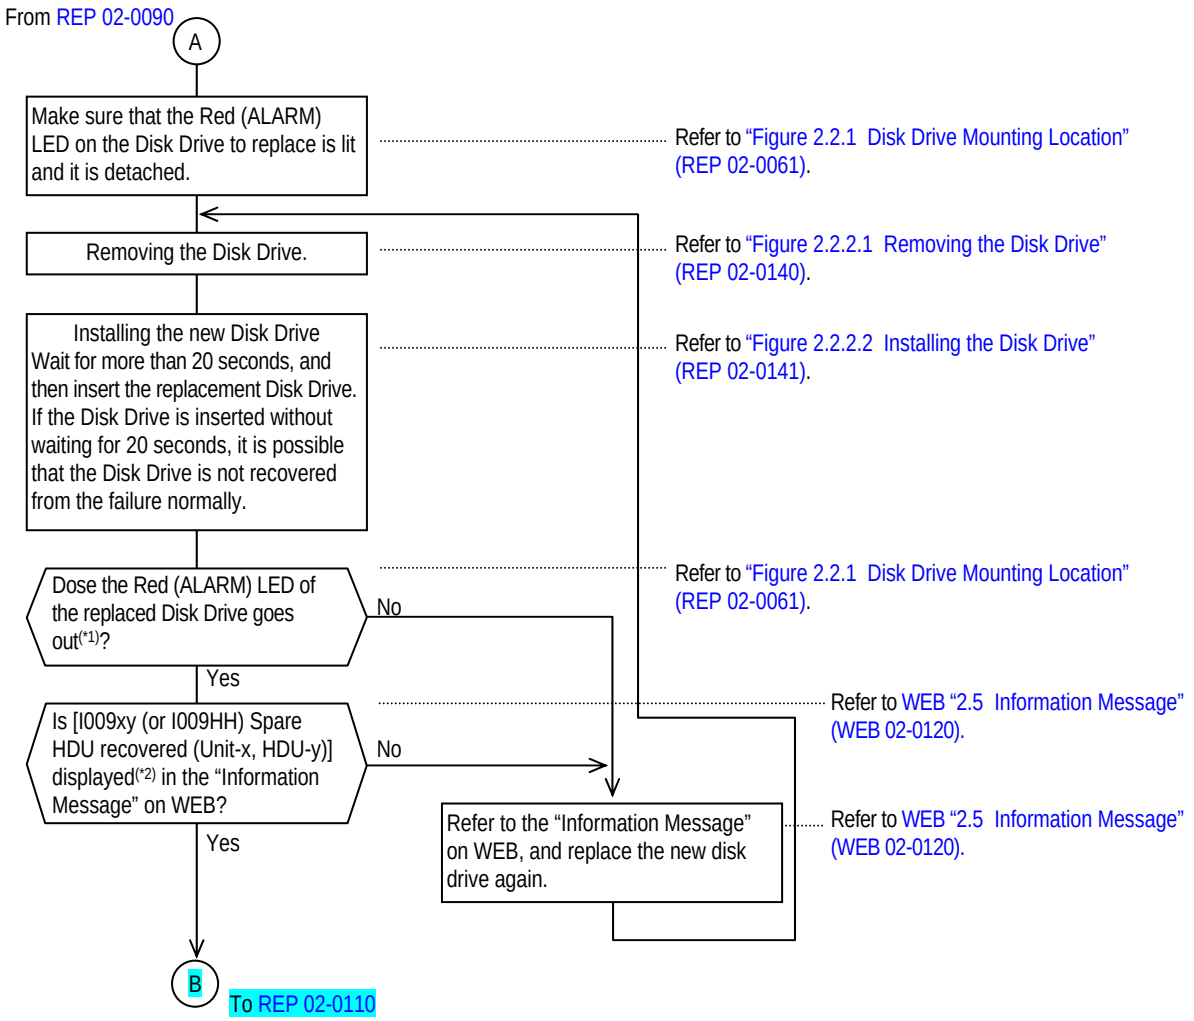
*1 : Be sure to backup the user data before replacing a Disk Drive in RAID 0 configuration. When the set RAID group and LU are deleted or formatted, related user data will be lost.
(A backing up and restoration of user data are operations to be performed by users.)



*2 : You can replace the Disk Drive using the procedure (a) for the case of RAID 0 with a Spare Disk only when the data migration to the Spare Disk by means of the dynamic sparing has terminated normally.
When the data migration to the Spare Disk has failed, replace the Disk Drive using the procedure (b-2) for the case of RAID 0 without Spare Disk.

Copyright © 2005, 2006, Hitachi, Ltd.

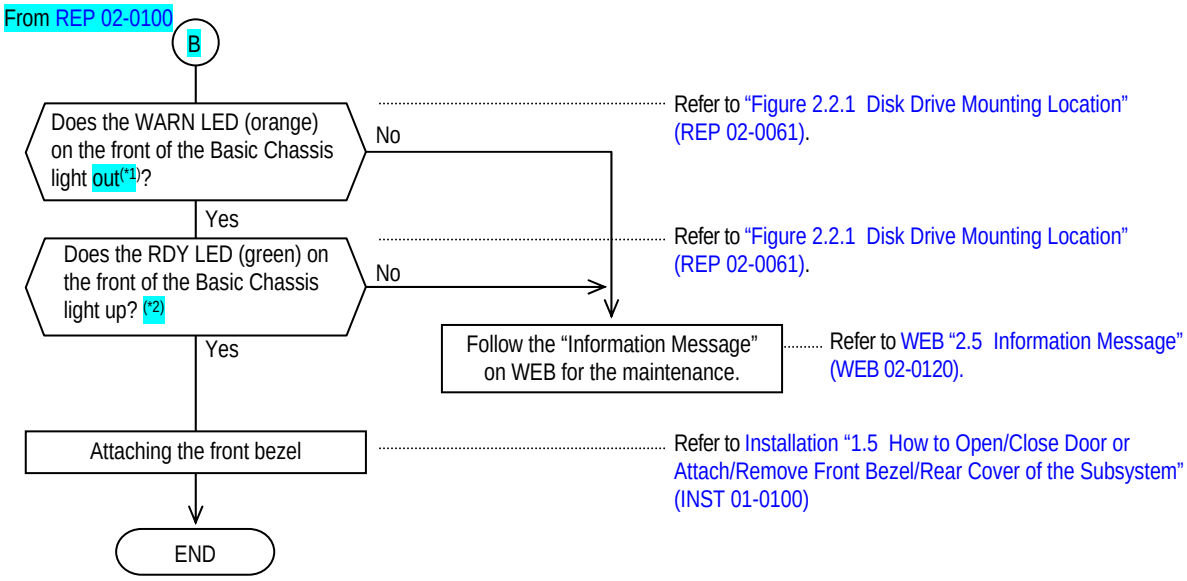
If no Spare Disk is provided, go to (b).



(a) The Spare Disk is set

(a-1) When the red (ALARM) LED on the Disk Drive to be replaced is on.

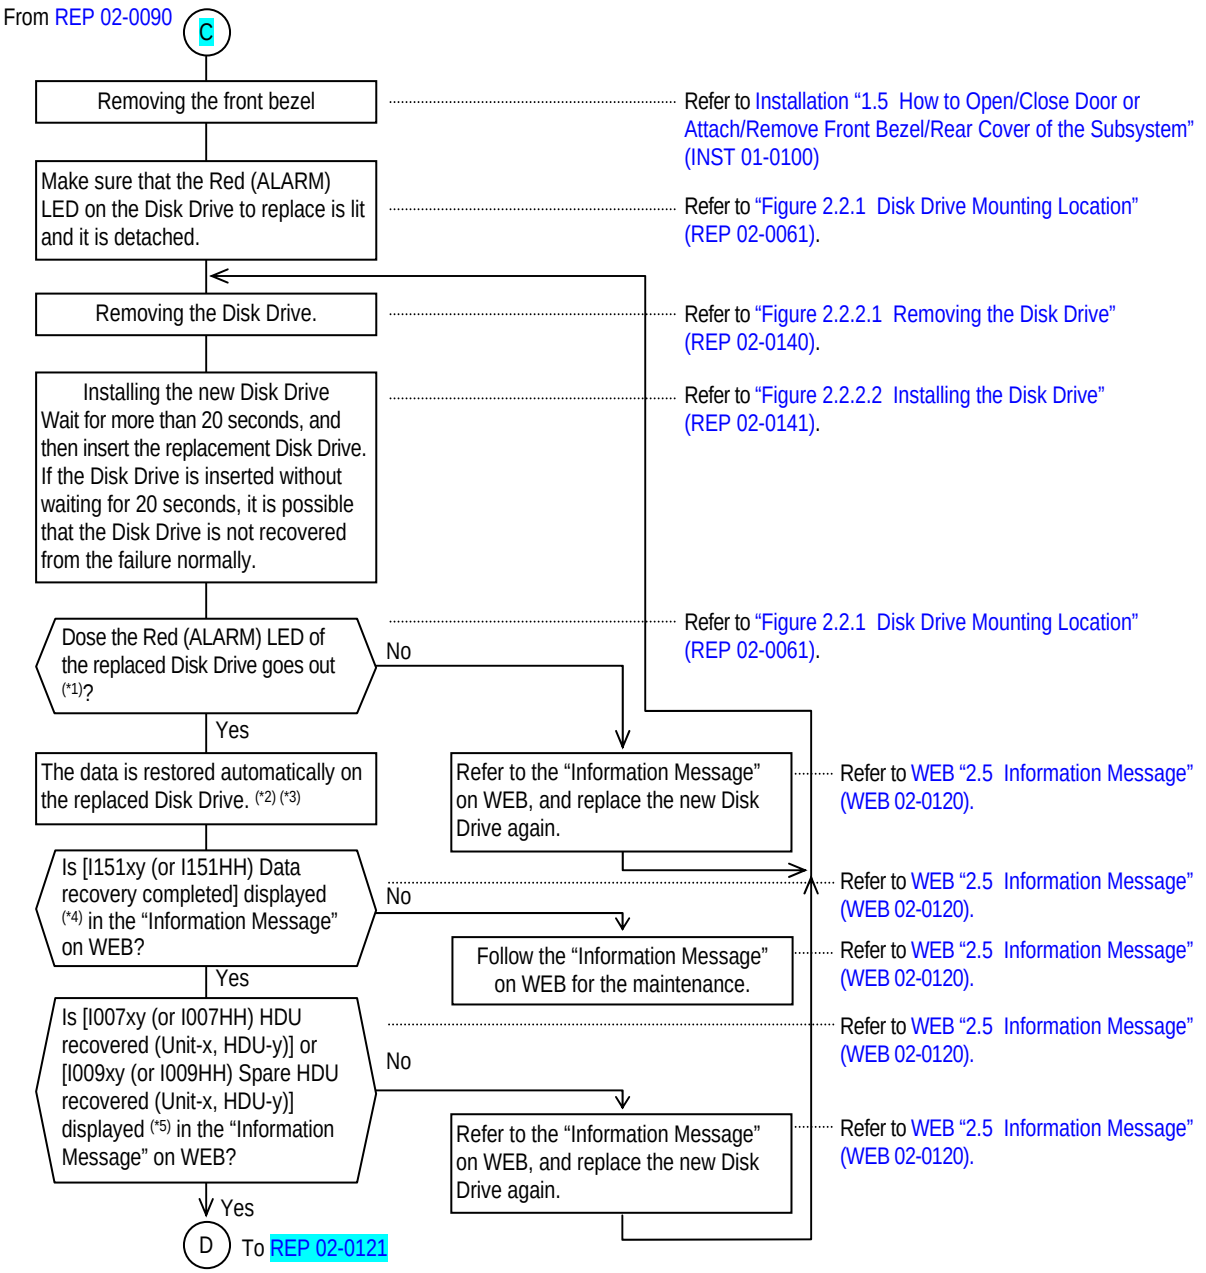
*1 : It will take time until this message is displayed. Refer to "Table 2.2.2 Standard Time Required for the Correction copy or Copy back" (REP 02-0231) for the standard of the time required.



Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The red (ALARM) LED of the Disk Drive lights off within about five minutes after the Disk Drive is inserted.
When the Red (ALARM) LED is not turned off, remove the inserted Disk Drive from the chassis, and insert it again after 20 seconds or more passed.
However, if the Disk Drive is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced Disk Drive may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Disk Drive from the chassis once and insert it again after 20 seconds or more passed.

*2 : This message is displayed within about five minutes after the red (ALARM) LED of the Disk Drive lights off.



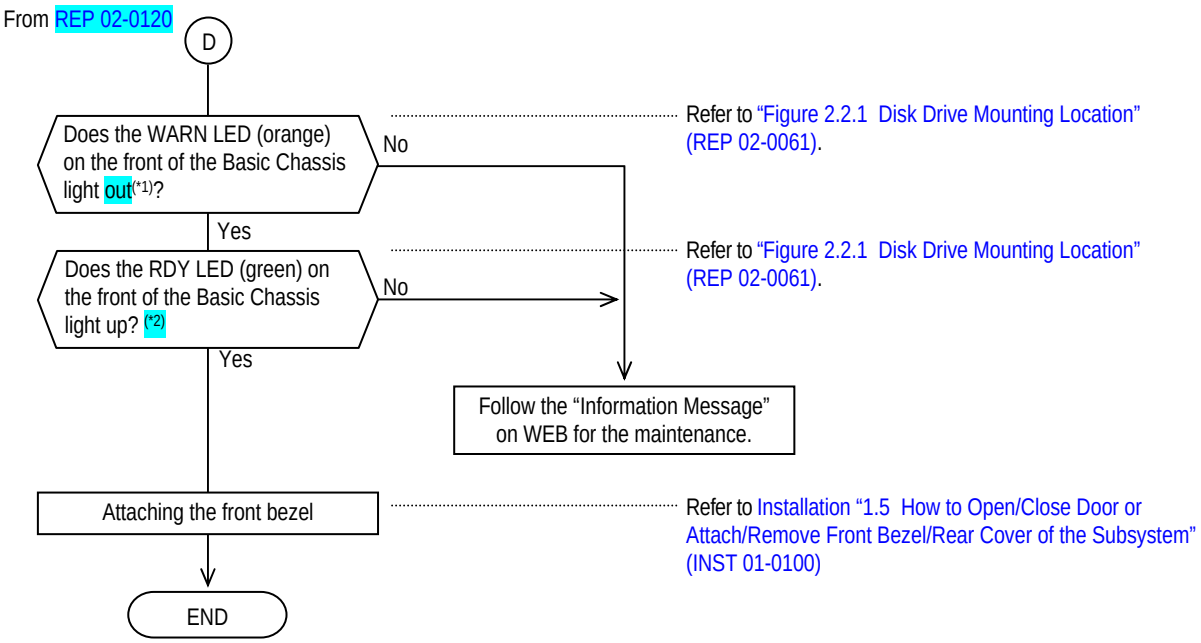
Copyright © 2005, 2006, Hitachi, Ltd.

*1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

*2 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The red (ALARM) LED of the Disk Drive lights off within about five minutes after the Disk Drive is inserted. When the Red (ALARM) LED is not turned off, remove the inserted Disk Drive from the chassis, and insert it again after 20 seconds or more passed.
However, if the Disk Drive is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced Disk Drive may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Disk Drive from the chassis once and insert it again after 20 seconds or more passed.



*2 : In case of it is set to automatic recovery mode.

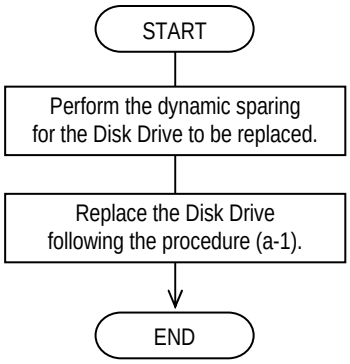
*3 : Open the Unit screen in the Storage Navigator Modular. Double click the Disk Drive under recovery procedure (indicated in yellow) in the Component Status Tag, then the progress of data recovery can be checked. (For detail, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

*4 : It will take time until this message is displayed. Refer to "Table 2.2.2 Standard Time Required for the Correction copy or Copy back" (REP 02-0231) for the standard of the time required.

*5 : This message is displayed within about five minutes after "I151xy (or I151HH) Data recovery completed" is displayed in the "Information Message" on WEB.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.



*2 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

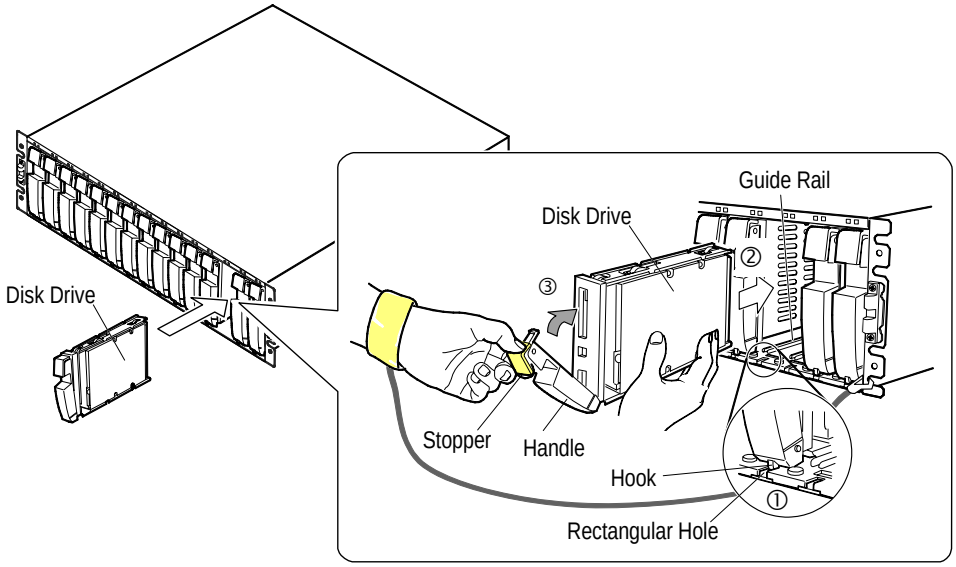
- Disk Drive for RKM/RKS/RKXS/RKAJ/RKAJAT/RKAJATL

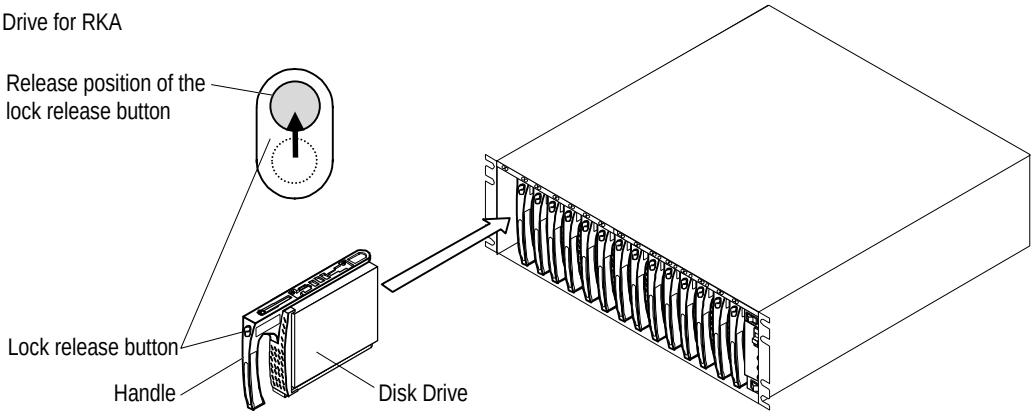
① Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the dummy (Disk Drive) by pulling it.

- Disk Drive for RKA



① Hold the handle and insert the Disk Drive without applying another operation to it. Insert it until the lock release button is latched at the locking position.

Figure 2.2.2.1 Removing the Disk Drive



Copyright © 2005, 2006, Hitachi, Ltd.

- Disk Drive for RKM/RKS/RKXS/RKAJ/RKAJAT/RKAJATL

① Slide the Disk Drive following the guide rail to the direction of the arrow without adding an impact.
② Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.
③ Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.
If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

- Disk Drive for RKA

① You can remove the Disk Drive by shifting the lock release button in the arrow direction (downward) and holding it there, and then pulling the handle toward you.

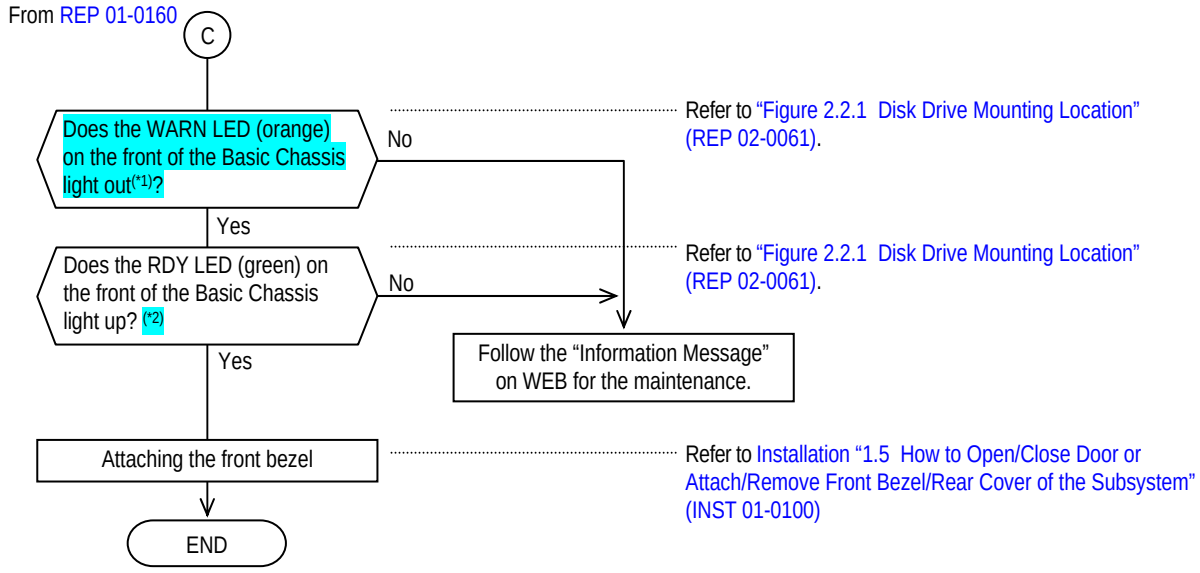
(b) The Spare Disk is not set or there is no Spare Disk that can be used

(b-1) Replacing Disk Drive in RAID 1, 5, 6, or 1+0 configuration
(When the red (ALARM) LED is on)

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The red (ALARM) LED of the Disk Drive lights off within about five minutes after the Disk Drive is inserted.
When the Red (ALARM) LED is not turned off, remove the inserted Disk Drive from the chassis, and insert it again after 20 seconds or more passed.
However, if the Disk Drive is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced Disk Drive may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Disk Drive from the chassis once and insert it again after 20 seconds or more passed.

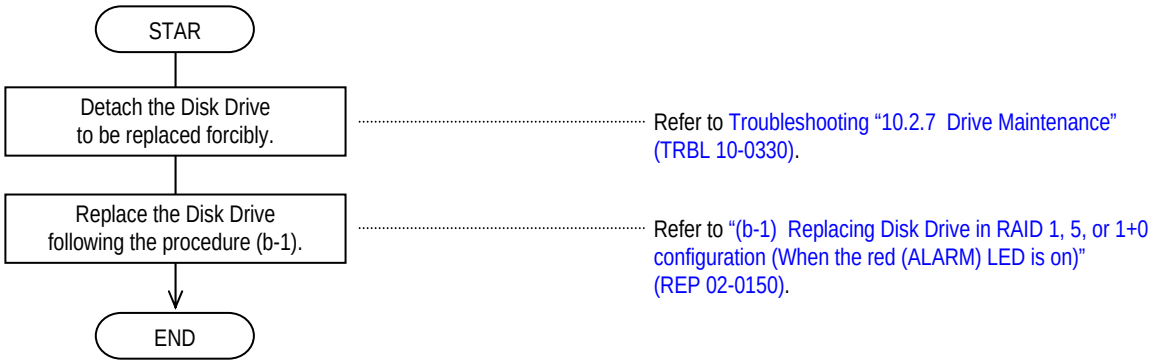


*2 : In case of it is set to automatic recovery mode.

*3 : Open the Unit screen in the Storage Navigator Modular. Double click the Disk Drive under recovery procedure (indicated in yellow) in the Component Status Tag, then the progress of data recovery can be checked. (For detail, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

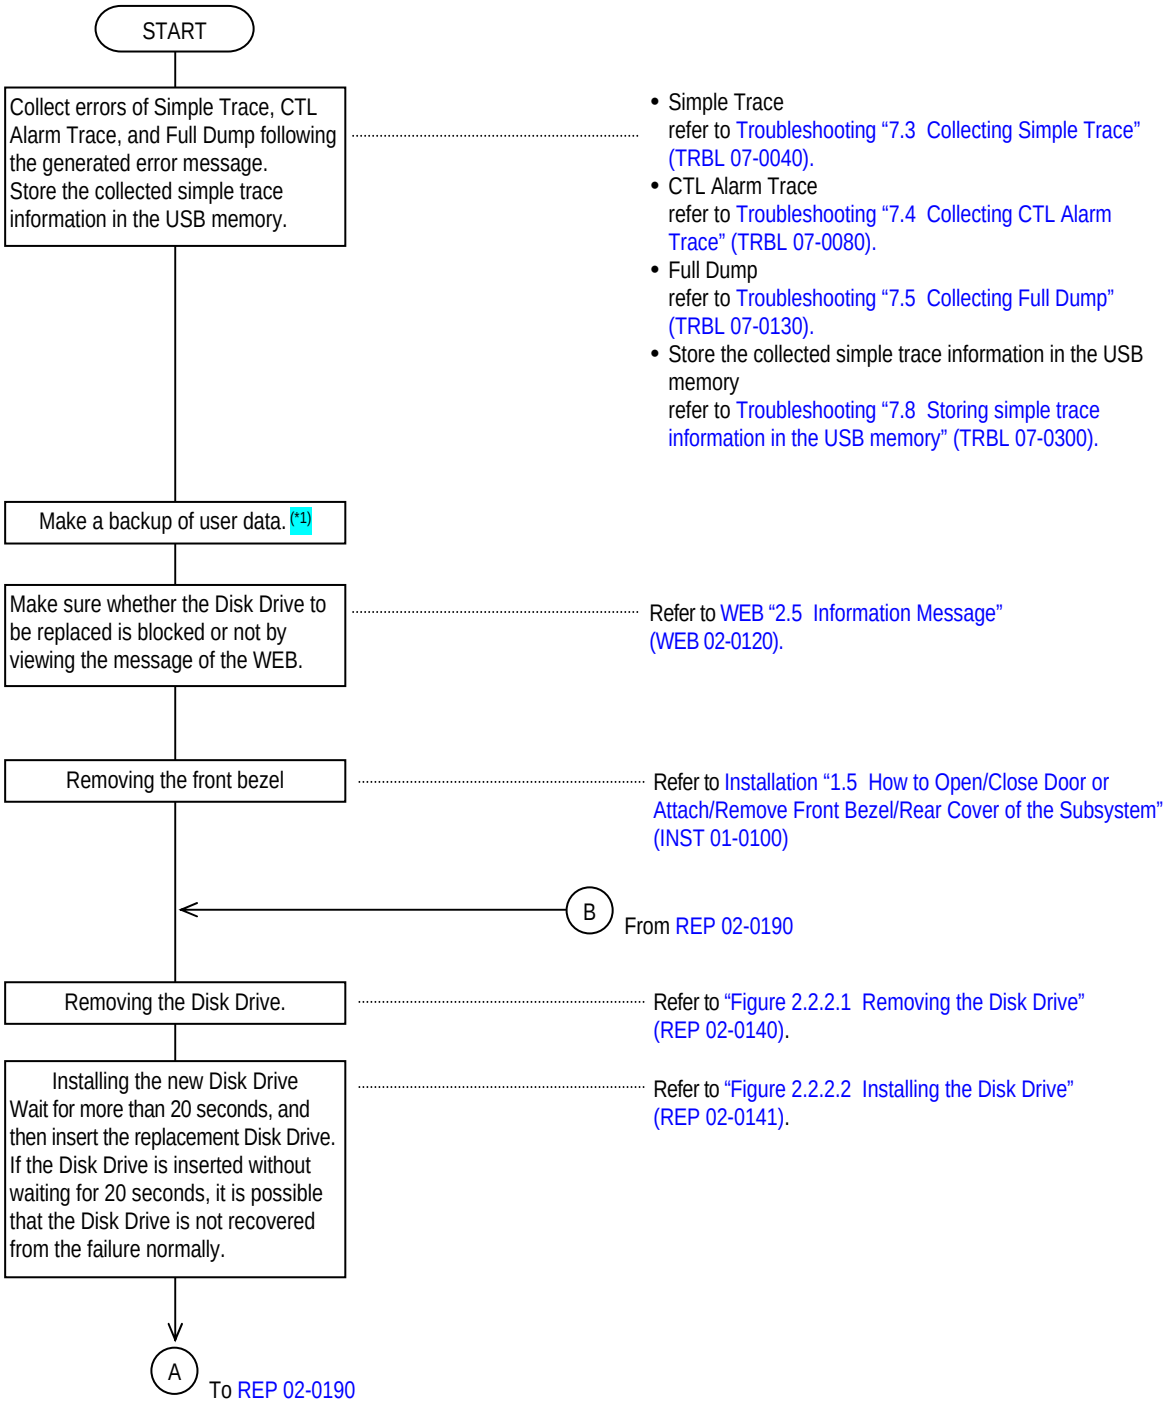
*4 : It will take time until this message is displayed. Refer to "Table 2.2.2 Standard Time Required for the Correction copy or Copy back" (REP 02-0231) for the standard of the time required.

*5 : This message is displayed within about five minutes after "I151xy (or I151HH) Data recovery completed" is displayed in the "Information Message" on WEB.



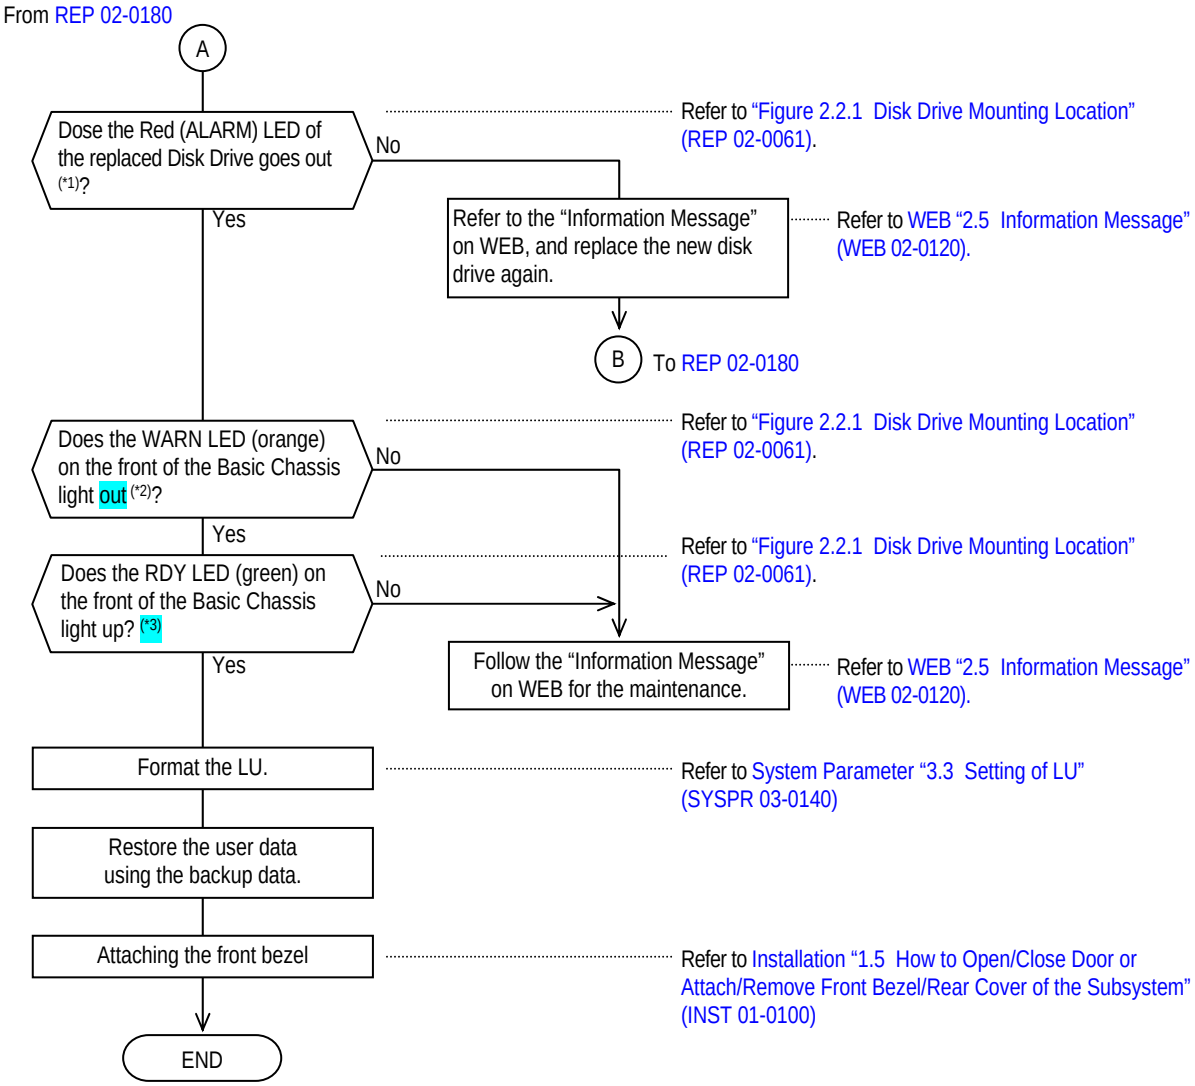
Copyright © 2005, 2006, Hitachi, Ltd.

*1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.



*2 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

(b-2) Replacing a Disk Drive in the RAID 1, 5, 6, or RAID 1+0 configuration (when the red (ALARM) LED is off)



Copyright © 2005, 2006, Hitachi, Ltd.

(b-3) Replacement of Disk Drive under RAID 0 configuration

*1 : The user data cannot be backed up when a Disk Drive targeted for the replacement is blocked or when there is a blocked Disk Drive in the RAID Group to which the Disk Drive targeted for the replacement belongs.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The red (ALARM) LED of the Disk Drive lights off within about five minutes after the Disk Drive is inserted. When the Red (ALARM) LED is not turned off, remove the inserted Disk Drive from the chassis, and insert it again after 20 seconds or more passed.
However, if the Disk Drive is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced Disk Drive may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Disk Drive from the chassis once and insert it again after 20 seconds or more passed.

*2 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

*3 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Disk Drive threshold

Errors counted in this subsystem and default threshold values are listed below.
The dynamic sparing functions when the error count threshold value is exceeded. After the dynamic sparing operation is completed, the failed Disk Drive is detached.

Table 2.2.1 Error and threshold value

No.	Kind of error	Threshold (Default) (Once/24 hours)			
		The Spare Disk is set		The Spare Disk is not set	
		FC	SATA	FC	SATA
1	Disk mechanical error. (Recovered)	50	50	50	50
2	Disk mechanical error. (Un-recovered)	2	2	2	2
3	A Disk Drive failure that becomes a factor to execute reassignment • Disk medium error. (Recovered) • Disk medium error. (Un-recovered) • Collectable errors in online verify. • Un-correctable errors in online verify.	25	50	200	100
4	Disk R/W error. (Recovered)	10	10	10	10
5	Disk R/W error. (Un-recovered)	2	2	2	2
6	Disk I/F error. (Recovered)	50	50	50	50
7	Disk I/F error. (Un-recovered)	2	2	2	2
8	Disk hardware error. (Recovered)	50	50	50	50
9	Disk hardware error. (Un-recovered)	2	2	2	2
10	Disk SCSI I/F error. (Recovered)	50	50	50	50
11	Disk SCSI I/F error. (Un-recovered)	2	2	2	2

There threshold values above can be referred to and updated from the Storage Navigator Modular (‡1).
However, the recovered or un-recovered disk media errors and the correctable or uncorrectable errors in online verify operations are count up together in the reassigned count, so that the threshold value can be updated but it is not effective.
The accumulated number of errors is not cleared even if the power supply of the subsystem is turned off (the subsystem performs the planned shutdown).

‡1 : For the details of the Storage Navigator Modular, refer to the "Storage Navigator Modular (for GUI) User's Guide".

(3) Transition of WEB of spare recovery operation of the [Information Message]

When the recovery completes normally, the "Information Message" from the WEB (WEB "2.5 Information Message" (WEB 02-0120)) change successively as shown below.

(a) Data recover (Data recovery onto the Spare Disk when a disk blocked is detected)

W060xy (or W060HH) HDU alarm
W060AT SATA HDU alarm
W0GG00 HDU alarm [RKA] (Unit-x, HDU-y)
W0GH00 HDU alarm [RKAJ] (Unit-x, HDU-y)
..... : Data Disk blocked

I150xy Data recovery started / I150HH Data recovery started
..... : Start of data area recovery

I151xy Data recovery completed / I151HH Data recovery completed
..... : Completion of data area recovery

I008xy Data recovery to spare HDU / I008HH Data recovery to spare HDU
..... : Completion of recovery onto Spare Disk

I1GG00 HDU changed to spare (Unit-x, HDU-y)
..... : The blocked data disk is changed to the spare disk, and the spare disk before the failure is changed to the data disk. (‡1)

W061xy (or W061HH) Spare HDU alarm(Unit-x, HDU-y)
W061AT SATA Spare HDU alarm (Unit-x, HDU-y)
W0GJ00 Spare HDU alarm [RKA] (Unit-x, HDU-y)
W0GK00 Spare HDU alarm [RKAJ] (Unit-x, HDU-y)
..... : Spare Disk blocked(‡1) (‡2)

‡1 : In the microprogram revision less than 0740/C, this message has set "Spare Drive" of "Configuration Settings" – "Restore Options" of the Storage Navigator Modular to variable (default value), and it is displayed after the Disk Drive restoration is completed only when the capacity and the rotational speed of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination are matched and both of them are not the Disk Drives of the RKA.
In the microprogram revision 0740/C or more, this message has set "Spare Drive" of "Configuration Settings" – "Restore Options" of the Storage Navigator Modular to variable (default value), and it is displayed after the Disk Drive restoration is completed if the capacity and the rotational speed of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination are matched and both of them are not the Disk Drives of the RKA when "Applying No Copy Back Mode on All the Units" is set to disable. Also, this message is displayed after the Disk Drive restoration is completed if the Disk Drive capacity of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination is matched when "Spare Disk Drive Active Mode" is variable and "Applying No Copy Back Mode on All the Units" is set to enable.
However, when the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS/RKXS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

Copyright © 2005, 2006, Hitachi, Ltd.

‡2 : This message is displayed in the Warning Information.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Data recover (Dynamic sparing from data disk to Spare Disk)

I15Axy Dynamic sparing start / I15AHH Dynamic sparing start
…… : Start of Dynamic sparing

I150xy Data recovery started / I150HH Data recovery started
…… : Start of disk recovery

I151xy Data recovery completed / I151HH Data recovery completed
…… : Completion of data recovery

I008xy Data recovery to spare HDU / I008HH Data recovery to spare HDU
…… : Completion of recovery onto Spare Disk

I1GG00 HDU changed to spare (Unit-x, HDU-y)
…… : The blocked data disk is changed to the spare disk, and the spare disk before the failure is changed to the data disk. (‡1)

W060xy (or W060HH) HDU alarm
W060AT SATA HDU alarm
W0GG00 HDU alarm [RKA] (Unit-x, HDU-y)
W0GH00 HDU alarm [RKAJ] (Unit-x, HDU-y)
…… : Data Disk blocked(‡2)

W061xy (or W061HH) Spare HDU alarm(Unit-x, HDU-y)
W061AT SATA Spare HDU alarm (Unit-x, HDU-y)
W0GJ00 Spare HDU alarm [RKA] (Unit-x, HDU-y)
W0GK00 Spare HDU alarm [RKAJ] (Unit-x, HDU-y)
…… : Spare Disk blocked(‡3) (‡4)

‡1 : This message is displayed in the Warning Information.

‡2 : This message is displayed only when "I1GG00 HDU changed to spare(Unit-x, HDU-y)" is not displayed before this.

‡3 : In the microprogram revision less than 0740/C, this message has set "Spare Drive" of "Configuration Settings" – "Restore Options" of the Storage Navigator Modular to variable (default value), and it is displayed after the Disk Drive restoration is completed only when the capacity and the number of rotation of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination are matched and both of them are not the Disk Drives of the RKA. In the microprogram revision 0740/C or more, this message has set "Spare Drive" of "Configuration Settings" – "Restore Options" of the Storage Navigator Modular to variable (default value), and it is displayed after the Disk Drive restoration is completed if the capacity and the number of rotation of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination are matched and both of them are not the Disk Drives of the RKA when "Applying No Copy Back Mode on All the Units" is set to disable. Also, this message is displayed after the Disk Drive restoration is completed if the Disk Drive capacity of the blocked Disk Drive and the Spare Disk Drive at the data recovery destination is matched when "Spare Disk Drive Active Mode" is variable and "Applying No Copy Back Mode on All the Units" is set to enable.

Copyright © 2005, 2006, Hitachi, Ltd.

‡4 : This message is displayed only when “I1GG00 HDU changed to spare(Unit-x, HDU-y)” is displayed before this.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Copy back

I140xy System copy started / I140HH System copy started

..... : Start of system area recovery(‡1)

I141xy System copy completed / I141HH System copy completed

..... : Completion of system area recovery(‡1)

I150xy Data recovery started / I150HH Data recovery started

..... : Start of data area recovery

I151xy Data recovery completed / I151HH Data recovery completed

..... : Completion of data area recovery

When the recovery terminates abnormally, whichever [I142xy System copy failed (Unit-x, HDU-y)] or [I142HH System copy failed (Unit-x, HDU-y)] or [I152xy Data recover failed (Unit-x, HDU-y)] or [I152HH Data recover failed (Unit-x, HDU-y)] is displayed. Take a recovery action following the messages.

(4) Confirming completion of data recovery or copy back

Select "Information Message" from the WEB (WEB "2.5 Information Message" (WEB 02-0120)) and make sure that the data recovery is completed normally.

Table 2.2.2 shows the standard of the time required of the Correction copy and the Copy back when selecting optional numbers of the Disk Drives which configure the RAID Group. The time required of the Correction copy and the Copy back also increases as the number of the FC or S-ATA Disk Drives that configures the RAID Group increases. Figure 2.2.2.2 shows the graph where the standard of the time required of the Correction copy can be confirmed in the case of all the numbers. A horizontal axis corresponds to the number of the Disk Drives, and the vertical axis corresponds to the time required of the Correction copy.

The correction copy, copy back and dynamic sparing do not operate mutually at the same time and also they do not operate at the same time for two or more Disk Drives. Therefore, when the data of two or more Disk Drives (n Disk Drives) was recovered, the time that it takes to complete recovering all the data of the n Disk Drives becomes n times the standard time.

‡1 : This message is displayed only when the Disk Drives, including the Disk Drives #0 to #4 of the RKM/RKS/RKXS or the Disk Drives #0 to #4 of the RKAJ corresponding to the unit ID#0 connected to the RKH, are replaced.

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.2.2 Standard Time Required for the Correction copy or Copy back(‡1)

Unit : min

Item		Disk Drive (G byte)(*1)			71.3	143.3	245.7	287.6	393.4	491.9
Correction copy(*2)	AMS500 AMS200	4 Disk Drives	RAID 6	(2D+2P)	25	45	250	90	390	430
		6 Disk Drives		(4D+2P)	30	55	260	120	410	430

		16 Disk Drives		(15D+1P)	-	-	760	-	1240	1480
		4 Disk Drives	RAID 1+0	(2D+2D)	-	-	250	-	390	440
		16 Disk Drives		(8D+8D)	-	-	250	-	390	440
		2 Disk Drives	RAID 1	(1D+1D)	-	-	250	-	390	440

*1 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

*2 : The time shown above is a general guideline of a recovery time for a case where no I/O operation is requested by a host computer. If an I/O operation is requested by a host computer, the time becomes longer.

‡1 : It is the standard of the correction copy time when data of one Disk Drive was recovered.

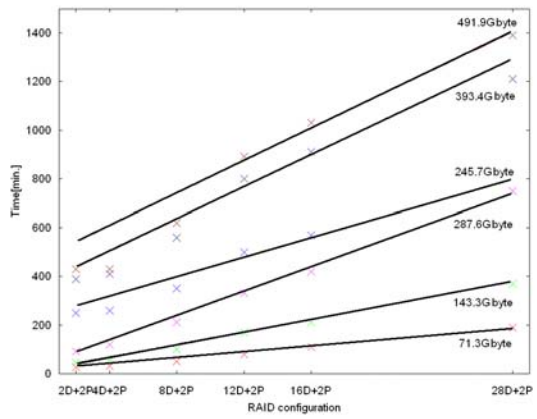
*1 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.



*2 : The time shown above is a general guideline of a recovery time for a case where no I/O operation is requested by a host computer. If an I/O operation is requested by a host computer, the time becomes longer.

2.2.2 Replacing Backup Battery Unit

The replacement of the Backup Battery Unit is work of a basic subsystem (RKM/RKS/RKXS/RKH). Select a procedure from the following and execute it.
The Backup Battery Unit differs respectively in RKM/RKS/RKXS and /RKH. Be careful not to make a mistake in part model names.

NOTE : • Only one Backup Battery Unit (ASSY) is installed in the RKS/RKXS. Replace the Backup Battery Unit (ASSY) #0 side. This Backup Battery Unit is not installed in #1 side.
• There is no battery switch in the Backup Battery Unit (ASSY) of Rev. C to be installed in the RKM/RKS.
• There is no battery switch of RKXS/RKH.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement) (In the case of RKM/RKS/RKXS/RKH)	1. When the power is turned off during the replacement, user data on the cache that has not been written on a disk is not backed up because the power is not supplied from the battery. 2. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 3. When replacing two Backup Battery Units at the same time (replacing Backup Battery Unit for the RKS/RKXS, replacing four Backup Battery Units at the same time for the RKH), the Cache is changed to the Write-Through mode (*1) and the R/W performance is somewhat deteriorated, so that replace them quickly. Also, if the Backup Battery Units (ASSY) are all removed from the Basic Chassis, the subsystem becomes the WARNING status. However, when the Backup Battery Units are all recovered normally, the WANING status of the subsystem is released. 4. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the preventive replacement after the LED lights on. 5. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	Refer to "(1) Procedure for replacement with the power turned on " (REP 02-0250).
2	Replacement with the power turned off	—	Refer to "(2) Procedure for replacement with the power turned off " (REP 02-0270).

*1 : The Write-Through means the operation to write the write data to the Disk Drive and respond to the host computer immediately after the subsystem received the write data from the host computer.
Therefore, the response time of the command to the host computer delays when the subsystem executes the Write-Through. Refer to Theory "4.3.1 Command execution" (THEO 04-0070) for the conditions to execute the Write-Through.

CAUTION

- A closed type nickel-hydrogen battery can cause an electric shock or explosion if it is handled wrongly. Observe the following requirements for handling.
  - Do not disassemble or remake the battery.
  - Do not deform the battery.
  - Do not connect plus and minus poles with a metallic article such as a wire.
  - Do not reverse the connections of plus and minus poles.
  - Do not peel off the covering tube.
  - Do not connect the battery directly to the outlet.
  - Do not connect the battery to anything other than this subsystem for charging/discharging.
  - Do not leave the battery in a hot place. Store it in a dark and cool place.
  - Do not discard a used battery at the site where it was removed for replacement.

(1) Procedure for replacement with the power turned on
(Refer to "Figure 2.2.3 Replacing Backup Battery Unit" (REP 02-0260).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100).)

(b) Turn off the battery switch of the Backup Battery Unit to be replaced.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(c) Shift the latch on the Battery Units to the Release position and pull the Battery Unit toward you until the latch pin comes out (to release the Unit).
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, loosen the screw that is fixing the latch of the Backup Battery Unit, set the latch to the Release position, and then pull out the Backup Battery Unit forward.

NOTE : Handle the Battery Unit carefully because its depth is shallow (150mm) and weight is heavy (3.0kg).

(d) Take out the Battery Unit holding its main body by your both hands.

(e) Make sure that the Battery switch on the new Backup Battery Unit has been turned off.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

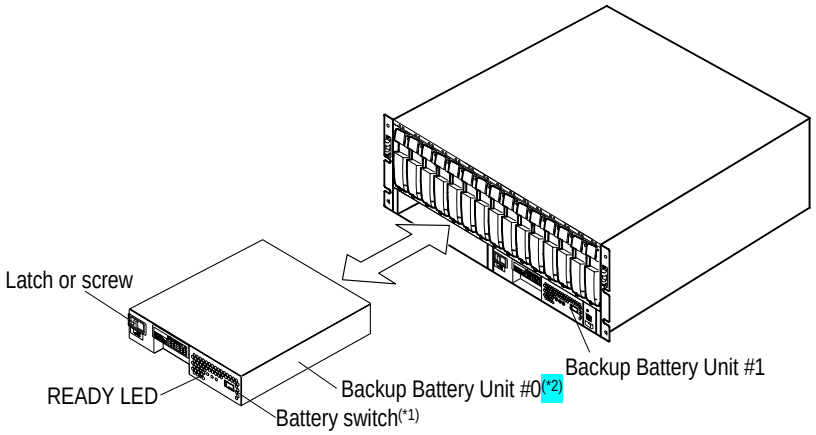
(f) Wait for more than 20 seconds, in the case of RKM/RKS, insert the new Backup Battery Unit in the specified location in the subsystem to the position where it is completely fixed until latch moves to Lock side (‡1).
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, shift the latch (fixing screw) of the new Backup Battery Unit to the Release position, and insert the subsystem. Shift the latch (fixing screw) of the Backup Battery Unit to the Lock position, tighten the latch (fixing screw).
If the Backup Battery Unit is inserted without waiting for 20 seconds, it is possible that the Backup Battery Unit is not recovered from the failure normally (‡2).

(g) Turn on the battery switch of the Backup Battery Unit.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(h) Charge the battery after the READY LED (green) on the Backup Battery Unit blinks until it changes to lighting. (Although the READY LED (green) on the Backup Battery Unit blinks during the charge, it changes to lighting when the charge is completed. It is about six hours at the maximum.)

‡1 : If the Backup Battery Unit (ASSY) is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Backup Battery Unit (ASSY) may not recover normally.

‡2 : Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Backup Battery Unit (ASSY) from the chassis once and insert it again after 20 seconds or more passed.



Copyright © 2005, 2006, Hitachi, Ltd.

(i) Check that the READY LED (green) on the Backup Battery Unit is on.
Check that the RDY LED (green) on the front of the Basic Chassis is on and the ALARM and WARN LEDs are off(‡1).
The RDY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).

(j) Refer to "Information Message" on WEB, and check to see that [I00300 Battery recovered] or [I0030x Battery recovered (Battery-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of Backup Battery Unit has completed.

(k) Attach the front bezel.

(l) Dispose of recycling the battery in the removed Backup Battery Unit. For recycling, refer to "Chapter 5. Recycling" (REP 05-0000).

*1 : In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS, there is no battery switch. Also, the latch is fixed with a screw.
*2 : Only one Backup Battery Unit (ASSY) is installed in the RKS/RKXS.
*3 : The figure shows RKM.

Figure 2.2.3 Replacing Backup Battery Unit (RKM/RKS/RKXS)

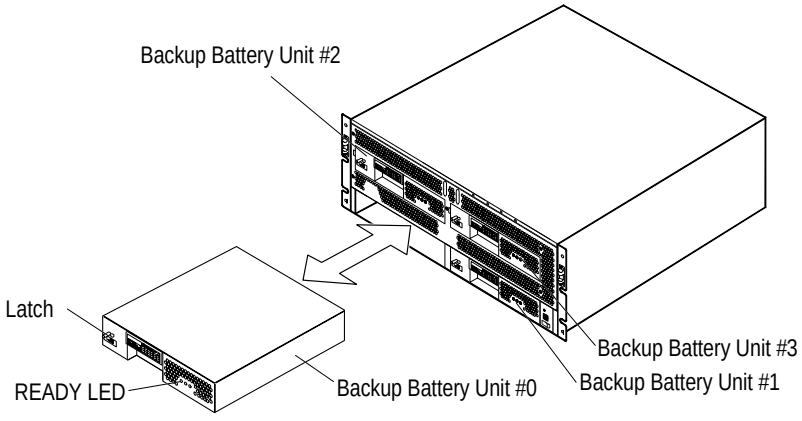


Figure 2.2.3.1 Replacing Backup Battery Unit (RKH)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off
(Refer to "Figure 2.2.3 Replacing Backup Battery Unit" (REP 02-0260).)
Check the state of Device main switch at first.
- When main switch is on ·····(2-1)
- When main switch is off ····· (2-2)

(2-1) When main switch is on
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch
(b) Check to see that PWR LED (green) on the Front Bezel turns off (POWER OFF).
If it does not go POWER OFF, connect the Maintenance PC to WEB (Refer to Troubleshooting "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).), and analyze the cause of failure.
(c) After turning off the main switch, check to see that CACHE POWER LED (green) on the Controller is off.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.
If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)

(d) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(e) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))
(f) Turn off the battery switch of the Backup Battery Unit to be replaced.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.
(g) Shift the latch of the Battery Unit to the Release position and pull out the unit toward you.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, loosen the screw that is fixing the latch of the Backup Battery Unit, set the latch to the Release position, and then pull out the Backup Battery Unit forward.

NOTE : Since the depth of a battery unit is as short as 150mm and it is as heavy as about 3.0kg, please pull out carefully.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Remove the Backup Battery Unit you holding the Backup Battery Unit main body.
(i) Make sure that the Battery switch on the new Backup Battery Unit has been turned off.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.
(j) In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, insert the new Backup Battery Unit in the specified location in the subsystem to the position where it is completely fixed until latch moves to Lock side.
In the case of RKXS/RKH, shift the latch (fixing screw) of the new Backup Battery Unit to the Release position, and insert the subsystem. Shift the latch (fixing screw) of the Backup Battery Unit to the Lock position, tighten the latch (fixing screw).
(k) Turn on the battery switch of the Backup Battery Unit.
In case of the Backup Battery Unit of REV.C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.
(l) Turn on the AC Power Unit Switch of the both Power Units.
(m) Turn on the main switch (the subsystem usually recovers in about five minutes).
(n) Charge the battery after the READY LED (green) on the Backup Battery Unit blinks until it changes to lighting. (Although the READY LED (green) on the Backup Battery Unit blinks during the charge, it changes to lighting when the charge is completed. It is about six hours at the maximum.)
(o) Check that the READY LED (green) on the Backup Battery Unit is on.
(p) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
(q) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).
(r) Attach the Front Bezel.
(s) Recycle the removed battery. For the recycling procedure, refer to "Chapter 5. Recycling" (REP 05-0000).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(2-2) When main switch is off

(a) Check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))

(d) Turn off the battery switch of the Backup Battery Unit to be replaced.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(e) Shift the latch of the Battery Unit to the Release position and pull out the unit toward you.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, loosen the screw that is fixing the latch of the Backup Battery Unit, set the latch to the Release position, and then pull out the Backup Battery Unit forward.

NOTE : Since the depth of a battery unit is as short as 150mm and it is as heavy as about 3.0kg, please pull out carefully.

(f) Remove the Backup Battery Unit you holding the Backup Battery Unit main body.

(g) Make sure that the Battery switch on the new Backup Battery Unit has been turned off.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(h) Insert the new Backup Battery Unit in the specified location in the subsystem to the position where it is completely fixed until latch moves to Lock side.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, shift the latch (fixing screw) of the new Backup Battery Unit to the Release position, and insert the subsystem. Shift the latch (fixing screw) of the Backup Battery Unit to the Lock position, tighten the latch (fixing screw).

(i) Turn on the battery switch of the Backup Battery Unit.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(j) Turn on the AC Power Unit Switch of the both Power Units.

(k) Turn on the main switch (the subsystem usually recovers in about five minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

(l) Charge the battery after the READY LED (green) on the Backup Battery Unit blinks until it changes to lighting. (Although the READY LED (green) on the Backup Battery Unit blinks during the charge, it changes to lighting when the charge is completed. It is about six hours at the maximum.)

(m) Check that the READY LED (green) on the Backup Battery Unit is on.

(n) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

(o) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

(p) Attach the Front Bezel.

(q) Recycle the removed battery. For the recycling procedure, refer to "Chapter 5. Recycling" (REP 05-0000).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.2.3 Replacing Fan Assembly

⚠ CAUTION

Since each fan is rotating with high-speed, be careful not to be caught by it.

Select a procedure from the following and execute it.

CAUTION

- The replacement of the component is restricted in time. This operation requires referring to the manual. If the subsystem is left with this component removed for more than 10 minutes, it will stop by detecting the thermal alarm.
- When the CALM LED on the Control Unit is on while the ALM LED of the Fan Assembly is on, be sure to solve the trouble of the Control Unit first.
- When replacing the Fan Assembly, do it in haste after preparing a replacement Fan Assembly and arranging cables, etc. so that they do not disturb the replacement.

The same parts are used for both of the left and right (upper and lower) Fan Assemblies of the subsystem. However, care should be taken when installing them because each of them must face a peculiar direction (up or down, or left or right).

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes and restart the fans of the Fan Assembly to rotate. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. Be sure to replace the Power Unit first when the Power Unit and the Fan Assembly fail at the same time. 3. Replace them with the power turned off in case of failures of two fans. 4. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 5. The array subsystem becomes a planned shutdown and the power supply is turned off, so that, work so not to pull out two Fan Assemblies. 6. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	See "(1) Procedure for replacement with the power turned on" (REP 02-0310)

To be continued to the next page.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Power status during the replacement	Restriction	Reference section
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	See "(2) Procedure for replacement with the power turned off" (REP 02-0330)

(1) Procedure for replacement with the power turned on
(In the case of the RKM/RKS/RKXS/RKH, refer to "Figure 2.2.5 Replacing Fan Assembly (RKM/RKS/RKXS/RKH)" (REP 02-0320).)
(In the case of the RKA, refer to "Figure 2.2.5.1 Replacing Fan Assembly (RKA)" (REP 02-0320).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Make sure that the ALM LED (red) on the Fan Assembly is on.
(b) In the case of the RKM/RKS/RKXS/RKH, loosen the screw which is fixing the lever of the Fan Assembly, open the lever, and move it forward.
In the case of the RKA, insert the key (for latch) into the latch of the Fan Assembly, slide the key to the Release position, and shift the Fan Assembly toward you holding a finger grip until the latch pin comes out (the latch is released).
(c) Remove the Fan Assembly by pulling it out holding its main body with your both hands.
(d) In the case of the RKM/RKS/RKXS/RKH, after waiting for longer than 20 seconds, and then insert the new Fan Unit into the specified position in the subsystem, raise it by fitting the hook of the lever to the cutout of the subsystem, and tighten it with the fixing screw (‡1).
In the case of the RKA, after waiting for longer than 20 seconds, push in the new Fan Assembly until it clicks the latch (‡1).
If the Fan Assembly is inserted without waiting for 20 seconds, it is possible that the Fan Assembly is not recovered from the failure normally (‡2).

NOTE : • Do not catch a ENC cable, when the Fan Assembly for the inserted.
• Place the same Fan Assembly in the right and left of the subsystem facing them in the reverse direction.

‡1 : If the Fan Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Fan Unit may not recover normally.
‡2 : Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Fan Unit from the chassis once and insert it again after 20 seconds or more passed.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Check that the status of the ALM LED (red) on the Fan Assembly changes from on to off.
(f) Check if the fans of the mounted Fan Assembly are rotating.
(g) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
(h) Refer to "Information Message" on WEB, and check to see that [I00500 FAN recovered (CTL-Unit, FAN-x)] or [I005xy (or I005HH) FAN recovered (Unit-x, FAN-y)] is indicated. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Fan Assembly has completed.

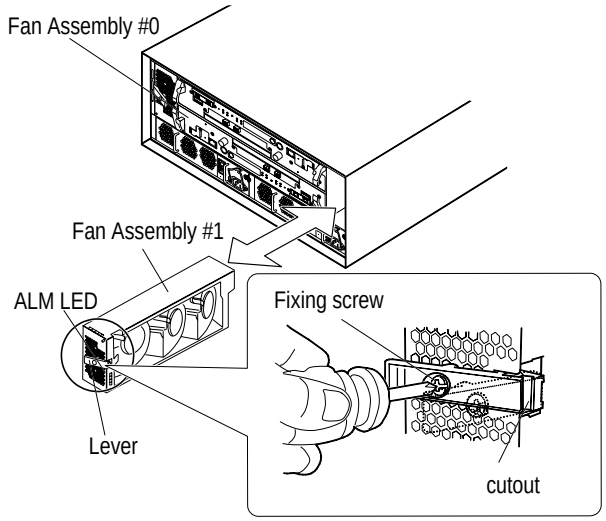

Figure 2.2.5 Replacing Fan Assembly (RKM/RKS/RKXS/RKH)

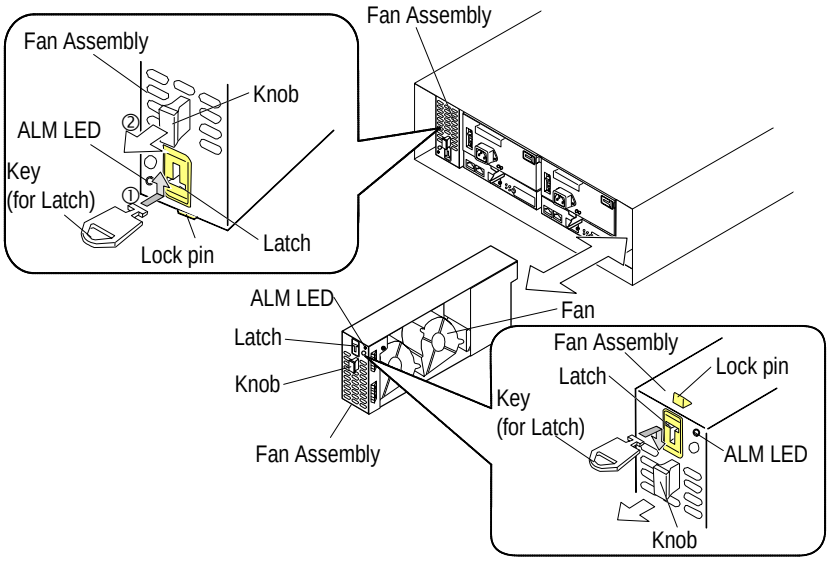

Figure 2.2.5.1 Replacing Fan Assembly (RKA)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off

(In the case of the RKM/RKS/RKXS/RKH, refer to "Figure 2.2.5 Replacing Fan Assembly (RKM/RKS/RKXS/RKH)" (REP 02-0320).)

(In the case of the RKA, refer to "Figure 2.2.5.1 Replacing Fan Assembly (RKA)" (REP 02-0320)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch.

Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the WEB.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch .

(c) In the case of the RKM/RKS/RKXS/RKH, loosen the screw which is fixing the lever of the Fan Assembly, open the lever, and move it forward.
In the case of the RKA, insert the key (for latch) into the latch of the Fan Assembly, slide the key to the Release position, and shift the Fan Assembly toward you holding a finger grip until the latch pin comes out (the latch is released).

(d) Remove the Fan Assembly by pulling it out holding its main body with your both hands.

(e) In the case of the RKM/RKS/RKXS/RKH, insert the new Fan Unit into the specified position in the subsystem, raise it by fitting the hook of the lever to the cutout of the subsystem, and tighten it with the fixing screw.
In the case of the RKA, push in the new Fan Assembly until it clicks the latch.

NOTE : • Do not catch a ENC cable, when the Fan Assembly for the inserted.
• Place the same Fan Assembly in the right and left of the subsystem facing them in the reverse direction.

Copyright © 2005, 2006, Hitachi, Ltd.

(f) Turn on the AC Power Unit Switch of the both Power Units.
(g) Turn on the main switch (the subsystem usually recovers in about five minutes).
Check that the status of the ALM LED (red) changes from on to off.
(h) Check if the fans of the mounted Fan Assembly are rotating.
(i) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
(j) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.2.4 Replacing Power Unit

The Power Unit differs respectively in RKM/RKS, RKXS/RKH, RKXS/RKAJAT/RKAJATL and RKA. Be careful not to install wrong ones by checking their part model names.

CAUTION

- The replacement of the component is restricted in time. This operation requires referring to the manual. If the subsystem is left with this component removed for more than 10 minutes, it will stop by detecting the thermal alarm.
- When a trouble of the Power Unit is detected due to a trouble of the Fan Assembly, the Power Unit does not need to be replaced.
  When a trouble of the Power Unit is detected during replacement of the Fan Assembly, pull out and then insert the Power Unit.
- When replacing the Power Unit, do it in haste after preparing a replacement Power Unit and arranging cables, etc. so that they do not disturb the replacement.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes. 2. When the Power Unit and another module fail at the same time, replace the Power Unit first. Otherwise, a powering off (subsystem down) may occur because of an abnormal temperature rise. 3. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 4. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	Refer to "(1-1) Procedure for replacement with the power turned on (Be sure to perform the following operations (a) to (j) within 10 minutes.)" (REP 02-0350)
		When both of the two power supplies are required to be replaced, be sure to replace each one of them at a time, or replace them while the power is turned off.	Refer to "(1-1) Procedure for replacement with the power turned on (Be sure to perform the following operations (a) to (j) within 10 minutes.)" (REP 02-0350)

To be continued to the next page.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Power status during the replacement	Restriction	Reference section
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	Refer to "(1-2) Procedure for replacement with the power turned off" (REP 02-0370)

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

(1-1) Procedure for replacement with the power turned on

(Be sure to perform the following operations (a) to (j) within 10 minutes.)

(Refer to "Figure 2.2.6 Replacing Power Unit" (REP 02-0360).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

(a) Check that ALARM LED (Red) of the Power Unit to be replaced is on.
Check that READY LED (Green) of the Power Unit not to be replaced is on.

NOTE : When the ALARM LEDs of Power Unit of the both systems are on, replace the Power Unit in the state in which the power is turned off.

(b) Turn on the AC Power Unit Switch of the Power Unit to be replaced.

(c) Disconnect all the power cables connected to the Power Unit to be replaced.

(d) In the case of the RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKAJATL, loosen the screw which is fixing the latch of the Power Unit, shift the latch (fixing screw) to the Release position, and move it forward by holding the handle.
In the case of the RKA, insert the key (for latch) into the latch of the Fan Assembly, slide the key to the Release position, and shift the fan unit toward you holding a handle until the latch pin comes out (the latch is released).

(e) Remove the Power Unit by pulling it out holding its main body with your both hands.

(f) Check that the AC Power Unit Switch of the new Power Unit is turned off.

(g) In the case of the RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKAJATL, after waiting for 20 seconds or more, shift the latch (fixing screw) of the new Power Unit (RKM/RKS/RKXS/RKH) to the Release position, insert it slowly into the sheet metal slit part at the top of the Power Unit (‡1), and then push it to the end.
In the case of the RKA, push the unit in until the latch makes with a click.
If you insert the Power Unit without waiting for more than 20 seconds, Power Unit may not be recovered (‡2).

NOTE : Do not catch a ENC cable, when the Power Unit for the inserted.

‡1 : If the Power Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Power Unit may not recover normally.

‡2 : Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Power Unit from the chassis once and insert it again after 20 seconds or more passed.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Connect all the removed cables.

(i) Turn on the AC Power Unit Switch of the installed Power Unit.
Check that the READY LED (green) of the Power Unit is on.

(j) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.

(k) Refer to "Information Message" on WEB, and check to see that [I006xy (or I006HH) PS recovered (Unit-x, PS-y)] or [I00600 PS recovered (CTL-Unit, PS-x)] is indicated. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Power Unit has completed.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

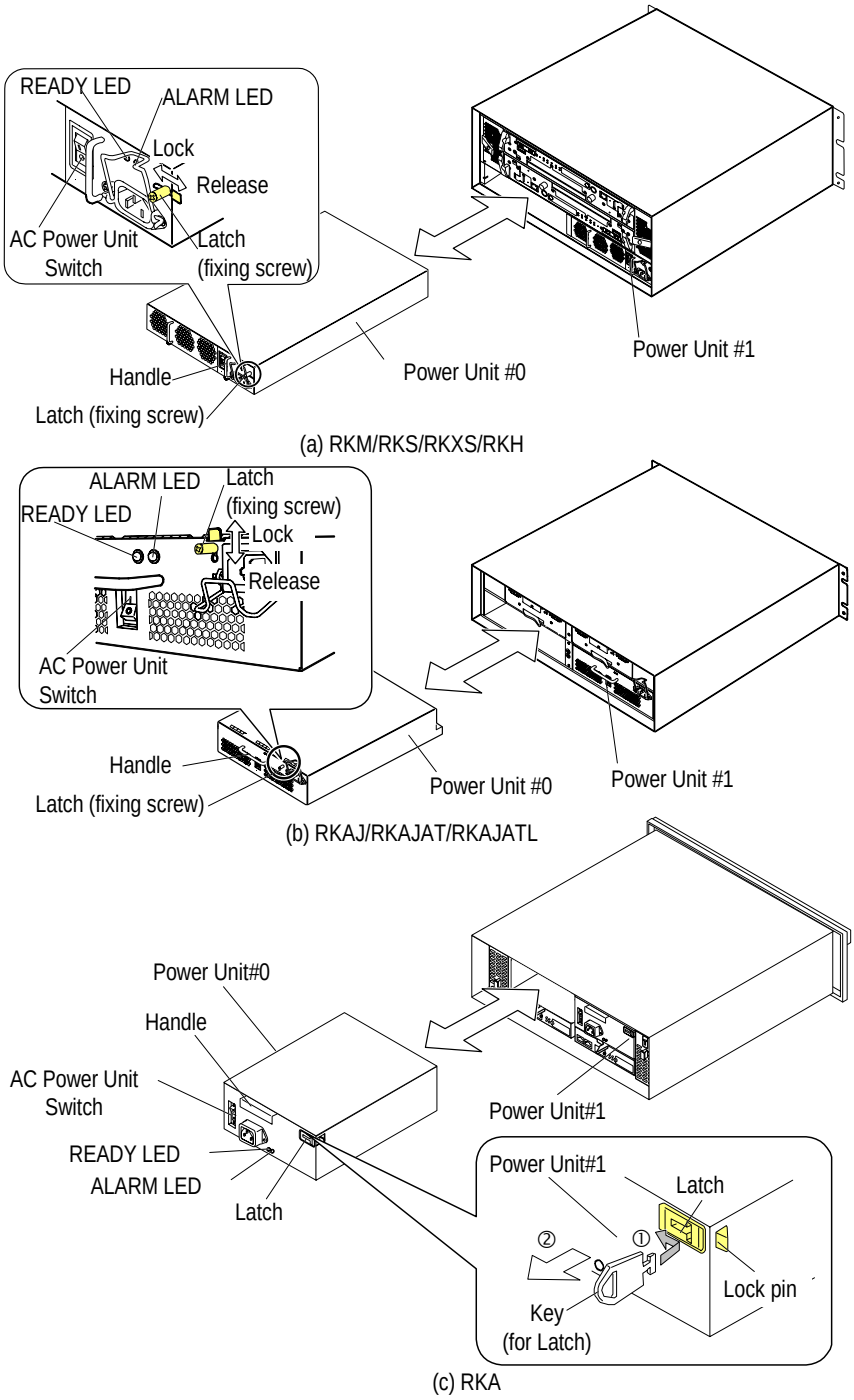

Figure 2.2.6 Replacing Power Unit

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

(1-2) Procedure for replacement with the power turned off
(Refer to "Figure 2.2.6 Replacing Power Unit" (REP 02-0360).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

(a) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the WEB.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.
(c) Remove the all cables connected to the Power Unit to be replaced.
(d) In the case of the RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKAJATL, loosen the screw which is fixing the latch of the Power Unit, shift the latch (fixing screw) to the Release position, and move it forward by holding the handle.
In the case of the RKA, insert the key (for latch) into the latch of the Fan Assembly, slide the key to the Release position, and shift the fan unit toward you holding a handle until the latch pin comes out (the latch is released).
(e) Remove the Power Unit by pulling it out holding its main body with your both hands.
(f) Make sure that the AC Power Unit Switch on the Power Unit is off.
(g) In the case of the RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKAJATL, shift the latch (fixing screw) of the new Power Unit (RKM/RKS/RKXS/RKH) to the Release position, insert it slowly into the sheet metal slit part at the top of the Power Unit, and then push it to the end.
In the case of the RKA, push the unit in until the latch makes with a click.

NOTE : Do not catch a ENC cable, when the AC Power Unit for the inserted.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Connect the all cables as they were before.

(i) Turn on the AC Power Unit Switch of the both Power Units, and then turn on the main switch. Check that the READY LEDs (green) of the both Power Units are on (the subsystem usually recovers in about five minutes).

(j) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

(k) When the remote adapter is connected, check that the LED of the Remote Adapter connected is on.

(l) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

2.2.5 Replacing Control Unit

When replacing it online while the NAS unit is connected, check the fail over of the NAS Unit (NNC) before the performance, and check the fail back after the replacement(Refer to the DF700 NAS SOFTWARE Maintenance Manual "Table 7.3-2 Hardware Failures" (NAS 07-0120) (#19)).

The following two types of Basic Chassis exist in the SANRISE AMS1000.

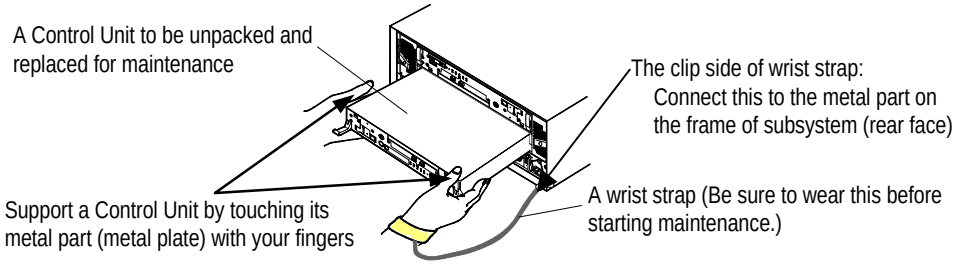
- DF-700-RKH (abbr.: RKH)
- DF-700-RKHE (abbr.: RKHE)

The Control Unit of the RKH and the Control Unit of the RKHE cannot be mixed in this Basic Chassis.
This manual does not describe the RKHE except for the following differences.
When the RKHE is used, it becomes the same procedure as the RKH. Therefore, read the RKH as the RKHE excluding the part described in parallel and use it.

Differences between the RKH and the RKHE

Chassis Name	Installed Control Unit Model Name	Processor (Control CPU)	Control Memory (L2 Cache Memory)
RKH	DF-F700-F1JH	POWER PC 7447A (1.4GHz)	512 K bytes
RKHE	DF-F700-F2JH	POWER PC 7448 (1.7GHz)	1 M bytes

CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, 2006, Hitachi, Ltd.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. The procedure varies depending on whether the CALM LED, EALM LED or RST LED is on or off. 3. Replace the Control Unit after blocking the Control Unit to be replaced. 4. When replacing Control Unit of both systems (CTL 0 and CTL 1), power off the subsystem before the replacement. 5. In the case of the single Controller configuration, perform the replacement after turning off the power. 6. In the case of Preventive replacement, there may be an error report in the host computer depending on the operating conditions of the host computer. The prior contact to the customer is required. 7. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 8. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	When the CALM LED is on • In the case of the RKM/RKS : See "(1-1) When the CALM LED, EALM LED or RST LED of the RKM/RKS/RKXS/RKH is on" (REP 02-0410). When the CALM LED is off (Preventive replacement) • In the case of the RKM/RKS : See "(1-2) When the CALM LED, EALM LED or RST LED of the RKM/RKS/RKXS/RKH is off"" (REP 02-0460).
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	"(2) Procedure for replacement with the power turned off" (REP 02-0500).
3	Replacement to be made with the power turned off (with the cache memory data volatilized forcibly)	1. Make the replacement after getting a permission of the Technical Support Center because user data in the cache will be lost. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 3. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	"(3) Procedure for replacement with the power turned off (with the cache memory data volatilized forcibly)" (REP 02-0520).

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for replacement with the power turned on (for the case of the dual Controller configuration only)

(1-1) When the CALM LED, EALM LED or RST LED of the RKM/RKS/RKXS is on
(Refer to "Figure 2.2.7 Control Unit replacement and LED locations (RKS/RKXS)" (REP 02-0440), "Figure 2.2.7.3 Control Unit replacement and LED locations (RKM)" (REP 02-0450) and "Figure 2.2.7.5 Control Unit replacement and LED locations (RKH)" (REP 02-0451).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

NOTE :
- Do not replace the Control Unit which operates normally.
  Before replacing the Control Unit, confirm that it is the CALM LED (red), EALM LED (red) or RST LED (orange) in on.
- When replacing the Control Unit while the subsystem power is turned on, be sure to replace them one by one. When replacing the Control Unit of the both systems (Control Unit#0 and Control Unit#1) at the same time, follow the procedure explained in "(2) Procedure for replacement with the power turned off" (REP 02-0500).
- System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually is required.
- When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
- Replace the Control Unit after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) Make sure that the CALM LED (red), EALM LED (red) or RST LED (orange) on the Control Unit to be replaced is on.

(b) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit to be replaced is installed.

(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(d) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Remove the all cables connected to the Control Unit. (When the Additional Chassis of Rack Mount Style is connected, disconnect the ENC cable also.)

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) When the Interface Board is not installed in the removed Control Unit, remove the host connector.
(h) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(i) Remove the Cache Unit mounted on the Control Unit.
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Cache Unit temporarily in the place where the anti-static measures are taken.

(j) When the Interface Board is installed in the removed Control Unit, remove that Interface Board.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was removed, loosen the screws of the connector cover for the maintenance of the Control Unit and remove the Panel.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover of the new Control Unit, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

NOTE : Use the Control Unit whose model name is the DF-F700-F1JH for the RKH.
Use the Control Unit whose model name is the DF-F700-F2JH for the RKHE.

(l) Be sure to install the removed Cache memory in the position with the same slot number as before in the new Control Unit.
(m) When the Interface Board was removed from the removed Control Unit, install the Interface Board fitting it to the positioning pin of the new Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was installed, loosen the screws of the connector cover for the maintenance of the new Control Unit, attach the removed Panel, and fix it by tightening the screws.

Copyright © 2005, 2006, Hitachi, Ltd.

(n) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

Copyright © 2005, 2006, Hitachi, Ltd.

(o) Connect the removed interlocking cable to the new Control Unit when the special UPS is connected.
(p) When the host connector was removed from the removed Control Unit, install that host connector in the new Control Unit.
(q) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out.
(r) When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (s).

NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(s) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.
(t) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next (‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if “I1G300 CTL recovery start” is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB.
(There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When pushing the levers at the same time in the direction shown by the arrows (⟵), perform this operation within one minute. If it has taken more than one minute to perform the operation, it may not be recovered. In this case, execute the replacement procedure again. Nevertheless, if it is not recovered, perform the Control Unit replacement since the failure may be caused in the Control Unit.

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until “I1GZ00 The spin up of disk drives completed” is displayed for the RAID Group that “I1GY00 The request of spin up of disk drives is accepted” is displayed in “Information Message” on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off (“I1G300 CTL recovery start” is not displayed in “Information Message” on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(u) Make sure that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). (The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)

(v) Connect the removed all cables to the Control Unit.

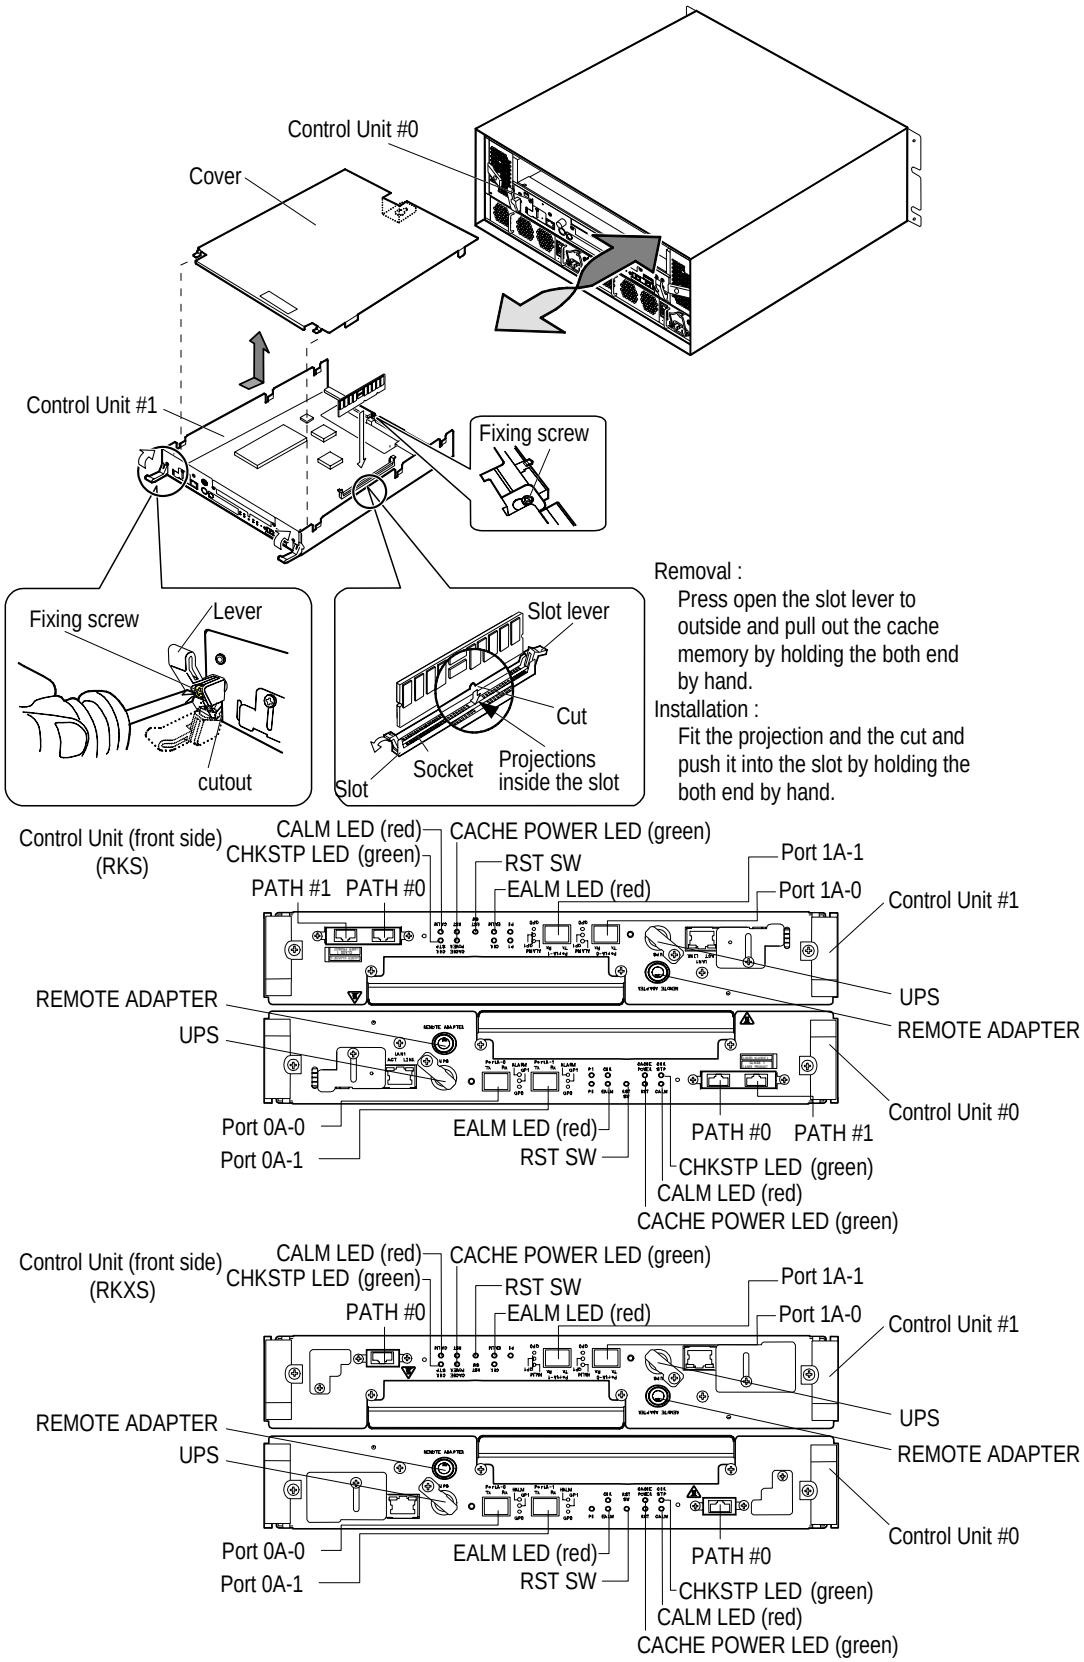
NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(w) Check that the READY LED (green) on the front of the Basic Chassis is on. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
In case of the RKXS, when the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.

(x) Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Control Unit has completed.
Check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to the Information Message on WEB when the Basic Chassis is the RKH/RKHE. (‡2)

(y) Check that the LED of the remote adaptor connected to the Control Unit is installed lights on when the remote adaptor is connected.

(z) Check that the maintenance port IP address is set correctly.
When the maintenance port IP address is displayed as "0.0.0.0", set it.
Refer to System Parameter "4.2 (4) Setting of Maintenance LAN" (SYSPR 04-0100).



‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

‡2 : Perform the maintenance referring to the recovery method of this message when "I5390x The CTL type different from the other CTL was detected" is displayed while the Control Unit is upgraded from the RKH to the RKHE.

(1-2) When the CALM LED, EALM LED or RST LED of the RKM/RKS/RKXS is off
(Refer to "Figure 2.2.7 Control Unit replacement and LED locations (RKS/RKXS)" (REP 02-0440), "Figure 2.2.7.3 Control Unit replacement and LED locations (RKM)" (REP 02-0450) and "Figure 2.2.7.5 Control Unit replacement and LED locations (RKH)" (REP 02-0451).)

NOTE : • When replacing the Control Unit while the subsystem power is turned on, be sure to replace them one by one. When replacing the Control Unit of the both systems (Control Unit #0 and Control Unit #1) at the same time, follow the procedure explained in "(2) Procedure for replacement with the power turned off" (REP 02-0500).
• System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.
• When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
• There may be an error report in the host computer depending on the operating conditions of the host computer.
The prior contact to the customer is required.
• Replace the Control Unit after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) For preventive detaching of the Control Unit, press RST SW.
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).
Make sure that the CALM LED (red), EALM LED (red) or RST LED (orange) turns on within one second and the WARNING LED (orange) on the Front Bezel blinks.
(b) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit to be replaced is installed.
(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.
(d) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.
(e) Remove the all cables connected to the Control Unit that was blocked for prevention against a failure. (When the Additional Chassis of Rack Mount Style is connected, disconnect the ENC cable also.)

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) When the Interface Board is not installed in the removed Control Unit, remove the host connector.
(h) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(i) Remove the Cache Unit mounted on the Control Unit.
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Interface Board and Cache Unit temporarily in the place where the anti-static measures are taken.

(j) When the interface board is installed in the removed Control Unit, remove that Interface Board.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was removed, loosen the screws of the connector cover for the maintenance of the Control Unit and remove the Panel.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover of the new Control Unit, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

NOTE : Use the Control Unit whose model name is the DF-F700-F1JH for the RKH.
Use the Control Unit whose model name is the DF-F700-F2JH for the RKHE.

(l) Be sure to install the removed Cache memory in the position with the same slot number as before in the new Control Unit.
(m) When the Interface Board was removed from the removed Control Unit, install the Interface Board fitting it to the positioning pin of the new Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was installed, loosen the screws of the connector cover for the maintenance of the new Control Unit, attach the removed Panel, and fix it by tightening the screws.
(n) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(o) Connect the removed interlocking cable to the new Control Unit when the special UPS is connected.
(p) When the host connector was removed from the removed Control Unit, install that host connector in the new Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(q) When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (r).

NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(r) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.

(s) Wait for more than 20 seconds, and then insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next (‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When pushing the levers at the same time in the direction shown by the arrows (⟵), perform this operation within one minute. If it has taken more than one minute to perform the operation, it may not be recovered. In this case, execute the replacement procedure again. Nevertheless, if it is not recovered, perform the Control Unit replacement since the failure may be caused in the Control Unit.

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off ("I1G300 CTL recovery start" is not displayed in "Information Message" on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.

‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(t) Make sure that the WARNING LED (orange) on the Front Bezel is off(‡1).
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)
If WARNING LED (orange) is on, replace the Control Unit again.
If WARNING LED (orange) is blinking, make sure WARNING LED (orange) goes off by referring to WEB.

(u) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(v) Make sure that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
In case of the RKXS, when the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.

(w) Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Control Unit has completed.
Check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to the Information Message on WEB when the Basic Chassis is the RKH/RKHE. (‡2)

(x) Check that the LED of the remote adaptor connected to the Control Unit is installed lights on when the remote adaptor is connected.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

‡2 : Perform the maintenance referring to the recovery method of this message when "I5390x The CTL type different from the other CTL was detected" is displayed while the Control Unit is upgraded from the RKH to the RKHE.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off

(Refer to "Figure 2.2.7 Control Unit replacement and LED locations (RKS/RKXS)" (REP 02-0440), "Figure 2.2.7.3 Control Unit replacement and LED locations (RKM)" (REP 02-0450) and "Figure 2.2.7.5 Control Unit replacement and LED locations (RKH)" (REP 02-0451).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

(a) Confirm the installation location of the Control Unit whose CALM LED (red), EALM LED (red) or RST LED (orange) is on.

(b) Turn off the main switch.

Make sure that the POWER LED (green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(c) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(d) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(e) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) When the Interface Board is not installed in the removed Control Unit, remove the host connector.
(h) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(i) Remove the Cache Unit mounted on the Control Unit.
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Interface Board and Cache Unit temporarily in the place where the anti-static measures are taken.

(j) When the interface board is installed in the removed Control Unit, remove that Interface Board.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was removed, loosen the screws of the connector cover for the maintenance of the Control Unit and remove the Panel.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover of the new Control Unit, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

NOTE : Use the Control Unit whose model name is the DF-F700-F1JH for the RKH.
Use the Control Unit whose model name is the DF-F700-F2JH for the RKHE.

(l) Be sure to install the removed Cache memory in the position with the same slot number as before in the new Control Unit.
(m) When the Interface Board was removed from the removed Control Unit, install the Interface Board fitting it to the positioning pin of the new Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted. Install the Interface Board making its sheet metal part face inside of the Control Unit. When the NAS Interface Board for the RKM/RKS/RKXS was installed, loosen the screws of the connector cover for the maintenance of the new Control Unit, attach the removed Panel, and fix it by tightening the screws.
(n) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(o) When the host connector was removed from the removed Control Unit, install that host connector in the new Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(p) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(q) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(r) Turn on the AC Power Unit Switch of the both Power Units.
(s) Turn on the main switch. (Usually the Control Unit recovers in about five minutes.)
Check that the WARNING LED (orange) on the front of the Basic Chassis gone out(‡1).
(t) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
In case of the RKXS, when the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.
(u) Check that "I10000 Subsystem is ready" is displayed referring to the Information Message on WEB.
(v) Check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to the Information Message on WEB when the Basic Chassis is the RKH/RKHE. (‡2)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.
‡2 : Perform the maintenance referring to the recovery method of this message when "I5390x The CTL type different from the other CTL was detected" is displayed while the Control Unit is upgraded from the RKH to the RKHE.

Copyright © 2006, Hitachi, Ltd.

(w) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

Copyright © 2006, Hitachi, Ltd.

(3) Procedure for replacement with the power turned off (with the cache memory data volatilized forcibly)
(Refer to "Figure 2.2.7 Control Unit replacement and LED locations (RKS/RKXS)" (REP 02-0440), "Figure 2.2.7.3 Control Unit replacement and LED locations (RKM)" (REP 02-0450) and "Figure 2.2.7.5 Control Unit replacement and LED locations (RKH)" (REP 02-0451).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

NOTE : When doing the following works, get a permission of the Technical Support Center. When replacing the controller with the power turned on (with the cache memory data not volatilized) in a maintenance work, refer to procedure "(2) Procedure for replacement with the power turned off" (REP 02-0500).

(a) Confirm the installation location of the Control Unit whose CALM LED (red), EALM LED (red) or RST LED (orange)is on.
(b) Turn off the AC Power Unit Switch of the both Power Units.
(c) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off
In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.
(d) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.
(e) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) When the Interface Board is not installed in the removed Control Unit, remove the host connector.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(i) Remove the Cache Unit.
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the ends of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(j) When the interface board is installed in the removed Control Unit, remove that Interface Board. Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was removed, loosen the screws of the connector cover for the maintenance of the Control Unit and remove the Panel.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover of the new Control Unit, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

NOTE : Use the Control Unit whose model name is the DF-F700-F1JH for the RKH.
Use the Control Unit whose model name is the DF-F700-F2JH for the RKHE.

(l) Be sure to install the removed Cache memory in the position with the same slot number as before in the new Control Unit.

(m) When the Interface Board was removed from the removed Control Unit, install the Interface Board fitting it to the positioning pin of the new Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted. Install the Interface Board making its sheet metal part face inside of the Control Unit.
When the NAS Interface Board for the RKM/RKS/RKXS was installed, loosen the screws of the connector cover for the maintenance of the new Control Unit, attach the removed Panel, and fix it by tightening the screws.

(n) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(o) When the host connector was removed from the removed Control Unit, install that host connector in the new Control Unit.

(p) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE :
- Do not catch a ENC cable, when the Control Unit for the inserted.
- The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2005, 2006, Hitachi, Ltd.

(q) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(r) Turn on the AC Power Unit Switch of the both Power Units.
(s) Turn on the main switch. (Usually the Control Unit recovers in about five minutes.)
(t) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
In case of the RKXS, when the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.
(u) Check that "I10000 Subsystem is ready" is displayed referring to the Information Message on WEB.
(v) Check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to the Information Message on WEB when the Basic Chassis is the RKH/RKHE. (‡2)
(w) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.
‡2 : Perform the maintenance referring to the recovery method of this message when "I5390x The CTL type different from the other CTL was detected" is displayed while the Control Unit is upgraded from the RKH to the RKHE.

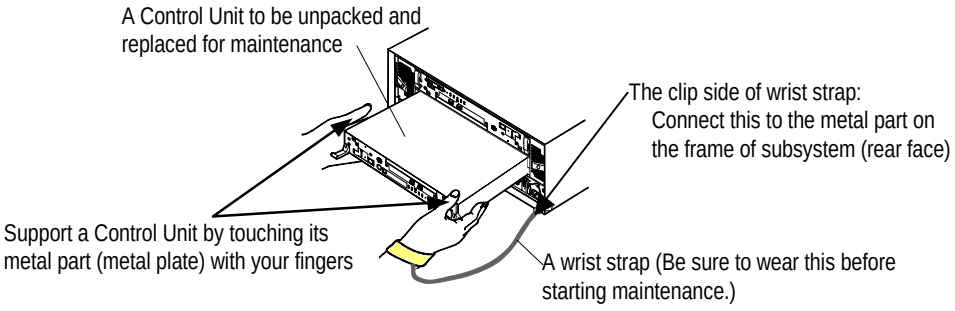
2.2.6 Replacing Cache Unit

When replacing it online while the NAS is connected, check the fail over of the NAS Unit (NNC) before the performance, and check the fail back after the replacement.
(Refer to the DF700 NAS SOFTWARE Maintenance Manual "7.7 NAS Hardware Replacement When a Failure Occurs")

CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

Replace the specified slot number only for the Cache memory replacement.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. The procedure varies depending on whether the CALM LED or EALM LED is on or off. 3. Replace the Control Unit after blocking the Control Unit to be replaced. 4. When replacing Control Unit of both systems (CTL 0 and CTL 1), power off the subsystem before the replacement. 5. In the case of the single Controller configuration, perform the replacement after turning off the power. 6. In the case of Preventive replacement, there may be an error report in the host computer depending on the operating conditions of the host computer. The prior contact to the customer is required. 7. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 8. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	When the CALM LED is on • In the case of the RKM/RKS : See "(1-1) When the CALM LED of the RKM/RKS/RKXS/ RKH on the Control Unit is on" (REP 02-0560). When the CALM LED is off (Preventive replacement) • In the case of the RKM/RKS : See "(1-2) When the CALM LED of the RKM/RKS/RKXS/ RKH on the Control Unit is off" (REP 02-0610).
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	• In the case of the RKM/RKS : See "(2) Procedure for replacement with the power turned off" (REP 02-0640).

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for replacement with the power turned on

(1-1) When the CALM LED of the RKM/RKS/RKXS/RKH on the Control Unit is on

(Refer to "Figure 2.2.8 Cache Memory replacement and LED locations (RKS/RKXS)" (REP 02-0590), "Figure 2.2.8.1 Cache Memory replacement and LED locations (RKM)" (REP 02-0600) and "Figure 2.2.8.2 Cache Memory replacement and LED locations (RKH)" (REP 02-0601).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

NOTE :
- Do not replace the Control Unit which operates normally. Before replacing the Control Unit, confirm that it is blocked (the CALM LED (RED) in on).
- System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.
- When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
- Replace the Cache Unit after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) Make sure that CALM LED (RED) on the Control Unit mounting the Cache Unit to be replaced lights up. If it does not light up, remove the Cache memory following "(1-2) When the CALM LED of the RKM/RKS/RKXS/RKH on the Control Unit is off" (REP 02-0610).

(b) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit installing the Cache memory that is not replaced in DF700 are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit in which the Cache memory to be replaced is installed.

(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(d) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.

(e) Remove all the power cables connected to the Control Unit mounting the Cache Unit to be replaced.

NOTE :
- When the cable cannot be removed easily, do not pull it by force. Besides, the cable can be damaged if it is bent upward or downward forcibly.
- When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Copyright © 2005, 2006, Hitachi, Ltd.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(h) Remove the Cache Unit, in which the failure occurred, after recording its installation location, capacity, and model name.
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed. Install the Interface Board making its sheet steel part face inside of the Control Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(i) Install the new Cache Unit to the Control Unit.

NOTE : • Install the new Cache Unit in the removed slot #.
• Install a new Cache Unit with the same capacity as that of the former one in the same slot
• For the RKH, install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively, and make the capacity and the installation position of the Control Unit #0 and the Control Unit #1 the same.

(j) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(k) Connect the removed interlocking cable to the Control Unit when the special UPS is connected.
(l) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out. If the controller is inserted before 20 seconds has elapsed, the Control Unit may not be recovered normally.
(m) When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (n).

NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(n) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(o) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next(‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When returning the levers in the arrow directions (⟶) at the same time, operate them within one second. If the operation takes longer than one second, the Control Unit may not be recovered. If it occurs, execute the recovery procedure once again. If the Control Unit is not recovered in spite of the re-execution, replace the Control Unit because it may be faulty.

(p) Check that the CALM LED (red) on the Control Unit is off.
(q) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡3).
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off ("I1G300 CTL recovery start" is not displayed in "Information Message" on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.
‡3 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(r) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(s) Check that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.

(t) Check that "I0010x CTL recovered (CTL-x)" is displayed referring to the Information Message window on WEB. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Cache Unit has completed.

(u) Check that the LED of the remote adaptor connected to the Control Unit in which the replaced Cache memory is installed lights on when the remote adaptor is connected.

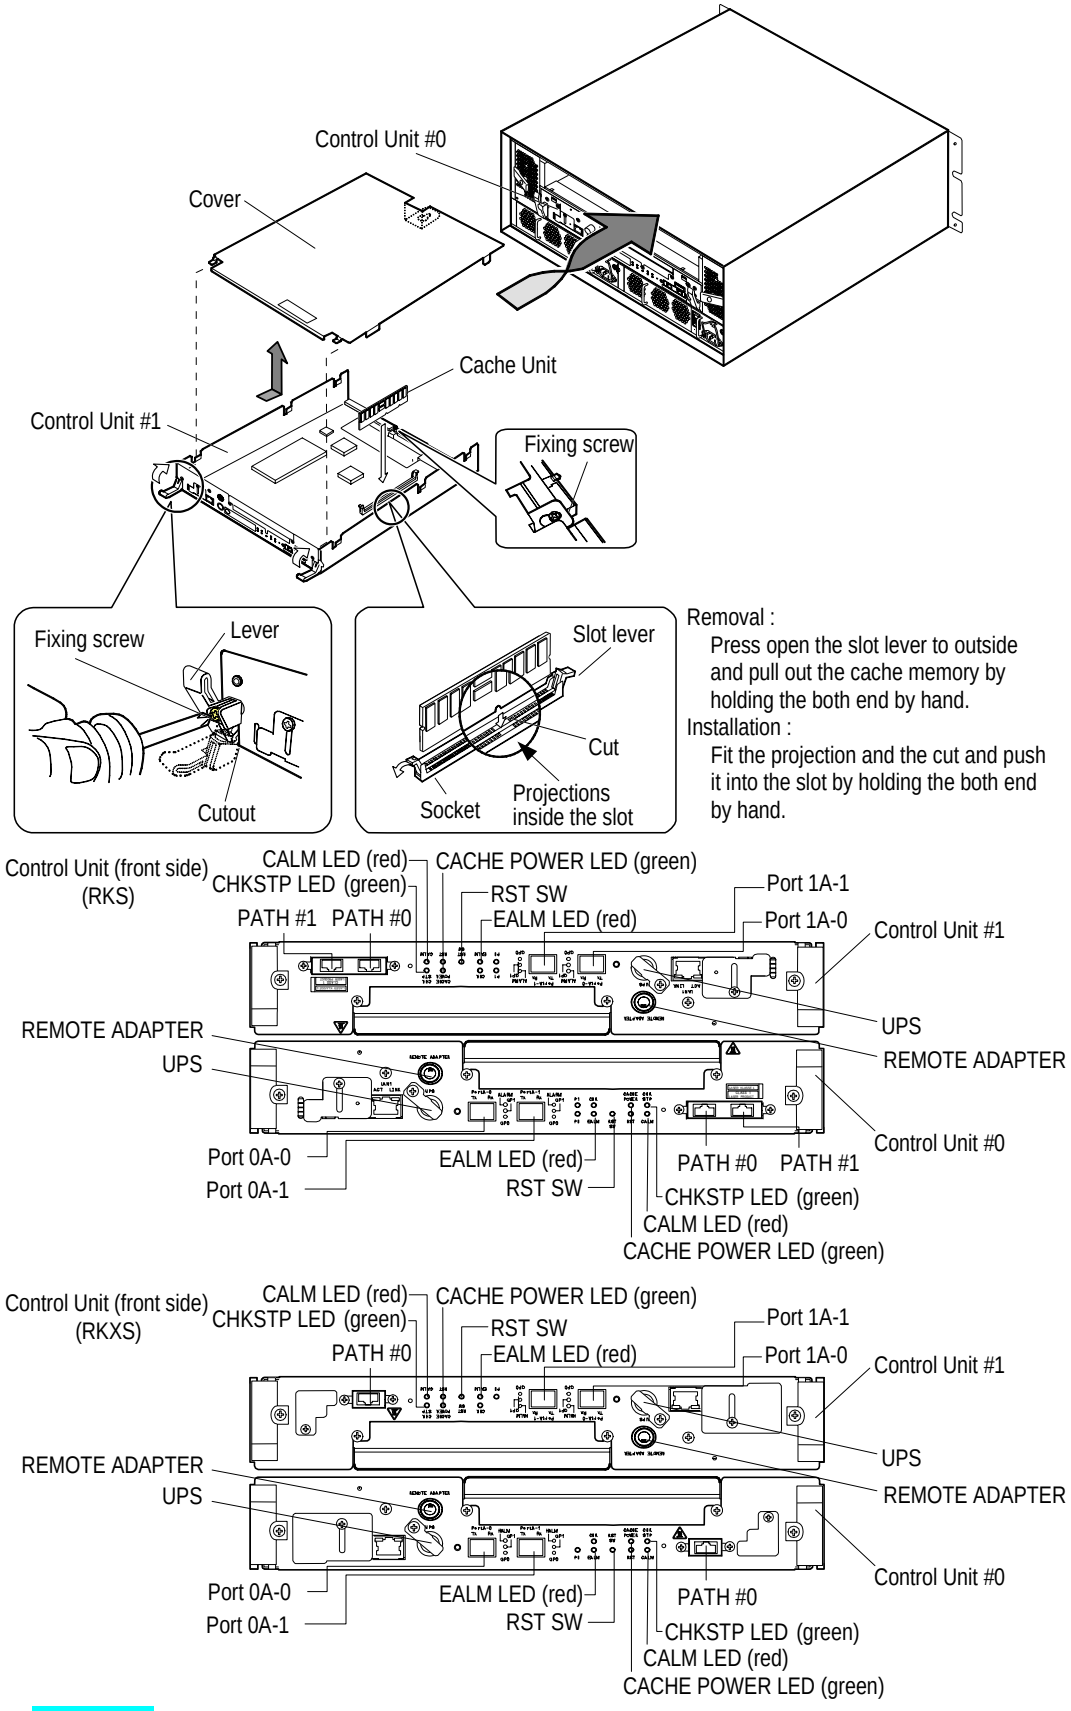

Figure 2.2.8 Cache Memory replacement and LED locations (RKS/RKXS)

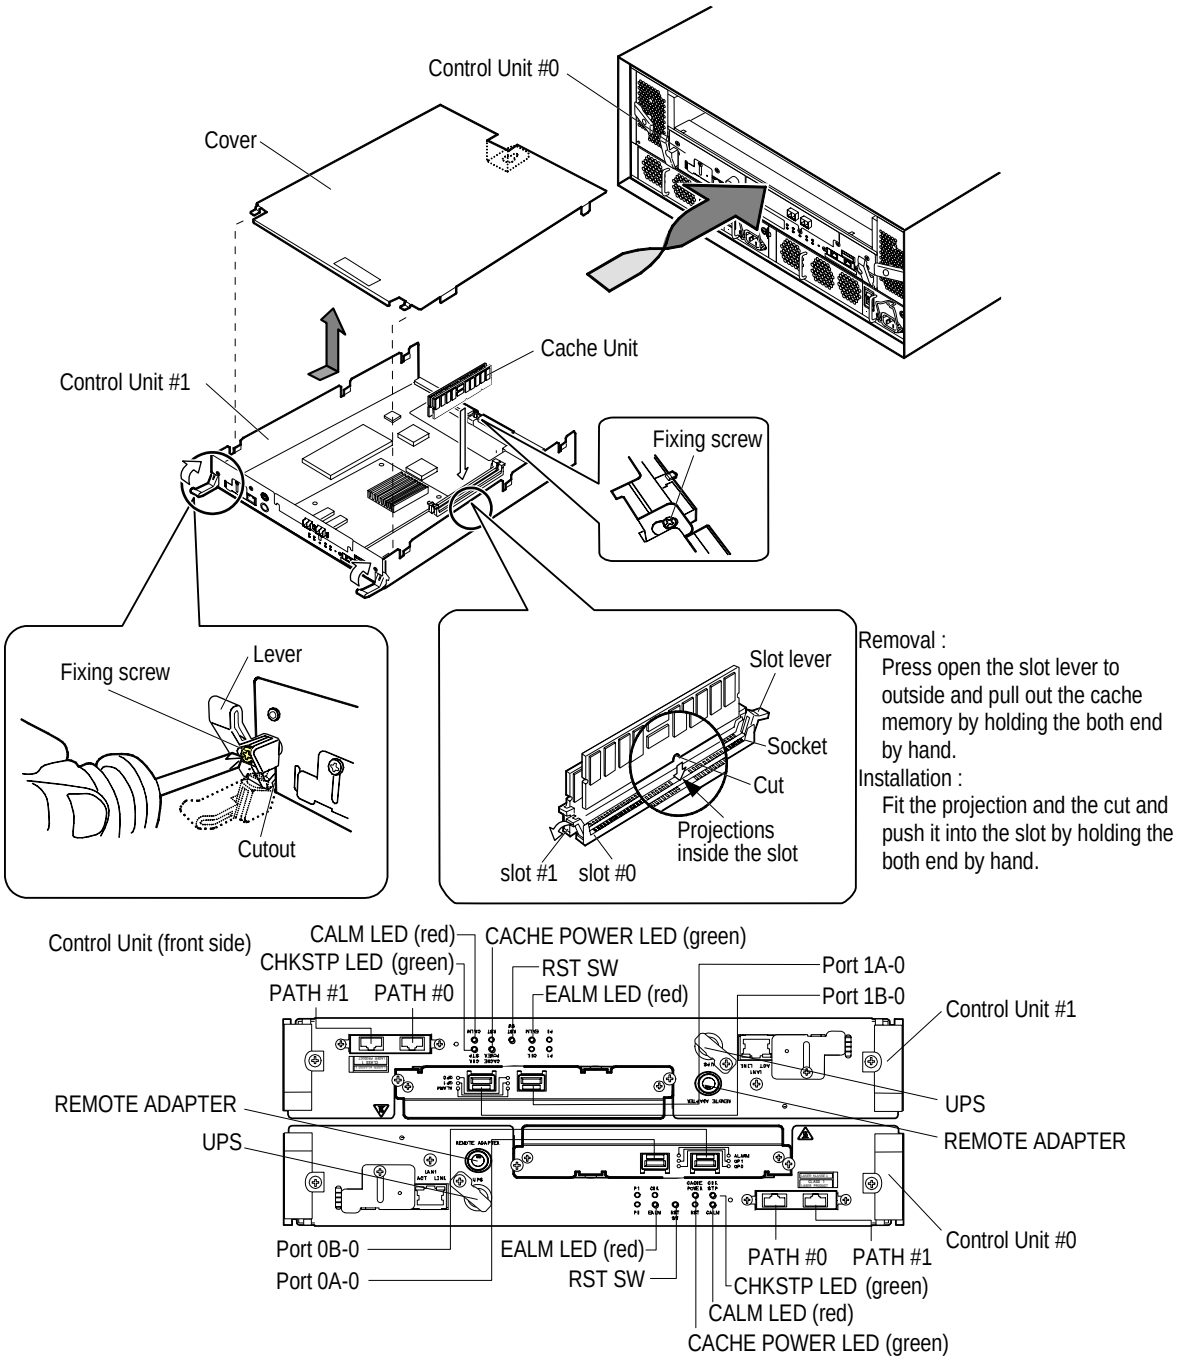
Copyright © 2005, 2006, Hitachi, Ltd.



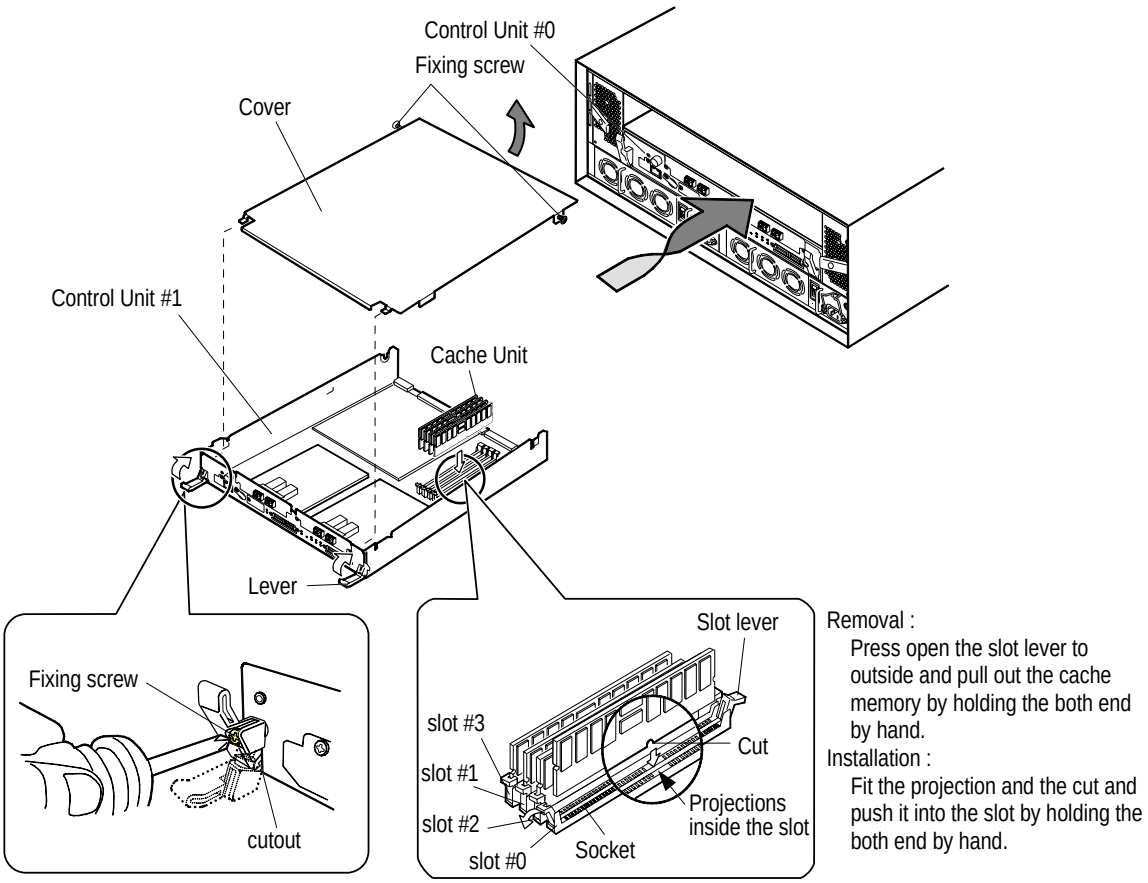


Figure 2.2.8.1 Cache Memory replacement and LED locations (RKM)

Copyright © 2006, Hitachi, Ltd.

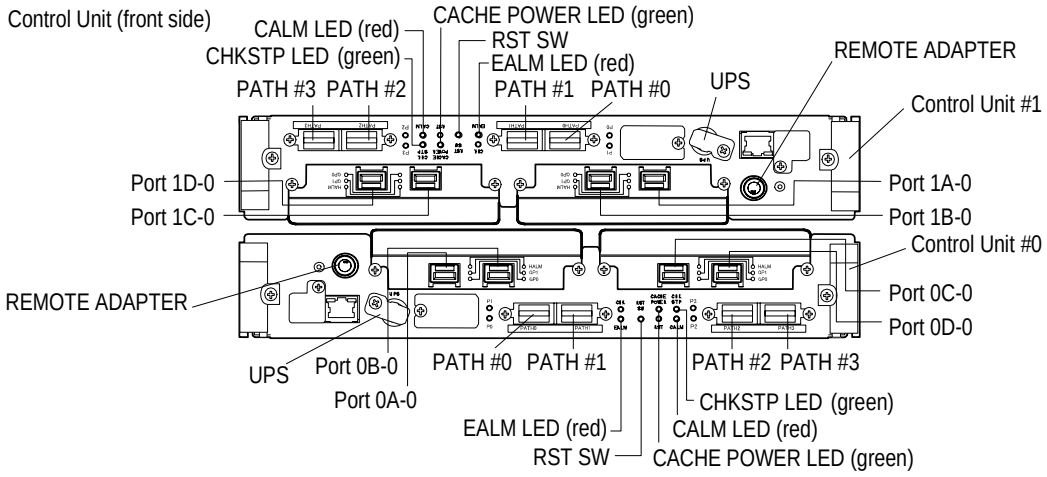

Figure 2.2.8.2 Cache Memory replacement and LED locations (RKH)

Copyright © 2006, Hitachi, Ltd.

(1-2) When the CALM LED of the RKM/RKS/RKXS/RKH on the Control Unit is off
(Refer to "Figure 2.2.8 Cache Memory replacement and LED locations (RKS/RKXS)" (REP 02-0590), "Figure 2.2.8.1 Cache Memory replacement and LED locations (RKM)" (REP 02-0600) and "Figure 2.2.8.2 Cache Memory replacement and LED locations (RKH)" (REP 02-0601).)

NOTE : • System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.
• When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
• There may be an error report in the host computer depending on the operating conditions of the host computer.
The prior contact to the customer is required.
• Replace the Cache Unit after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) Press the RST SW on the Control Unit, in which the Cache Unit to be replaced is installed, and make sure that the CALM LED (red) comes on. Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter). If not, remove the Cache Unit following the "(2) Procedure for replacement with the power turned off" (REP 02-0640).
(b) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit installing the Cache memory that is not replaced in DF700 are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit in which the Cache memory to be replaced is installed.
(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.
(d) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.
(e) Remove the all cables connected to the Control Unit on which the Cache Unit to be replaced is mounted.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

Copyright © 2005, 2006, Hitachi, Ltd.

(f) Remove the Control Unit by pulling it out toward you.

(g) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(h) Remove the Cache Unit to be replaced for the purpose of preventive maintenance after recording its installation location, capacity, and model name. Install the Interface Board making its sheet steel part face inside of the Control Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(i) Install the Cache Unit in the Control Unit.

NOTE : • Install the new Cache Unit in the removed slot #.
• Install a new Cache Unit with the same capacity as that of the former one in the same slot
• For the RKH, install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively, and make the capacity and the installation position of the Control Unit #0 and the Control Unit #1 the same.

(j) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(k) Connect the removed interlocking cable to the Control Unit when the special UPS is connected.

(l) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out. If the controller is inserted before 20 seconds has elapsed, the Control Unit may not be recovered normally.

(m)When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (n).

NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(n) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(o) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next(‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When returning the levers in the arrow directions (⟶) at the same time, operate them within one second. If the operation takes longer than one second, the Control Unit may not be recovered. If it occurs, execute the recovery procedure once again. If the Control Unit is not recovered in spite of the re-execution, replace the Control Unit because it may be faulty.

(p) Check that the CALM LED (red) on the Control Unit is off.
(q) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡3).
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)
(r) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off ("I1G300 CTL recovery start" is not displayed in "Information Message" on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.
‡3 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(s) Check that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.

(t) Check that "I0010x CTL recovered (CTL-x)" is displayed referring to the Information Message window on WEB. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Cache Unit has completed.

(u) Check that the LED of the remote adaptor connected to the Control Unit in which the replaced Cache memory is installed lights on when the remote adaptor is connected.

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off
(Refer to "Figure 2.2.8 Cache Memory replacement and LED locations (RKS/RKXS)" (REP 02-0590), "Figure 2.2.8.1 Cache Memory replacement and LED locations (RKM)" (REP 02-0600) and "Figure 2.2.8.2 Cache Memory replacement and LED locations (RKH)" (REP 02-0601).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(d) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(e) Remove the Control Unit by pulling it out toward you.

(f) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(g) Remove the Cache Unit, in which the failure occurred, after recording its installation location, capacity, and model name. Install the Interface Board making its sheet steel part face inside of the Control Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Install the Cache Unit in the Control Unit.

NOTE : • Install the new Cache Unit in the removed slot #.
• Install a new Cache Unit with the same capacity as that of the former one in the same slot
• For the RKH, install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively, and make the capacity and the installation position of the Control Unit #0 and the Control Unit #1 the same.

(i) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(j) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(k) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(l) Turn on the AC Power Unit Switch of the both Power Units.
(m) Turn on the main switch (the subsystem usually recovers in about five minutes).
(n) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
(o) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

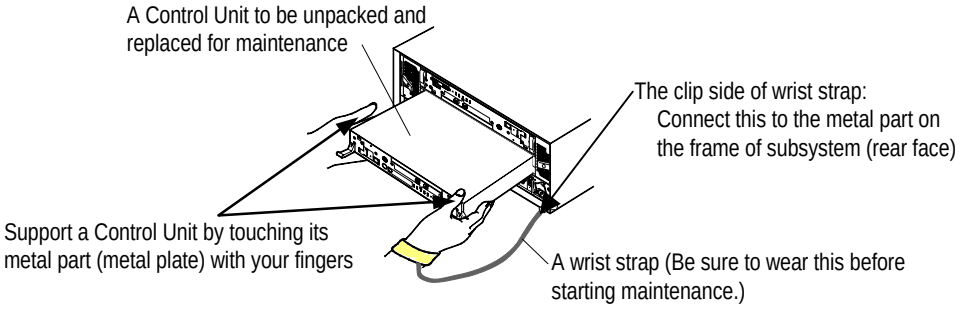
‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

2.2.7 Replacing Interface Board

When replacing it online while the NAS unit is connected, check the fail over of the NAS Unit (NNC) before the performance, and check the fail back after the replacement.
(Refer to the DF700 NAS SOFTWARE Maintenance Manual "Table 7.3-2 Hardware Failures" (NAS 07-0120) (#19))

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

Select a procedure from the following and execute it.

NOTE : Be careful that the position to install the Interface Board is determined. (Refer to Table 2.2.3).

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. The procedure varies depending on whether the CALM LED or EALM LED is on or off. 3. Replace the Control Unit after blocking the Control Unit to be replaced. 4. When replacing Control Unit of both systems (CTL 0 and CTL 1), power off the subsystem before the replacement. 5. In the case of Preventive replacement, there may be an error report in the host computer depending on the operating conditions of the host computer. The prior contact to the customer is required. 6. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 7. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	When the CALM LED is on • See "(1-1) When the CALM LED on the Control Unit is on" (REP 02-0680). When the CALM LED is off (Preventive replacement) • See "(1-2) When the CALM LED on the Control Unit is off" (REP 02-0720).
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	See "(2) Procedure for replacement with the power turned off" (REP 02-0750).

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.2.3 Installation position of the Interface Board

Installation case	Installation position	
	Interface Board #0	Interface Board #1
1	FC Interface Board	–
2	–	NAS Interface Board
3	iSCSI Interface Board	–
4	FC Interface Board	FC Interface Board
5	FC Interface Board	NAS Interface Board
6	iSCSI Interface Board	FC Interface Board
7	iSCSI Interface Board	NAS Interface Board

(1) Procedure for replacement with the power turned on

(1-1) When the CALM LED on the Control Unit is on

(Refer to "Figure 2.2.8.4 Replacing Interface Board (RKM/RKS/RKXS)" (REP 02-0711) and "Figure 2.2.8.5 Replacing Interface Board (RKH)" (REP 02-0712).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

NOTE : • Do not replace the Control Unit which operates normally. Before replacing the Control Unit, confirm that it is blocked (the CALM LED (RED) in on).
- System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.
- When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
- Replace the Interface Board after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) Collect Simple Trace and Constitution Information (Port Information). (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : If you change the interface board different type, all the following information is cleared. So please collect simple trace and constitute information to keep constitution information before change.

- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information / iSCSI port setting information
- CHAP security information (iSCSI)

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Make sure that CALM LED (RED) on the Control Unit mounting the Interface Board to be replaced lights up. If it does not light up, remove the Interface Board following "(1-2) When the CALM LED on the Control Unit is off" (REP 02-0720).

(c) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit installing the Interface Board that is not replaced in DF700 are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit in which the Interface Board to be replaced is installed.

(d) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(e) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.

(f) Remove all the power cables connected to the Control Unit mounting the Interface Board to be replaced.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(g) Remove the Control Unit by pulling it out toward you.

(h) Remove the Host Connector. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)

(i) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(j) Remove the Interface Board mounted on the Control Unit.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Install the new Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

NOTE : Install the new Interface Board in the removed position.

(l) Install the removed Host Connector in the new Control Unit. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)

Copyright © 2005, 2006, Hitachi, Ltd.

(m) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(n) Connect the removed interlocking cable to the Control Unit when the special UPS is connected.
(o) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out. If the controller is inserted before 20 seconds has elapsed, the Control Unit may not be recovered normally.
(p) When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (q).

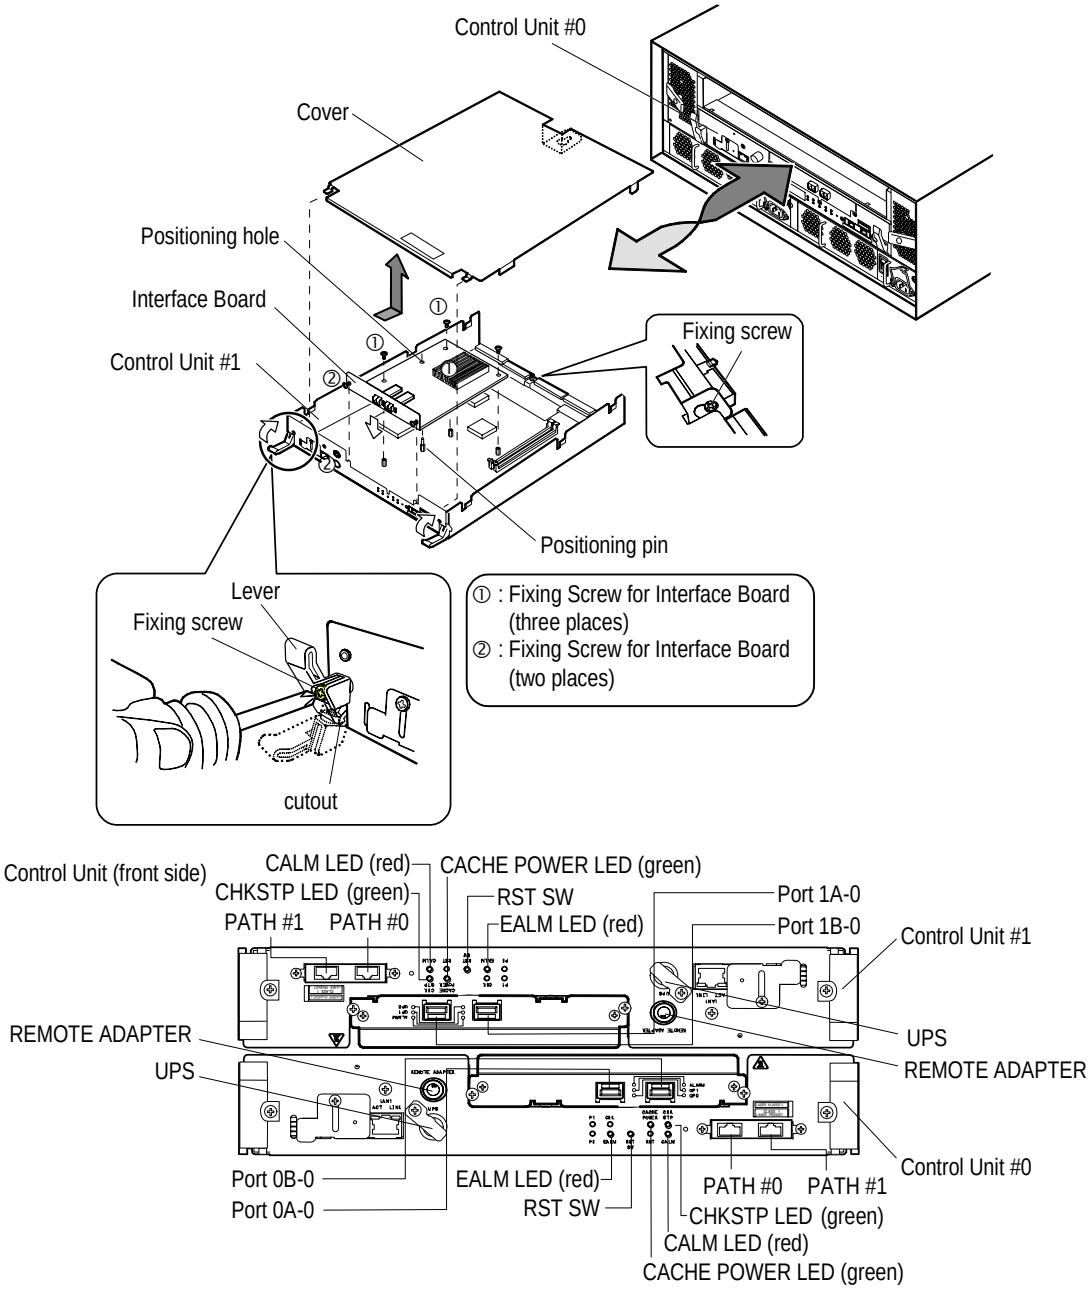
NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(q) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.
(r) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next(‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When returning the levers in the arrow directions (⟶) at the same time, operate them within one second. If the operation takes longer than one second, the Control Unit may not be recovered. If it occurs, execute the recovery procedure once again. If the Control Unit is not recovered in spite of the re-execution, replace the Control Unit because it may be faulty.

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off ("I1G300 CTL recovery start" is not displayed in "Information Message" on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.



(s) Check that the CALM LED (red) on the Control Unit is off.
(t) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)
(u) Reconnect all cables that were disconnected.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(v) Check that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
(w) Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Interface Board has completed.
(x) Check that the LED of the remote adaptor connected to the Control Unit in which the replaced Interface Board is installed lights on when the remote adaptor is connected.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The figure shows the case where the FC Interface Board is installed in the Control Unit .

Figure 2.2.8.4 Replacing Interface Board (RKM/RKS/RKXS)

Copyright © 2006, Hitachi, Ltd.

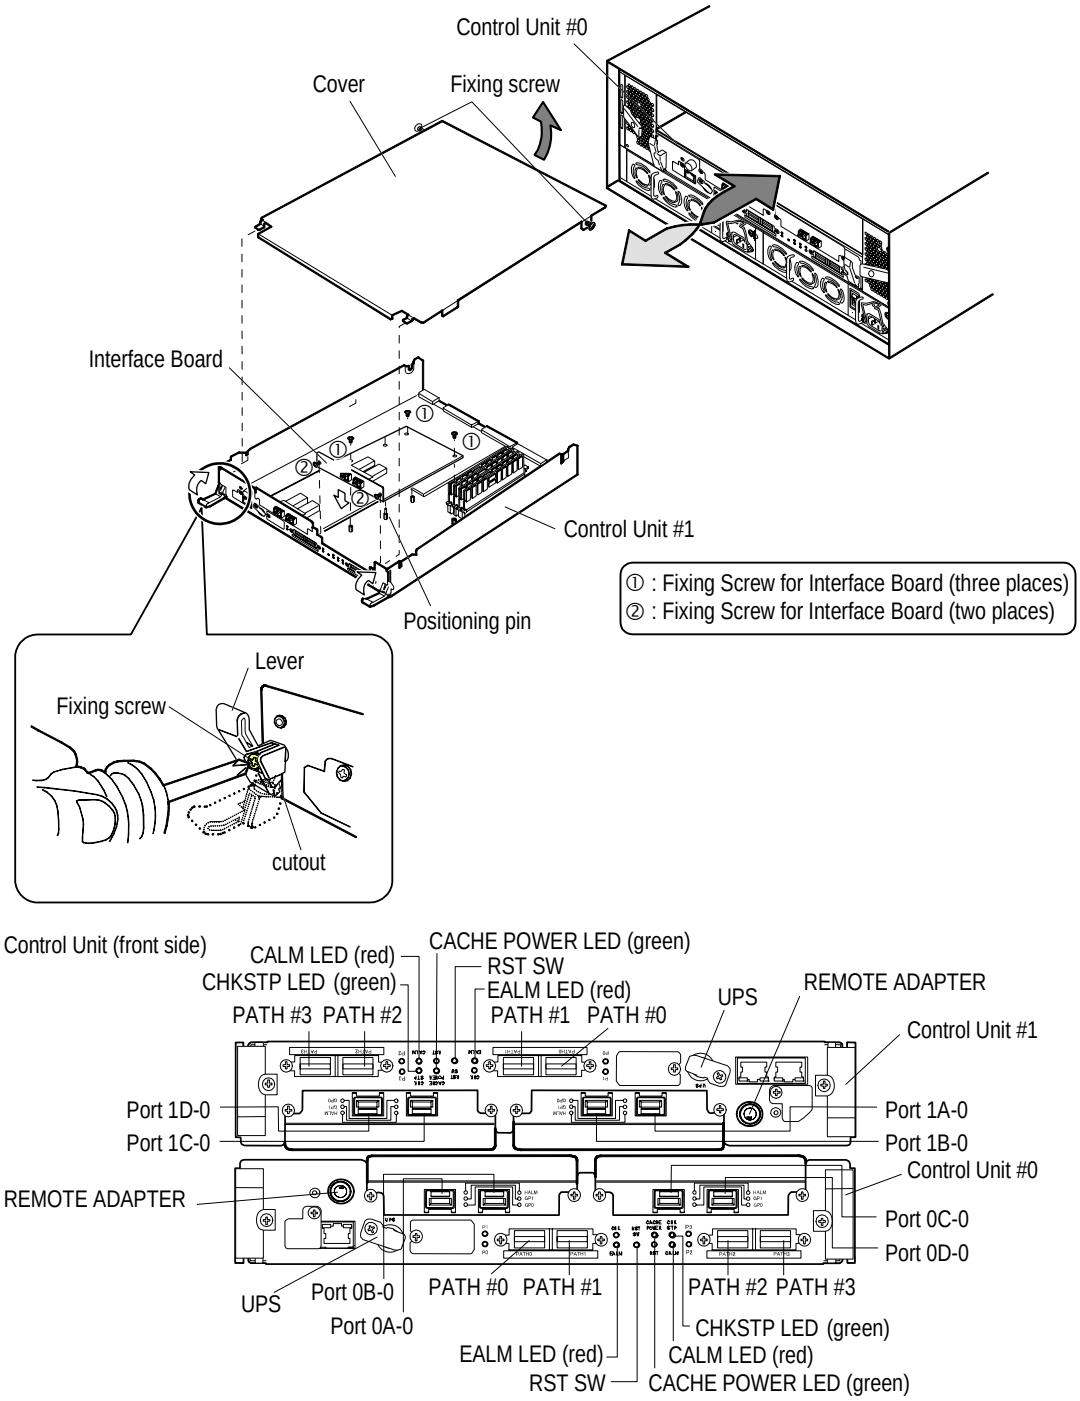


Figure 2.2.8.5 Replacing Interface Board (RKH)

Copyright © 2006, Hitachi, Ltd.

(1-2) When the CALM LED on the Control Unit is off
(Refer to "Figure 2.2.8.4 Replacing Interface Board (RKM/RKS/RKXS)" (REP 02-0711) and "Figure 2.2.8.5 Replacing Interface Board (RKH)" (REP 02-0712).)

NOTE : • System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.
• When the Control Unit is replaced while the LU of the subsystem is being formatted, restoration of the Control Unit which is inserted may be delayed until the LU formatting is completed.
• There may be an error report in the host computer depending on the operating conditions of the host computer.
The prior contact to the customer is required.
• Replace the Interface Board after recovering the UPS when the special UPS is connected and a failure occurs in the UPS.

(a) Collect Simple Trace and Constitution Information (Port Information). (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : If you change the interface board different type, all the following information is cleared. So please collect simple trace and constitute information to keep constitution information before change.
• Host Group Information / Target Information
• Host Group Option / Target Option
• Mapping Information
• Fibre Channel Information Port Setting Information/ NAS Connection Information / iSCSI port setting information
• CHAP security information (iSCSI)

(b) Press the RST SW on the Control Unit, in which the Interface Board to be replaced is installed, and make sure that the CALM LED (red) comes on. Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter). If not, remove the Interface Board following the "(2) Procedure for replacement with the power turned off" (REP 02-0750).

(c) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit installing the Interface Board that is not replaced in DF700 are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit in which the Interface Board to be replaced is installed.

(d) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(e) At the time of the NAS Unit connection, turn off the AC Input Power Switch of the NAS Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(f) Remove the all cables connected to the Control Unit on which the Interface Board to be replaced is mounted.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(g) Remove the Control Unit by pulling it out toward you.
(h) Remove the Host Connector. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)
(i) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(j) Remove the Interface Board mounted on the Control Unit.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Install the new Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

NOTE : Install the new Interface Board in the removed position.

(l) Install the removed Host Connector in the new Control Unit. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)
(m) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(n) Connect the removed interlocking cable to the Control Unit when the special UPS is connected.
(o) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out. If the controller is inserted before 20 seconds has elapsed, the Control Unit may not be recovered normally.

Copyright © 2005, 2006, Hitachi, Ltd.

(p) When the RKAJ/RKAJAT/RKA is connected, connect the ENC cable. When the RKAJ/RKAJAT/RKA is not connected, go to Step (q).

NOTE : • When the RKAJ/RKAJAT/RKA is connected, the loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(q) At the time of the NAS Unit connection, connect the NAS interface cables (PCI-Express cable and CTRL cable). Also, turn on the AC Input Power Switch of the NAS Unit.

(r) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next(‡1).
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡2) of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When returning the levers in the arrow directions (⟶) at the same time, operate them within one second. If the operation takes longer than one second, the Control Unit may not be recovered. If it occurs, execute the recovery procedure once again. If the Control Unit is not recovered in spite of the re-execution, replace the Control Unit because it may be faulty.

(s) Check that the CALM LED (red) on the Control Unit is off.

‡1 : If the Control Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the EALM LED (red) and the CALM LED (red) may not be turned off ("I1G300 CTL recovery start" is not displayed in "Information Message" on WEB).
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted Control Unit from the chassis once and insert it again after 20 seconds or more passed.

‡2 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(t) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)

(u) Reconnect all cables that were disconnected.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(v) Make sure that the READY LED (green) on the Front Bezel is on. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.

(w) Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
At the time of the NAS Unit connection, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message window on WEB after starting the NAS OS. (Refer to WEB "2.5 Information Message"(WEB 02-0120).)
When this is indicated, the replacement of Interface Board has completed.

(x) Check that the LED of the remote adaptor connected to the Control Unit in which the replaced Interface Board is installed lights on when the remote adaptor is connected.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off

(Refer to "Figure 2.2.8.4 Replacing Interface Board (RKM/RKS/RKXS)" (REP 02-0711) and "Figure 2.2.8.5 Replacing Interface Board (RKH)" (REP 02-0712).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Collect Simple Trace and Constitution Information (Port Information). (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : If you change the interface board different type, all the following information is cleared. So please collect simple trace and constitute information to keep constitution information before change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information / iSCSI port setting information
- CHAP security information (iSCSI)

(b) Turn off the main switch.

Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Interface Board is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(c) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(d) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(f) Remove the Control Unit by pulling it out toward you.
(g) Remove the Host Connector. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)
(h) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(i) Remove the Interface Board mounted on the Control Unit.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(j) Install the new Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

NOTE : Install the new Interface Board in the removed position.

(k) Install the removed Host Connector in the new Control Unit. (This procedure is unnecessary for the NAS Interface Board and iSCSI Interface Board.)
(l) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(m) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit #0 and #1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2005, 2006, Hitachi, Ltd.

(n) Reconnect all cables that were disconnected.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(o) Turn on the AC Power Unit Switch of the both Power Units.
(p) Turn on the main switch (the subsystem usually recovers in about five minutes).
(q) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1).
The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
(r) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.2.8 Replacing Host Connector

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Host Connector against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

Copyright © 2005, Hitachi, Ltd.

Refer to the figure below for the Host Connector replacement work. Host Connector can be replaced with the power turned on.
When the SNMP Agent Support Function is enabled, the SNMP Trap is sent if the host connector is blocked or removed.

NOTE : Host Connector can be Type1and Type2. When removing or installing a Host Connector, work according to each type.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. The procedure varies depending on whether the ALARM LED is on or off. 2. In the case of Preventive replacement, there may be an error report in the host computer depending on the operating conditions of the host computer. The prior contact to the customer is required. 3. The host connectors different from each other are installed in the RKM and RKS/RKXS/RKH respectively. When replacing each of them, be careful not to use a wrong one. ① RKM/RKH 4G bps Host connector ② RKS/RKXS which installs the Interface Board 4G bps Host connector ③ RKS/RKXS which installs the Interface Board 2G bps Host connector	When the CALM LED is on • See "(1-1) When the ALARM LED on the Host Connector is on" (REP 02-0790) When the CALM LED is off (Preventive replacement) • See "(1-2) When the ALARM LED on the Host Connector is off" (REP 02-0810).
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	See "(2) Procedure for replacement with the power turned off" (REP 02-0820).

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for replacement with the power turned on

(1-1) When the ALARM LED on the Host Connector is on
(Refer to "Figure 2.2.8.6 Replacing Host Connector" (REP 02-0800).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

NOTE : Do not replace the Host Connector which operates normally.
Before replacing the Host Connector, confirm that it is blocked (the ALARM LED (RED) in on).

(a) Make sure that ALARM LED (RED) on the Host Connector to be replaced lights up. If it does not light up, remove the Host Connector following "(1-2) When the ALARM LED on the Host Connector is off" (REP 02-0810).

(b) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(c) Remove the Host Connector.

- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(d) Make sure that 20 seconds or longer has elapsed after the Host Connector was taken out. If the Host Connector is inserted before 20 seconds has elapsed, the Host Connector may not be recovered normally.

(e) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.

(f) Connect the Fibre Channel Interface cables.

(g) If the port LED does not light on, the other failure may be considered, so that restore it following Troubleshooting "Chapter 1. Flowchart for troubleshooting" (TRBL 01-0000).

(h) Refer to "Information Message" on WEB, and check to see that [I53A00 Host Connector recovered (Port xy-z)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of Host Connector has completed.

Copyright © 2005, 2006, Hitachi, Ltd.

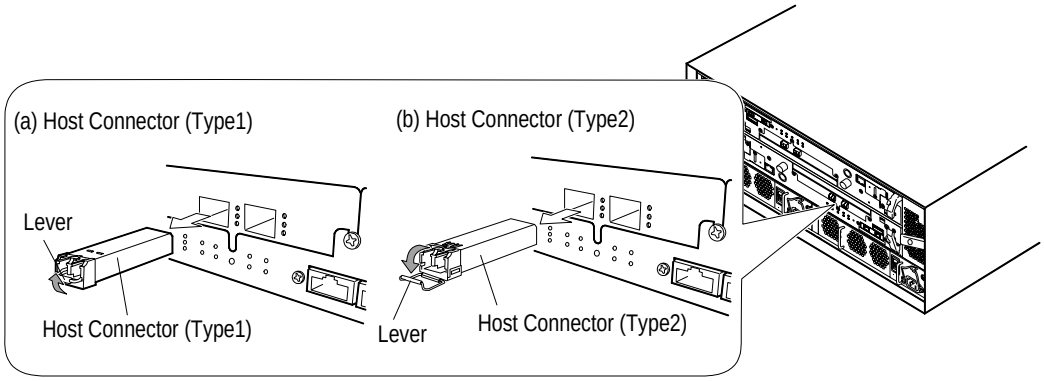

Figure 2.2.8.6 Replacing Host Connector

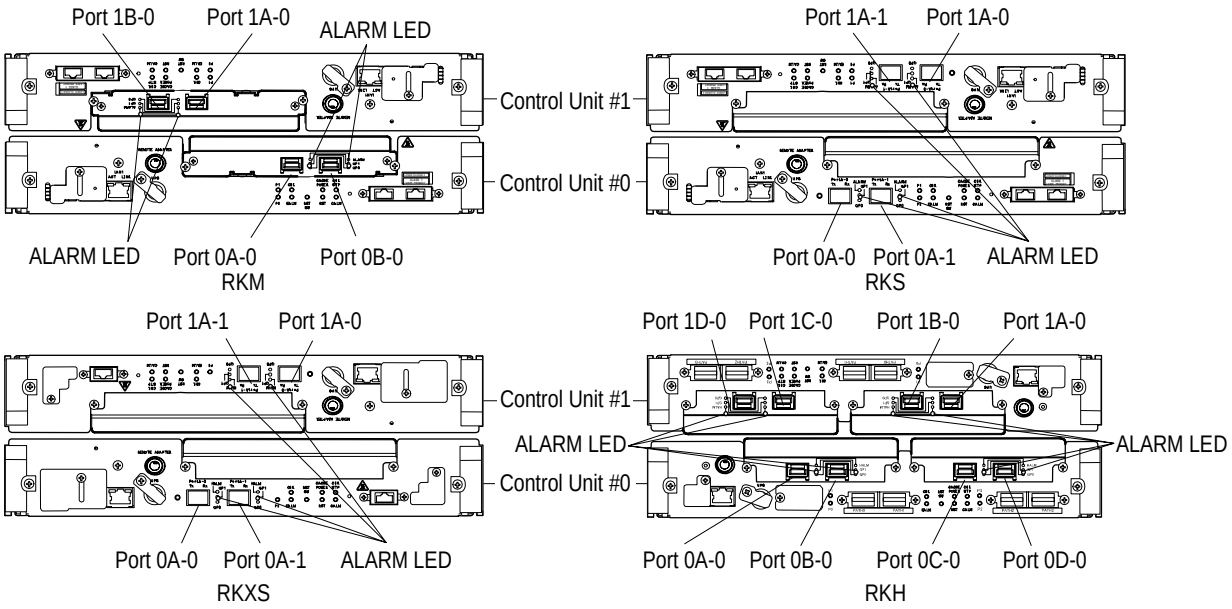

Figure 2.2.8.7 Port and ALARM LED

Copyright © 2005, 2006, Hitachi, Ltd.

(1-2) When the ALARM LED on the Host Connector is off
(Refer to "Figure 2.2.8.6 Replacing Host Connector" (REP 02-0800).)

NOTE : There may be an error report in the host computer depending on the operating conditions of the host computer.
The prior contact to the customer is required.

(a) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(b) Remove the Host Connector.
- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(c) Make sure that 20 seconds or longer has elapsed after the Host Connector was taken out. If the Host Connector is inserted before 20 seconds has elapsed, the Host Connector may not be recovered normally.

(d) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.

(e) Connect the Fibre Channel Interface cables.

(f) If the port LED does not light on, the other failure may be considered, so that restore it following Troubleshooting "Chapter 1. Flowchart for troubleshooting" (TRBL 01-0000).

(g) Refer to "Information Message" on WEB, and check to see that [I53A00 Host Connector recovered (Port xy-z)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of Host Connector has completed.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off
(Refer to "Figure 2.2.8.6 Replacing Host Connector" (REP 02-0800).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(d) Remove the Host Connector.
- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(e) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.
(f) Connect the Fibre Channel Interface cables.
(g) Turn on the AC Power Unit Switch of the both Power Units.
(h) Turn on the main switch (the subsystem usually recovers in about five minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

(j) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

(k) If the port LED does not light on, the other failure may be considered, so that restore it following Troubleshooting "Chapter 1. Flowchart for troubleshooting" (TRBL 01-0000).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.2.9 Replacing ENC Unit/SENC Unit

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install an ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. By so doing, you can discharge the static electricity from your body may change the parts.

The ENC Unit/SENC Unit is a precision machine that may have troubles because of electrostatic discharge. Be sure to put on the wristband before starting work in order to protect ENC Units/SENC Units from electrostatic discharge.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert an ENC Unit/SENC Unit into the subsystem, support the ENC Unit/SENC Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within ten minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. When replacing the ENC Unit/SENC Unit, the subsystem must be in the status shown below. • The microprogram is not being performed. • The Control Unit is not being replaced. • Any part other than the above is not being replaced. 3. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 4. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	When the ALM LED (red) of the ENC Unit/ SENC Unit to be replaced is on Refer to "(1-1) When the ALM LED of the ENC Unit/SENC Unit to be replaced is on" (REP 02-0850) When the ALM LED (red) of the ENC Unit/ SENC Unit to be replaced is off (Preventive replacement) Refer to "(1-2) When the ALM LED of the ENC/SENC Unit to be replaced is off" (REP 02-0870)
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	Refer to "(2) Procedure for replacement with the power turned off" (REP 02-0890)

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

- When two or more ENC Units/SENC Units need to be replaced on the same Loop, replace the Control Unit of the RKH/RKM/RKS/RKXS first, and then replace the ENC Unit/SENC Unit of the additional chassis. Also, when replacing the ENC Units/SENC Units of two or more additional chassis, replace the additional chassis that N of the subsystem ID# xN is smaller.
- When a failure of the battery system (whose message code is W03000, W0300x, W03100, W0310x, W03200, W0320x, W03300, W0330x, or W0340x) has occurred, recover the subsystem from the battery system failure before replacing the ENC Unit/SENC Unit.
- When the subsystem power is turned off because of an ENC Unit/SENC Unit failure using an improper procedure such as an operation of a breaker in the case where the interlocking with the UPS is in use, the subsystem power may not be turned on after that. In such a case, power on the subsystem after turning off and on the output from the UPS.
  If the UPS cannot be turned off and on, power off the subsystem after removing the cable for interlocking with the UPS. (When the cable is removed, a warning will be issued.)

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

(1) Procedure for replacement with the power turned on

(1-1) When the ALM LED of the ENC Unit/SENC Unit to be replaced is on
(Refer to "Figure 2.2.9 Replacing of ENC Unit/SENC Unit" (REP 02-0860).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

(a) Make sure that the ALM LED (Red) of the ENC Unit/SENC Unit to be replaced is lit.
When ALM LED (red) on the ENC Unit/SENC Unit is off, remove the ENC Unit/SENC Unit following "(1-2) When the ALM LED of the ENC/SENC Unit to be replaced is off" (REP 02-0870).

(b) Raise the lever on the ENC Unit/SENC Unit in the direction shown by the arrow ① (←) and pull out the ENC Unit/SENC Unit a little way toward you.

(c) Remove the ENC cable connected to the ENC Unit/SENC Unit to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(d) Remove the ENC Unit/SENC Unit by pulling it out toward you.

(e) After waiting for 20 seconds or longer, insert a new ENC Unit/SENC Unit into the specified location with its lever raised. When doing this, do not insert the ENC Unit/SENC Unit completely.
If the ENC Unit/SENC Unit is inserted without waiting for 20 seconds or longer, it is possible that the ENC Unit/SENC Unit is not recovered from the failure normally(‡1).

NOTE : Do not catch a ENC cable, when the ENC Unit/SENC Unit is inserted.

(f) Connect the ENC cable to new ENC Unit/SENC Unit.

(g) Return the levers in the direction shown by the arrows ② (·····>).

NOTE : When returning the both levers in the directions shown by the arrows ② (·····>) at the same time, operate the levers within one second.
If the returning of the levers takes longer time, it is possible that the recovery from the error fails. When this happens, execute the replacement procedure again.
If the subsystem is not recovered from the failure nevertheless, replace the ENC Unit/SENC Unit because the ENC Unit/SENC Unit is considered to have failed.
For the SENC Unit, the CHK LED (Red) lights on for about 10 seconds (while the CUDG is being executed) after the SENC Unit has been inserted.

(h) Make sure that the ALM LED (red) on the ENC Unit/SENC Unit is off(‡2).

‡1 : Remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : If the ENC Unit/SENC Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced ENC Unit/SENC Unit may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Check that the READY LED (green) on the front of the Basic Chassis is on and the ALARM LED (red) and WARNING LED (orange) goes out(‡1). The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
When the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.

(j) Refer to "Information Message" on WEB, and check to see that [I00Axy Loop recovered (Path-x, Loop-y)] and [I00Bxy (or I00BHH) ENC recovered (Unit-x, ENC-y)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of ENC Unit/SENC Unit has completed.

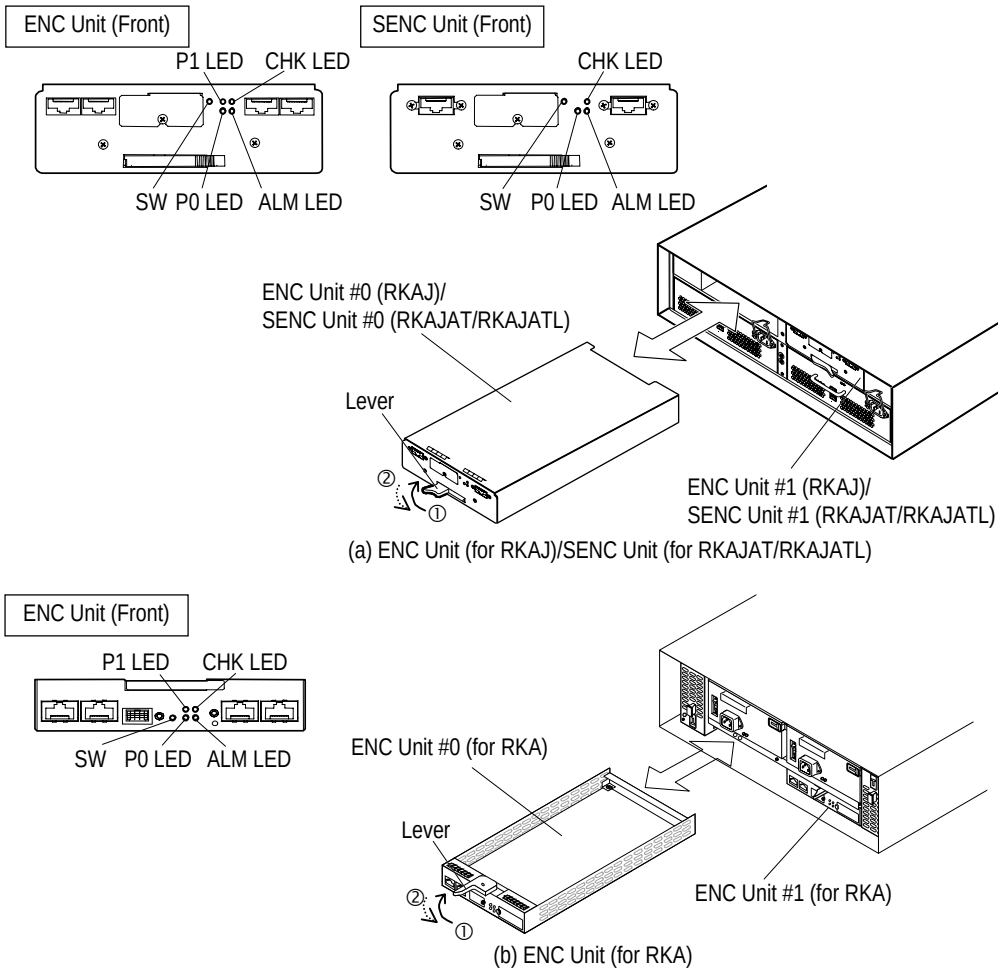

Figure 2.2.9 Replacing of ENC Unit/SENC Unit

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(1-2) When the ALM LED of the ENC/SENC Unit to be replaced is off
(Refer to "Figure 2.2.9 Replacing of ENC Unit/SENC Unit" (REP 02-0860).)

(a) Raise the lever on the ENC Unit/SENC Unit in the direction shown by the arrow ① (←) and pull out the ENC Unit/SENC Unit a little way toward you.

NOTE : When raising the lever on the ENC Unit/SENC Unit in the directions shown by the arrows ① (←) at the same time, operate the levers within one second.

(b) Remove the ENC cable connected to the ENC Unit/SENC Unit to be replaced.
(c) Remove the ENC Unit/SENC Unit by pulling it out toward you.
(d) After waiting for 20 seconds or longer, insert a new ENC Unit/SENC Unit into the specified location with its lever raised. When doing this, do not insert the ENC Unit/SENC Unit completely.
If the ENC Unit/SENC Unit is inserted without waiting for 20 seconds or longer, it is possible that the ENC Unit/SENC Unit is not recovered from the failure normally(‡1).

NOTE : Do not catch a ENC cable, when the ENC Unit/SENC Unit is inserted.

(e) Connect the ENC cable to new ENC Unit/SENC Unit.
(f) Return the levers in the direction shown by the arrows ② (·····>).

NOTE : When returning the both levers in the directions shown by the arrows ② (·····>) at the same time, operate the levers within one second.
If the returning of the levers takes longer time, it is possible that the recovery from the error fails. When this happens, execute the replacement procedure again.
If the subsystem is not recovered from the failure nevertheless, replace the ENC Unit/SENC Unit because the ENC Unit/SENC Unit is considered to have failed.
For the SENC Unit, the CHK LED (Red) lights on for about 10 seconds (while the CUDG is being executed) after the SENC Unit has been inserted.

(g) Make sure that the ALM LED (red) on the ENC Unit/SENC Unit is off(‡2).
(h) When an ENC Unit/SENC Unit other than that to be replaced is detached in the replacement of the ENC Unit/SENC Unit installed in the RKH/RKM/RKS/RKXS or removal of the ENC cable connected to it, remove the ENC cable connected to the detached ENC Unit/SENC Unit. (You may replace the ENC cables in any order because the ENC Unit/SENC Unit to be replaced is detached. An ENC Unit/SENC Unit other than that to be replaced cannot be detached no matter which cable connected to the front or rear ENC Unit/SENC Unit is removed first.)
Perform a restoration of the detached ENC Unit /SENC Unit following the procedure starting from step (b).
When the ENC Unit/SENC Unit cannot be restored because of a wrong restoration procedure, restore it by performing turning off and on of the subsystem power.

‡1 : Remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.
‡2 : If the ENC Unit/SENC Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced ENC Unit/SENC Unit may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Check that the READY LED (green) on the front of the Basic Chassis is on and the ALARM LED (red) and WARNING LED (orange) goes out(‡1). The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.
When the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.

(j) Refer to "Information Message" on WEB, and check to see that [I00Axy Loop recovered (Path-x, Loop-y)] and [I00Bxy (or I00BHH) ENC recovered (Unit-x, ENC-y)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of ENC Unit/SENC Unit has completed.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off
(Refer to "Figure 2.2.9 Replacing of ENC Unit/SENC Unit" (REP 02-0860).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred. Store the information on the collected simple trace in the USB memory.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))
- For the Store the collected simple trace in the USB memory (refer to Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300))

(a) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the WEB.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.
Make sure that the CACHE POWER LED (green) of the Control Unit has gone out.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Raise the lever on the ENC Unit/SENC Unit in the direction shown by the arrow ① (←) and pull out the ENC Unit/SENC Unit a little way toward you.
(d) Remove the cables connected to the ENC Unit/SENC Unit.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(e) Remove the ENC Unit/SENC Unit by pulling it out toward you.
(f) Insert a new ENC Unit/SENC Unit into the specified location with its lever raised. When doing this, do not insert the ENC Unit/SENC Unit completely.

NOTE : Do not catch a ENC cable, when the ENC Unit/SENC Unit is inserted.

(g) Connect the ENC cable to new ENC Unit/SENC Unit.
(h) Return the levers in the direction shown by the arrows ② (·····>).
(i) Turn on the AC Power Unit Switch of the both Power Units.

Copyright © 2005, Hitachi, Ltd.

(j) Turn on the main switch (the subsystem usually recovers in about five minutes).
Make sure that the ALM LED (red) has not gone out.

NOTE : For the SENC Unit, the CHK LED (Red) lights on for about 10 seconds (while the CUDG is being executed) after the power of the SENC Unit was turned on.

After doing this, make sure that the ALM LED (red) on the ENC Unit/SENC Unit is not on.
When the ENC Unit/SENC Unit is replaced without turning off the AC Power Unit Switch of the Power Unit (Item (c)) by mistake, an unexpected error message may be displayed.

{ Examples of error message:
W03100 Battery removed
W08000 Loop alarm (Path-0, Loop-0) }

If the above occurs, execution of the following procedure will make the recovery.
(a) → (b) → (h) → (i)

(k) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.
When the Power Saving function is enabled, the WARNING LED (orange) may light up or blinking at low speed while executing the ENC/SENC automatic download. If the WARNING LED still lights up or blinking at low speed after completing the ENC/SENC automatic download, refer to Information Message on WEB and perform the maintenance according to the recovery method of the message.

(l) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

2.2.10 Replacing ENC cable

CAUTION

To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on	1. When replacing the ENC Unit/SENC Unit, the subsystem must be in the status shown below. • The microprogram is not being performed. • The Control Unit is not being replaced. • Any part other than the above is not being replaced. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 3. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis usually goes out about 30 seconds later.	Refer to "(1) Procedure for replacement with the power turned on" (REP 02-0920)
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	Refer to "(2) Procedure for replacement with the power turned off" (REP 02-0940)

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• When a failure of the battery system (whose message code is W03000, W0300x, W03100, W0310x, W03200, W0320x, W03300, W0330x, or W0340x) has occurred, recover the subsystem from the battery system failure before replacing the ENC cable.
• When the subsystem power is turned off because of an ENC Unit/ SENC Unit failure using an improper procedure such as an operation of a breaker in the case where the interlocking with the UPS is in use, the subsystem power may not be turned on after that. In such a case, power on the subsystem after turning off and on the output from the UPS.
If the UPS cannot be turned off and on, power off the subsystem after removing the cable for interlocking with the UPS. (When the cable is removed, a warning will be issued.)

(1) Procedure for replacement with the power turned on
(See "Figure 2.2.9.1 Locations of the Lever and LEDs on the ENC Unit/SENC Unit" (REP 02-0930).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
• For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
• For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
• For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Among the ENC/SENC Units which are connected to the ENC cables to be replaced, open the lever, which is attached to the ENC/SENC Unit of the one whose N of the subsystem ID# xN is large, rapidly in the direction of release, and pull it out a little.

NOTE : When raising the lever on the ENC Unit/SENC Unit in the directions shown by the arrows ① (←) at the same time, operate the levers within one second.

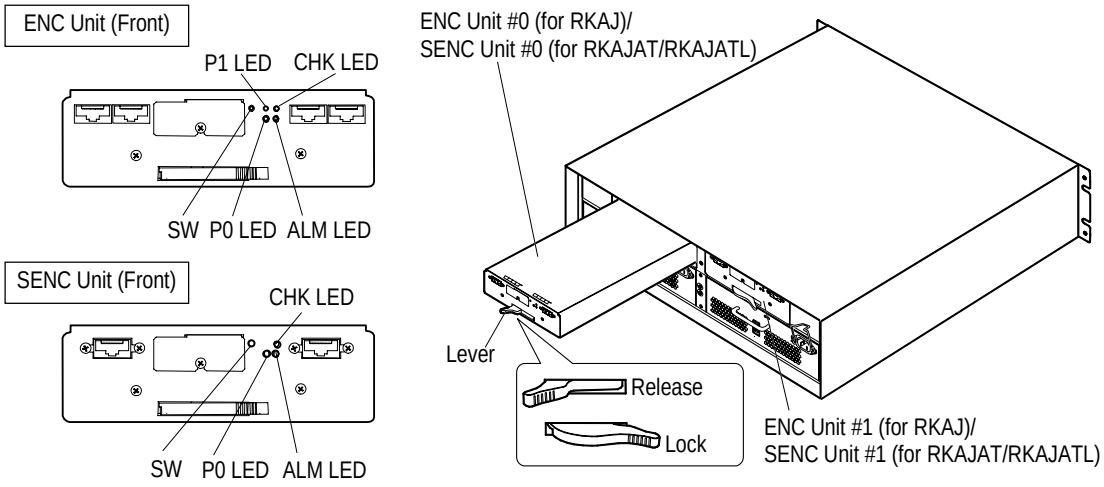
(b) Remove the ENC cable to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(c) Connect a new ENC cable. (Refer to Installation "3.4.11 Connecting the ENC cables" (INST 03-0670))

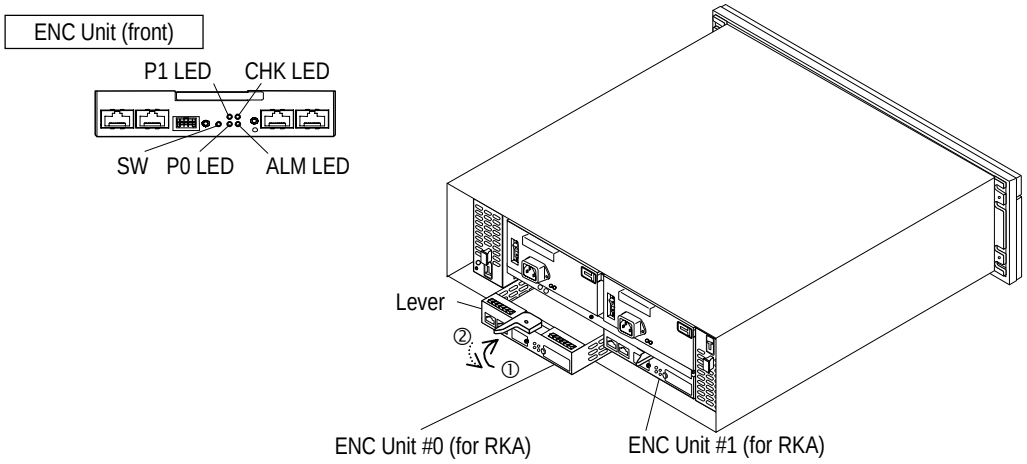
(d) After waiting for 20 seconds or longer, return the lever in the arrow direction ② (--->).
If the ENC Unit/SENC Unit is inserted without waiting for 20 seconds or longer, it is possible that the ENC Unit/SENC Unit is not recovered from the failure normally.(‡1).

NOTE : • When returning the both levers in the directions shown by the arrows ② (·····>) at the same time, operate the levers within one second.
If the returning of the levers takes longer time, it is possible that the recovery from the error fails. When this happens, execute the replacement procedure again. If the subsystem is not recovered from the failure nevertheless, replace the ENC Unit/SENC Unit because the ENC Unit/SENC Unit is considered to have failed.
• Do not catch a ENC cable, when the ENC Unit/SENC Unit is inserted.



‡1 : Remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.

Copyright © 2005, 2006, Hitachi, Ltd.



(e) Check that the ALM LED (red) on the ENC Unit/SENC Unit is off(‡1).

(f) Check that the READY LED (green) on the front of the Basic Chassis is on and the ALARM LED (red) and WARNING LED (orange) goes out(‡2). The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) before it lights up.

(g) Refer to "Information Message" on WEB, and check to see that [I00Axy Loop recovered (Path-x, Loop-y)] or [I00Bxy (or I00BHH) ENC recovered (Unit-x, ENC-y)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of ENC cable has completed.

(a) ENC Unit (for RKAJ)/SENC Unit (for RKAJAT/RKAJATL)

(b) ENC Unit (for RKA)

Figure 2.2.9.1 Locations of the Lever and LEDs on the ENC Unit/SENC Unit

‡1 : If the ENC Unit/SENC Unit is removed and then inserted at the time between the execution and the completion of the spin-up of the priced option, Power Saving (until "I1GZ00 The spin up of disk drives completed" is displayed for the RAID Group that "I1GY00 The request of spin up of disk drives is accepted" is displayed in "Information Message" on WEB), the Red (ALARM) LED of the replaced ENC Unit/SENC Unit may not be turned off.
Check that the Disk Drives executing the spin-up command are all spun up, and then remove the inserted the ENC Unit/SENC Unit from the chassis once and insert it again after 20 seconds or more passed.

‡2 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off

(See "Figure 2.2.9.1 Locations of the Lever and LEDs on the ENC Unit/SENC Unit" (REP 02-0930).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch.

Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the WEB.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(b) Turn off the AC Power Unit Switch of the both Power Units.

Make sure that the CACHE POWER LED (green) of the Control Unit has gone out.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Among the ENC/SENC Units which are connected to the ENC cables to be replaced, open the lever, which is attached to the ENC/SENC Unit of the one whose N of the subsystem ID# xN is large, rapidly in the direction of release, and pull it out a little.

(d) Remove the ENC cable to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(e) Connect a new ENC cable. (Refer to Installation "3.4.11 Connecting the ENC cables" (INST 03-0670))

(f) Return the lever in the arrow direction ②.

NOTE : Do not catch a ENC cable, when the ENC Unit/SENC Unit is inserted.

(g) Turn on the AC Power Unit Switch of the both Power Units.

(h) Turn on the main switch (the subsystem usually recovers in about five minutes).

After doing this, make sure that the ALM LED (red) on the ENC Unit/SENC Unit is not on.

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

(j) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

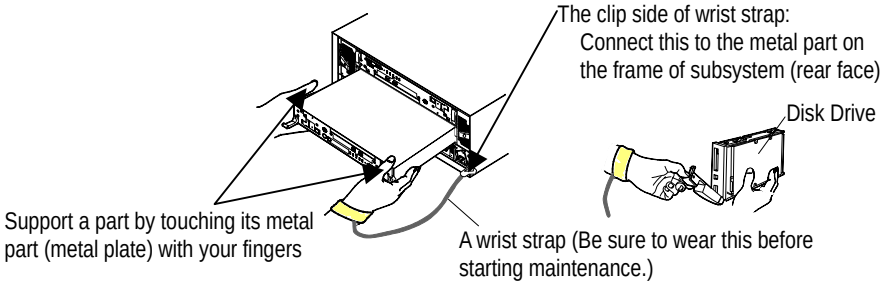
2.2.11 Replacing Basic Chassis of Rack Mount Style

Perform this work only when an instructed to do so is given by the Technical Support Center for coping with troubles.

⚠ CAUTION



Be sure to perform the operation with two or more workers.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- When you install a Disk Drive or Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Disk Drive or Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive or Control Unit into the subsystem, support the Disk Drive or Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	Not applicable	—
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	Refer to "(1) Procedure for replacement with the power turned off" (REP 02-0960)

(1) Procedure for replacement with the power turned off

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

NOTE : • When the power has already been turned off, make sure that the cache is not in the cache backup mode. (Refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the cache is in the cache backup mode, make the replacement after canceling the mode.
• Write down the serial number of the subsystem before the replacement. Write down the same serial number as the removed subsystem in the new subsystem.

(a) Turn off the main switch. (The POWER LED goes out.)

Make sure that the POWER LED (green) on the Front Bezel goes out. If the power cannot be turned off, have the Web be connected and find out a cause of the trouble

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))

(d) Remove all the cables connected to the components (Control Unit, and Power Unit).

NOTE : When the cable cannot be removed easily, do not pull it by force. Pull out the Control Unit and Power Unit a little, and then perform the cable removal again. Besides, the cable can be damaged if it is bent upward or downward forcibly.

(e) Remove parts (Disk Drives, Backup Battery Unit, Fan Assembly, Control Unit, Power Unit, and ENC Unit) referring to each removal procedure of them.
Affix labels bearing HDD numbers on the removed Disk Drives and put the drives in the box for temporary storage arranging them in the same order as they were installed in the subsystem.
The Disk Drive is not installed in RKH.

(f) Remove the frame and replace it with a new one. (The weight of the frame whose each part is removed is 13 kg.)
In the case of the Floor Model, refer to Installation "2.3 Installing Floor Stand Kit" (INST 02-0050) in the for Installation.
In the case of the rackmount model, refer to Installation "3.4.3 Mounting on Rack Frame" (INST 03-0400) in the for Installation.

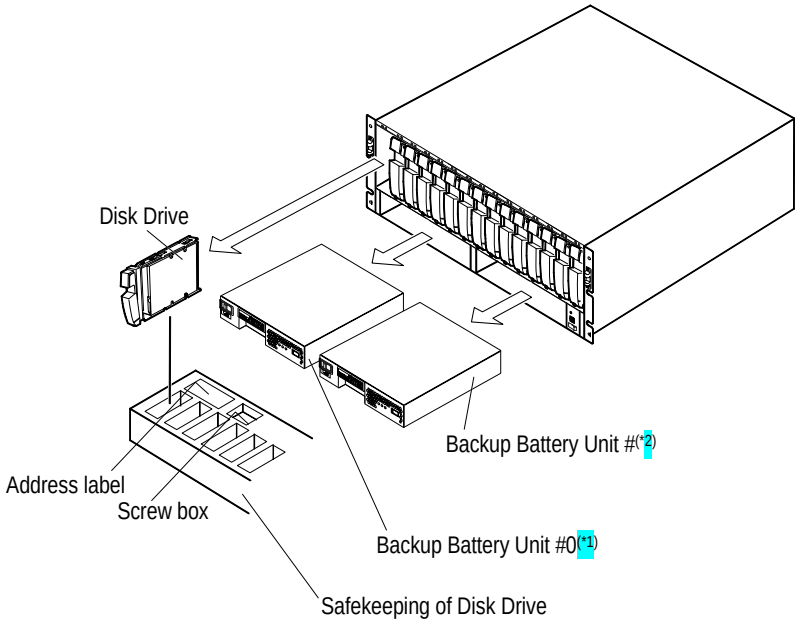
(g) Reinstall the parts. (Refer to "2.2 Replacement of Components" (REP 02-0050).)
Reinstall all the removed parts in the same positions where they were installed before.

(h) Return all the removed cables as they were before.

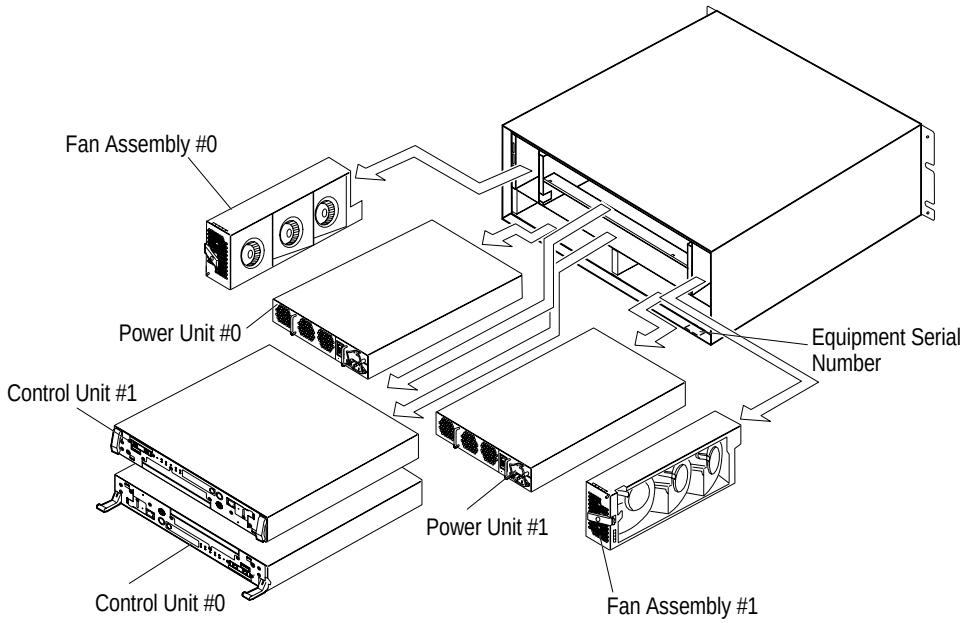
(i) Turn on the AC Power Unit Switch of the both Power Units.

(j) Turn on the main switch (the subsystem usually recovers in about five minutes).

(k) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.



(l) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).



(m) Affix the new subsystem and write down the same serial number as the removed subsystem.

(n) Attach the Front Bezel.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	Not applicable	—
2	Replacement with the power turned off	1. At the time of the preventive replacement, do not perform the preventive replacement work while the READY LED (green) on the front of the Basic Chassis is blinking at high speed because the automatic download of the ENC/SENC firmware is being executed. Make the replacement after the LED lights on. 2. At the time of the preventive replacement, do not perform the preventive replacement work while the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the preventive replacement work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out at the maximum of 30 to 85 minutes later and the READY LED (green) lights up.	Refer to "(1) Procedure for replacement with the power turned off" (REP 02-1000)

(1) Procedure for replacement with the power turned off

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

NOTE : When the power has already been turned off, make sure that the cache is not in the cache backup mode. (Refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the cache is in the cache backup mode, make the replacement after canceling the mode.

(a) Turn off the main switch. (The POWER LED goes out.)

Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the memory is still being backed up, first release it from the back-up state, and then replace the Control Unit.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache memory data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(c) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))

(d) Remove all the cables connected to the components (Control Unit, Power Unit, and ENC Unit/SENC Unit).

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the Control Unit, Power Unit, and ENC Unit/SENC Unit a little, and then perform the cable removal again.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(e) Remove parts (Disk Drives, Fan Assembly(‡1), Power Unit, and ENC Unit/SENC Unit) referring to each removal procedure of them.
Affix labels bearing HDD numbers on the removed Disk Drives and put the drives in the box for temporary storage arranging them in the same order as they were installed in the subsystem.

(f) Remove the frame and replace it with a new one. (The weight of the frame whose each part has been removed is 13 kg.)
In the case of the Floor Model, refer to Installation "2.3 Installing Floor Stand Kit" (INST 02-0050) in the Maintenance Manual for Installation.
In the case of the rackmount model, refer to Installation "3.4.3 Mounting on Rack Frame" (INST 03-0400) in the Maintenance Manual for Installation.

(g) Install all the removed parts in the same positions as before in the new chassis.
(Refer to "2.2 Replacement of Components" (REP 02-0050).)

(h) Return all the removed cables as they were before.

(i) Turn on the AC Power Unit Switch of the both Power Units.

(j) Turn on the main switch (the subsystem usually recovers in about five minutes).

(k) Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡2). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

(l) When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).

(m) Attach the Front Bezel.

‡1 : Fan Assembly is for RKA only.

‡2 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.2.13 Replacing Remote Adapter

Select a procedure from the following and execute it.

No.	Remote adapter condition at the time of replacement	Restriction	Reference for replacement procedure
1	One Remote adapter	The replacement cannot be done in the state in which the subsystem power is on.	See "(1) Replacement procedure with the one Remote Adapter" (REP 02-1030).
2	When the Remote adapter is duplicated.	If both of the two remote adapters are required to be replaced, be sure to replace them one by one, or replace them in the state in which the subsystem power is turned off.	See "(2) Replacement procedure to be used when the Remote Adapter is duplicated" (REP 02-1040).

(1) Replacement procedure with the one Remote Adapter

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the main switch of the subsystem connected to the Remote Adapter to be replaced.

NOTE : Make sure that the subsystem is not in the Cache Backup mode. (Refer to "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).) When the subsystem is in the Cache Backup mode, perform the replacement after canceling the mode.

(b) Turn off the AC Power Unit Switch of the Power Units.

(c) Remove all the remote and power cables from the Remote adapter.

(d) Replacing the new Remote Adapter

(e) Connect the removed remote cable and power cable.

(f) Turn on the AC Power Unit Switch of the Power Units.
Make sure that the READY LEDs (green) of the both Power Units are on.

(g) Turn on the main switch.

(h) Make sure that the following LEDs on the Remote Adapter are on.

- POWER LED
- LEDs for the connectors among the J100 to J105 to which the remote cables are connected.

Copyright © 2005, Hitachi, Ltd.

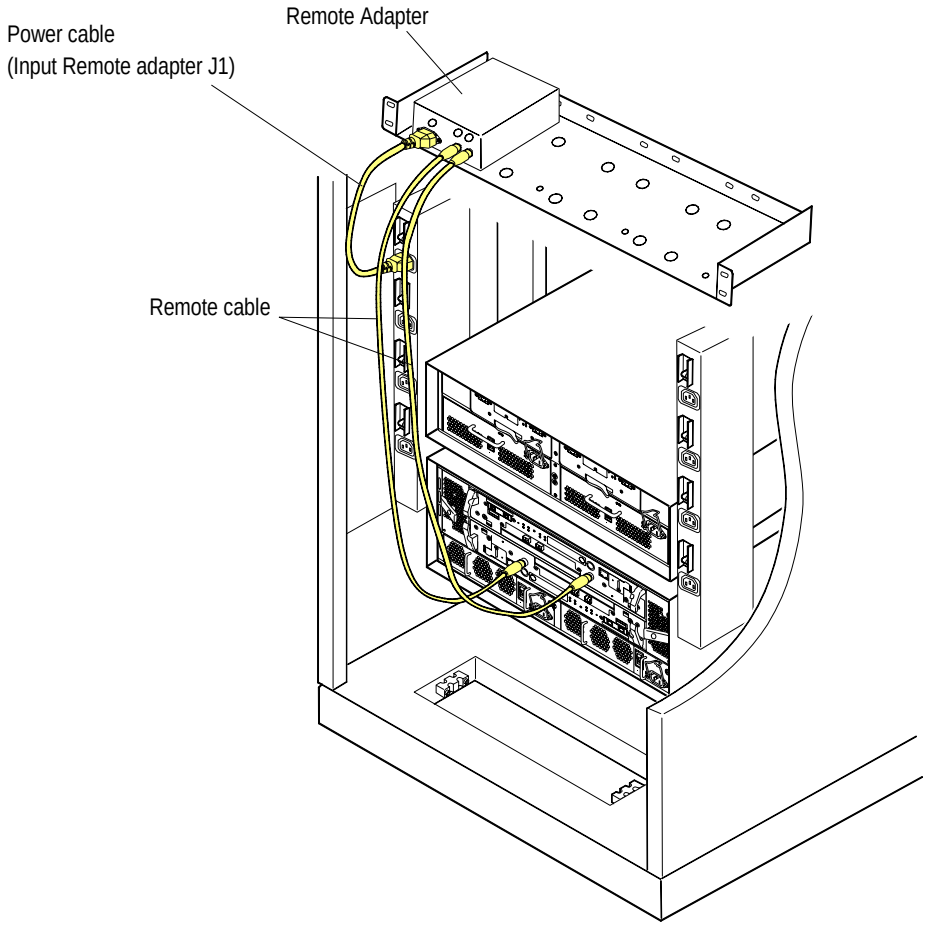

Figure 2.2.12 Replacing Remote Adapter

(2) Replacement procedure to be used when the Remote Adapter is duplicated

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Make sure that all the LEDs of the Remote Adapter not to be replaced are on.

(b) Remove the remote and power cables from the Remote Adapter to be replaced.

(c) Replacing the new Remote Adapter

(d) Connect the removed remote cable and power cable.

(e) Make sure that the following LEDs on the Remote Adapter are on.

- POWER LED
- LEDs for the connectors among the J100 to J105 to which the remote cables are connected.

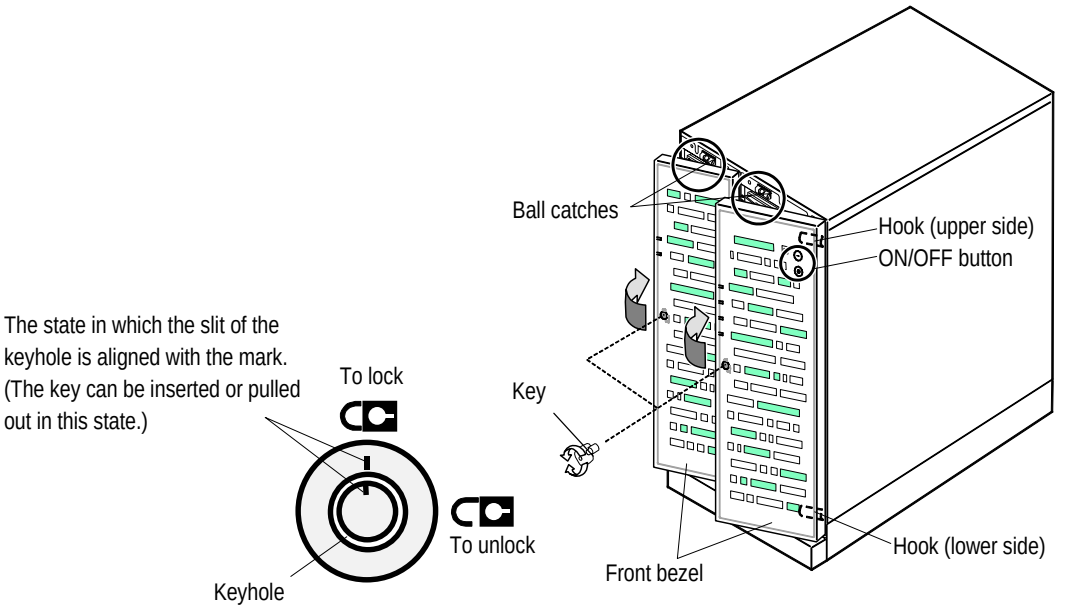
2.2.14 Replacing Front Bezel

(1) How to replace Front Bezel of Floor Model

CAUTION

Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

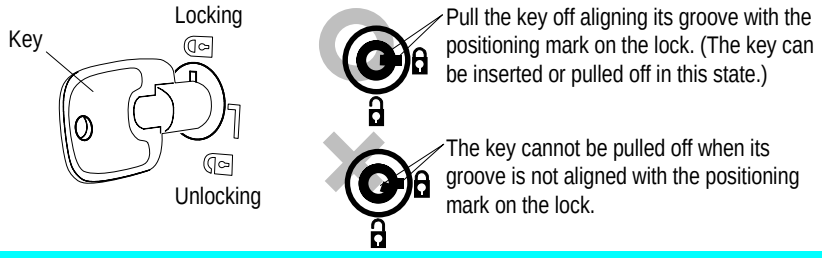


CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Since front bezels of the RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.
- When installing or removing the Front Bezel, try not to operate the main switch incorrectly with the hook or the ON/OFF button of the Front Bezel.

A key is necessary to attach or remove the Front Bezel.

(a) Insert the key into the keyhole on the replacing Front Bezel and release the Lock of the Front Bezel.
(b) Pull the replacing Front Bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the replacing Front Bezel from the slots on the subsystem main body by shifting the bezel to the left and remove the bezel.
(d) Hold the side of new Front Bezel with your both hands.
(e) Hang the hook of the new Front Bezel (lower side) on the hole in the bottom right part of the subsystem.
(f) Hang the hook of the new Front Bezel (upper side) on the hole in the top right part of the subsystem.
(g) After making the hooks of the new Front bezel engaged, press the bezel against the main body until it is stopped.
(h) Fix the attached Front Bezel by turning the key.



Copyright © 2006, Hitachi, Ltd.

The floor (RKM+RKAJ+H2J) model is shown as an example.

Figure 2.2.13 Procedure for Replacing Front Bezel

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

Copyright © 2006, Hitachi, Ltd.

(2) How to replace Front Bezel of the Rackmount Model

CAUTION

Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

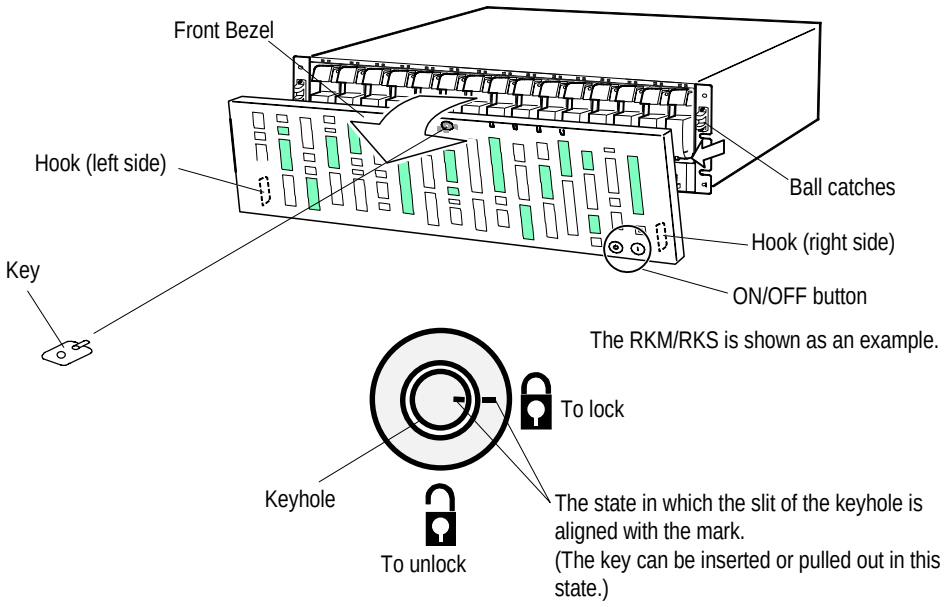
CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Since front bezels of the RKH/RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.
- When installing or removing the Front Bezel, try not to operate the main switch incorrectly with the hook or the ON/OFF button of the Front Bezel.

A key is necessary to attach or remove the Front Bezel.

(a) Insert the key into the keyhole on the replacing Front Bezel and release the Lock of the Front Bezel.
(b) Pull the replacing Front Bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the replacing Front Bezel from the slots on the subsystem main body by shifting the bezel to the right and remove the bezel.
(d) Hold the side of new Front Bezel with your both hands.
(e) Hang the hook of the new Front Bezel (left side) on the hole in the bottom left part of the subsystem.
(f) Hang the hook of the new Front Bezel (right side) on the hole in the bottom right part of the subsystem.
(g) After making the hooks of the new Front Bezel engaged, press the bezel against the main body until it is stopped.
(h) Fix the attached Front Bezel by turning the key.

Copyright © 2006, Hitachi, Ltd.



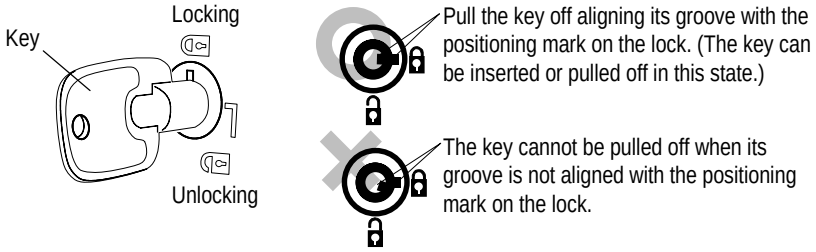


Figure 2.2.14 Procedure for Replacing Front Bezel

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

- When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
- When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

2.3 Replacing the RKNAS parts

Perform the following procedures before replacing the parts of the RKNAS.

NOTE : When replacing the host connector, the following procedures are unnecessary.

(1) Stop the NAS OS of the RKNAS targeted for the replacement (refer to Installation "1.7.3 Stop/Start/Restart of the NAS" (INST 01-0320)).
(2) Turn off the AC Input Power Switch of the RKNAS.
(3) Remove the Front Bezel of the RKNAS ("refer to Installation "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130)).

NOTE : When replacing the interface cables, do not remove the Front Bezel.

(4) Remove the RKNAS from the rack frame. Remove it in the reverse procedures referring to Installation "3.4.8 Installing the RKNAS" (INST 03-0601).

CAUTION

Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

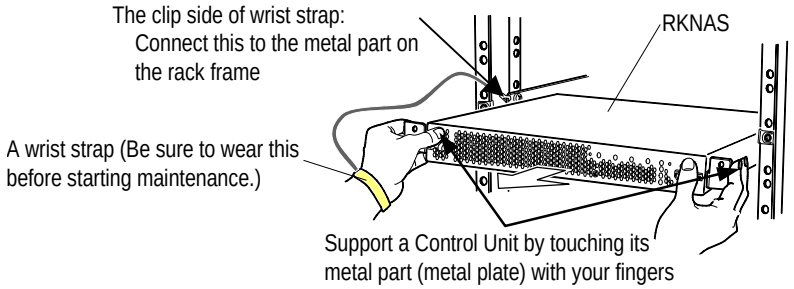
NOTE : When replacing the interface cables, do not remove the RKNAS from the rack frame.

(5) Refer to the procedure for replacing each part.
- Replacing the Power Unit ····· "2.3.1 Replacing the Power Unit" (REP 02-1060)
- Replacing the Fan Assembly ····· "2.3.2 Replacing the Fan Assembly" (REP 02-1090)
- Replacing the memories (DIMM) ····· "2.3.3 Replacing the memories (DIMM)" (REP 02-1120)
- Replacing the Host Connector ····· "2.3.4 Replacing the Host Connector" (REP 02-1140)
- Replacing the Interface cable ····· "2.3.5 Replacing the Interface cable" (REP 02-1200)
- Replacing the NAS Chassis ····· "2.3.6 Replacing the NAS Chassis" (REP 02-1210)
- Replacing Front Bezel of RKNAS ····· "2.3.7 Replacing Front Bezel of RKNAS" (REP 02-1240)

Copyright © 2005, 2006, Hitachi, Ltd.

2.3.1 Replacing the Power Unit

⚠ CAUTION



- Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.
- Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are RKNAS, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

NOTE : Check that the fans of the FAN Assembly have stopped.

Copyright © 2005, 2006, Hitachi, Ltd.

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(1) Remove the cover.
Remove the four fixing screws (two each at right and left) which are fixing the cover, and remove the cover by pulling it up after sliding it.

(2) Remove the separator.
Loosen the screws (at two places) of the separator and slide it to the arrow ① (·····>) direction, and remove the separator.

(3) Remove the power cables. Remove them by holding the housings of the power cables connected to the main board (two places).

NOTE : Do not pull the power cables to remove them.

(4) Remove the Power Unit.
Remove the screws (two places) of the Power Unit, and then remove it by lifting it up with your hands.

(5) Install the new Power Unit.
Install the new Power Unit at the original position, and fix it by fastening the screws (two places).

(6) Connect the power cables (at two places) to the Main Board.

NOTE : Connect the power cables to the Main Board through the separator.

(7) Fix the cables of a thin bundle by the Cable Clamp.

(8) Attach the separator.
Attach the separator by sliding it to the arrow ② (<·····) direction and fix the screws (at two places) by fastening them.

(9) Attach the cover.
Attach the cover by sliding it, and fix the four screws (two each at right and left) by fastening them.

(10) Install the RKNAS in the rack frame (refer to Installation "3.4.8 Installing the RKNAS" (INST 03-0601)).

(11) Connect all the removed cables.

(12) Attach the Front Bezel (refer to Installation "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130)).

(13) Turn on all the AC Input Power Switches of the RKNAS.
The READY LED (green) on the RKNAS does not light up at this timing. Check the lighting of the READY LED (green) on the RKNAS after starting the NAS OS. Also, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message on WEB in the window after starting the NAS OS (refer to WEB "2.5 Information Message" (WEB 02-0120)).

Copyright © 2005, 2006, Hitachi, Ltd.

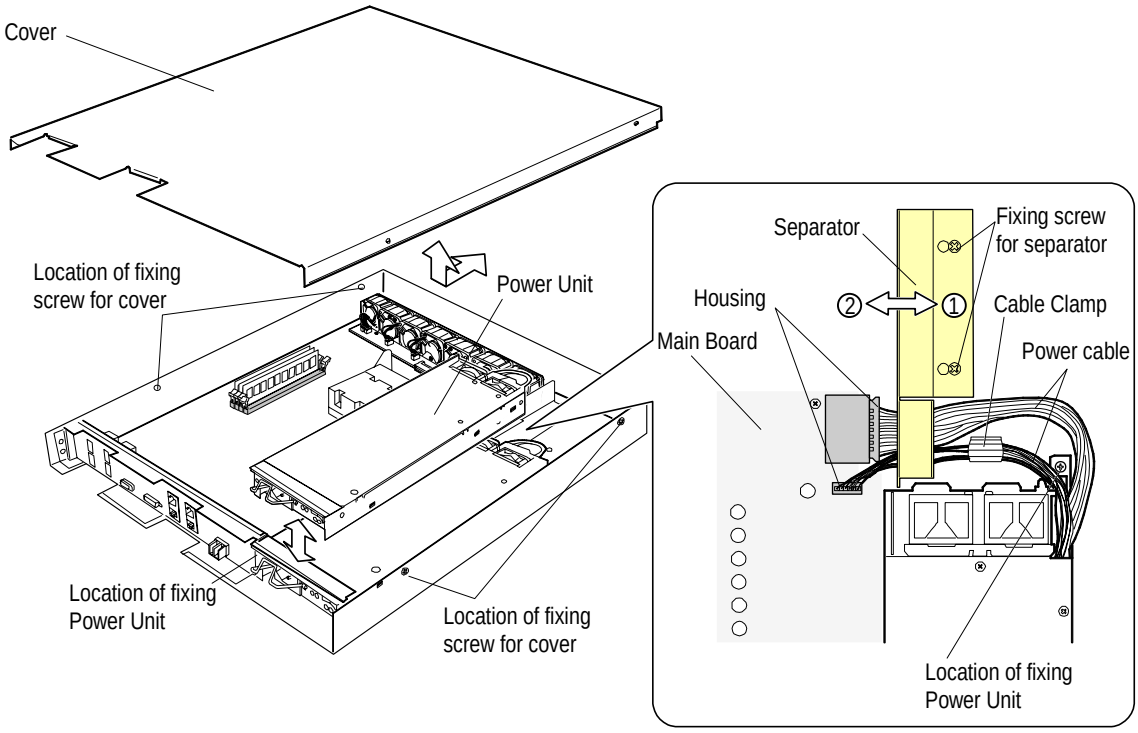


Figure 2.3.1 Replacing Power Unit

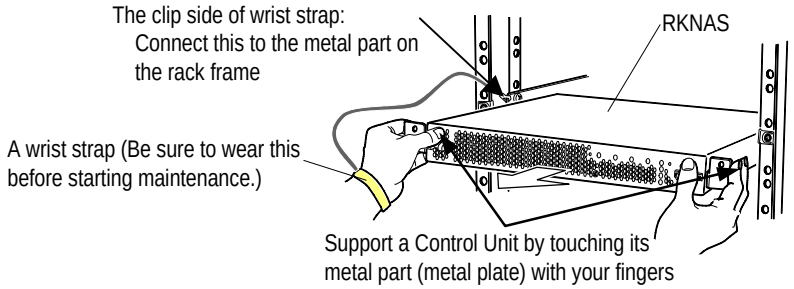
Copyright © 2005, Hitachi, Ltd.

2.3.2 Replacing the Fan Assembly

⚠ CAUTION



- Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.
- Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are RKNAS, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

NOTE : Check that the fans of the FAN Assembly have stopped.

Copyright © 2005, 2006, Hitachi, Ltd.

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(1) Remove the cover.
Remove the four fixing screws (two each at right and left) which are fixing the cover, and remove the cover by pulling it up after sliding it.

(2) Loosen the screws (at two places) of the separator and slide it to the arrow ① (·····>) direction.

(3) Remove the Fan Assembly.
Remove the screws (at two places) of the Fan Assembly, slide the Fan Assembly to the arrow ③ (·····>) direction, and then remove it by pulling the connector from the Main Board.

NOTE : Place the removed Fan Assembly in the place where anti-static measures are taken.

(4) Install the new Fan Assembly.
Slide the Fan Assembly to the arrow ④ (<·····)direction, connect the connector to the Main Board, and then fix the screws (at two places) of the Fan Assembly by fastening them.

NOTE : Install the FAN Assembly after confirming there is the insulting paper on the flat cable for the LED.

(5) Slide the separator to the arrow ② (<·····) direction and fix the screws (at two places) by fastening them.

(6) Attach the cover.
Attach the cover by sliding it, and fix the four screws (two each at right and left) by fastening them.

(7) Install the RKNAS in the rack frame (refer to Installation "3.4.8 Installing the RKNAS" (INST 03-0601)).

(8) Connect all the removed cables.

(9) Attach the Front Bezel (refer to Installation "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130)).

(10) Turn on all the AC Input Power Switches of the RKNAS.
The READY LED (green) on the RKNAS does not light up at this timing. Check the lighting of the READY LED (green) on the RKNAS after starting the NAS OS. Also, check that "IA1U0x NNC recovered from partial alarm (NNC-x)" or "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message on WEB in the window after starting the NAS OS (refer to WEB "2.5 Information Message" (WEB 02-0120)).

Copyright © 2005, Hitachi, Ltd.

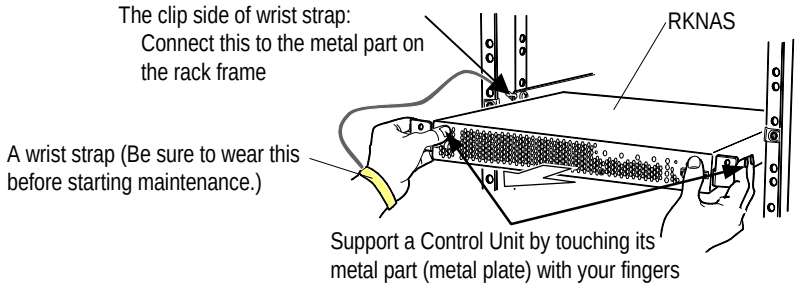
2.3.3 Replacing the Memory (DIMM)

⚠ CAUTION



- Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.
- Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are RKNAS, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

NOTE : Check that the fans of the FAN Assembly have stopped.

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Remove the cover.
Remove the four fixing screws (two each at right and left) which are fixing the cover, and remove the cover by pulling it up after sliding it.

(2) Remove the memories (DIMM) in which a failure occurred after recording the installation position, capacity and the model name of the memories (DIMM).

NOTE : Place the removed memories (DIMM) temporarily at the place where the electrostatic measures were done.

(3) Install the new memories (DIMM).
Install the memories (DIMM) of the same capacity with the removed memories (DIMM).

NOTE : Install the memories (DIMM) in the slot A0 and the slot B0 for the RKNAS2G.

(4) Attach the cover.
Attach the cover by sliding it, and fix the four screws (two each at right and left) by fastening them.

(5) Install the RKNAS in the rack frame (refer to Installation "3.4.8 Installing the RKNAS" (INST 03-0601)).

(6) Connect all the removed cables.

(7) Attach the Front Bezel (refer to Installation "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130)).

(8) Turn on all the AC Input Power Switches of the RKNAS. The READY LED (green) on the RKNAS does not light up at this timing. Check the lighting of the READY LED (green) on the RKNAS after starting the NAS OS. Also, check that "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message on WEB in the window after starting the NAS OS (refer to WEB "2.5 Information Message" (WEB 02-0120)).

2.3.4 Replacing the Host Connector

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

Copyright © 2005, 2006, Hitachi, Ltd.

Refer to the figure below for the Host Connector replacement work. Host Connector can be replaced with the power turned on.
When SNMP Agent Support Function is enabled, if the host connector is installed or the unblocked host connector is removed, SNMP Trap is transmitted.

NOTE : Host Connector can be Type1and Type2. When removing or installing a Host Connector, work according to each type.

Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. The procedure varies depending on whether the WARNING LED of RKNAS is on or off. 2. In the case of Preventive replacement, there may be an error report in the host computer depending on the operating conditions of the host computer. The prior contact to the customer is required.	When the WARNING LED of NAS is on • See "(1-1) When the WARNING LED of RKNAS is on" (REP 02-1160). When the WARNING LED is off (Preventive replacement) • See "(1-2) When the WARNING LED of RKNAS is off" (REP 02-1180).
2	Replacement with the power turned off	—	See "(2) Procedure for replacement with the power turned off" (REP 02-1190).

Copyright © 2005, Hitachi, Ltd.

(1) Procedure for replacement with the power turned on

(1-1) When the WARNING LED of RKNAS is on

(Refer to "Figure 2.3.4 Replacing Host Connector" (REP 02-1170).)

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Make sure that WARNING LED (orange) of RKNAS lights up. If it does not light up, remove the Host Connector following "(1-2) When the WARNING LED of RKNAS is off" (REP 02-1180).

(b) Refer to "Information Message" on WEB, and check to see that [IA1X0x NNC Host Connector failure detected (NNC-x)] or [IA1L0x PCDG error [Host Connector] (NNC-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)

(c) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force. Besides, the cable can be damaged if it is bent upward or downward forcibly.

(d) Remove the Host Connector.

- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(e) Make sure that 20 seconds or longer has elapsed after the Host Connector was taken out. If the Host Connector is inserted before 20 seconds has elapsed, the Host Connector may not be recovered normally.

(f) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.

(g) Connect the Fibre Channel Interface cables.

(h) Refer to "Information Message" on WEB, and check to see that [IA1U0x NNC recovered from partial alarm (NNC-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)

When this is indicated, the replacement of Host Connector has completed.

Copyright © 2005, Hitachi, Ltd.

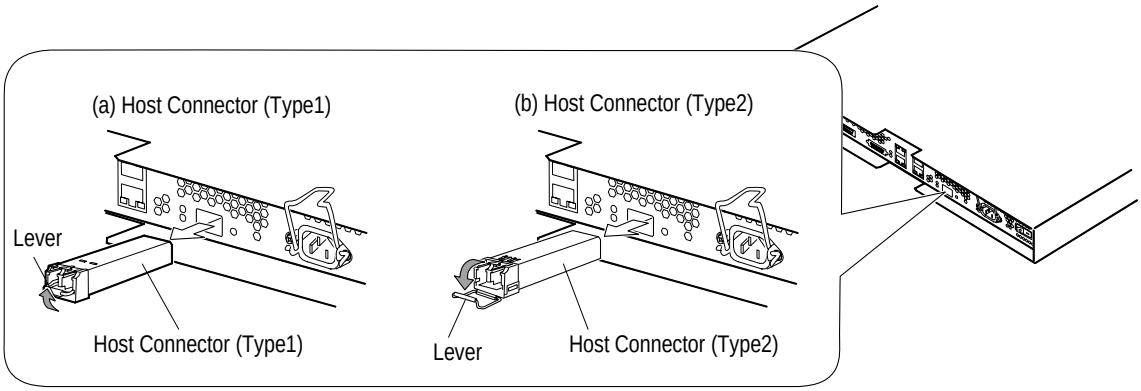

Figure 2.3.4 Replacing Host Connector

Copyright © 2005, Hitachi, Ltd.

(1-2) When the WARNING LED of RKNAS is off
(Refer to "Figure 2.3.4 Replacing Host Connector" (REP 02-1170).)

NOTE : There may be an error report in the host computer depending on the operating conditions of the host computer.
The prior contact to the customer is required.

(a) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(b) Remove the Host Connector.
- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(c) Make sure that 20 seconds or longer has elapsed after the Host Connector was taken out. If the Host Connector is inserted before 20 seconds has elapsed, the Host Connector may not be recovered normally.

(d) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.

(e) Connect the Fibre Channel Interface cables.

(f) Refer to "Information Message" on WEB, and check to see that [IA1U0x NNC recovered from partial alarm (NNC-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of Host Connector has completed.

Copyright © 2005, Hitachi, Ltd.

(2) Procedure for replacement with the power turned off
(Refer to "Figure 2.3.4 Replacing Host Connector" (REP 02-1170).)
Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.
- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(a) Turn off the AC Power Unit Switch of the RKNAS.
(b) Remove the Fibre Channel cables connected to the Control Unit mounting the Host Connector to be replaced.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

(c) Remove the Host Connector.
- In the case of Host Connector (Type1), pull out the Host Connector after pushing down the Lever to the forward.
- In the case of Host Connector (Type2), pull out the Host Connector after raising the Lever.

(d) Check the insertion direction of the Host Connector and inset the Host Connector in the port until it clicks.
(e) Connect the Fibre Channel Interface cables.
(f) Turn on the AC Power Unit Switch of the RKNAS.
(g) Make sure that the READY LED (green) on the RKNAS comes on.
(h) Refer to "Information Message" on WEB, and check to see that [IA1U0x NNC recovered from partial alarm (NNC-x)] is indicated. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)
When this is indicated, the replacement of Host Connector has completed.

Copyright © 2005, 2006, Hitachi, Ltd.

2.3.5 Replacing the NAS Interface cable

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(1) When replacing the PCI-Express cable or the CTRL cable, remove the repeat binder which bundling the NAS Interface Cable (PCI-Express cable and the CTRL cable) to be replaced.

(2) Remove the NAS Interface cable to be replaced.
Remove the NAS Interface cable which is connecting between the RKNAS and the RKNAS, and the RKNAS and the basic subsystem.
Remove the PCI-Express cable by pulling out the Lever.

NOTE : When the cable cannot be removed, do not pull it forcibly. If you bend the cable up and down forcibly, it may be damaged.

(3) Connect the new NAS Interface cable.
Connect between the RKNAS and the RKNAS, and the RKNAS and the basic subsystem with the new NAS Interface cable.
When the PCI-Express cable or the CTRL cable was replaced, bundle the connected PCI Express cable and the CTRL cable with the repeat binder (at the position of approximately 150mm from the tip of the table).

(4) Turn on all the AC Input Power Switches of the RKNAS.
The READY LED (green) on the RKNAS does not light up at this timing. Check the lighting of the READY LED (green) on the RKNAS after starting the NAS OS. Also, check that "IA1U0x NNC recovered from partial alarm (NNC-x)" or "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message on WEB in the window after starting the NAS OS (refer to WEB "2.5 Information Message" (WEB 02-0120)).

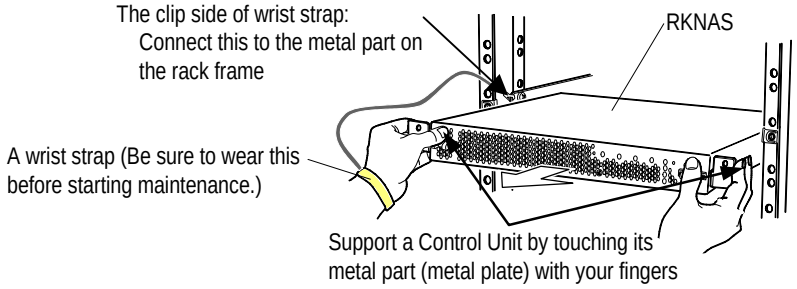
2.3.6 Replacing the NAS Chassis

The Main Board is included in the NAS Chassis.

⚠ CAUTION



- Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.
- Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are RKNAS, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

A failure may be caused by the electric shock since the RKNAS is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).

NOTE : Check that the fans of the FAN Assembly have stopped.

Copyright © 2005, 2006, Hitachi, Ltd.

Perform the replacement work in the following procedure after collecting the simple trace, the Control Unit blockade trace, and the Full Dump error according the message of the error occurred.

- For the Simple Trace (Troubleshooting "7.3 Collecting Simple Trace" (TRBL 07-0040))
- For the CTL Alarm Trace (Troubleshooting "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080))
- For the Full Dump (Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130))

(1) Remove the cover.
Remove the four fixing screws (two each at right and left) which are fixing the cover, and remove the cover by pulling it up after sliding it.
(2) Remove the torque screws, and remove the Brand Plate from the NAS Chassis.
(3) Remove each parts (Power Unit, Fan Assembly, Memory (DIMM), Host Connector, and Interface cable) from the NAS Chassis (refer to "2.3 Replacing the NAS parts" (REP 02-1050).
(4) Install the removed parts (Power Unit, Fan Assembly, Memory (DIMM), Host Connector, and Interface cable) in the new NAS Chassis (refer to "2.3 Replacing the NAS parts" (REP 02-1050). Install all the removed parts in the same position.

NOTE : Install the memory (DIMM) after removing the dust cover from the memory slot of the new NAS chassis.

(5) Attach the removed Brand Plate on the new NAS Chassis, and fix it by tightening the torque screws.
(6) Attach the cover.
Attach the cover by sliding it, and fix the four screws (two each at right and left) by fastening them.
(7) Install the RKNAS in the rack frame (refer to Installation "3.4.8 Installing the RKNAS" (INST 03-0601)).
(8) Connect all the removed cables.
(9) Attach the Front Bezel (refer to Installation "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130)).
(10) Turn on all the AC Input Power Switches of the RKNAS.
The READY LED (green) on the RKNAS does not light up at this timing. Check the lighting of the READY LED (green) on the RKNAS after starting the NAS OS. Also, check that "IA1U0x NNC recovered from partial alarm (NNC-x)" or "IA1V0x NNC recovered (NNC-x)" is displayed referring to the Information Message on WEB in the window after starting the NAS OS (refer to WEB "2.5 Information Message" (WEB 02-0120)).

2.3.7 Replacing Front Bezel of RKNAS

(1) How to replace Front Bezel of RKNAS

CAUTION

Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.

(a) Pull the replacing Front Bezel toward you holding its sides to disengage it from the ball catches.
(b) Hold the side of new Front Bezel with your both hands.
(c) After making the hooks of the new Front Bezel engaged, press the bezel against the main body until it is stopped.

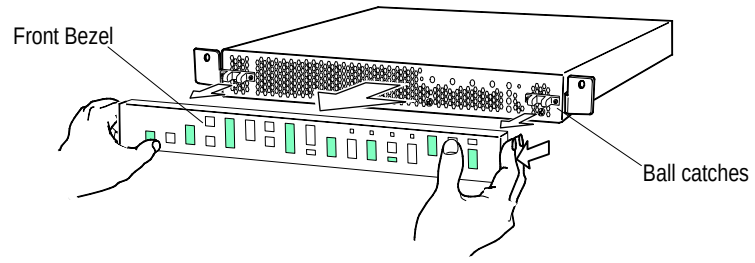

Figure 2.3.7 Procedure for Replacing Front Bezel

Chapter 3. Periodic Maintenance

This chapter contains information on items of periodical maintenance which is performed to prevent failures of the subsystem from occurring and to maintain operation performance.

3.1 Periodic Maintenance Items

Table 7.1.1 shows periodical maintenance items of the subsystem. Inspect and clean the subsystem regularly according to the operation environment.

Table 3.1.1 Periodic Maintenance Items

No.	Item			Interval (*1)	Inspection item for each model			Standard time required (*2)
					Floor Model		Rackmount Model	
					RKM+H1J/ RKS+H1J/ RKXS+H1J	RKM+RKAJ+H2J/ RKM+RKAJAT+H2J/ RKS+RKAJ+H2J/ RKS+RKAJAT+H2J/ RKXS+RKAJAT+H2J	Rackmount Model (U7)	
1	Inspection	Inspecting FANs	Fan Assembly	Y1	"3.2.1 Inspecting fans" (REP 03-0020)	"3.2.1 Inspecting fans" (REP 03-0020)	"3.3.1 Inspecting fans" (REP 03-0040)	5 min
2	Cleaning	Cleaning the subsystem	Front bezel	Y1	"3.2.2 Cleaning the subsystem" (REP 03-0030)	"3.2.2 Cleaning the subsystem" (REP 03-0030)	"3.3.2 Cleaning the subsystem" (REP 03-0060)	5 min
			Rear cover	Y1	"3.2.2 Cleaning the subsystem" (REP 03-0030)	"3.2.2 Cleaning the subsystem" (REP 03-0030)	–	5 min
			Rear door	Y1	–	–	"3.3.2 Cleaning the subsystem" (REP 03-0060)	5 min
3	Replacement of periodical replacement part		Battery	Y2	"3.4.1 Replacing Battery Unit" (REP 03-0070)	"3.4.1 Replacing Battery Unit" (REP 03-0070)	"3.4.1 Replacing Battery Unit" (REP 03-0070)	10 min

*1 : The maintenance intervals were set on the assumption that the average operation hours of the subsystem is 400 hours/month. Therefore, in the following cases, consult the customer to decide whether to change the intervals or not taking the actual operation hours in consideration. (See Table 3.1.2.)

*2 : Working hours change by the case where one RKH/RKM/RKS/RKXS/RKNAS is checked, and the number of RKAJ/RKAJAT/RKA.

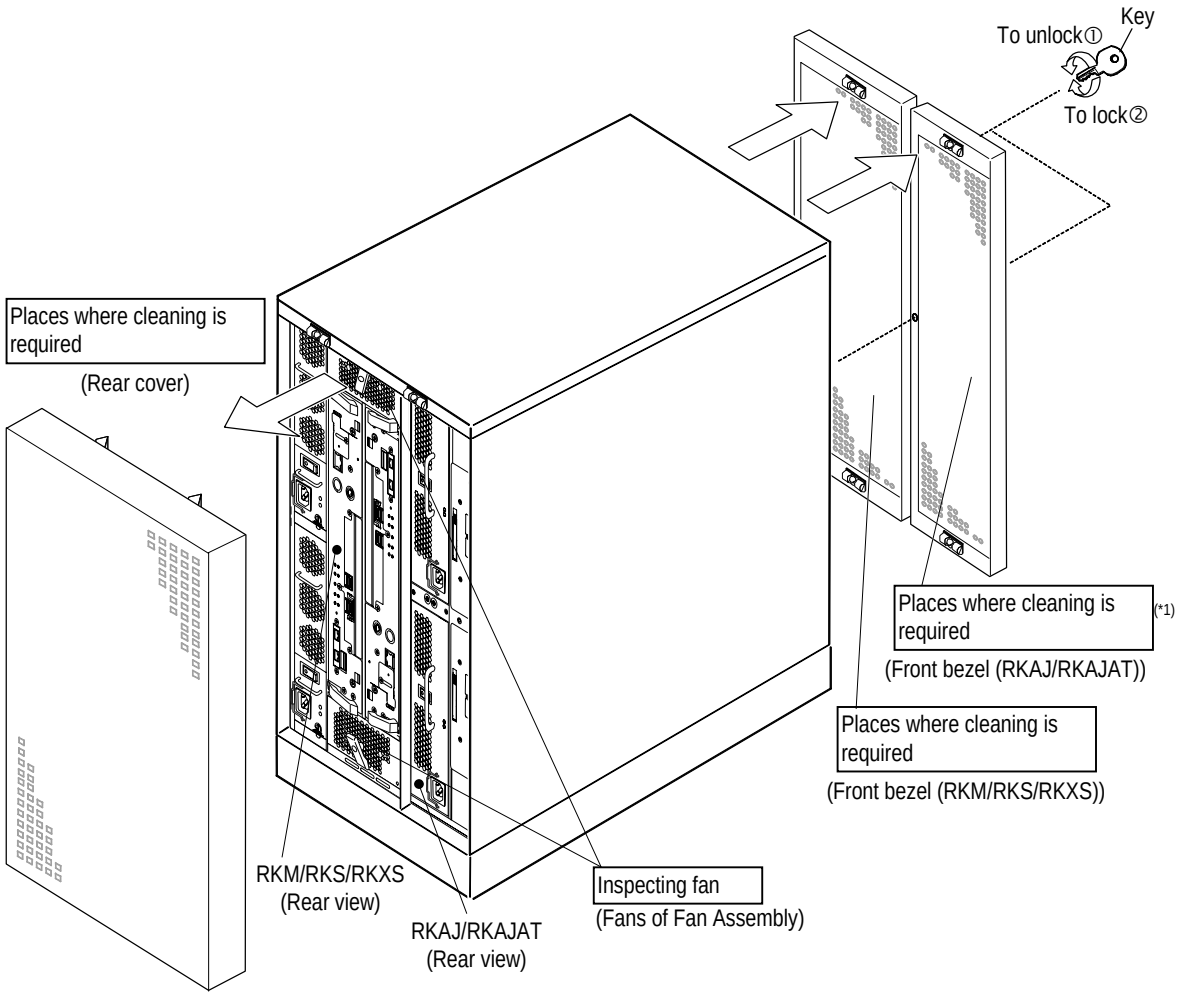

Table 3.1.2 Change of Maintenance Interval

Object item	Factors requiring change of maintenance interval		Remarks
	Case of shortening the interval	Case of lengthening the interval	
• Inspection of fans • Cleaning of the subsystem	• Operation hours are long. • Installation environment is bad. • To fit the interval for user's operation schedule. • To improve service for user • Necessity to shorten the interval is recognized for other reason.	• Operation hours are short. • Installation environment is excellent.	Also examine items to be added to the factors shown on the left such as the frequency of the subsystem failure occurrence and items common to the subsystem and a connected system.

Copyright © 2005, 2006, Hitachi, Ltd.

3.2 Inspecting and Cleaning Floor Model

Perform the inspection and cleaning periodically. Parts of the floor models to be inspected and cleaned are shown in Figure 3.2.1 (for the RKM+H1J/RKS+H1J/RKXS+H1J, RKM+RKAJ+H2J/RKM+RKAJAT+H2J/RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J).

*1 : The floor model (RKM+H1J/RKS+H1J/RKXS+H1J) does not have this part.

Figure 3.2.1 Inspecting and Cleaning of Floor Model

Copyright © 2005, 2006, Hitachi, Ltd.

3.2.1 Inspecting fans

Inspect the fans while the subsystem powered on.

⚠ CAUTION

Since each fan is rotating with high-speed, be careful not to be caught by it.

(1) In the case of the Floor (RKM+H1J/RKS+H1J/RKXS+H1J/RKM+RKAJ+H2J/RKM+RKAJAT+H2J /RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J) Model, remove the rear cover.
(2) Make sure that fans of the Fan Assembly on the rear side of the subsystem are rotating.
(3) In the case of the Floor (RKM+H1J/RKS+H1J/RKXS+H1J/RKM+RKAJ+H2J/RKM+RKAJAT+H2J /RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J) Model, reinstall the rear cover after the inspection and cleaning are completed.

Copyright © 2005, 2006, Hitachi, Ltd.

3.2.2 Cleaning the subsystem

To clear the subsystem, check whether or not air vents are clogged by dust. If they are clogged, remove the dust with a vacuum cleaner or wipe the dust out from it with a dry cloth.

⚠ CAUTION

- Be sure to keep the front bezel and rear panel clean.
  Or else, the ventilation is deteriorated so that the temperature inside the subsystem may rise causing a failure or even a fire.
- Be careful not to move the subsystem during cleaning.

⚠ CAUTION

If you touch a live part, it is feared that you receive an electric shock.

(1) Clean the outside of the Front Bezel.
(2) Insert the key in the Front Bezel and turn it in the direction shown by the arrow ① (⟶) to unlatch the bezel.
(3) Remove the Front Bezel. (See Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))
(4) Clean the internal surfaces of the Front Bezel.
(5) Attach the Front Bezel.
(6) Turn the key in the direction shown by the allow ② (<·····) to latch the front bezel.
(7) In the case of the Floor (RKM+H1J/RKS+H1J/RKXS+H1J/RKM+RKAJ+H2J/RKM+RKAJAT+H2J /RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J) Model, remove the rear cover.
(8) Clean the outer and inner sides of the rear cover.
(9) In the case of the Floor (RKM+H1J/RKS+H1J/RKXS+H1J/RKM+RKAJ+H2J/RKM+RKAJAT+H2J /RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J) Model, reinstall the rear cover after the inspection and cleaning are completed.

Copyright © 2005, 2006, Hitachi, Ltd.

3.3 Inspecting and Cleaning Rackmount Model with U7 Rack Frame

3.3.1 Inspecting fans

This work is for the RKM/RKS/RKXS/RKH only.
Perform the inspection of the fans with the power turned on.

⚠ CAUTION

Since each fan is rotating with high-speed, be careful not to be caught by it.

(1) Open the rear door. To open it, insert an Allen wrench into the keyhole on the door, turn it in the direction shown by the arrow ① (⟶), and open the door leaving the wrench as it is. (See Figure 3.3.1.)
(2) Make sure that the fans of the Fan Assembly in the rear of the mounted unit are rotating.
(3) Fit the Allen wrench in the key socket on the door turn it in the direction shown by the arrow ① (⟶), and close the door leaving the wrench as it is.

When the RKNAS is installed, inspect the fans of the RKNAS as follows.
Perform the inspection of the fans with the power turned on.

(1) Remove the Front Bezel of the RKNAS. (Refer to Installation "1.5.3 (1-2) NAS Unit" (INST 01-0141).)
(2) Check that the fans of the FAN Assembly in the front of the RKNAS are rotating.
(3) Attach the Front Bezel of the RKNAS.

Copyright © 2005, 2006, Hitachi, Ltd.

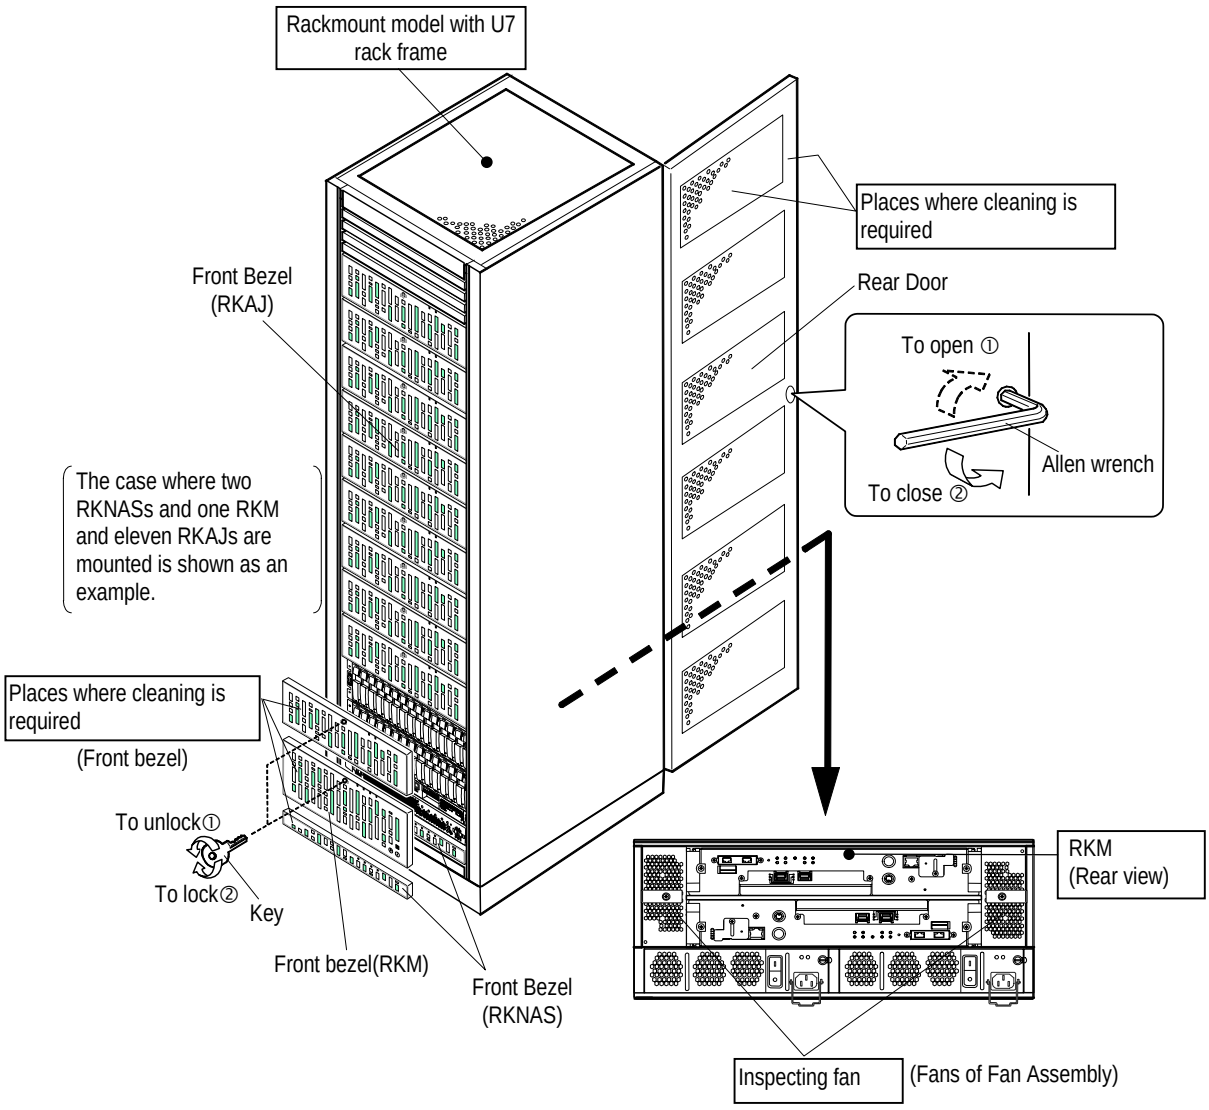

Figure 3.3.1 Inspecting and Cleaning Rackmount Mode with U7 Rack Frame

Copyright © 2005, 2006, Hitachi, Ltd.

3.3.2 Cleaning the subsystem

To clear the subsystem, check whether or not air vents are clogged by dust. If they are clogged, remove the dust with a vacuum cleaner or wipe the dust out from it with a dry cloth.

CAUTION

- Be sure to keep the front bezel and rear panel clean.
  Or else, the ventilation is deteriorated so that the temperature inside the subsystem may rise causing a failure or even a fire.
- Be careful not to move the subsystem during cleaning.

CAUTION

If you touch a live part, it is feared that you receive an electric shock.

(1) Clean the outside of the Front Bezel.
(2) Insert the key in the Front Bezel and turn it in the direction shown by the arrow ① (⟶) to unlatch the bezel. (This work is unnecessary for RKNAS.)

CAUTION

Attach or remove the front bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(3) Remove the Front Bezel. (Installation "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100).)
(4) Clean the internal surfaces of the Front Bezel.
(5) Attach the Front Bezel.
(6) Turn the key in the direction shown by the allow ② (·····>) to latch the Front Bezel. (This work is unnecessary for RKNAS.)
(7) Clean the external surfaces of the rear door.
(8) Open the rear doors. (Installation "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)
(9) Clean the internal surfaces of the rear door.
(10) Close the rear door. To close it, insert the Allen socket wrench into the keyhole on the door, turn it in the direction shown by the arrow ① (⟵), and close the door leaving the wrench as it is.

Copyright © 2005, Hitachi, Ltd.

3.4 Replacing Periodical Replacement Parts

In the subsystem, a battery, which is a part with limited life, is used and it must be replaced periodically. To replace the battery, replace the Backup Battery Unit containing the battery. The battery has a usable period. Confirm the time limit and do not use the battery which passed the time limit.
When replacing two Backup Battery Units at the same time (one Backup Battery Unit is replaced for the floor model of the RKS/RKXS) or replacing four at the same time, it can be performed during the operation (being used for the customer's business), but the Cache becomes the write through mode and the R/W performance is slightly deteriorated.

3.4.1 Replacing Battery Unit

⚠ CAUTION

- Do not disassemble the battery, or a burn or electric shock may be caused.
- If a battery is handled wrongly, it is feared that an explosion is caused.

CAUTION

- When a device is kept with power-off for more than three months, the battery may be excessively discharged, and it may cause an unrecoverable damage for RKM/RKS. In such a storing condition, either charge the battery at least once every three months for more than six (6) hours, or switch off the battery. Even though the battery is switched off, to prevent damages from natural discharge, the battery must be charged once every six months for more than six (6) hours. When the battery without the switch is installed, charge it once every six months for more than six (6) hours.
- When a device is kept with power-off for more than six months, the battery may be excessively discharged, and it may cause an unrecoverable damage for RKXS/RKH. In such a storing condition, the battery must be charged once every six months for more than six (6) hours.

(1) Procedure for replacing a Disk Drive is "2.2.2 Replacing Backup Battery Unit" (REP 02-0240).
(2) For disposing and keeping the used battery, refer to "Chapter 5. Recycling" (REP 05-0000).

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 4. Maintenance Tools

4.1 Maintenance Tools for Hardware

Names and usages of maintenance tools to be used for installation and maintenance are shown below.

No.	Tool name	Specification	Usage
1	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
2	Phillips screwdriver	No.2	General use
3	Slotted screwdriver	No.1	For Device ID Setting Switch
4	Allen wrench	No.3	For installing floor stand kit
5	Allen wrench	No.4	For fastening of AC power cable.
6	Allen wrench	No.6	For opening/closing doors (of rack frame)
7	Spanner	No.22	For adjusting leveling bolt (of U7 rack frame)
8	USB memory	–	For storing simple trace information
9	Wrist strap	–	For discharge static electricity
10	Torque screwdriver	No.T10	For installing the Brand Plate to the NAS Chassis

Copyright © 2005, 2006, Hitachi, Ltd.

4.2 Maintenance Tools for Software

Maintenance tool consists of Storage Navigator Modular or Subsystem's built-in Web, trace analysis tool (TDCONV), and back-end diagnostic tool.

The following describes the outline of each maintenance tool.

(1) Storage Navigator Modular
Storage Navigator Modular is operated on the terminal device (RC and WEB etc) connected through a LAN with Array unit. This program enables you to perform the operation for Array unit such as referencing the state of Array unit and setting a configuration.
For details, refer to "Storage Navigator Modular (for GUI) User's Guide".

(2) Subsystem's built-in WEB
By having WEB function in Array unit, you can access the Array unit from the terminal device connected through a LAN using a WEB browser. Subsystem's built-in WEB enables you to perform the maintenance operations such as confirming a failure status of the subsystem, referencing a error message, installing the microprogram, and collecting failure information.
For details, refer to "Maintenance manual for WEB".

(3) Back-end diagnostic tool
When Loop Failure (W080xy) occurs, Back-end diagnostic tool performs the Loop Failure Detection Function from Diagnosis for Loop Failure Detection Function window in Subsystem's built-in WEB, and identifies the failed Disk Drive.
For details, refer to Troubleshooting "6.1.14 A failure occurred during operation : Case 4 (Loop failure)" (TRBL 06-0600).

Connection of maintenance tools for software is shown in Figure 4.2.1.

Copyright © 2005, Hitachi, Ltd.

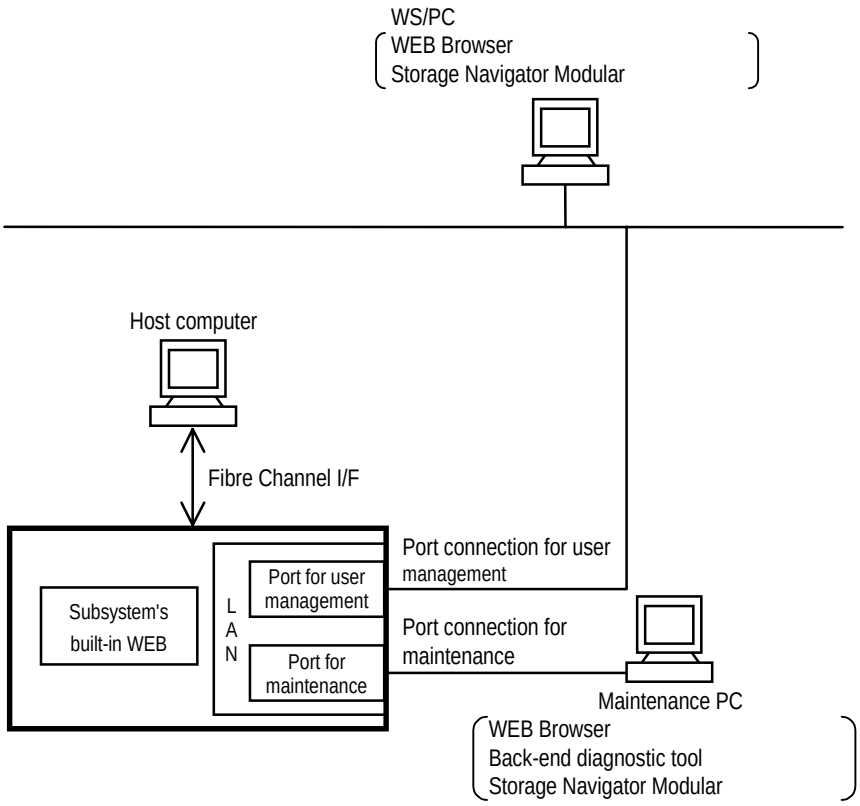

Figure 4.2.1 Connection of maintenance tool for software

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

Chapter 5. Recycling

(1) Parts to be recycled

The battery used in the subsystem is a sealed Nickel-hydride rechargeable battery. The lead battery is a valuable resource which can be recycled.
When you replace it or dispose of a used subsystem, please cooperate in the recycling. How to dispose of the battery or Backup Battery Unit which becomes useless owing to replacement etc. is shown below.

⚠ DANGER

- Do not disassemble the case, do not modify it, or do not peel off the label. There are high voltage parts inside: If you attempt any of these actions, you may get an electrical shock or burn.
- Do not disassemble the battery; this may cause short circuits inside or outside of the battery. If the components are exposed to the air, the battery may cause overheat, burst or ignite. Disassembling the battery may expose you to its alkaline solution, which can be dangerous.
- Do not cut the output cable. Do not modify the connector. If you attempt any of these actions, you may get an electrical shock or burn. A short-circuit may cause abnormal chemical reactions inside the battery which leads to overheating, bursting or ignition.
- Follow the instructions when you recharge the battery pack. If you recharge it in a way different from specified here, it may cause the following problems: The battery may become charged excessively; excessive current may be produced; or the battery cannot be recharged. As a result, the battery may leak, become overheated, burst, or ignite.
- Do not use excessive force when you connect the battery pack to the charger or other devices. If you cannot connect it easily, check the positive and negative are correct for the connector. If you connect the battery in reverse, it will be charged incorrectly and abnormal chemical reactions may occur inside. As a result, the battery may become overheated, burst or ignite.
- Do not connect the battery to a power receptacle. If you apply an excessive amount of voltage to the battery, it may produce excessive current making the battery overheat, burst or ignite.
- Do not use or leave the battery where the temperature can become high, such as, near a fire or a heating element. High temperatures may damage the battery's separator, which may cause short circuit, making it overheat, burst or ignite.
- Do not incinerate the battery pack or heat it. If you do so, the insulator may melt, the safety fuse/
  mechanism may be damaged, or the electrolyte may gush out. As a result, the battery may become burst, explode or ignite.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, 2006, Hitachi, Ltd.

- Do not connect the negative terminal to the positive with metal wire. Do not carry or store the battery with other metal parts. This may cause a short circuit or produce excessive current which can cause the battery to leak, overheat, burst or ignite.
- Do not let the battery become wet by soaking it in the water or seawater. If the battery gets wet, a short circuit may occur and an excessive amount of current may be produced causing abnormal chemical reactions inside. As a result, the battery may become overheated, burst or ignite.
- Do not nail the battery, hit it with a hammer, or stamp on it. The battery may be broken or dented and a short circuit may occur inside. As a result, the battery may become overheated, burst or ignite.
- Do not solder directly to the battery. If you do so, heat will melt the insulator and damage the safety fuse/mechanism. As a result, the battery may leak or may become overheated, burst or ignite.
- Do not recharge the battery where there is a high temperature, such as near a fire.

  This may cause abnormal chemical reactions inside the battery and it may become overheated, burst or ignite. High temperatures may also cause deterioration of performance/life of the battery.

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ WARNING

- Do not place the battery pack in the microwave oven or under high pressure. Either of these actions will rapidly heat the battery or break its seals: As a result, the battery may become overheated, burst or ignite.
- If you find anything strange or unusual with the battery when you use/carry/store it, remove the battery from the device and stop using it. For example, strange smells, strange colors, or deformation are a sign you must stop using the battery.
- If it takes longer than the specified time to complete recharging, stop recharging the battery: Otherwise, the battery may become overheated, burst or ignite.
- If the battery leaks and gets into your eyes, immediately flush your eyes with clean water (tap water) and do not rub your eye. Then visit the doctor immediately. If you do not seek any treatment for your eyes, problems may occur later. Because the battery uses highly concentrated alkaline as electrolyte, it may burn or you may lose your sight if it contacts your skin or eyes. If the battery's liquid contacts your skin or eyes, you must flush them with plenty of clean water and visit the doctor at once.

(2) Display of recycling mark

The following three-arrow recycling mark shows that the sealed Nickel-hydride rechargeable battery is a part to be recycled. A label bearing the mark is affixed on the battery.

(3) Specifications of lead battery

Table 5.1 Specifications of sealed Nickel-hydride rechargeable battery (RKM/RKS/RKXS/RKH)

No.	Specification	Backup Battery Unit	
		RKM/RKS/RKH	RKXS
1	Manufacturer	Matsushita Battery Industrial Co., Ltd.	Matsushita Battery Industrial Co., Ltd.
2	Model	HHR-33AH15W1	HHR-33AH10W＊ (＊:1 to 9)
3	Voltage (V)	6	6
4	Capacity (mAh)	9600	6400

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Disposal and safety in storage

Before storing a sealed Nickel-hydride rechargeable battery, cover its terminals with electric tape, etc. to prevent a short circuit. Store it separately from batteries of other type such as dry battery.

(5) Method of storage

Table 5.3 Storage method

No.	Item	Requirement
1	Storage method	Store a Backup Battery Unit being packed in the following conditions. • Do not apply it any unusual vibration or shock. • Do not put it on its side. • Keep it in a place where the temperature is within a range of 0 to 35 °C.
2	Allowable storage term	The expiration date of the storage able term is a date indicated on the usable term label.
3	Stock management(*1)	Manage stored batteries or Backup Battery Units in the way of FIFO. Since a label for entering the usable time limit is affixed on each package, please utilize it.

*1 : When replacing the Backup Battery Unit, check the usable time limit of it following "(6) Checking usable term of maintenance part" (REP 05-0030).

(6) Checking usable term of maintenance part

If the battery is left uncharged for longer than six months, it will discharge excessively and becomes unable to be fully recharged. Therefore, when the Backup Battery Unit is stored as a maintenance part, it must be stored on charge under the following condition, and used within one year. (Concerning the batteries mounted on the subsystem, since they are charged while the subsystem power is on, no problem will occur.)

No.	Items	Conditions
1	Period of Long-term storage	One year
2	Storage temperature	0°~35°
3	Supplemental charge interval	Once per six months

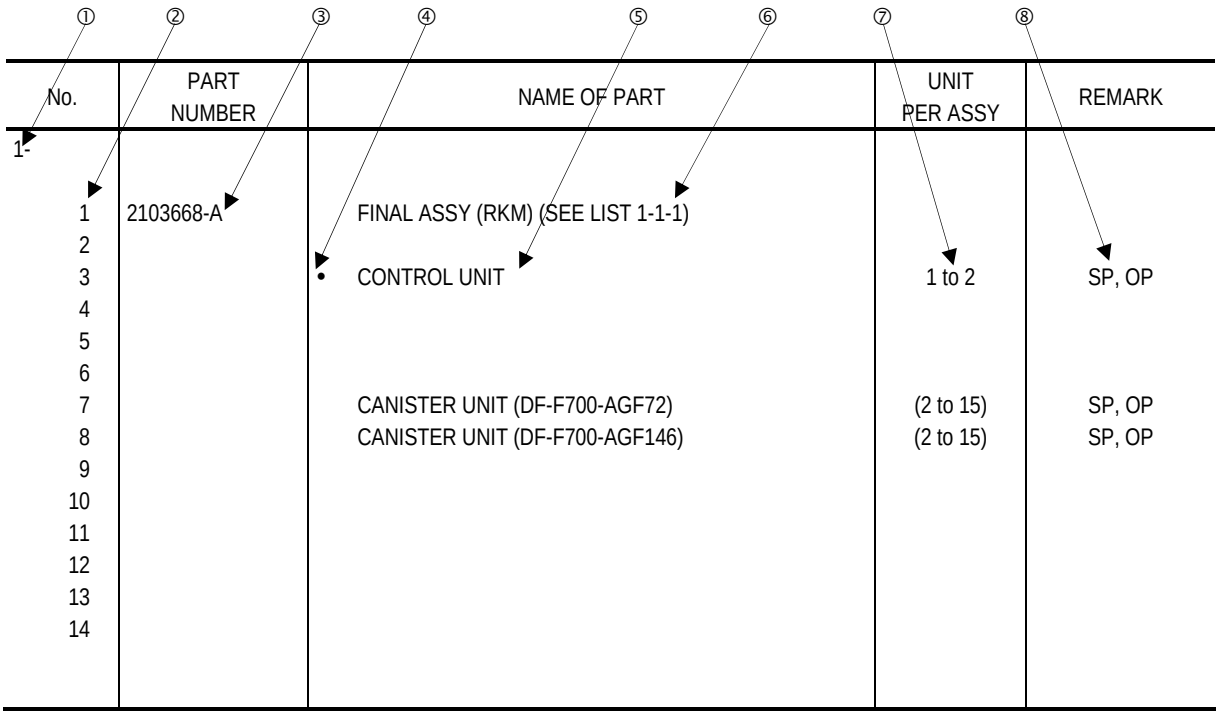
Parts Catalog

Chapter 1. Parts Catalog..... PARTS 01-0000

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.



Chapter 1. Parts Catalog

This chapter contains catalogs of the parts of the subsystem and the devices composing the system.

Names and installation locations of parts are shown for the each model and the device.

In addition, classification of parts (into maintenance parts and optional parts) is also contained.

1.1 How to Use this Parts Catalog

① : Indicates a list number of an assembly which is a broad division of the subsystem.

② : Indicates a serial number of a part listed in the above list.

③ : Indicates a part number (drawing number).

④ : Indicates relationship of parts as follows.

No dots: Main assembly

• : Detail part of a main assembly

•• : Detail part of a one-dot subassembly

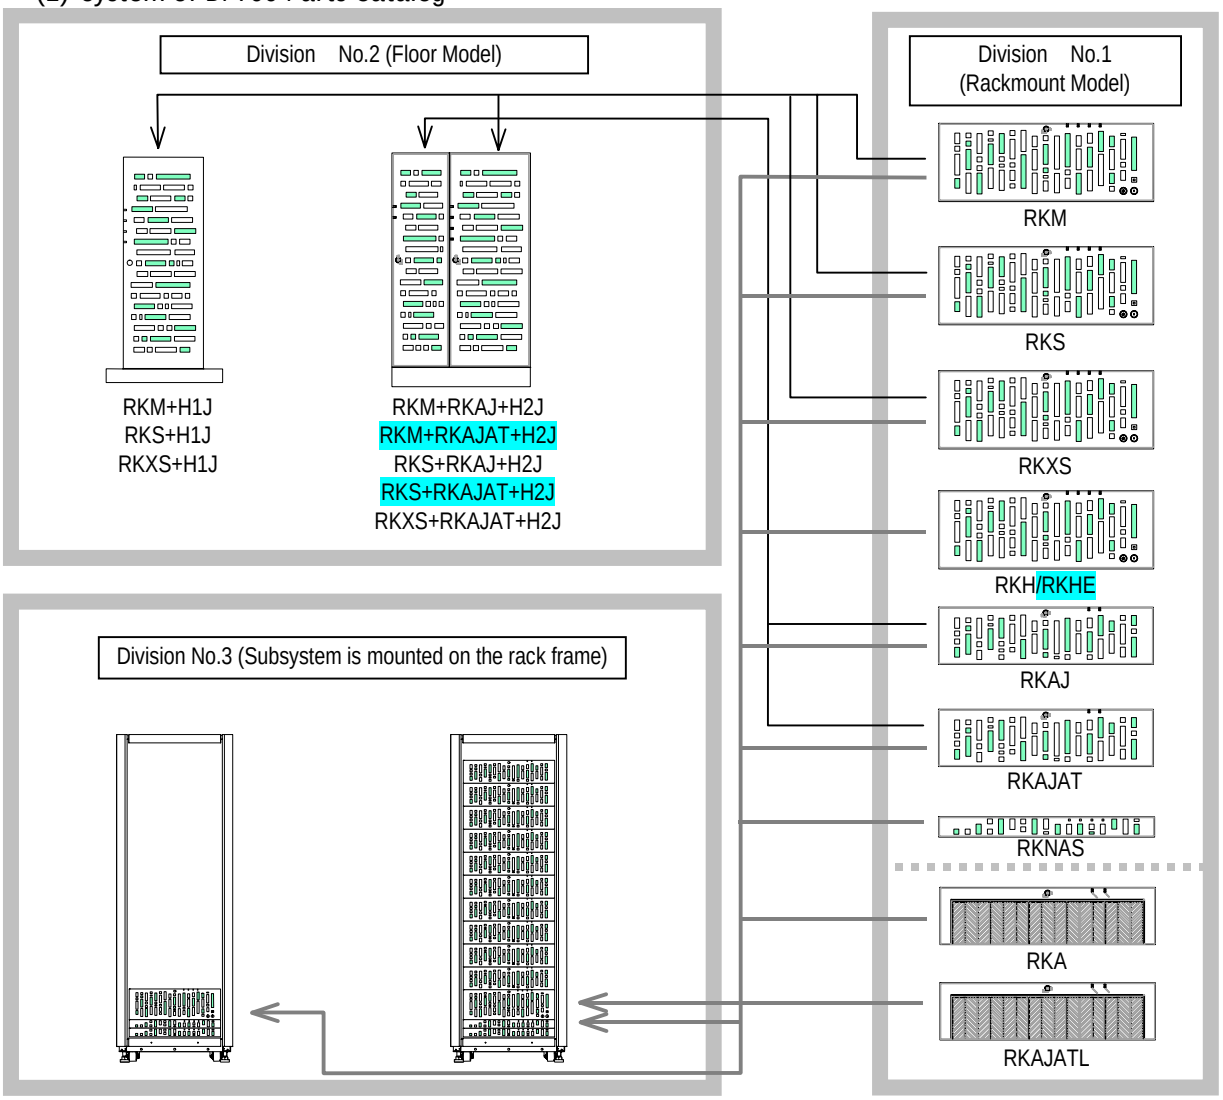
••• : Detail part of a two-dot subassembly

⑤ : Indicates a part name

⑥ : Indicates a number of a detailed list when it exists. (Ex.: See No. 3-1-1.)

⑦ : Indicates a quantity per assembly.

Number in parentheses indicates the minimum and maximum quantities of the installed parts.



⑧ : SP and OP means maintenance part and optional part respectively.

Copyright © 2005, Hitachi, Ltd.

1.2 System of Parts Catalog

The parts and devices which composes the system are classified as shown below.

(1) System of DF700 Parts Catalog

Copyright © 2005, 2006, Hitachi, Ltd.

Division	Classification	Name of Part	No.	Sheet No.

Chapter 1. Before Using Web

Precautions when restarting.

If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

1.1 The Operating Environment

The operating environment where is able to use Web is shown below.

Table 1.1.1 Operating Environment

No.	Item	Description	Remark
1	OS	Microsoft Windows 98, NT 4.0, 2000, XP, 2003, Solaris8, IRIX6.5, AIX4.3, 5.1	—
2	PC	Pentium (Pentium Ⅱ (233 MHz or more) is recommended), Memory 40 M bytes or more (64 M bytes or more is recommended)	—
3	WS	Turbo Sparc 170 M Hz, Memory 256 M bytes or more R10000 195 M Hz, Memory 128 M bytes or more	—
4	Disk requirement	• 60 M bytes, under ordinary maintenance work • 1.2 G bytes per one Controller, under Full Dump collection(*1) {Storing temporary file of Browser : 600 M bytes Storing Full Dump: 600 M bytes}	• Data compression tool is required for Full Dump. • Refer to "3.5.3 Collecting Full Dump" (WEB 03-0370) or "3.5.4 Collecting Full Dump (Full Dump(SnapShot/TCE))" (WEB 03-0400) for the capacity of Full Dump when it is uncompressed.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Full Dump collection may be requested by the Technical Support Center at the time of a tough failure.

Copyright © 2005, 2006, Hitachi, Ltd.

1.2 Notices on (restriction of) the support browser

In the case of Windows2003, because the strict data security is the default setting, the Web function cannot work.
In order to solve the above problem, change the setting of the browser as follows.

- Select [Tools] - [Internet Options …] - [Security] - [Custom Level …] - [Custom Setting Reset] of the browser in this order and select the setting of the security level from Medium or lower and click the "Reset" button.

  The making of the setting as Medium solves the problem. However, if you want to use Win2003 leaving the security level as High, make the following settings for the detailed items of the [Custom Level …].
  - Enable the [Active scripting] of the [Scripting].
  - Enable the [Allow META REFRESH] of the [Miscellaneous].
  - Enable the [File download] of the [Downloads].
  - Enable the [Run ActiveX controls and plug-ins] of the [ActiveX controls and plug-ins].

- The WEB function operates normally in other Windows because the security level is being [Medium].
  However, set the following items in [Settings] of [Tools] - [Internet Options …] - [Security] - [Custom Level …] to [Enable].
  - Enable the [Active scripting] of the [Scripting].
  - Enable the [File download] of the [Downloads].
- There may be a case where a new line is started in a window depending on a setting of the browser. In such a case, make the character size smaller.

< Method of character size change >

In the case of IE

Select "Middle" or smaller size for the "Character Size" in the "Display".

In the case of Netscape

Select the "Reduction of Font Size" in the "Display" and keep it being selected until paragraphs become easy to be read.

- There may be a case where an empty dialogue box is displayed during operation in the Maintenance mode. In such a case, close the window by clicking on the mark of "X" in the upper left corner of the dialogue box, restart the browser, and then make a retry from the entry of the URL.
- When a window size is changed while a page is displayed by Netscape, the succeeding operation in the Refresh mode may not be done normally. In such a case, display the page over again by clicking the Re-Display button.
- In the case of using Netscape
  Memory cache: 1024 k bytes (default) or larger
  Disk cache: 7680 k bytes (default) or larger

< Method of cache size setting >

Select the "Edition", "Setting", "Details", and "Cache" in this order.
Specify sizes of the memory cache and disk cache.

Copyright © 2005, 2006, Hitachi, Ltd.

- When obtaining trace information etc. with Netscape, there are cases that a sub-screen to specify the file download destination does not automatically close.
  In such a case, press a close button at the upper right corner of the sub-screen to close the sub-screen after download complete.
- When using Netscape Navigator 7.x, select [Edit]-[Preference...]-[Advanced]-[HTTP Networking], and set "Use HTTP 1.0" in the "Direct Connection Options" and "Proxy Connection Options". When this setting is not made, the summary window is not displayed correctly.
- When collecting Full Dump using Netscape Navigator 4.7x, pay attention to free space in PC because information to be downloaded won't be compressed.

	Installed cache of the subsystem	Free Capacity needed on PC
RKM	1 G bytes (Minimum)	853 M bytes
	4 G bytes (Maximum)	2,970 M bytes
RKS	1 G bytes (Minimum)	720 M bytes
	2 G bytes (Maximum)	1,496 M bytes
RKXS	512 M bytes (Minimum)	405 M bytes
	1 G bytes (Maximum)	758 M bytes
RKH	2 G bytes (Minimum)	1,926 M bytes
	8 G bytes (Maximum)	5,820 M bytes

Copyright © 2005, 2006, Hitachi, Ltd.

1.3 The Characteristic of the Network Function

- LAN interface
  The connector for 10Base-T/100Base-TX is equipped with the Controller. 10Base-T/100Base-TX and half-duplex/full-duplex communication are selected automatically by the automatic negotiation function.

  NOTE : The fixed setting of the negotiation cannot be performed.
  Communicate by setting the device to be connected to the automatic negotiation.

- Network parameter
  The DF700 has the following network parameters, and the User management port of each Control Unit can be set or changed from the WEB browser or the Storage Navigator Modular.

Network parameter	Description	Values set when shipped from the factory				Remark
		Control Unit #0		Control Unit #1		
		Maintenance port < Fixed IP >	User management port <Variable IP>	Maintenance port < Fixed IP >	User management port <Variable IP>	
IP Address	The IP Address is changed/set up.	10.0.0.16	192.168.0.16	10.0.0.17	192.168.0.17	(*1)
Subnet Mask	The Subnet Mask is changed/set up.	255.255.255.0	255.255.255.0	255.255.255.0	255.255.255.0	
Default Gateway	The Default Gateway is changed/set up.	0.0.0.0	0.0.0.0	0.0.0.0	0.0.0.0	
DHCP	Enable/Disable of the DHCP function is set up.	OFF	OFF	OFF	OFF	(*2)

*1 : The network connection is possible in the above IP Address (192.168.0.16) for the unchanging from the factory setting value. Please manage the IP Address after the change certainly, if the IP Address is changed from the IP Address of factory setting.

*2 : When DHCP mode is valid, IP address is obtained from the DHCP server.
When the DHCP server has not started up or DHCP function has been miss-set, obtaining the IP address fails and the device IP address remains to be "0.0.0.0". (Storage Navigator Modular or Web cannot be used via LAN.)
In this case, the device IP address can be obtained by starting up the DHCP server or setting DHCP function correctly if necessary.
In the configuration which uses this subsystem as an external disk drive of the DHCP server, when the IP address of this subsystem is acquired using the DHCP function, if the network address of the reserved IP address for the maintenance port is assigned as an IP address, the IP addresses of the port for the user control and the port for the maintenance may not operate normally because they compete.
Request the system administrator that the DHCP server does not assign IP address of "10.0.0.x", "192.168.0.x", "192.168.233.x", "172.23.211.x", "10.197.181.x" to the device.

Copyright © 2005, 2006, Hitachi, Ltd.

- Automatic change of network parameters of the Maintenance port (when the microgram revision is less than 0726/A)
  When setting the network parameters of the User management port, the IP address of the Maintenance port is automatically changed as shown below according to the IP address value of the User management port to be set.
  - When setting the User management port of CTL0 to 10.xxx.xxx.xxx, the Maintenance port of CTL0 is 192.168.0.16.
  - When setting the User management port of CTL0 to other than 10.xxx.xxx.xxx, the Maintenance port of CTL0 is 10.0.0.16.
  - When setting the User management port of CTL1 to 10.xxx.xxx.xxx, the Maintenance port of CTL1 is 192.168.0.17.
  - When setting the User management port of CTL1 to other than 10.xxx.xxx.xxx, the Maintenance port of CTL1 is 10.0.0.17.

- Manual change of network parameters of the Maintenance port (When the microprogram revision is 0726/A or more)
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.
  The following can be set as the fixed values of the network parameters used in the Maintenance port.
  - 10.0.0.xxx
  - 192.168.0.xxx
  - 192.168.233.xxx
  - 172.23.211.xxx
  - 10.197.181.xxx

  NOTE : • For the part of xxx, set 16 to CTL0 except when connecting the Maintenance port to the network (in that case, 17 is automatically set to CTL1).
  • However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
  If this is the case, set network address other than maintenance port in the LAN device which is connected via the Gateway in the extension of the User management port, or set maintenance port other than the network address of LAN device which is connected via the Gateway. (Refer to System Parameter "4.2 (4) Setting Maintenance of LAN"(SYSPR 04-0100).)

Copyright © 2005, 2006, Hitachi, Ltd.

- Automatic change of network parameters of the Maintenance port (when the microgram revision is 0735/B and the microprogram revision is 0740/B or more)
  When setting the network parameters of the User management port, if "Maintenance port IP address automatic change mode" is enabled, the IP address of the Maintenance port is automatically changed as shown below according to the IP address value of the User management port to be set.
  - When setting the User management port of CTL0 to 10.xxx.xxx.xxx, the Maintenance port of CTL0 is 192.168.0.16.
  - When setting the User management port of CTL0 to other than 10.xxx.xxx.xxx, the Maintenance port of CTL0 is 10.0.0.16.
  - When setting the User management port of CTL1 to 10.xxx.xxx.xxx, the Maintenance port of CTL1 is 192.168.0.17.
  - When setting the User management port of CTL1 to other than 10.xxx.xxx.xxx, the Maintenance port of CTL1 is 10.0.0.17.

  When "Maintenance IP address automatic change mode" is disabled, it becomes the same operational specification as the manual change of the network parameters of the Maintenance port.

  NOTE : However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
  If this is the case, set network address other than maintenance port in the LAN device which is connected via the Gateway in the extension of the User management port, or set maintenance port other than the network address of LAN device which is connected via the Gateway. (Refer to System Parameter "4.2 (4) Setting Maintenance of LAN"(SYSPR 04-0100).)

1.4 Support Browser List

Table 1.1.2 Support Browser List

(○ : support × : not support)

No.	Platform	OS		Browser		Supported or not supported	Java Applet supported or not supported (*2) (*3)
		Type	Ver.	Type	Ver.(*1)		
1	WS	IRIX	6.5	Netscape Navigator	4.76	○	×
		Solaris	2.6	Netscape Navigator	4.76	○	×
			8	Netscape Navigator	4.76	○	×
		AIX (*4)	4.3	Mozilla (*4)	1.5	○	×
			5.1	Mozilla (*4)	1.7	○	×
2	PC	Windows	98	Internet Explorer	6.0	○	○
			NT/2000	Internet Explorer	6.0	○	○
			XP	Internet Explorer	6.0	○	×
			2003 (IA32)	Internet Explorer	6.0	○	○
			2003 (IA64)	Internet Explorer	6.0	○	×
					6.0 (32 Bit)	○	○
		Windows	98	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×
			NT/ 2000/XP	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×
			2003 (IA32/IA64)	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×

*1 : Service Pack 1 is included.

*2 : When installing the microprogram, the Maintenance PC must be started by the OS from the drive C in order to prevent a problem of security from occurring.

*3 : Java Applet is used for the following cases.
Microprogram installation, Host command trace download, and Online ENC/SENC firmware download.

*4 : It supports from the microprogram revision 0720/A-S.

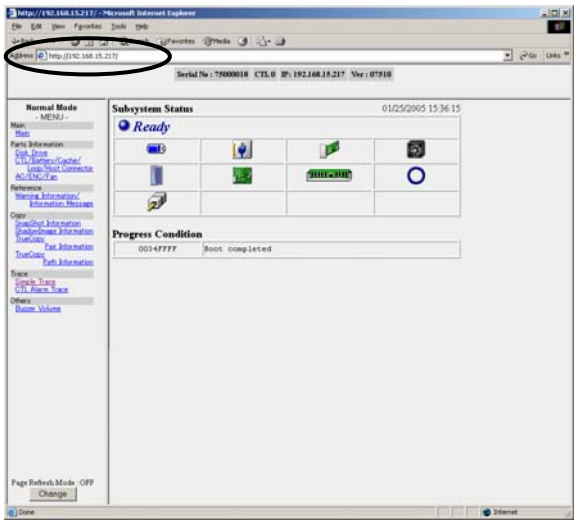
.

Chapter 2. The Normal Mode Operation Procedure



2.1 Transferring to the Normal Mode

For entering Normal mode, input IP address of Maintenance LAN connecter to which the LAN cable is connected into the [address] window of Web Browser.

Under dual system configuration, input one of IP addresses of LAN-Connecter for maintenance. The status of the devices (both Controllers) can be monitored from one controller.
If it is connected, the next screen is displayed.

NOTE : • Set the TCP/IP to "Disable DNS" because the connection takes a long time when the TCP/IP of the network is set to the condition in which the DNS is used. For the setting procedure, refer to the instruction manual of the PC to be used.

• Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used. To make sure the setting, refer to the instruction manual of the browser to be used.

Copyright © 2005, Hitachi, Ltd.

2.2 Screen Outline

If the function of the Normal Mode is shown with the menu form and clicked, the proper function is executed. The main screen outline of the Normal Mode is shown below. Window display differs depending on microprogram revision.

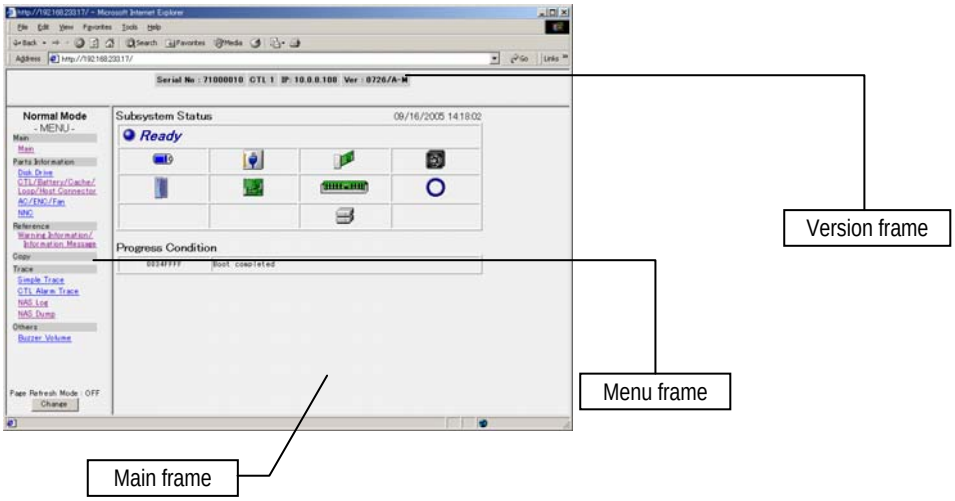


Figure 2.2.1 Main screen outline of the Normal Mode

(1) Version frame

- Web Title

  A Web title set by a user is displayed as it is. When it is not set, nothing is displayed.
- Serial No

  The subsystem serial number is shown.
- CTL

  Shows the number of the Controller to which the Web is connected.
- IP

  The IP Address of the controller where it was connected is shown.
- Ver

  The version of the Microprogram of the device is shown.

Copyright © 2005, Hitachi, Ltd.

(2) Menu frame

If the function of the Normal Mode is displayed with the menu frame and clicked, the proper function is executed.

- Main
  The Main screen of the Normal Mode is displayed.
- Parts Information
  The status of the exchange parts is displayed.
- Warning Information
  The fault information that was detected during the status of the device information are displayed.
- Information Message
  The fault information that was detected during the device operation and the status of the device information are displayed.
- Simple Trace
  A window for collecting the Simple trace is displayed.
- CTL Alarm Trace
  A window for collecting the CTL Alarm trace is displayed.
- NAS Log
  The window collecting the NAS Log is displayed.
- NAS Dump
  The window generating the NAS Dump is displayed.
- Buzzer Volume
  The screen that the Buzzer Volume is set up is displayed.
- Page Refresh Mode
  The mode for setting turning on or off of the automatic display function is displayed.
  When the [Change] button is clicked, the mode is changed to on or off.
  As the [OFF] display : This is not refreshed.
  As the [ON] display : The screen of the mainframe is refreshed every 5 seconds.
  The time of the latest refreshment (RTC) is displayed in the upper right part of the main frame.

NOTE : When the PC enters the suspension status during operation while the Page Refresh Mode is set to [ON], the Web may not operate correctly after the PC is released from the suspension status.
In the case where the Web is connected for the purpose of status monitoring, etc., set the power management of the PC so that the PC should not enter the suspension status.

(3) Main frame

- Subsystem Status
  The status of the device and the status of the exchange parts are displayed.
- Progress Condition
  The Progress Condition as the device booting is displayed.

Copyright © 2005, Hitachi, Ltd.

2.3 Main Screen of the Normal Mode

The main screen of the Normal Mode is consisted of the Patrol Lamp, the summary of exchange parts status, the Progress Condition display box.

The Patrol Lamp shows the status of subsystem.

The “summary of exchange parts status” notifies replacement parts errors by turning the parts in red.
If the image of the part is clicked, the details information of the proper part are displayed.

The Main screen of the Normal Mode is shown below.

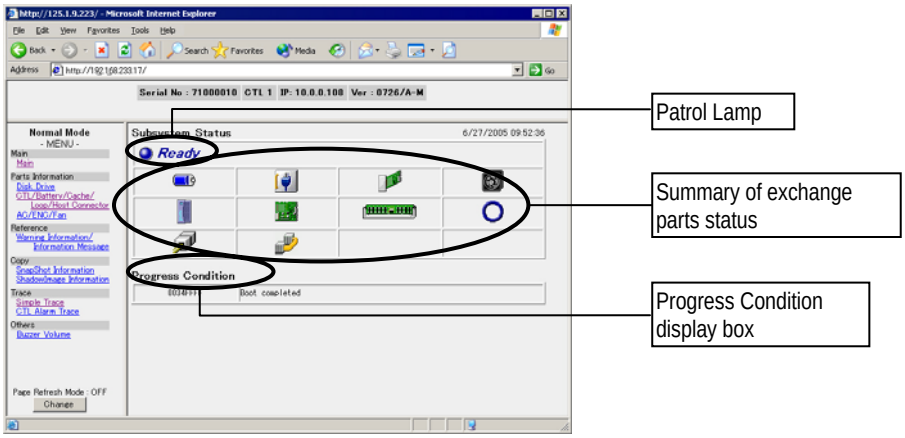

Figure 2.3.1 Main screen of the Normal Mode

Copyright © 2005, Hitachi, Ltd.

(1) Patrol Lamp

Monitoring the device, the status is displayed. The Status of the Patrol Lamp is shown below

Image	Status
Booting... Black	• During the start
Ready Blue	• Normal
Warning Yellow	• Warning status
Alarm Red	• Alarm status

(2) Display of Progress Condition

The Progress Condition as the device booting is displayed.

(3) Summary of Exchange Parts Status

The condition of the exchange parts is displayed. If the image of the part is clicked, the details of the proper part are displayed. The status of each exchange part is shown below.

Backup Battery Unit

Image	Status
 Blue	• Normal
 Red	• Backup Battery Unit error

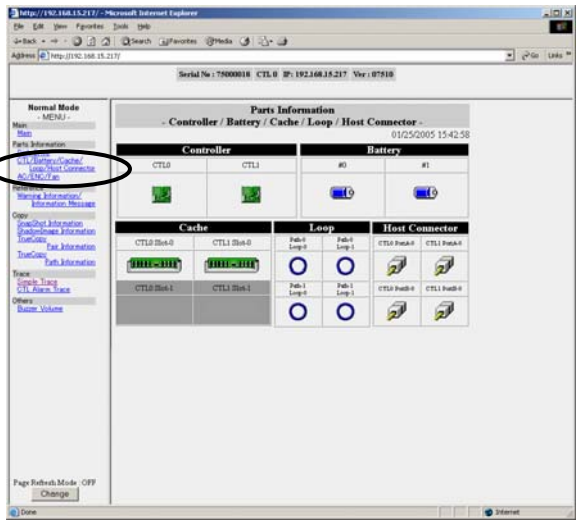
2.4 Display of Exchangeable Parts Status (Parts Information)

(1) Checking the status through an image

The display screen of exchange part status displays the status of the Disk Drive, Control Unit, Cache Unit, Fan Assembly, Backup Battery Unit, Power Unit, ENC Unit (SENC Unit), Fiber Loop, NNC (NAS Unit) that are implemented. Furthermore, this is not displayed, if it is not implemented.

Also, the exchange part of abnormal status displays a red image. The Parts Information screen is shown below.

(a) Disk Drive



• Disk Drive

Image		Status
Disk Drive (FC)	Disk Drive (SATA)	
Blue	Blue	• Normal
Red	Red	• Fault has occurred to the Disk Drive
Red and Black	Red and Black	• Disk Drive port that the fault occurred is not implementing the Disk Drive
No display		• Disk Drive is not implemented (Except for the status where the Disk Drive that the fault occurred was drawn out)

Copyright © 2005, Hitachi, Ltd.

(b) CTL/Battery/Cache/Loop/Host Connector

• Control Unit

Image	Status
Green	• Normal
Red	• Shutdown of the Control Unit (Status where it is not implemented with the setting of the dual system configuration is included)
Yellow	• Fault of the battery backup circuit
No display	• Even the fault has not occurred without being implemented with the setting of single system configuration

• Backup Battery Unit

Image	Status
Green	• Normal
Red	• There is a fault or not implemented

• Cache Unit

Image	Status
Green	• Normal
Red	• Fault (Status where is not implemented and extracted the fault cache memory is included)
No display	• It is not implemented and there is not a fault

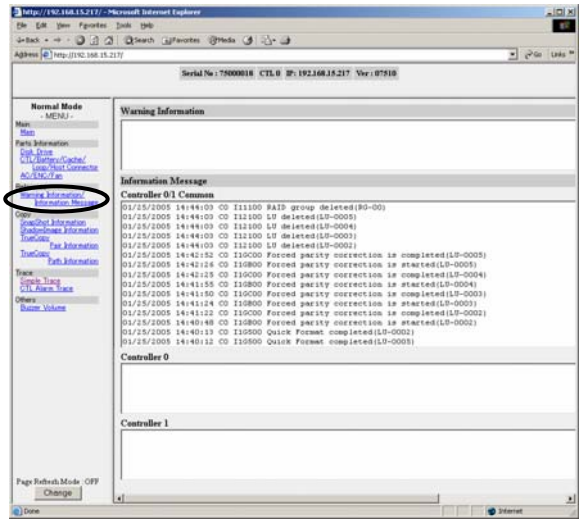
When the NAS OS is uninstalled (NEW), being installed (INST), in the middle of the start processing (BOOT), or the NAS OS installation fails, the following window is displayed.

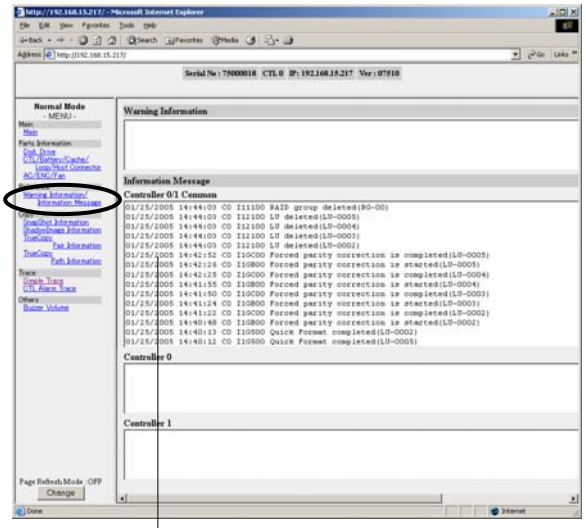


(2) Procedure of the Status checking by messages

A warning message about the failed part is displayed.

Refer to Troubleshooting “4.3 Confirm log messages” (TRBL 04-0100) for the details of the warning messages.

When checking the status of a component through a message, a clicking on the “Warning Information” of the menu frame in the main window changes the screen to the one shown below and a detailed message explaining the component status is displayed.



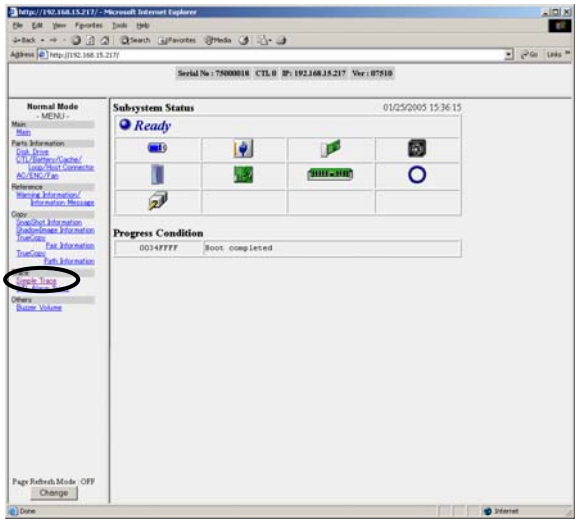
Copyright © 2005, 2006, Hitachi, Ltd.

2.5 Information Message

The fault information and status information of the device that detected it in during the device operation are displayed.

The fault information and status information after the device booting are displayed in the Controller 0/1 Common box.
The fault information and status information as the device booting are displayed in the box of Controller 0 and Controller 1 every the controller.

The Information Message screen is shown below.



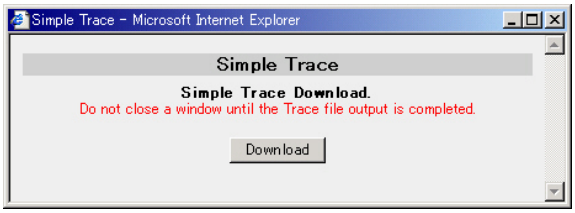
Copyright © 2005, Hitachi, Ltd.

2.6 Collecting Simple Trace

This is a function to download current trace information.
To perform the down-lord, a free capacity of approximately 30 Mbytes is required in the PC.

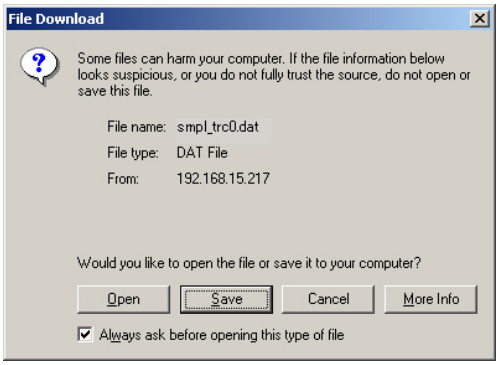
Simple Trace of both the Control Units can be collected through one Control Unit.
It is not necessary to collect from both the controllers. (When it is collected from Control Unit #0, File name is "smpl_trc0.dat". When collected from Control Unit #1, file name is "smpl_trc1.dat.")

(1) Click "Simple Trace" in the menu frame.

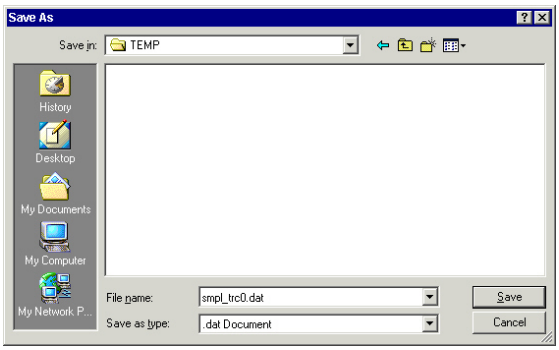


(2) When the "Simple Trace" is clicked, the following window is displayed.

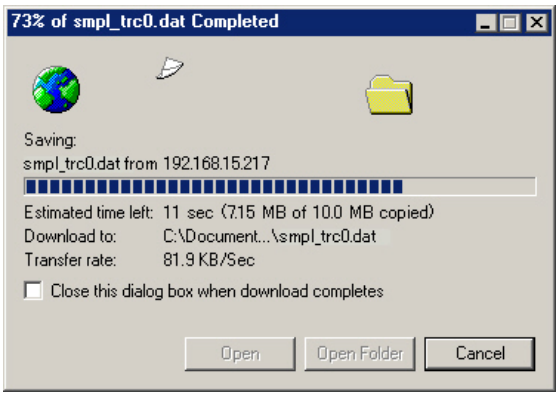
(3) When the [OK] button is clicked, the following window is displayed.



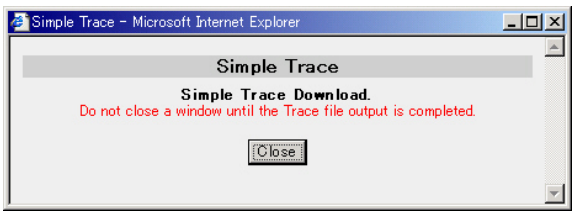
(4) The following window is displayed. Click the [Download] button.



Copyright © 2005, 2006, Hitachi, Ltd.



(5) Please click [Save], if it is continued. Please click [Cancel], if it is stopped.

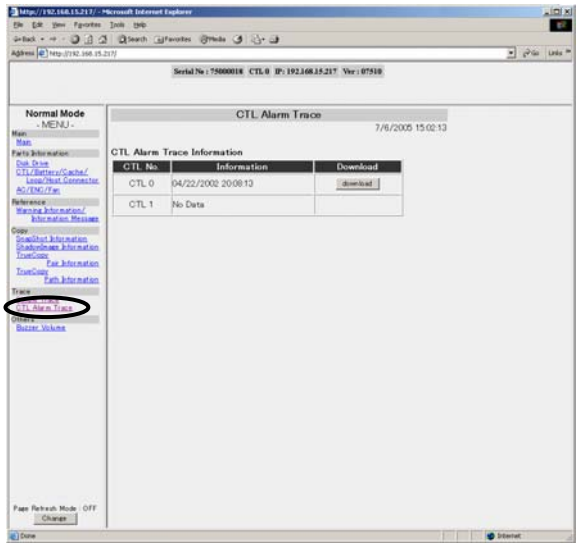


(6) If the following window is displayed. Please click [Save] after file name is setting, if it is continued.(‡1) Please click [Cancel], if it is stopped.

(7) The following window is displayed during execution download.

(8) The [Download] button changes to the [Close] button, so that, click the [Close] button and close the window when the download is completed.

‡1 : There may be a case where the default file name is given as “ctla_trc0.dat..dat” depending on the setting of the PC. In this case, reset the file name to “ctla_trc0.dat” or any other name.



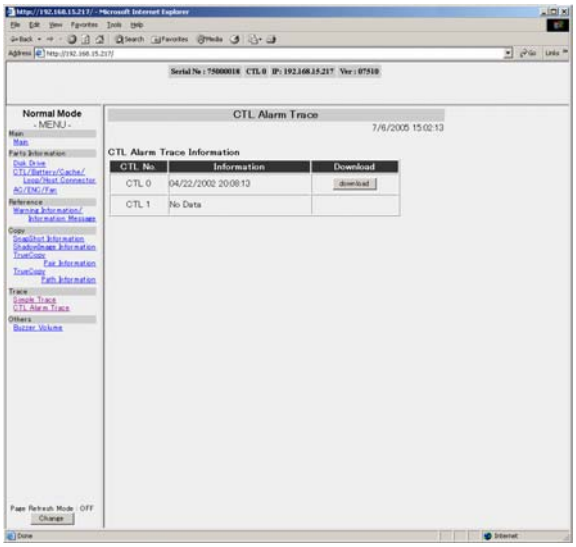
Copyright © 2005, Hitachi, Ltd.

2.7 Collecting CTL Alarm Trace

This is a function to download CTL Alarm trace information which is saved on the cache when a Controller is detached.
To perform the down-lord, a free capacity of approximately 20 M bytes (When Copy-on-write SnapShot Function is valid: approximately 40 M bytes) is required in the PC.
Collect CTL Alarm Trace from each Control Unit.
In order to distinguish from which Control Unit it is collected, store the collected data in different directories or with different file names.

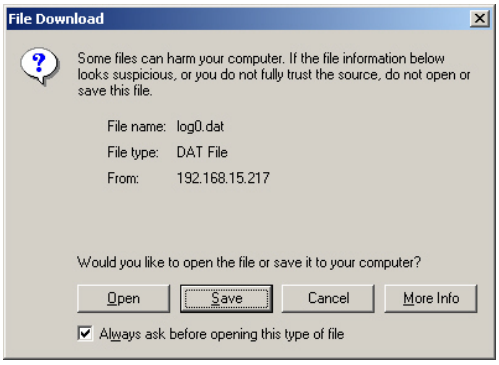
NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

(1) Click "CTL Alarm Trace" in the menu frame.
The CTL Alarm Trace Information window is displayed when the CTL alarm trace information is present.



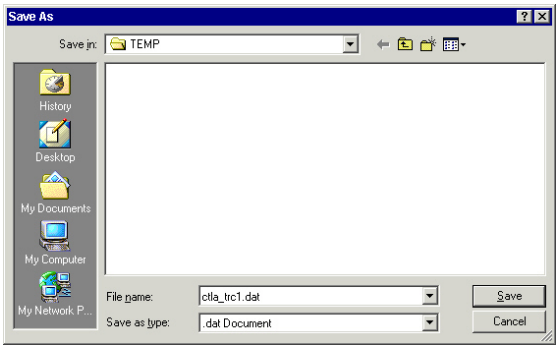
The following is displayed as contents of the information.

[Not Ready] .....: A status in which the trace area is not established in the subsystem
[Not Data] .....: A status in which the CTL Alarm trace information is not present or being generated
[MM/DD/20XY hh:mm:ss] .....: A status in which the CTL alarm trace information is present



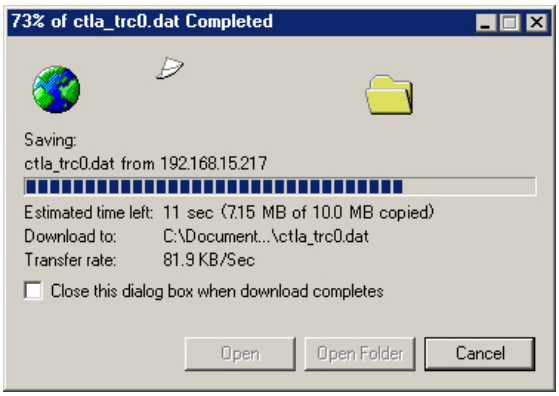
NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL alarm trace may not be collected normally. Connect the Maintenance PC to the LAN port of the blocked Control Unit, and collect the simple trace.
If simple trace cannot be obtained through detached Controller, connect the Maintenance PC to the Controller at the opposite side, and collect the simple trace.

Copyright © 2005, 2006, Hitachi, Ltd.



(2) To download the CTL Alarm trace information, press the “Download” button on the Control Unit side to be collected in “CTL Alarm Trace information”.

(3) The following window is displayed. Please click [Save], if it is continued. Please click [Cancel], if it is stopped.



(4) If the following window is displayed. Please click [Save] after file name is setting, if it is continued.(‡1) Please click [Cancel], if it is stopped.

Copyright © 2005, Hitachi, Ltd.

(5) The following window is displayed during execution download.

(6) The download completes.

‡1 : There may be a case where the default file name is given as “ctla_trc0.dat..dat” depending on the setting of the PC. In this case, reset the file name to “ctla_trc0.dat” or any other name.

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

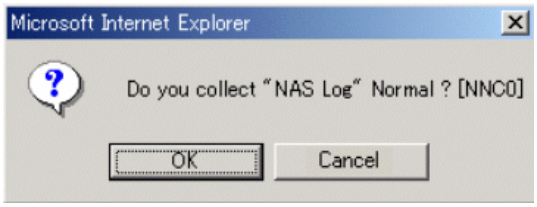
2.8 NAS Log collection

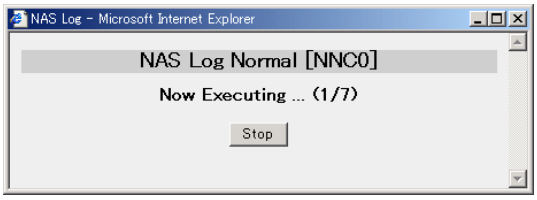
This is a function to download the log information on the present NAS OS.
The free capacity of approximately 4 M bytes in the Normal Mode, 12 M bytes in the Detail Mode and 150 M bytes in the Full Mode is required on the PC for downloading.
The NAS Log can collect only the information on the NNC (NAS Unit) connected to the Control Unit.

NOTE : • Do not perform the next NAS Log collection in one Control Unit until the NAS Log collection processing ends.
The operation when executing the NAS Log collection from two or more WEB and external application at the same time is not guaranteed.
• When the NAS Log is acquired from the PC connected to the LAN for control, it is required to access both of the user control port of the Disk Array subsystem and the control port of the NAS Unit from the PC. (It is recommended that both IP addresses are the same segments.)
• The access information between the clusters is necessary for the analytical work, so that collect the NAS Logs for both NAS Units in the cluster.

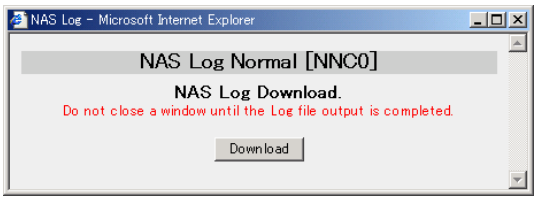


(1) Click "NAS Log" in "Trace" of the menu frame.
(2) Select the collection mode in "NAS Log", and click it.

Collection mode	Use	Capacity (standard)	Collection time (standard)
Normal Mode	Collect it only when there is a special instruction. (It is limited to when the remote collection of "Full Mode" and "Detail Mode" are impossible on the capacity side.)	About 4 M bytes (One NNC)	About 1 minute (One NNC)
Detail Mode	Collect it only when there is a special instruction. (It is limited to when the remote collection of "Full Mode" is impossible on the capacity side.)	About 12 M bytes (One NNC)	About 1 minute (One NNC)
Full Mode	If there is no special instruction, collect all in "Full Mode".	About 150 M bytes (One NNC)	About 4 minutes (One NNC)

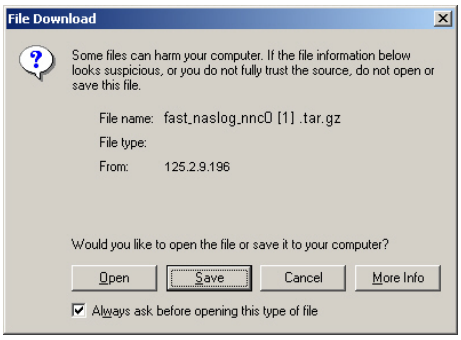


Copyright © 2005, 2006, Hitachi, Ltd.



(3) The confirmation message is displayed. Click the [OK] button.

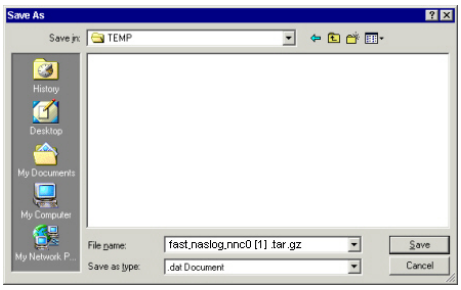
The following dialog is displayed.



(4) The following dialog is displayed when ending. Click the [Download] button.

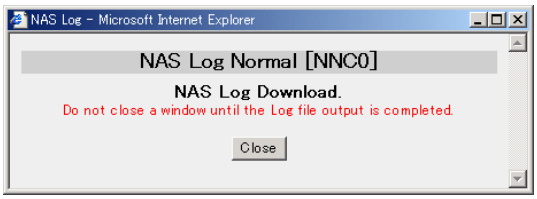
NOTE : Do not close this dialog while you download the NAS Log into the service PC. The NAS Log may not be able to be collected when closing it.

(5) The following dialog is displayed. Click [Save].



Copyright © 2005, 2006, Hitachi, Ltd.

(6) Specify the storage location of the file and the file name, and click [Save](‡1).
A default file name is as follows in the collection mode.



Item	Collection Mode		
	Normal Mode	Detail Mode	Full Mode
NNC 0	fast_naslog_nnc0[1].tar.gz	naslog_nnc0[1].tar.gz	full_naslog_nnc0[1].tar.gz
NNC 1	fast_naslog_nnc1[1].tar.gz	naslog_nnc1[1].tar.gz	full_naslog_nnc1[1].tar.gz
NNC 2	fast_naslog_nnc2[1].tar.gz	naslog_nnc2[1].tar.gz	full_naslog_nnc2[1].tar.gz
NNC 3	fast_naslog_nnc3[1].tar.gz	naslog_nnc3[1].tar.gz	full_naslog_nnc3[1].tar.gz

NOTE : There may be the cases where the numerical value of "[1]" of the file name is not 1 and "[1]" part is not attached depending of the browser environment.

The down-loading is started and the progress indicating message window is displayed.
When the down-loading completes, click [Close] button.

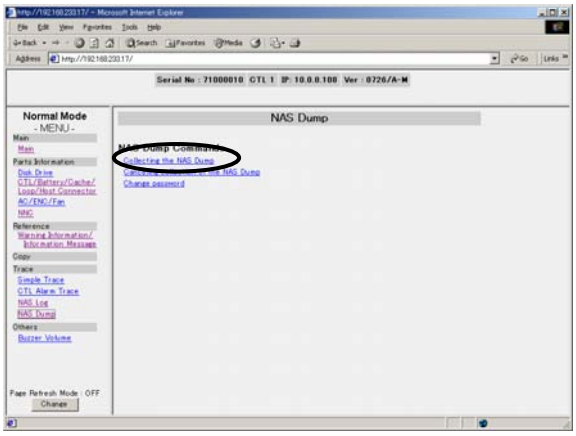
(7) Click [Close] button.

‡1 : A file name can be changed to "optional file name.tar.gz".

Copyright © 2006, Hitachi, Ltd.

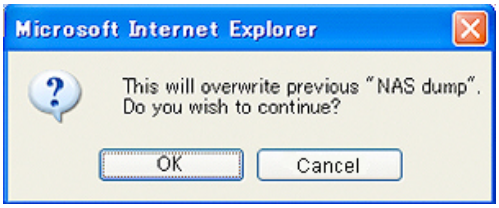
This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.



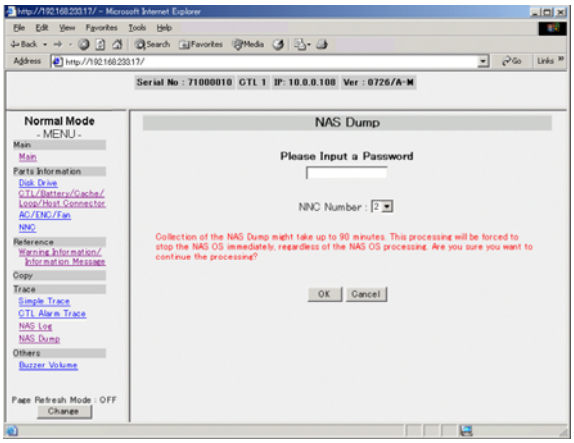
2.9 NAS Dump generation

This is a function to generate the full memory information on the present NNC (NAS Unit) and collect it in the Disk Drive.
The full memory information on the NNC (NAS Unit) is not downloaded in the PC at the NAS Dump generation opportunity.
The generation of the NAS Dump can be executed only in the NNC (NAS Unit) connected to the Control Unit.



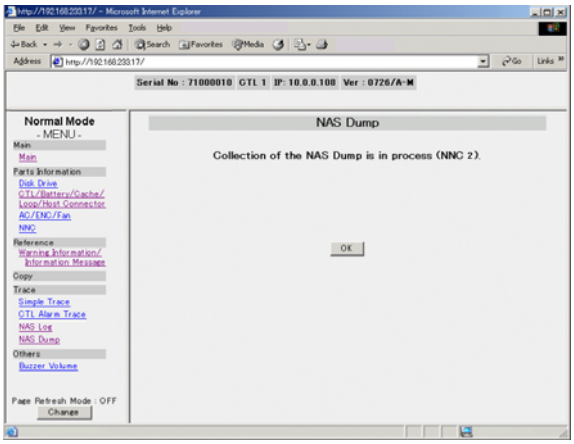
(1) NAS Dump generation

(a) Click "NAS Dump" in "Trace" of the menu frame.



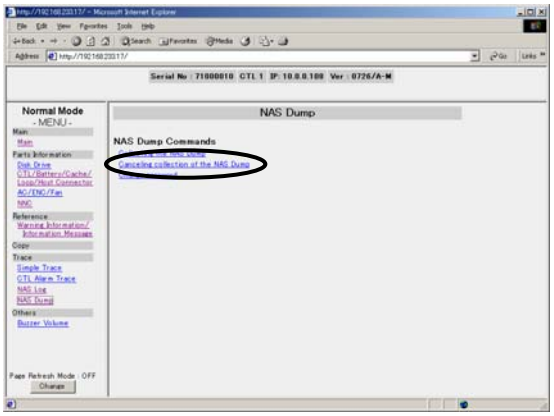
(b) Select the "Collecting the NAS Dump".

(c) The confirmation message is displayed. Click the [OK] button.

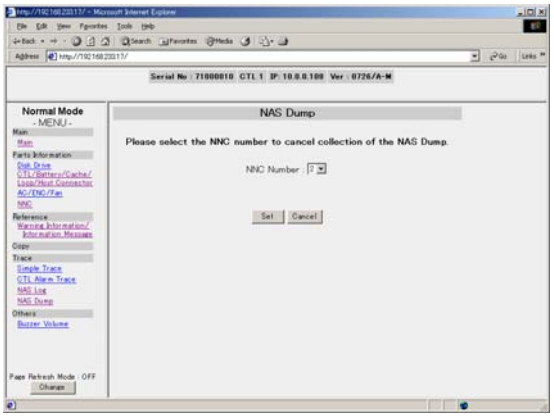


(d) Input the registered password, and click the [OK] button. (The default password is "user=NAS")

Copyright © 2005, 2006, Hitachi, Ltd.



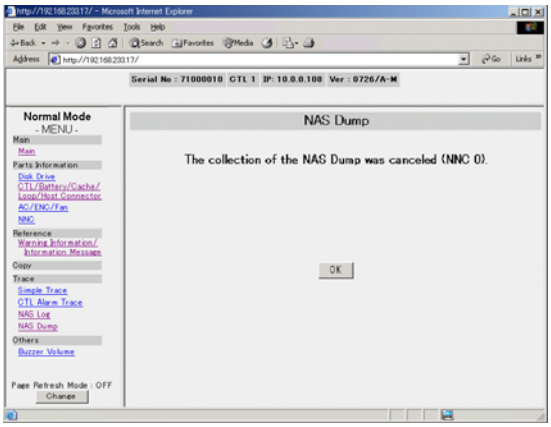
(e) The following window is displayed. Click the [OK] button.



Copyright © 2005, Hitachi, Ltd.

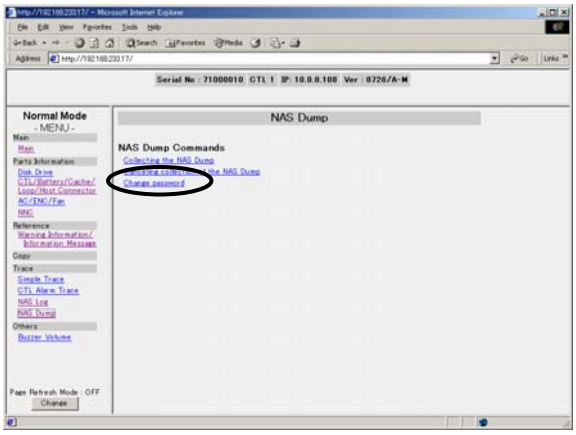
(2) Suspension of the NAS Dump generation

(a) Select the "Canceling collection of the NAS Dump".



(b) Specify the NNC (NAS Unit), which suspends the NAS Dump flushing, as "NNC Number", and click the [Set] button.

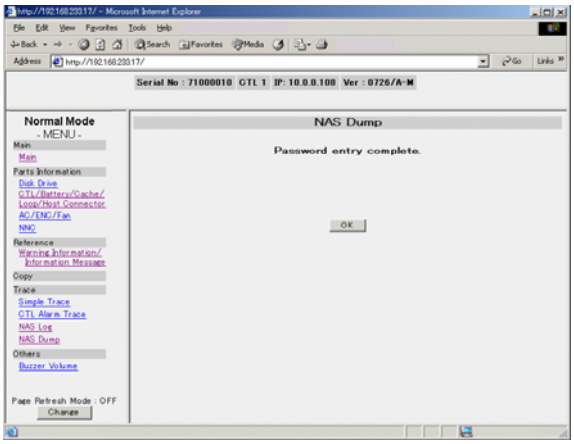
(c) The confirmation message is displayed. Click the [OK] button.



(b) A suspension completion window is displayed. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

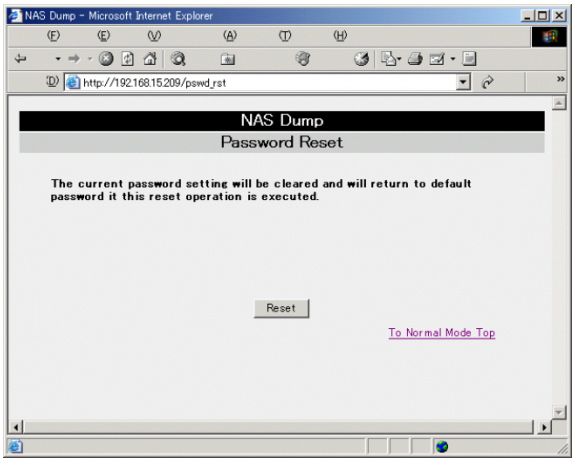
(3) Registration and change of the password



(a) Select the “Change password”.

(b) Input characters (one to eight half size alphanumeric characters) in “Old Password”, “New Password” and “Re-enter New Password”, and then click the [OK] button.

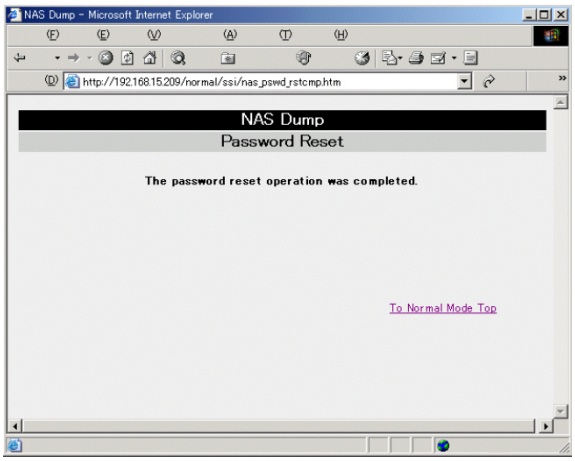
(c) The window, which the password was registered normally, is displayed. Click the [OK] button.



Copyright © 2005, Hitachi, Ltd.

(4) Password reset

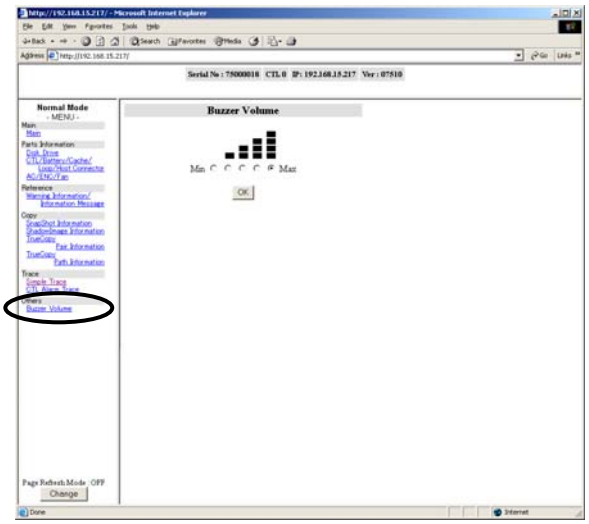
(a) Input "http://IPAddress/pswd_rst" in the address.



(b) Click the [Reset] button.

(b) The confirmation message is displayed. Click the [OK] button.

(c) The window, which the password reset was completed, is displayed. Click "To Normal Mode Top".



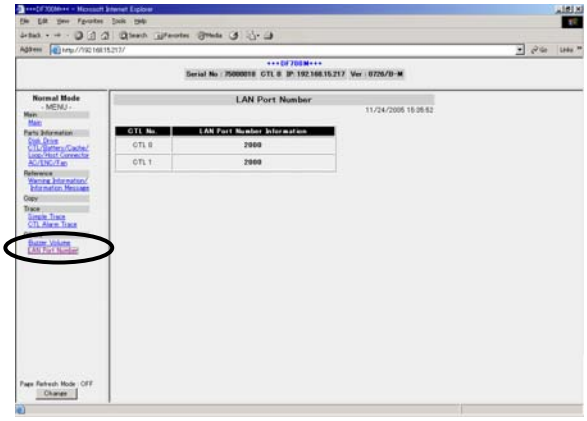
Copyright © 2005, Hitachi, Ltd.

2.10 Setting of the Buzzer Volume

The Buzzer Volume can be adjusted with 5 stages.

NOTE : Make this setting in the environment in which I/O's from a host computer are not issued while the system is maintained or before the host is started up.

Please click "Buzzer Volume" of menu frame to enter into the Buzzer Volume setting screen. The Buzzer Volume setting screen is shown below.



Select buzzer sound volume on the radio button and click [OK]. The buzzer sounds once at the selected volume, and it is recognized the volume is set.

2.11 Setting of the LAN Port Number

The set LAN Port Number is displayed.
Please click "LAN Port Number" of menu frame to enter into the LAN Port Number reference screen.

NOTE : "LAN Port Number" is displayed in microprogram Ver.0726/E or more.

The LAN Port Number reference screen is shown below.

Copyright © 2005, 2006, Hitachi, Ltd.

2.12 Host Command Trace Download

The following conditions are necessary to download the host command trace.

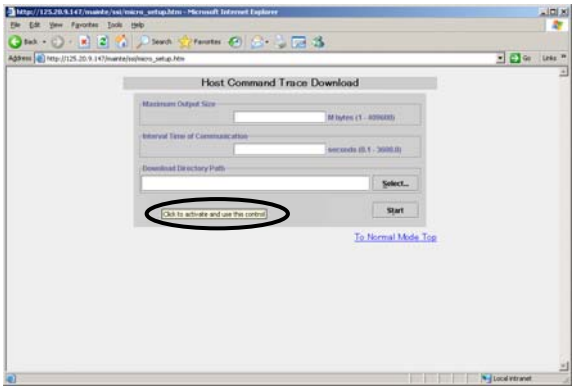
The host command trace information is required to analyze by executing the performance measurement.
If the host command trace exceeds a certain range, the new information is overwritten, so that the old information is deleted and cannot be analyzed.
This function is to collect the command information from the host in the Maintenance PC at a maximum.

Use this function only when the performance analysis is required. Do not use it normally.

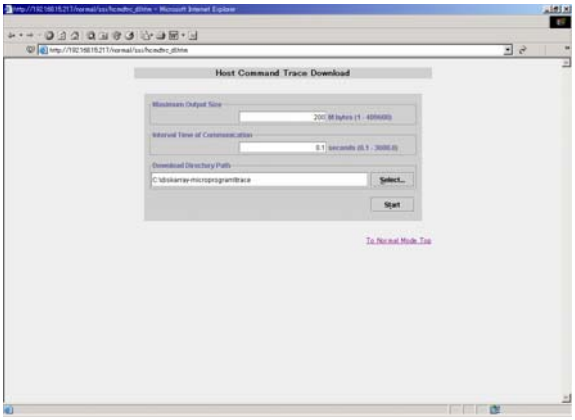
- The READY LED (green) on the Front Bezel lights on.
- For MICROPROGRAM "1.3 Preparation for installation of microprogram" (MICRO 01-0020) is performed and the Maintenance PC is set up.

The data size of the host command trace that can be downloaded is affected by environments of the service PC and a LAN.
Therefore, it is recommended to do the downloading in the following environment.

- The downloading is done through the LAN port for maintenance.
- The LAN interface used by the Maintenance PC is 100Base-TX or the superior.



Incidentally, the size of the data that can be downloaded varies depending on the load of I/O's issued to the disk array subsystem.



The setting methods to download the host command trace are shown below.

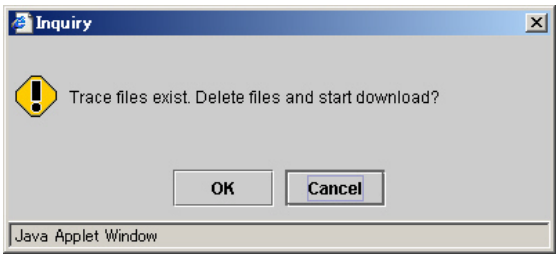
(1) Display in the host command trace download window.
Enter "http://(IP address)/hcmd_trc" in the [Address] of the Web browser.
In the case of the dual system configuration, enter an IP address of any one of the control units. (Only the information of the input IP address is collected. If the information for both Control Units is required, start two Web browsers.)
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Input of "Maximum Output Size", "Interval Time of Communication" and "Download Directory Path".
When the following message is displayed, it is necessary to click ActiveX Control with a mouse and to change it into the active status.

[Maximum Output Size] : Check the empty drive space of the Maintenance PC and input the maximum output size (the initial value is 200 M bytes).

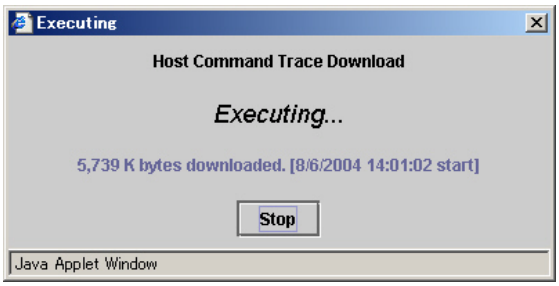
[Interval Time of Communication] : Input the interval time of downloading the host command trace (the initial value is 0.1 second).



[Download Directory Path] : Input the folder which stores the host command trace (the initial value is "C:¥diskarray-microprogram¥trace" and the folder can be selected by pressing the [Select] button).

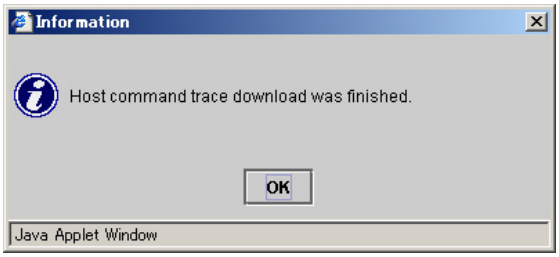
- It is required to create the storage folder beforehand.
- The folder can be created only in the "C:¥diskarray-microprogram" folder.
- The collected host command trace is divided into two or more files "hcmdtrc$p#_xxxxx.trc" ($: Control Unit number, #: port number, and xxxxx: following number) and output. When collecting the host command trace two or more times, create the folder in every case.

(3) Click the [Start] button to start the download.



Copyright © 2005, 2006, Hitachi, Ltd.

(4) The following window is displayed when the stored file exists.



Click the [OK] button.
Click [Cancel] if stopping it.

(5) The following window is displayed when executing the download.

(6) The following window is displayed when the download is completed.

If the [OK] button is clicked, the host command trace download window is displayed.

- Standard of the host command trace collection
  When collecting the host command trace, make the following a standard and set it.
  If the empty drive space of the host decreases, the system becomes unstable. Therefore, set the host command trace collection after checking the empty space.
  Also, when the command issue from the host exceeds the collectable IOPS, all the host commands are not collected.

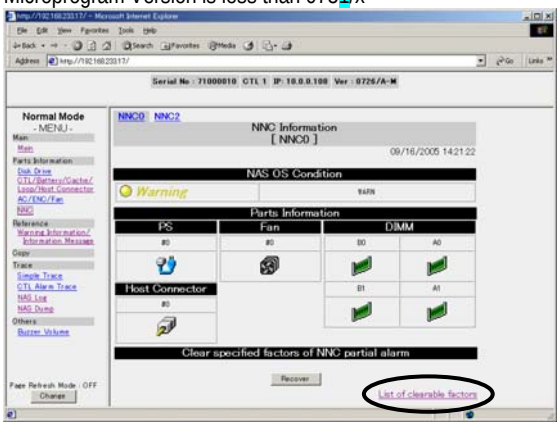
$$\text{Required disk capacity (M bytes)} = \frac{\text{Host command trace collection time (second)}}{\text{Interval time of communication (second)}} \times 76.8 \text{ (k bytes)}$$

Table 2.12.1 Required disk capacity for host command trace collection (M bytes)

Communication interval (second) and the collectable IOPS / Collection time (second)	0.1 6000	0.2 3000	0.5 1200
1	0.8	0.4	0.2
10	7.7	3.8	1.5
60	46.1	23.0	9.2

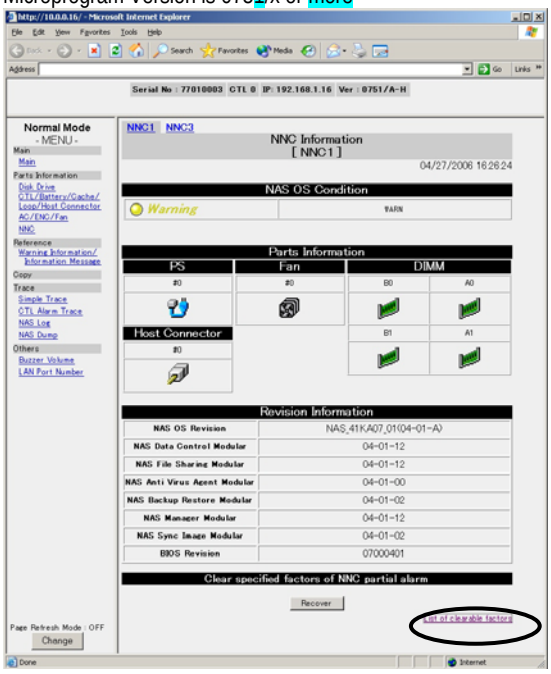
The collection time and the disk capacity vary depending on the issue interval of the command from the host.

Copyright © 2005, 2006, Hitachi, Ltd.



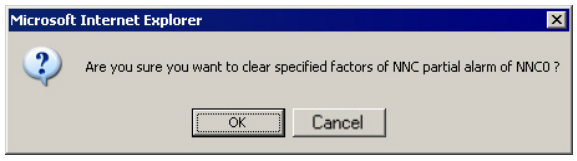
2.13 The function of the “Clear specified factors of NNC partial alarm”

There is a case where the Warning status of the Control Unit is not released and the WARNING LEDs on the array subsystem and the NAS unit are lighting up even though the recovery work for some specific NNC partial alarms.
Release the Warning status of the Control Unit and turn off each WARNING LED according to the following procedures.
The operation of the “Clear specified factors of NNC partial alarm” can be executed only to the NNC (NAS unit) connected to the Control Unit.



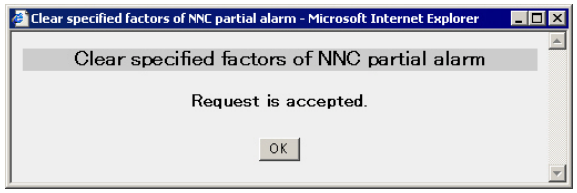
(1) Clear specified factors of NNC partial alarm.

(a) Click the [Recover] button.



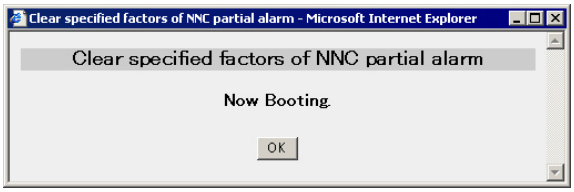
Microprogram Version is less than 0751/x

Microprogram Version is 0751/x or more



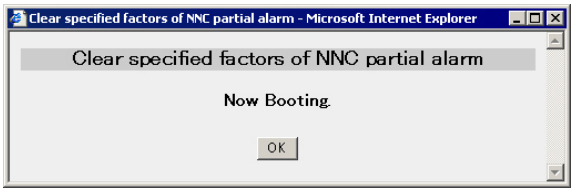
(b) A message asking you to verify the setting is displayed. Click the [OK] button.

(2) Checking the NNC partial alarm recovery.



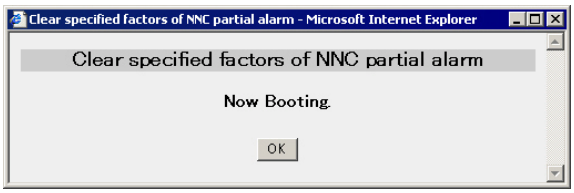
(a) When the “Clear specified factors of NNC partial alarm” is completed normally.

Click the [OK] button.
Click Warning Information on the menu window, and check that the indication of the partial alarm is turned off.



Copyright © 2005, 2006, Hitachi, Ltd.

(b) When the NNC partial alarm was recovered before clicking the [Recover] button.



Click the [OK] button.

(c) When the array subsystem was booting at the time of clicking the [Recover] button.

Click the [OK] button.
Execute it again in the procedure (1) after the array subsystem becomes the READY status.

(d) When the NAS unit was not connected to the Control Unit at the time of clicking the [Recover] button.

Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 3. The Maintenance Mode Operation Procedure

3.1 Transferring to the Maintenance Mode

The method of making the subsystem enter the maintenance mode varies depending on the lighting status of the READY LED (green) and ALARM LED (red) on the front bezel (RKH/RKM/RKS/RKXS).

- Do not make the work when the READY LED (green) on the Front Bezel is blinking at high speed. When it is high-speed blinking, the ENC/SENC firmware is being downloaded. Make the work after making sure that the READY LED (green) lights on after the maximum of 30 to 50 minutes (RKH: for the maximum of 40 to 60 minutes).
- Do not work when the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed. While this WARNING LED (orange) is blinking at high speed, the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the work after checking that this WARNING LED (orange) goes out in the maximum of 30 to 85 minutes, and the READY LED (green) on the front of the Basic Chassis lights up.
- When the READY LED (green) is on, proceed to the procedure starting from the step (2).
- When the ALARM LED (red) is on, wait for three minutes after making sure of the lighting of it, proceed to the procedure starting from the step (2).
- Also proceed to the procedure starting from the step (1) in the case where the READY LED (green) and ALARM LED (red) do not come on after waiting for ten minutes when the power is turned on.

(1) Make sure that the WARNING LED (orange) is not blinking fast. If it is blinking fast, wait for a while (80 seconds at the longest). It will cease to blink fast. There is no problem if it blinks slowly (at intervals of one second).

(2) Changing the maintenance mode.

- Single Controller

  Press the RST SW of the single Control Unit. (While pressing RST SW, the RST LED is on.) Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

- Dual Controller

(a) Press the RST SW of the Control Unit #0. (While pressing RST SW, the RST LED is on.)
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

(b) Press the RST SW of the Control Unit #1 immediately (within ten seconds) checking the CALM LED (red) of the Control Unit#0 comes on.
(Sometimes the buzzer may beeps when the RST SW is pressed, however, you do not have to stop it until these operations are completed.)
When the CALM LED of the Control Unit #0 does not go out in spite of the above operation, power off the subsystem and then power on the subsystem without pulling out or insert the Control Unit. After that, return to step (1) and execute the procedure over again.

NOTE : Because the Control Unit is shutdown status for the Maintenance Mode, the command from the host is impossible execution. Rebooting of the Control Unit is required for the return.

Copyright © 2005, 2006, Hitachi, Ltd.

When CALM LED on Control Unit#0 turns off and READY LED on Front Bezel turns off, it transfers to Maintenance mode.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Start the setting after making sure that the subsystem has entered the Ready status.

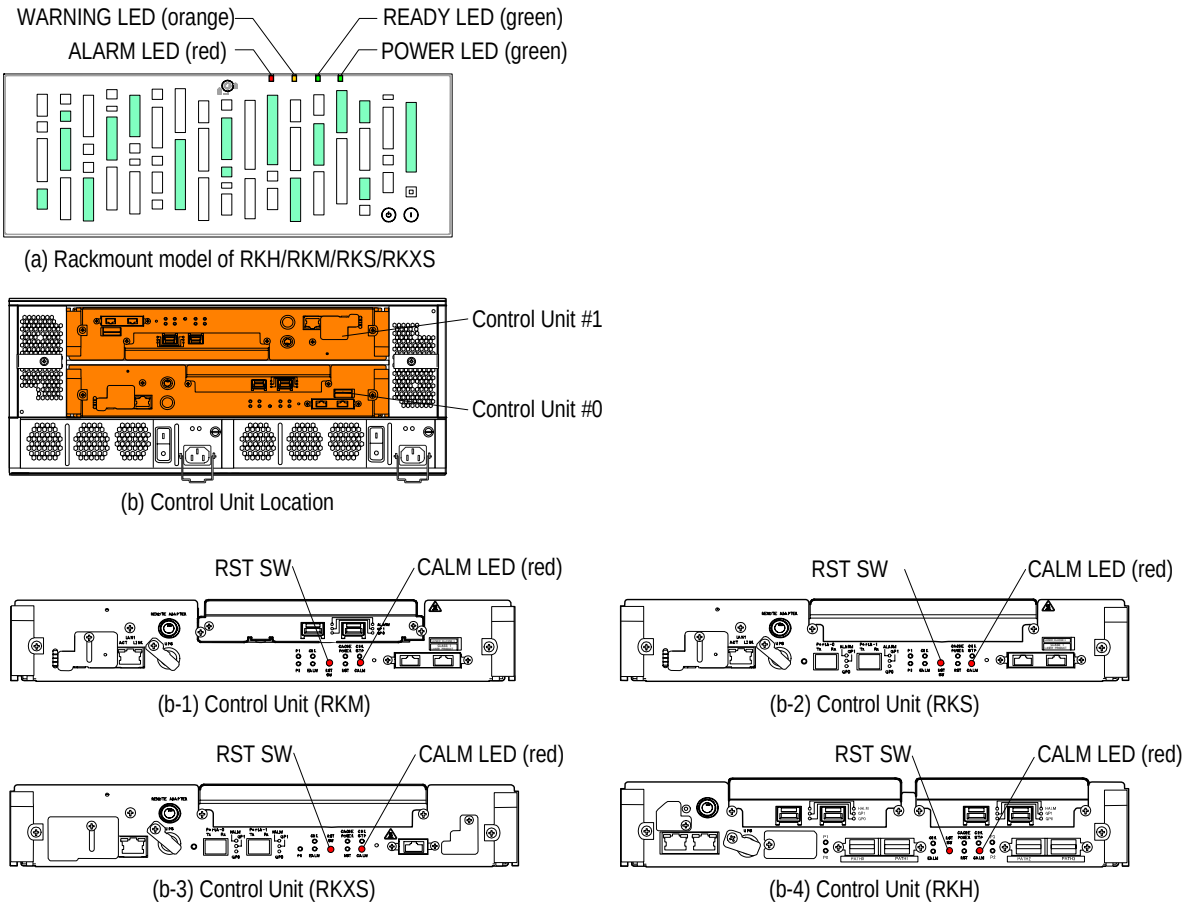


Figure 3.1.1 Indication Position

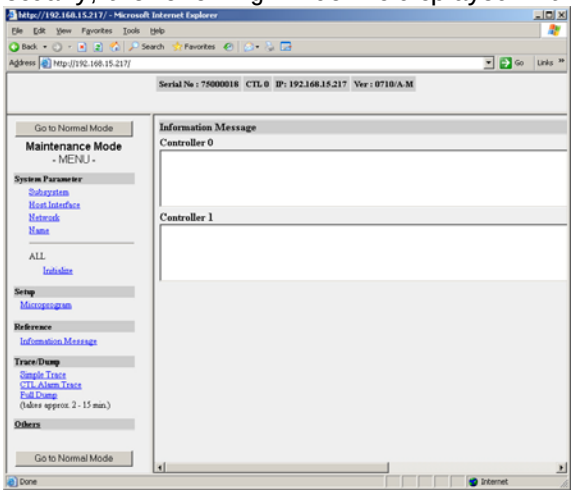
Illustrations in Figure 3.1.1 show cases of the rackmount model. They are the same for the floor model.

NOTE : • Set the TCP/IP to "Disable DNS" because the connection takes a long time when the TCP/IP of the network is set to the condition in which the DNS is used. For the setting procedure, refer to the instruction manual of the PC to be used.

• Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used. To make sure the setting, refer to the instruction manual of the browser to be used.

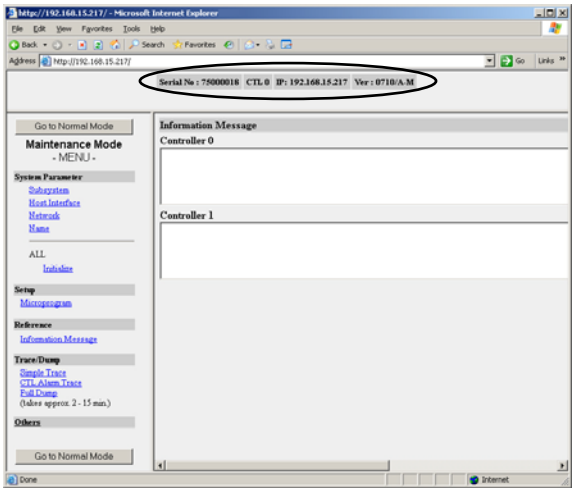
Copyright © 2005, 2006, Hitachi, Ltd.



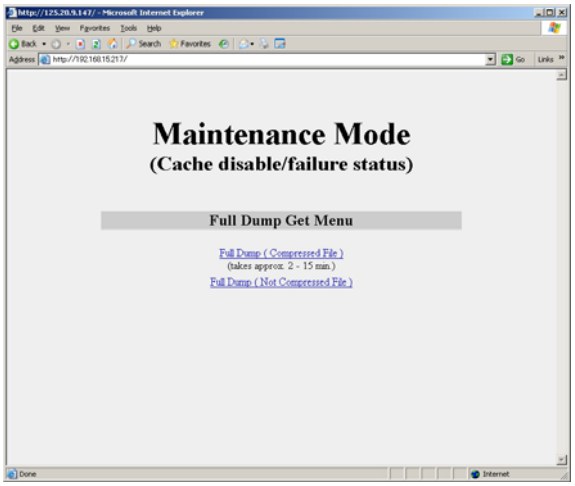
(3) Please input the IP Address of the Control Unit where it was connected with the network to the browser. Please input the page by the update button of the browser if it has already been connected with WEB.

NOTE : The contents that were set up with "System Parameter" and the Microprogram that was installed with "Setup" come into effect after the rebooting of the Control Unit.

A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

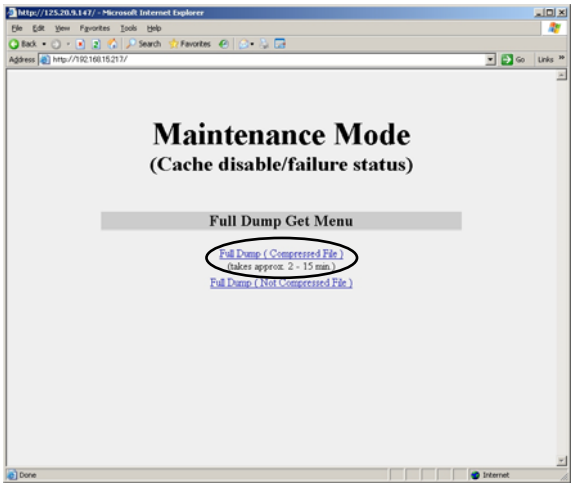


(4) Usually, the following window is displayed in the browser.



Copyright © 2005, Hitachi, Ltd.

When this window is displayed in the browser, check if the "Series No", the "CTL number" and the "IP" address, which are displayed in the upper part of the window, match with the device number, the CTL number and the IP address of the subsystem to be connected to WEB. The WEB connection in the maintenance mode is completed when these are matched. If not matched, the specification of the IP address at the WEB connection is incorrect. Enter the correct IP address of the Control Unit to be connected to WEB in the browser again.



Also, when the Cache memory access failure occurs, in the Control Unit connected to WEB, the following window is displayed in the browser. At this time, refer to "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).

Copyright © 2005, Hitachi, Ltd.

3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure

The message display and the setting operation do not function during the Cache memory access failure. Select "Full Dump (Compressed File)" on the window, and collect Full Dump. And then, contact the Technical Support Center.

* The time displayed on the window changes by the model or the status of the subsystem.

Also, connect WEB to the other Control Unit, and continue the maintenance work for the dual Control Unit system.

Copyright © 2005, 2006, Hitachi, Ltd.

3.2 Reference/Setting of the System Parameter and Initialize

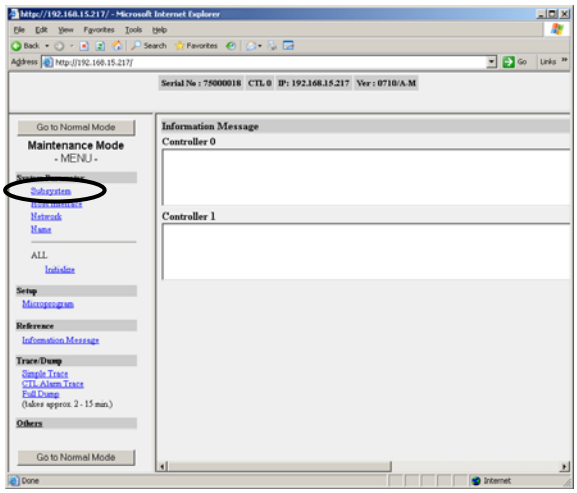
System Parameter is being classified to the following group and selecting each group executes the reference/setting and Initialize.

(1) Subsystem
Reference and setting of the system parameter regarding the Subsystem is executed (refer to Subsection "3.2.1 Subsystem" (WEB 03-0060)).

(2) Host Interface
Reference and setting of the system parameter regarding the host interfacing are executed (refer to Subsection "3.2.2 Host Interface" (WEB 03-0120)).

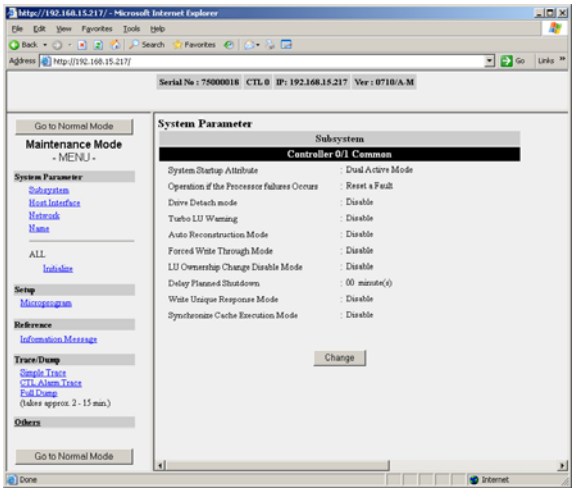
(3) Network
Reference and setting of the system parameter regarding the network are executed (refer to Subsection "3.2.3 Network" (WEB 03-0170)).

(4) Name
Reference and setting of the system parameter such as the Vendor ID, Product ID, Controller Name are executed (refer to Subsection "3.2.4 Name" (WEB 03-0220)).



(5) ALL
The system parameter information is initialized. (refer to Subsection "3.2.5 ALL" (WEB 03-0260)).

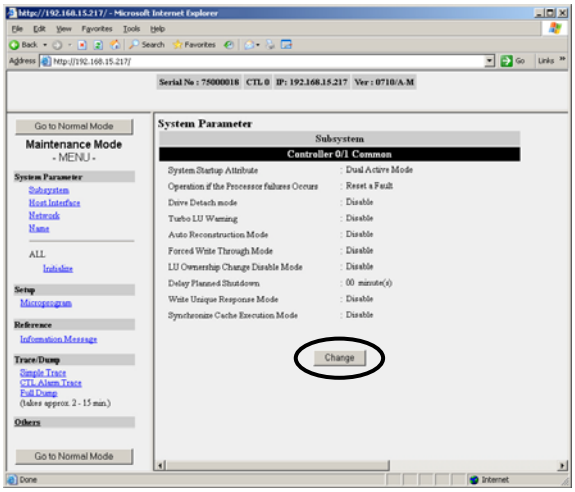
Copyright © 2005, Hitachi, Ltd.



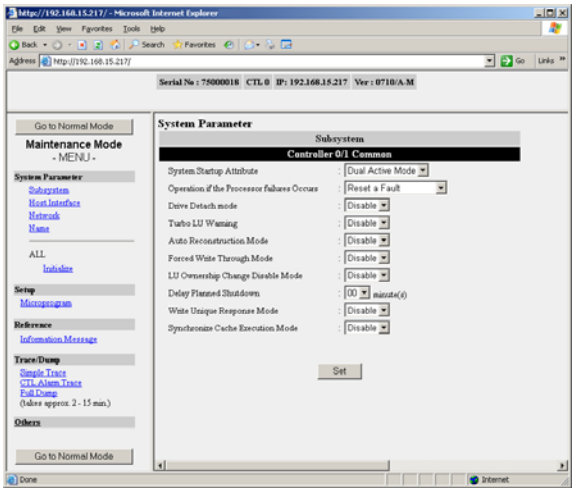
3.2.1 Subsystem

This function sets up/refer to the item regarding the Subsystem in the device.

(1) Please click “Subsystem”.



(2) The present setting value (the current value) is displayed.



Copyright © 2005, Hitachi, Ltd.

(3) Please click [Change] for the setting.
Please click [Back] of the browser for the unsetting.

(4) Please select the item that is set up from the pull-down menu of the corresponding item that is set up. At this time, please set up the item that is set up all.

Copyright © 2005, Hitachi, Ltd.

Explanation with regard to each item

[Controller 0/1 Common]

- System Startup Attribute

  The System Operation Attribute is designated.

  [Single Mode](‡1) : This is Single controller configuration. (SANRISE AMS1000 is not supported.)

  [Dual Active Mode] : This is Dual controllers configuration.

- Operation if the Processor failures Occurs

  The operation as the processor fault occurrence is designated.

  [Reset a Fault] : A fault is reset.

  [Shutdown the System] : The controller is shutdown.

- Drive Detach mode

  The Drive Shutdown Mode is designated.

  [Enable] : The Drive Shutdown Mode is effectively.

  [Disable] : The Drive Shutdown Mode is ineffectively.

- Turbo LU Warning

  Suppression of the R/W command operation regarding the LU concerned for the case where the Turbo LU Residence function becomes ineffective is set.

  [Enable] : The operation is suppressed.

  [Disable] : The operation is not suppressed

- Auto Reconstruction Mode

  The Auto Reconstruction Mode (Data restoration to a spare drive to be done when a drive is pulled out) is designated.

  [Enable] : The Auto Reconstruction Mode is effectively.

  [Disable] : The Auto Reconstruction Mode is ineffectively.

- Forced Write Through Mode

  The Forced Write Through Mode is designated.

  [Enable] : The Forced Write Through Mode is effectively.

  [Disable] : The Forced Write Through Mode is ineffectively.

- LU Ownership Change Disable Mode

  The LU Ownership Change Disable Mode (A mode in which no LU switching is done) is designated.

  [Enable] : The LU Ownership Change Disable Mode is effectively.

  [Disable] : The LU Ownership Change Disable Mode is ineffectively.

- Delay Planned Shutdown

  The Delay Planned Shutdown (Time from the power switch turning off to the deliberate shutdown) is designated.

  00 to 60 minute

- Write Unique Response Mode

  Specify this when setting the Write Unique Response Mode.

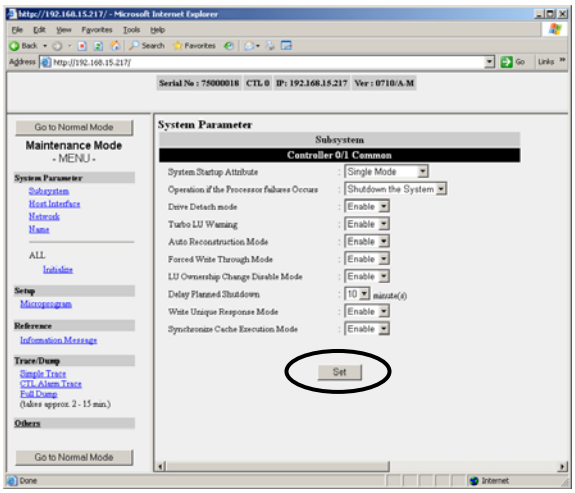
  [Enable] : The Write Unique Response Mode is effectively.

  [Disable] : The Write Unique Response Mode is ineffectively.

‡1 : The NAS Unit connection configuration does not support “Single mode”. Be sure to select “Dual Active mode”.

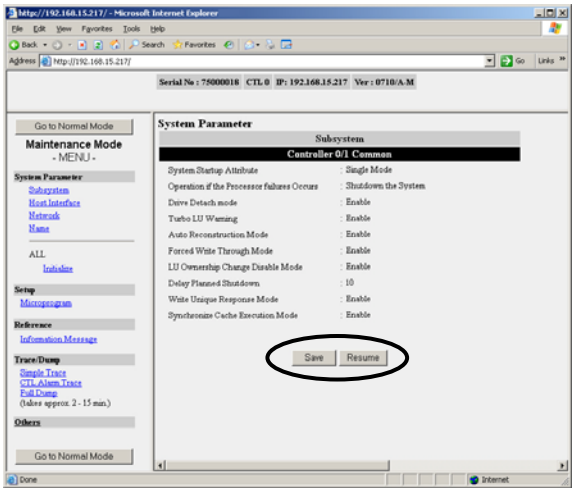
Copyright © 2005, 2006, Hitachi, Ltd.

• Synchronize Cache Execution Mode



This is specified when the Synchronize Cache command is executed.

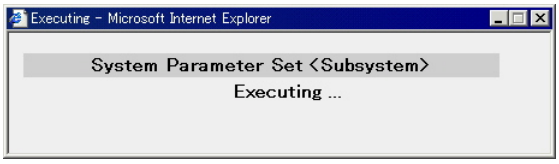
[Enable] : The Synchronize Cache Execution Mode is effectively.



[Disable] : The Synchronize Cache Execution Mode is ineffectively.

Copyright © 2005, Hitachi, Ltd.

(5) Please click [Set] after setting completion.



(6) The screen that confirms the following setting contents is displayed.
Please click [Save] if the setting is correct. Please click [Resume] if the setting contents are changed.

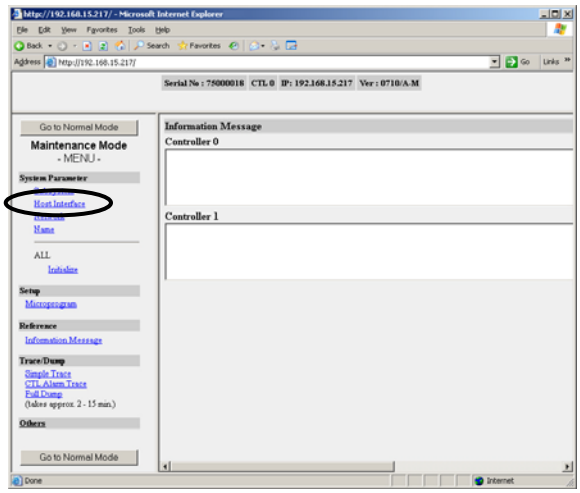
Copyright © 2005, Hitachi, Ltd.

(7) If [Resume] is clicked, it returns to the setting window of before.
If [Save] is clicked, the following window is displayed.

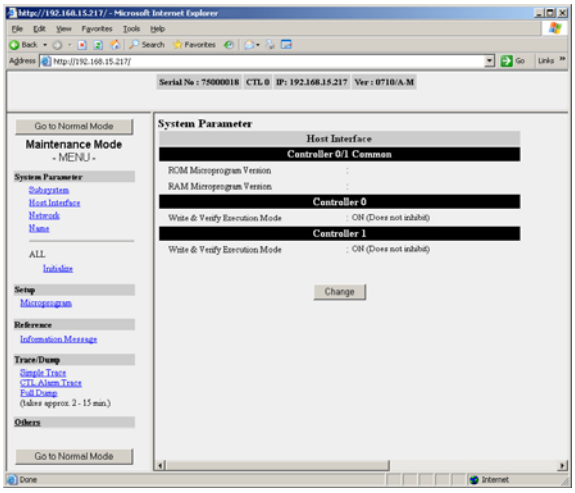
(8) The following window is displayed at the later time for a while.
Please click [OK], if the setting is continued. Please click [Cancel], if the setting is stopped.
If [Cancel] was clicked, the system parameter is not set up.

(9) If [OK] is clicked, the following window is displayed.

(10) If the following window is displayed at the later time for a while, the setting is completion.
If [OK] is clicked, it returns to the menu.



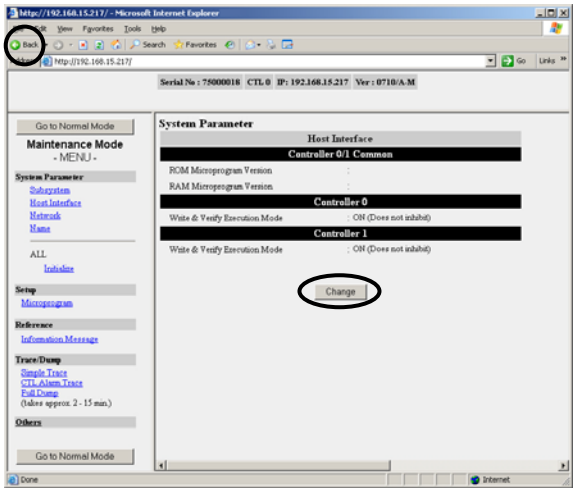
Copyright © 2005, Hitachi, Ltd.



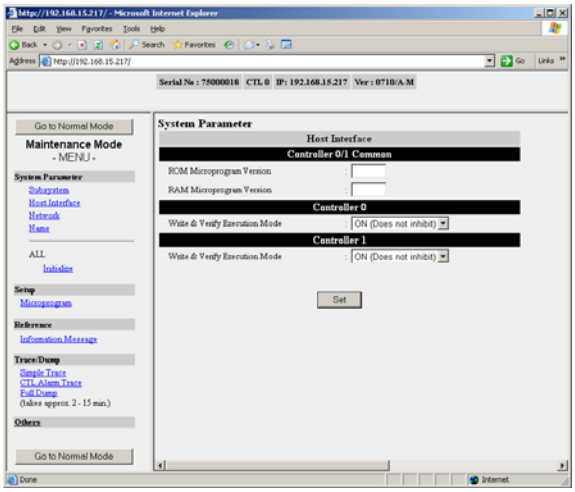
3.2.2 Host Interface

This function sets up/refer to the item regarding the host interfacing of the device.

(1) Please click “Host Interface”.



(2) The present setting value (the current value) is displayed.



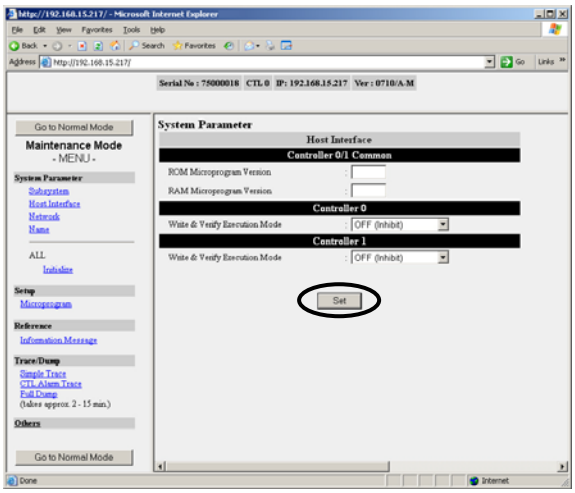
Copyright © 2005, 2006, Hitachi, Ltd.

(3) Please click [Change] for the setting.
Please click [Back] of the browser for the unsetting.

(4) Please select the item that is set up from the pull-down menu of the corresponding item that is set up. At this time, please set up the item that is set up all.

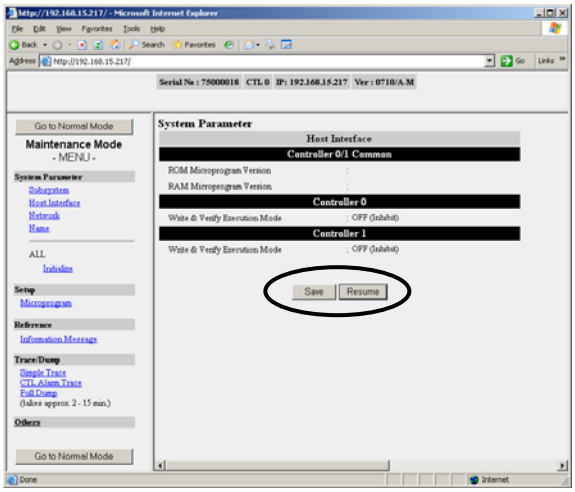
Explanation with regard to each item

[Controller 0/1 Common]



- ROM Microprogram Version :
  The response value of Product Revision Level (ROM Microprogram Version) in the Inquiry command is shown.
- RAM Microprogram Version :
  The response value of Product Revision Level (RAM Microprogram Version) in the Inquiry command is shown.

[Controller]



- Write & Verify Execution Mode
  The operations inside the Write & Verify command from the host are shown.
  [ON (Does not inhibit)] : The Write & Verify are executed.
  [OFF (Inhibit)] : This is executed and replace to the Write.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Please click [Set] after setting completion.

(6) The screen that confirms the following setting contents is displayed.
Please click [Save] if the setting is correct. Please click [Resume] if the setting contents are changed.

(7) If [Resume] is clicked, it returns to the setting window of before.
If [Save] is clicked, the following window is displayed.

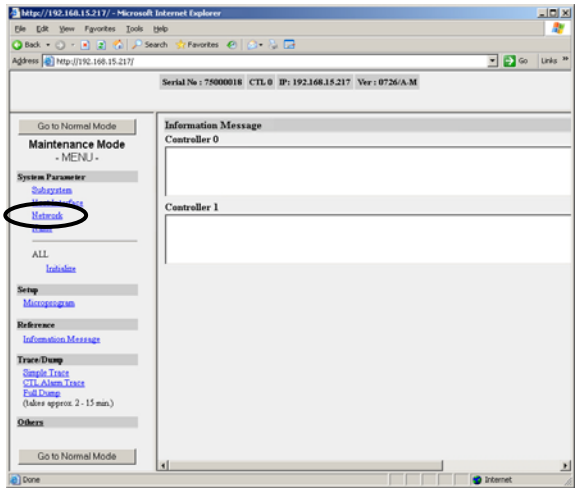
Copyright © 2005, 2006, Hitachi, Ltd.

(8) The following window is displayed at the later time for a while.
Please click [OK], if the setting is continued. Please click [Cancel], if the setting is stopped.
If [Cancel] was clicked, the system parameter is not set up.

(9) If [OK] is clicked, the following window is displayed.

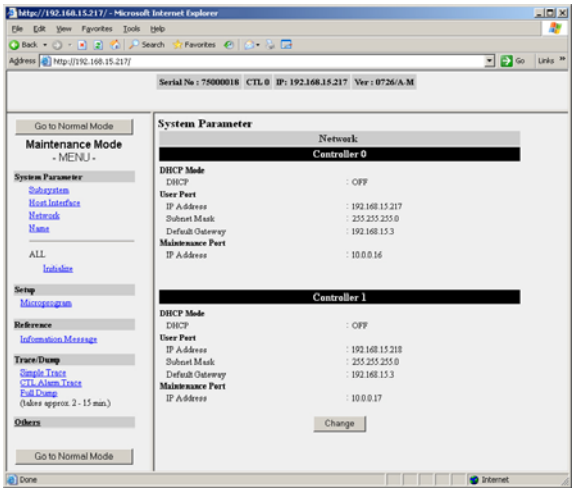
(10) If the following window is displayed at the later time for a while, the setting is completion.
If [OK] is clicked, it returns to the menu.

Copyright © 2005, 2006, Hitachi, Ltd.



This page is for editorial purpose only.

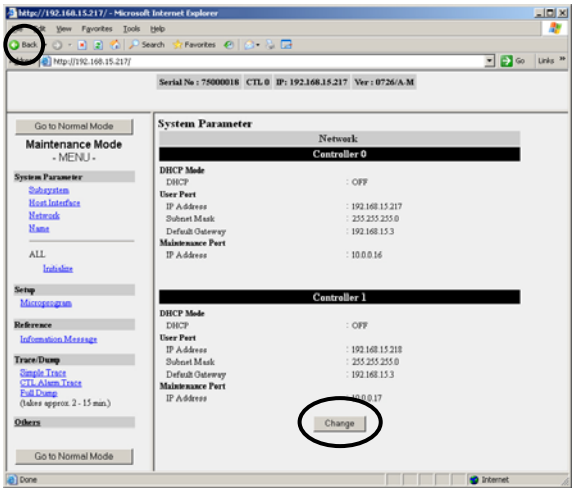
Copyright © 2005, 2006, Hitachi, Ltd.



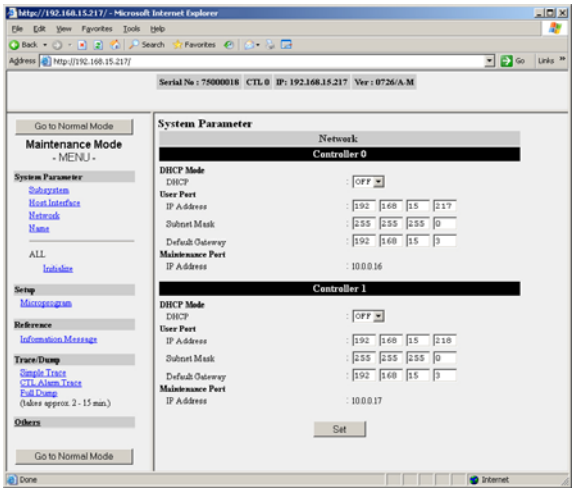
3.2.3 Network

This function sets up/refer to the item regarding the network (Setting the user management LAN port) of the device.

(1) Please click “Network”.



(2) The present setting value (the current value) is displayed.



Copyright © 2005, Hitachi, Ltd.

(3) Please click [Change] for the setting.
Please click [Back] of the browser for the unsetting.

(4) Please set up/select the corresponding item that is set up from the pull-down menu or input them.
At this time, please set up the item that is set up all.

Copyright © 2005, Hitachi, Ltd.

Explanation with regard to each item

[Controller 0]/[Controller 1]

- DHCP Mode

  DHCP : The DHCP function (‡1) is specified.

  [OFF] : Invalid the DHCP mode.

  [ON] : Valid the DHCP mode.

- User Port

  IP Address : Sets the IP ADDRESS.

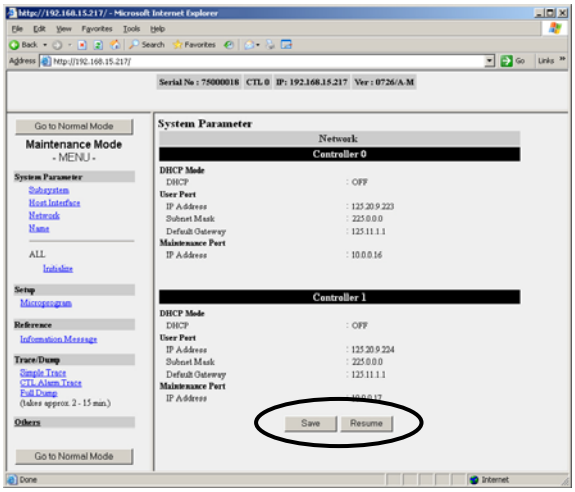
  Subnet Mask : Sets the Subnet Mask.

  Default Gateway : Sets the Default Gateway.

- Maintenance Port

  IP Address(‡2) : The IP address of the maintenance port, which is currently set, is displayed.
  It cannot be changed.

(5) Please click [Set] after setting completion.



‡1: When DHCP mode is valid, IP address is obtained from the DHCP server.
When the DHCP server has not started up or DHCP function has been miss-set, obtaining the IP address fails and the device IP address remains to be “0.0.0.0”. (Storage Navigator Modular or WEB cannot be used via LAN.)
In this case, the device IP address can be obtained by starting up the DHCP server or setting DHCP function correctly if necessary.
In the configuration which uses this subsystem as an external disk drive of the DHCP server, when the IP address of this subsystem is acquired using the DHCP function, if the network address of the reserved IP address for the maintenance port is assigned as an IP address, the IP addresses of the port for the user control and the port for the maintenance may not operate normally because they compete.
Request the system administrator that the DHCP server does not assign IP address of “10.0.0.x”, “192.168.0.x”, “192.168.233.x”, “172.23.211.x”, “10.197.181.x” to the device.

‡2: The IP address with the same network address as the displayed IP address of the maintenance port cannot be set.
Also, set up the network after restarting the subsystem and setting the IP address of the maintenance port (refer to System Parameter “4.2 (4) Settig of Maintenance LAN” (SYSPR 04-0100)) when the IP address of the maintenance port is displayed as “0.0.0.0”.
If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(6) The screen that confirms the following setting contents is displayed.
Please click [Save] if the setting is correct. Please click [Resume] if the setting contents are changed.

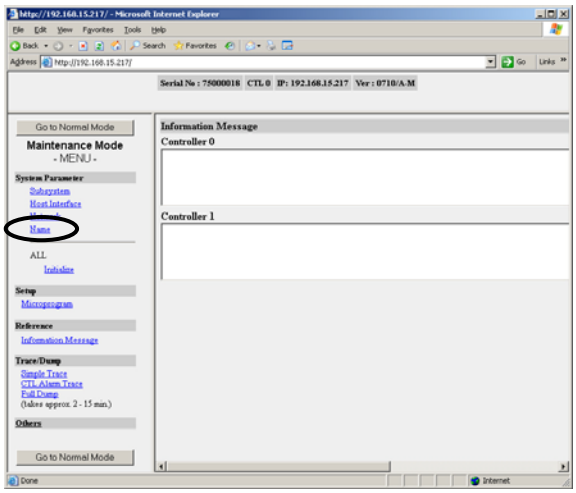
(7) If [Resume] is clicked, it returns to the setting window of before.
If [Save] is clicked, the following window is displayed.

(8) The following window is displayed.
Please click [OK], if the setting is continued. Please click [Cancel], if the setting is stopped.
If [Cancel] was clicked, the system parameter is not set up.

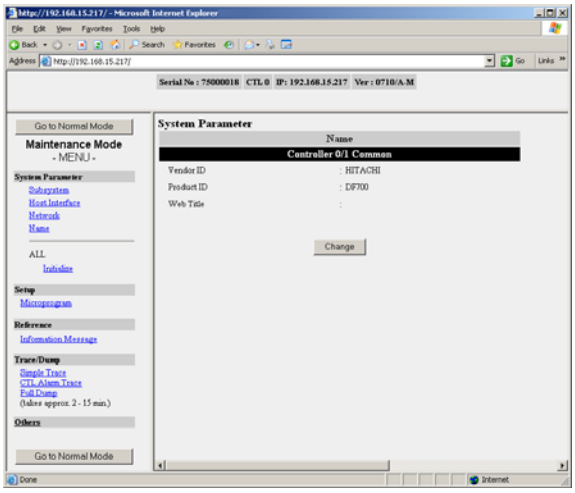
(9) If [OK] is clicked, the following window is displayed.

Copyright © 2005, Hitachi, Ltd.

(10) If the following window is displayed at the later time for a while, the setting is completion.
If [OK] is clicked, it returns to the menu.



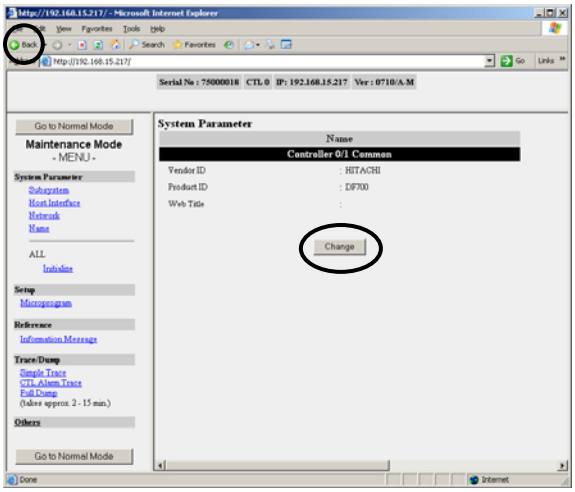
Copyright © 2005, Hitachi, Ltd.



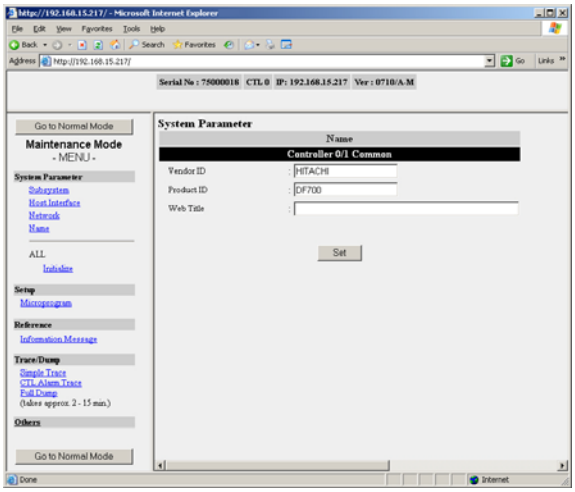
3.2.4 Name

This function can set up/refer to the item of the vendor name, model name etc. of the device.

(1) Please click “Name”.



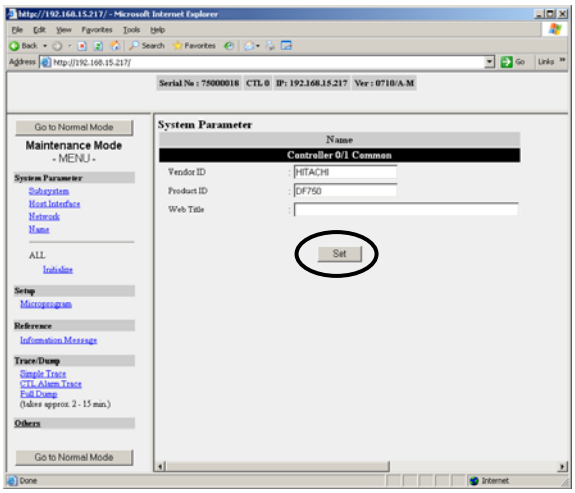
(2) The present setting value (the current value) is displayed.



Copyright © 2005, Hitachi, Ltd.

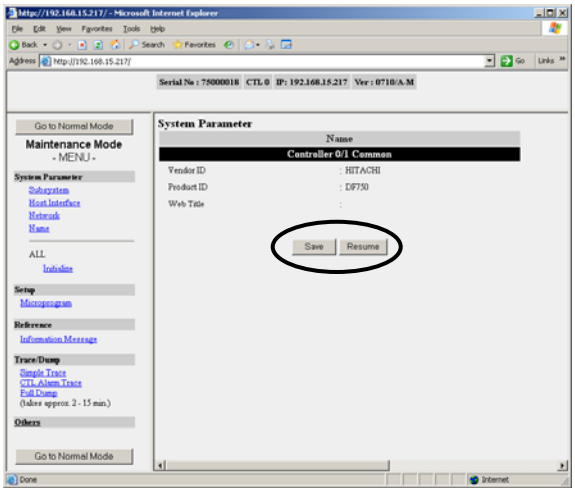
(3) Please click [Change] for the setting.
Please click [Back] of the browser for the unsetting.

(4) Please set up/select the corresponding item that is set up from the pull-down menu or input them.
At this time, please set up the item that is set up all.



Explanation with regard to each item

[Controller 0/1 Common]



- Vendor ID
  The vendor name that is reported with the Inquiry command is set up.
- Product ID
  The model name that is reported with the Inquiry command is set up.
- Web Title
  Sets the Web Title.

Copyright © 2005, Hitachi, Ltd.

(5) Please click [Set] after setting completion.

(6) The screen that confirms the following setting contents is displayed.
Please click [Save] if the setting is correct. Please click [Resume] if the setting contents are changed.

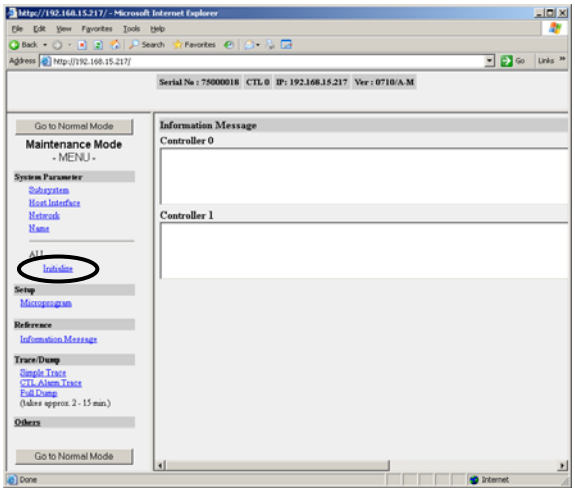
(7) If [Resume] is clicked, it returns to the setting window of before.
If [Save] is clicked, the following window is displayed.

Copyright © 2005, Hitachi, Ltd.

(8) Please click [OK], if the setting is continued. Please click [Cancel], if the setting is stopped. If [Cancel] was clicked, the system parameter is not set up.

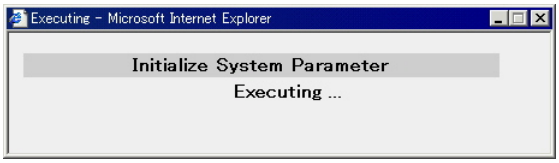
(9) If [OK] is clicked, the following window is displayed.

(10) If the following window is displayed at the later time for a while, the setting is completion. If [OK] is clicked, it returns to the menu.



Copyright © 2005, Hitachi, Ltd.

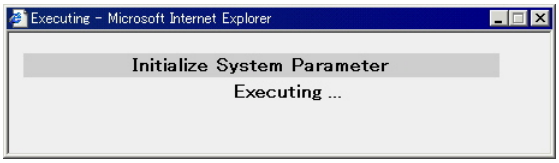
3.2.5 ALL



(1) Initialize

This function sets up the system parameter information of the device to the initial state.
If this function was executed, the resetting of the system parameter becomes needed, because the system parameter becomes the initial state.

(a) Please click “Initialize”.



(b) If [Initialize] is clicked, the following window is displayed.

(c) If the following confirmation message is displayed for a while. Please click [OK], if it is continued.

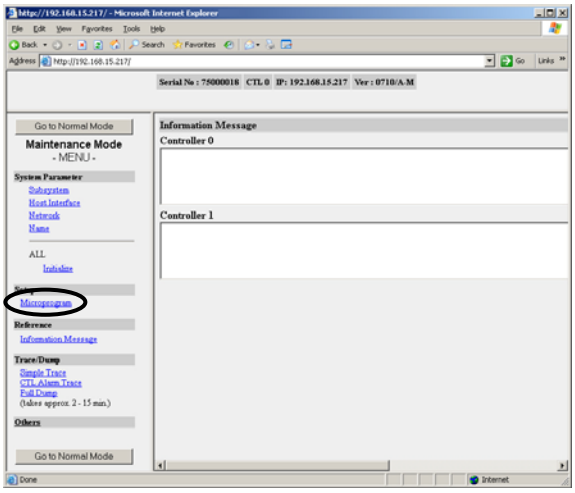
(d) If [OK] is clicked, the following window is displayed.

Copyright © 2005, Hitachi, Ltd.

(e) The system parameter becomes the initial state, the following window is displayed.
If [OK] is clicked, it returns to the menu.

Copyright © 2005, Hitachi, Ltd.

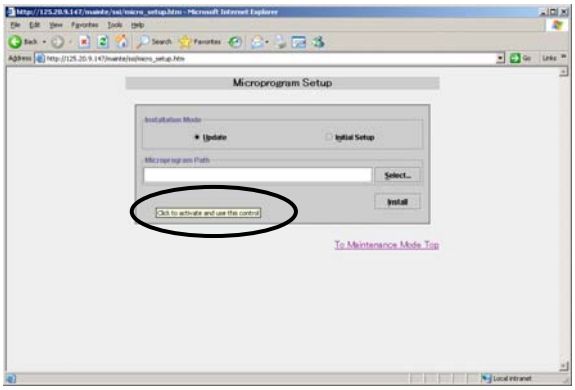
3.3 Setup



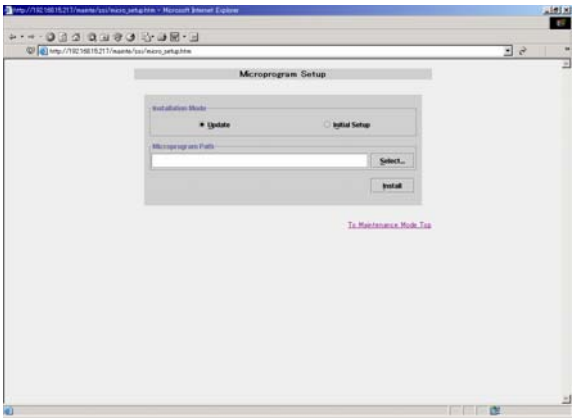
3.3.1 Microprogram

This function installs microprograms of the subsystem. There are two types of installation as shown below.

- Update installation ..... To install the microprograms with configuration information and system parameters taken over
- Initial setting up ..... To install the microprograms with configuration information and system parameters cleared



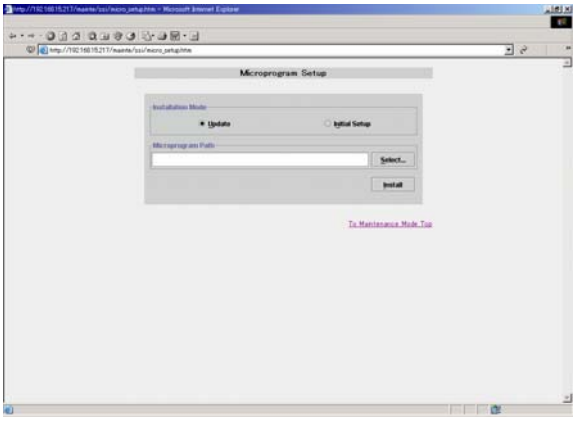
When the version of the microprogram is downgraded, click "Others" of the menu frame beforehand and display the "Others" window, and then check "Down Grade Check" of the displayed main frame for [Disable]. Change "Current" to "Disable" of "Down Grade Check" by clicking the [Change] button. (Refer to "3.6 Others" (WEB 03-0430).)

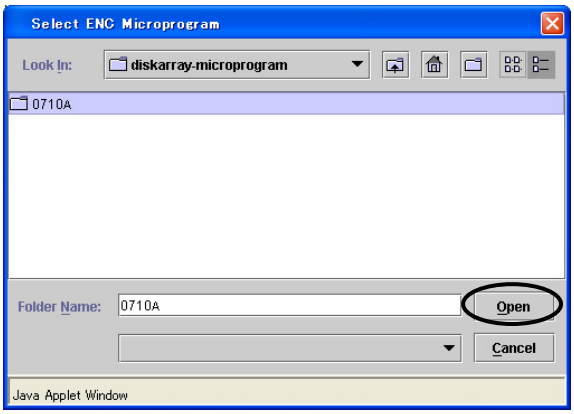


(1) Click "Microprogram".

Copyright © 2005, 2006, Hitachi, Ltd.

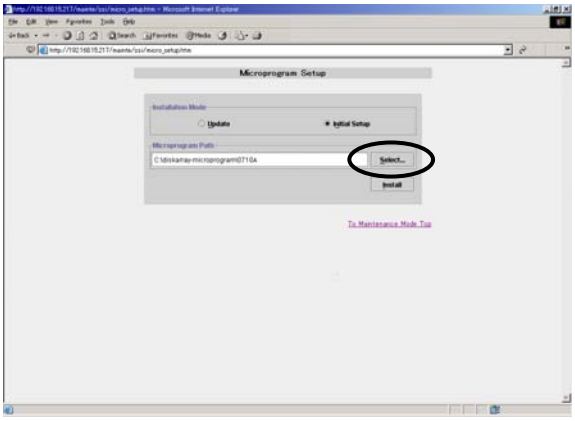
(2) When the “Microprogram” is clicked, the following window is displayed.
When the following message is displayed, it is necessary to click ActiveX Control with a mouse and to change it into the active status.





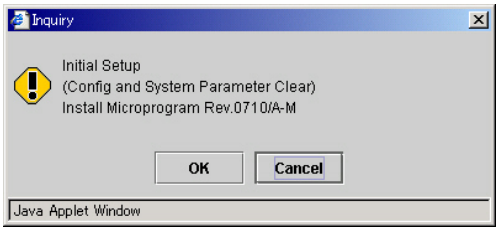
Copyright © 2006, Hitachi, Ltd.

(3) Select the installation type in the “Install Mode”.



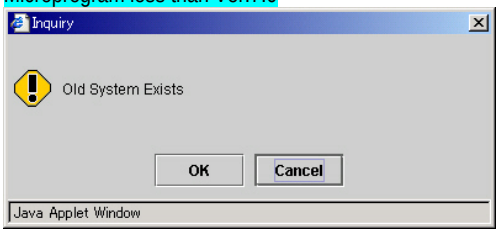
- Update..... Update installation
- Initial Setup..... Initial setting up

In the Microprogram Path field, specify the Unified version directory(‡1) in which the microprogram to be installed is stored.
When the “Select” button is clicked, the “Select Microprogram” window is displayed. Select the Unified version directory in which the microprogram is stored and click the “Open” button.



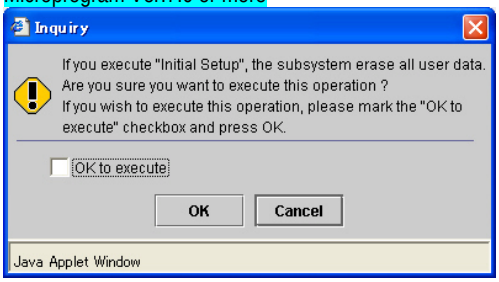
(4) Press the [Install] button.

‡1 : For the unified version directory, refer to “1.3.1 Hierarchy of Microprogram Storage Directories” (MICRO 01-0090).



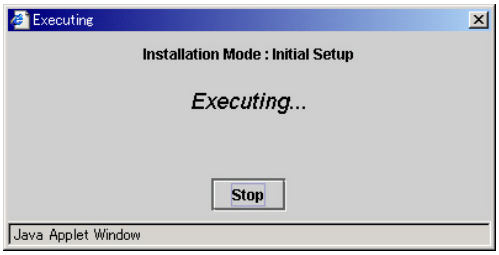
Copyright © 2006, Hitachi, Ltd.

(5) A dialog box for confirming whether to execute the installation is displayed. Press the [OK] button when you want to install or [Cancel] when you want to abort.



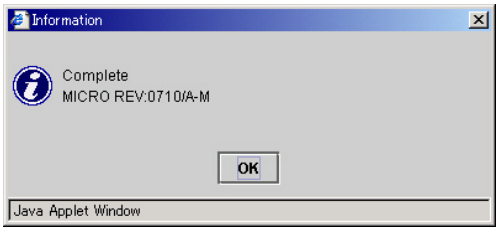
(6) The following dialog box is displayed when the microprogram has already been installed in the subsystem in the case where the initial setting up is specified.

Microprogram less than Ver.7.0



Microprogram Ver.7.0 or more

(7) When you want to continue the installation, press the [OK] button. When you want to abort the installation, press the [Cancel] button.

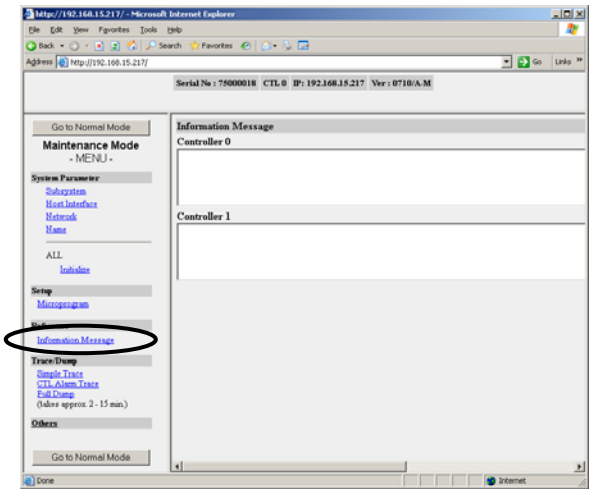


(8) When the installation is started, the following dialog box showing that the installation is in progress is displayed. The installation type and a name of a file being processed is displayed in the dialog box. When you abort the installation, press the [Stop] button.

NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the window in the procedure (9) was displayed, execute the new installation procedure again from the beginning.

Copyright © 2005, 2006, Hitachi, Ltd.

(9) When the installation is completed, the completion window is displayed. Click the [OK] button.



Copyright © 2005, 2006, Hitachi, Ltd.

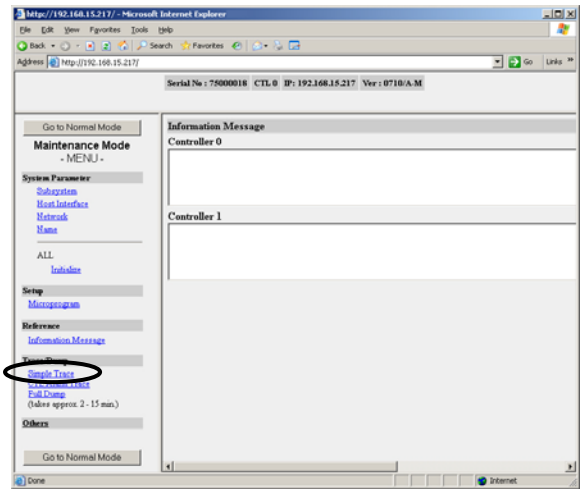
3.4 Reference

3.4.1 Information Message

If the abnormality occurred to the array device, this function displays the fault information.

The fault information of Controller # 0 is displayed in “Information Message” and the fault information of Controller # 1 is displayed in “Information Message”.

Copyright © 2005, Hitachi, Ltd.



3.5 Trace/Dump

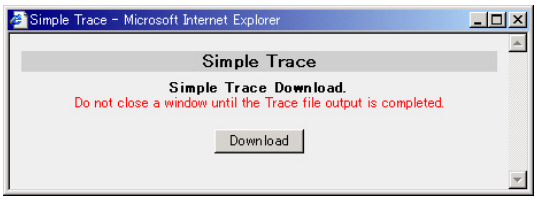
3.5.1 Collecting Simple Trace

This is a function to download current trace information.
To perform the down-load, a free capacity of approximately 30 M bytes is required in the PC.
Simple Trace of both the Controllers can be collected through one Controller. It is not necessary to collect from both the controllers. (When it is collected from Control Unit #0, File name is "smpl_trc0.dat". When collected from Control Unit #1, file name is "smpl_trc1.dat.")

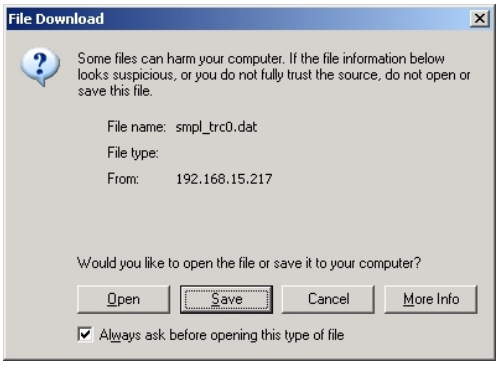
(1) Clear the cache of the browser in the following procedure before collecting the Simple Trace so that the old data collected last time is not saved.
- In the case of Internet Explorer, select the [Tools], [Internet Options], [General], [Temporary Internet files], and [Delete Files] in this order.
- In the case of Netscape, select the [Edit], [Preferences], [Cache], and [Clear Cache] in this order.

(2) Click "Simple Trace" in the menu frame.

(3) When the "Simple Trace" is clicked, the following window is displayed.

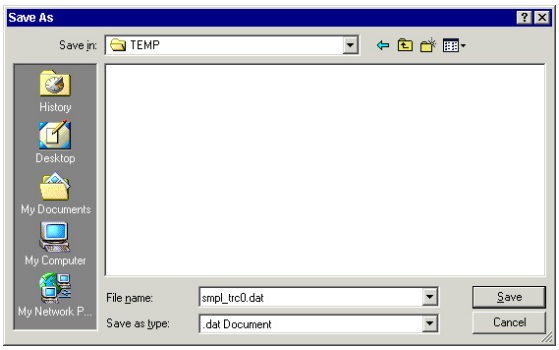


(4) When the [OK] button is clicked, the following window is displayed.

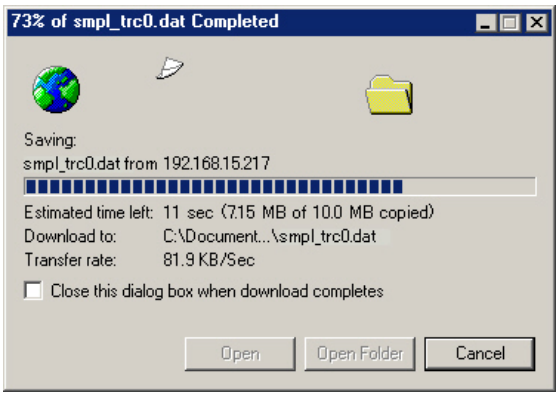


(5) The following window is displayed. Click the [Download] button.

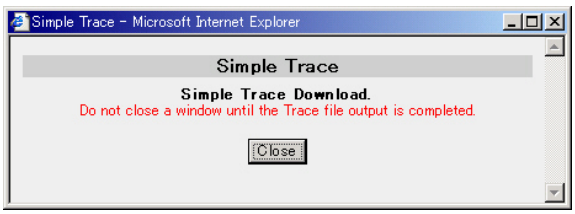
Copyright © 2005, 2006, Hitachi, Ltd.



Copyright © 2005, 2006, Hitachi, Ltd.



(6) Please click [Save], if it is continued. Please click [Cancel], if it is stopped.



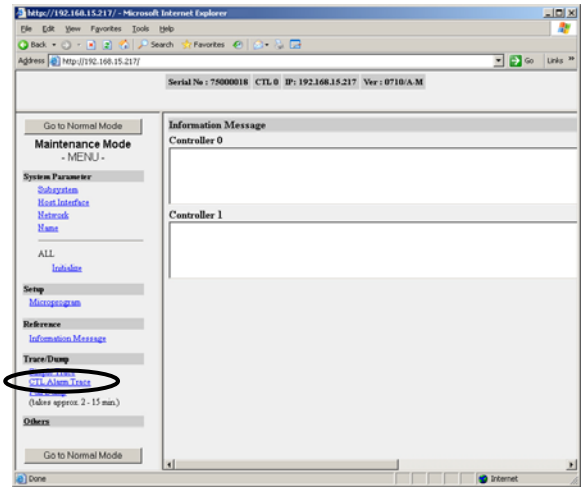
(7) If the following window is displayed. Please click [Save] after file name is setting, if it is continued.(‡1) Please click [Cancel], if it is stopped.

(8) The following window is displayed during execution download.

(9) The [Download] button changes to the [Close] button, so that, click the [Close] button and close the window when the download is completed.

‡1 : There may be a case where the default file name is given as “ctla_trc0.dat..dat” depending on the setting of the PC. In this case, reset the file name to “ctla_trc0.dat” or any other name.

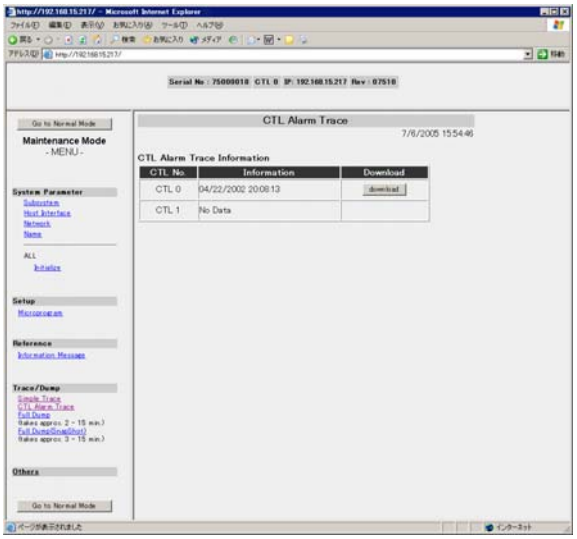
Copyright © 2005, Hitachi, Ltd.



3.5.2 Collecting CTL Alarm Trace

This is a function to download CTL Alarm trace information which is saved on the cache when a Controller is detached.
To perform the down-lord, a free capacity of approximately 20 M bytes (When Copy-on-write SnapShot Function is valid: approximately 40 M bytes) is required in the PC.
Collect CTL Alarm Trace from each Control Unit.
In order to distinguish from which Control Unit it is collected, store the collected data in different directories or with different file names.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.



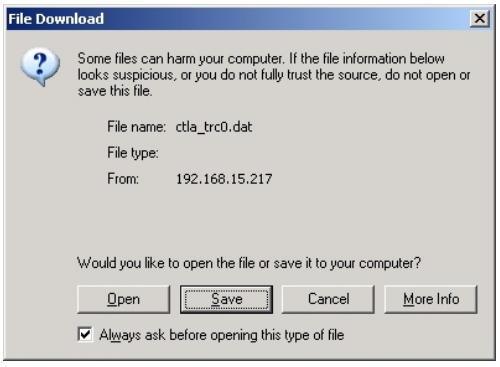
(1) Clear the cache of the browser in the following procedure before collecting the CTL Alarm Trace so that the old data collected last time is not saved.
- In the case of Internet Explorer, select the [Tools], [Internet Options], [General], [Temporary Internet files], and [Delete Files] in this order.
- In the case of Netscape, select the [Edit], [Preferences], [Cache], and [Clear Cache] in this order.

(2) Click “CTL Alarm Trace” in the menu frame.
The CTL Alarm Trace Information window is displayed when the CTL alarm trace information is present.

Copyright © 2005, 2006, Hitachi, Ltd.

(3) To download the CTL Alarm trace information, press the "Download" button on the Control Unit side to be collected in "CTL Alarm Trace information".(‡1)

The following is displayed as contents of the information.

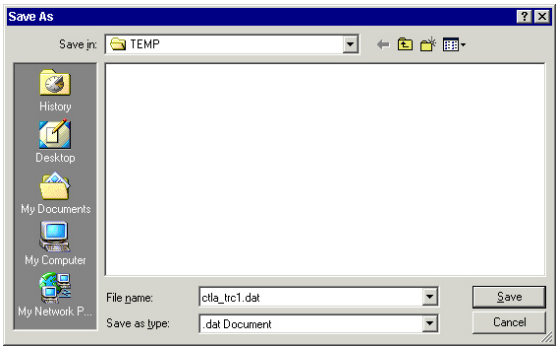


[Not Ready] ..... : A status in which the trace area is not established in the subsystem

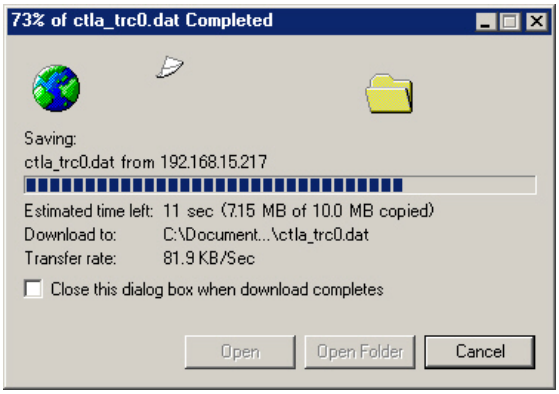
[Not Data] ..... : A status in which the CTL Alarm trace information is not present or being generated

[MM/DD/20XY hh:mm:ss] . : A status in which the CTL alarm trace information is present

NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL alarm trace may not be collected normally. Therefore, collect the simple trace.
If simple trace cannot be obtained through detached Controller, connect the Maintenance PC to the Controller at the opposite side, and collect the simple trace.



(4) The following window is displayed. Please click [Save], if it is continued. Please click [Cancel], if it is stopped.

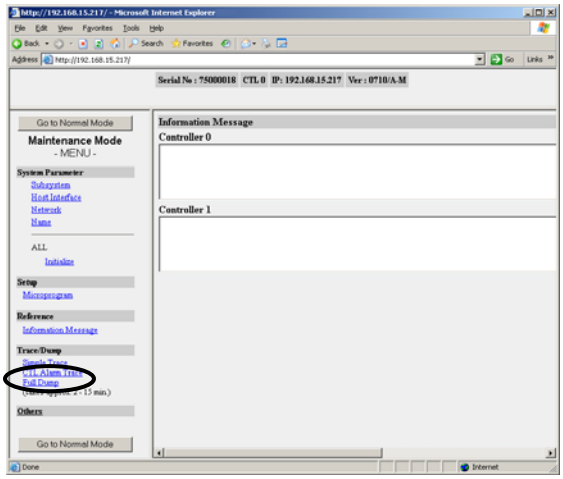


‡1 : An error message may be displayed. If it is displayed, click [OK], and collect the CTL Alarm Trace again after waiting for a while.

Copyright © 2005, Hitachi, Ltd.

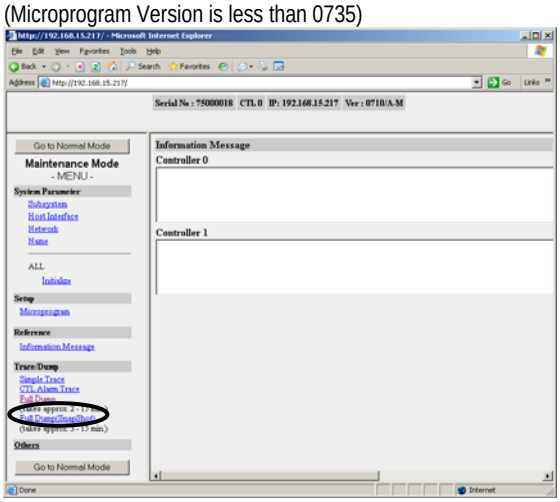
(5) If the following window is displayed. Please click [Save] after file name is setting, if it is continued. Please click [Cancel], if it is stopped.

(6) The following window is displayed during execution download.



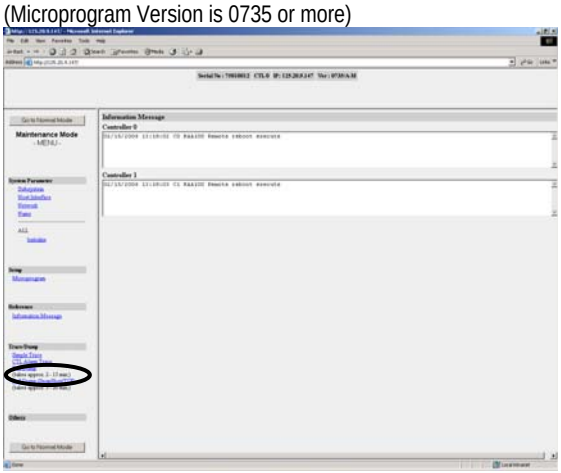
(7) The download completes.

Copyright © 2005, Hitachi, Ltd.

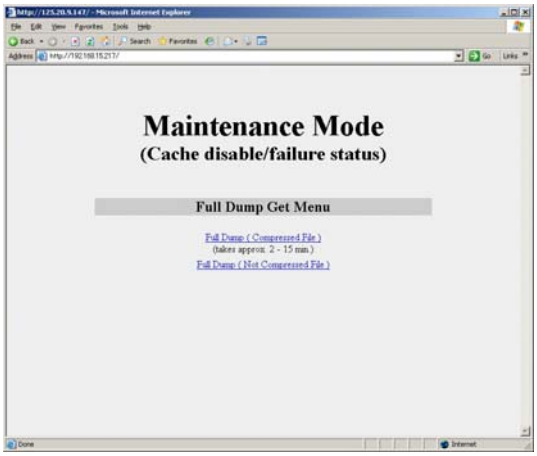


3.5.3 Collecting Full Dump

This function (Full Dump) is to download the logging information of the subsystem. The menu frame differs whether the priced optional feature, "Copy-on-write SnapShot Function", is installed or not.



"Copy-on-write SnapShot Function" uninstalled



"Copy-on-write SnapShot Function" installed
(Microprogram Version is less than 0735)

"Copy-on-write SnapShot Function" installed
(Microprogram Version is 0735 or more)

The cache memory access failure occurs when the following window is displayed. Refer to "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).

Copyright © 2005, 2006, Hitachi, Ltd.

When Copy-on-write SnapShot Function is installed, the information downloaded by this function (Full Dump) does not include the information in Copy-on-write SnapShot.
Collect Full Dump from each Control Unit.

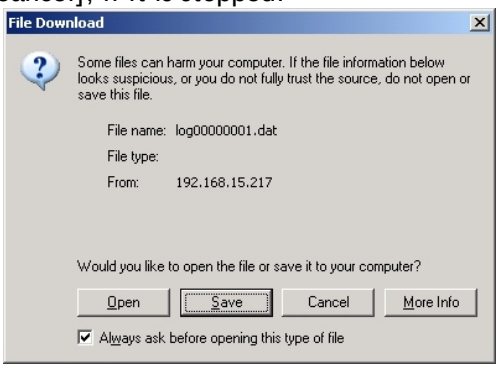
In order to distinguish from which Control Unit it is collected, store the collected data in different directories or with different file names.
To download, the following free capacity size is needed on PC.

- When Copy-on-write SnapShot Function is not installed

	Installed cache of the subsystem	Free Capacity needed on PC	
		no compression	compression (*1)
RKM	1 G bytes (Minimum)	753 M bytes	75 M bytes
	4 G bytes (Maximum)	922 M bytes	92 M bytes
RKS	1 G bytes (Minimum)	443 M bytes	44 M bytes
	2 G bytes (Maximum)	472 M bytes	47 M bytes
RKXS	512 M bytes (Minimum)	405 M bytes	41 M bytes
	1 G bytes (Maximum)	443 M bytes	44 M bytes
RKH	2 G bytes (Minimum)	1,414 M bytes	141 M bytes
	8 G bytes (Maximum)	1,724 M bytes	172 M bytes

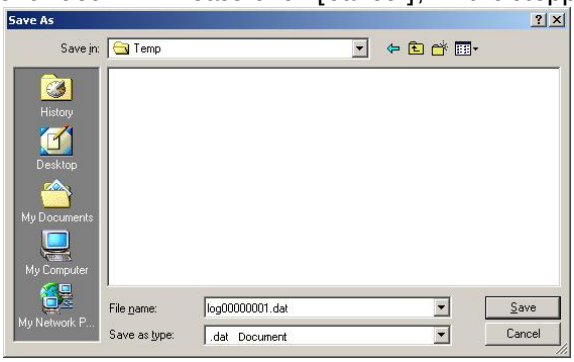
*1 : The value with compression has described the value when the compression rate is 10% as a standard.

NOTE : When this function is used, the menu other than Logging Data comes not to use it. Please enter into the Maintenance Mode again by the reset switch of the Controller, once again, if other menus are used, after this function was used.

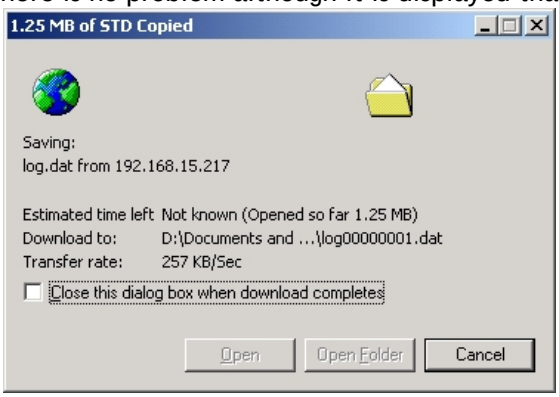


(1) Clear the cache of the browser in the following procedure before collecting the Full Dump so that the old data collected last time is not saved.
- In the case of Internet Explorer, select the [Tools], [Internet Options], [General], [Temporary Internet files], and [Delete Files] in this order.
- In the case of Netscape, select the [Edit], [Preferences], [Cache], and [Clear Cache] in this order.

(2) Please click “Full Dump”.



Copyright © 2005, 2006, Hitachi, Ltd.

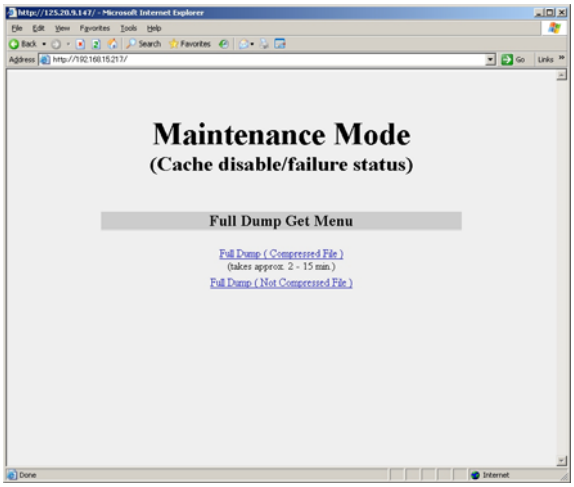


(3) The following window is displayed. Please click [Save], if it is continued. Please click [Cancel], if it is stopped.

(4) If the following window is displayed. Please click [Save] after file name is setting, if it is continued.(‡1) Please click [Cancel], if it is stopped.

(5) The following window is displayed during execution download.
There is no problem although it is displayed that the presumption remaining time is uncertain.

(6) The download completes.



‡1 : There may be a case where the default file name is given as "logx.dat.dat" depending on the setting of the PC. In this case, reset the file name to "logx.dat" or any other name. (x: Controller serial numbers)

Copyright © 2005, 2006, Hitachi, Ltd.

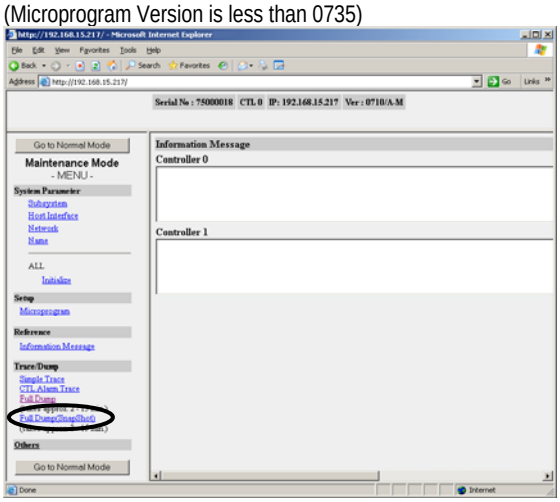
3.5.4 Collecting Full Dump (Full Dump(SnapShot/TCE))

This function (Full Dump(SnapShot)) is effective only when the priced optional feature, "Copy-on-write SnapShot Function" or "TrueCopy Extended Distance Function", is installed. If not, this menu frame may not be displayed.

The cache memory access failure occurs when the following window is displayed. Refer to "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).

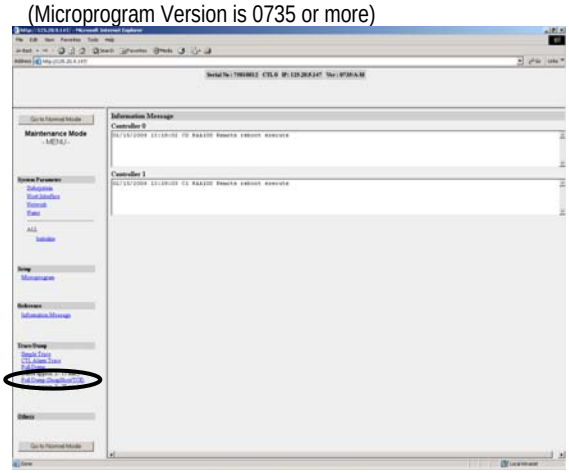
This function (Full Dump(SnapShot)) downloads the logging information of the subsystem. The downloaded information includes the information in Copy-on-write SnapShot.
Collect Full Dump from each Control Unit.
In order to distinguish from which Control Unit it is collected, store the collected data in different directories or with different file names.
To download, the following free capacity size is needed on PC.

	Installed cache of the subsystem	Free Capacity needed on PC	
		no compression	compression (*1)
RKM	1 G bytes (Minimum)	853 M bytes	85 M bytes
	4 G bytes (Maximum)	2,970 M bytes	297 M bytes
RKS	1 G bytes (Minimum)	720 M bytes	72 M bytes
	2 G bytes (Maximum)	1,496 M bytes	150 M bytes
RKXS	512 M bytes (Minimum)	–	–
	1 G bytes (Maximum)	758 M bytes	76 M bytes
RKH	2 G bytes (Minimum)	1,926 M bytes	193 M bytes
	8 G bytes (Maximum)	5,820 M bytes	582 M bytes



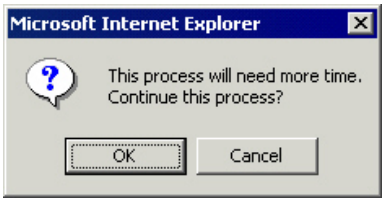
*1 : The value with compression has described the value when the compression rate is 10% as a standard.

NOTE : When this function is used, the menu other than Logging Data comes not to use it. Please enter into the Maintenance Mode again by the reset switch of the Controller, once again, if other menus are used, after this function was used.

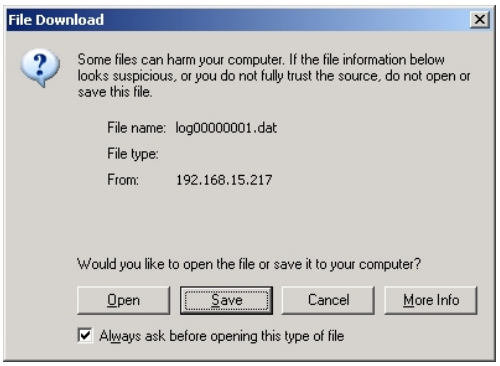


Copyright © 2005, 2006, Hitachi, Ltd.

(1) Please click "Full Dump(SnapShot)" or "Full Dump(SnapShot/TCE)".

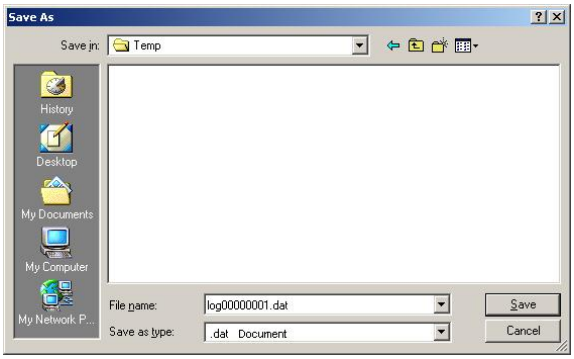


"Copy-on-write SnapShot Function" installed
(Microprogram Version is less than 0735)



"Copy-on-write SnapShot Function" installed
(Microprogram Version is 0735 or more)

(2) The following window is displayed. Please click [OK], if it is continued. Please click [Cancel], if it is stopped.



(3) The following window is displayed. Please click [Save], if it is continued. Please click [Cancel], if it is stopped.

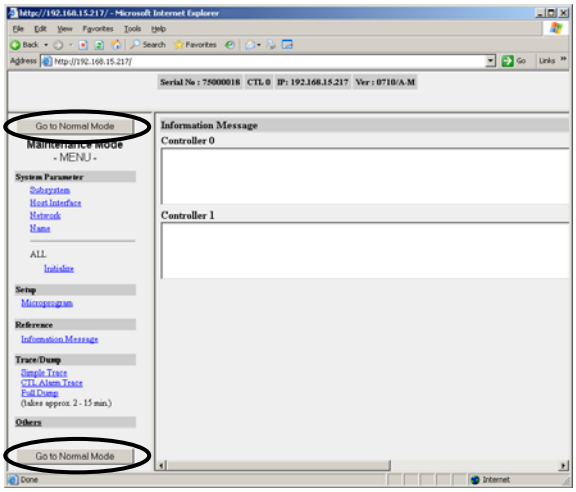
3.6 Other

The others are set up.
The contents that were set up in this function are not taken over and not step over the PS-OFF/ON.

(1) Please confirm the setting value of each item and click the check box of the item that the setting contents are changed. Please click [Change], if the setting contents are updated.

Explanation with regard to each item

- Configuration Clear Mode
  The transfer information initialization as the booting is designated.
  [Take Over] : Transfer booting (default).
  [Configuration Clear] : Default booting.
- World Wide Name Check Mode
  The World Wide Name Check Mode as the booting is designated.
  [Enable] : The WWN Check is executed (default).
  [Disable] : The WWN Check is not executed.
- Data Down Grade Check Mode
  It specifies whether to make the check of the version downgrade of the microprogram enable or disable when performing the update installation of the microprogram by using WEB.
  [Enable] : Guard the version downgrade of the microprogram (default).
  It is specified usually when the version of the microprogram is updated.
  [Disable] : The version downgrade of the microprogram is not checked.
  It is specified before the update installation is performed when the version of the microprogram is downgraded.



(2) Please confirm that the setting value was updated.

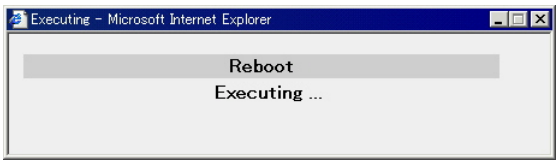
3.7 Return Method to the Normal Mode

The method that returns from the Maintenance Mode to the Normal Mode is shown.

(1) Please click [Go To Normal Mode]. The button of [Go To Normal Mode] is in the top and down on the menu window. Please select either button.



(2) The following window is displayed during execution.

(3) If the following confirmation message is displayed for a while. Please click [OK], if it is continued.

(4) The following window is displayed during execution.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) If the return to the Usually Mode completes, the array device becomes the Ready status. Please confirm that the READY LED of the device entire surface is lighted. (Usually Controller recovers in about four minutes. (about five minutes in case of the RKH))
Check that the READY LED (green) on the front of the Basic Chassis lights up, and the ALARM LED (red) and the WARNING LED (orange) go out(‡1). The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH) or the WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes) before the READY LED (green) on the front of the Basic Chassis lights up.

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.
