FE-95DF744-13

DF700

Disk Array Subsystem

Maintenance Manual

REV.18

Read this manual carefully and keep it.
• Before starting operation, read the safety instructions carefully and fully understand them. • After reading this manual, keep it at hand for your reference.

HITACHI

Preface

This manual explains the operation introduction, installation, maintenance, and WEB of the DF700 disk array subsystem for service personnel to make them understand the DF700.

This manual contains information on maintenance works of the DF700 series disk array subsystem such as subsystem outline, structure, installation, and actions against failures.
When performing a maintenance work, read this manual carefully, and fully understand the theory of operation, operation procedure, and instructions before starting the work.

This manual was carefully prepared and reviewed for completeness and correctness. However, please feel free to contact us concerning any question, mistake, omission, or any other issues about this manual.

Cautionary Notes

On This Manual

- Hitachi, Ltd. owns the copyrights of the DF700 Maintenance Manual. No part of this manual may be reused or reproduced without permission of Hitachi, Ltd.
- Hitachi, Ltd. is not liable for any troubles or accidents which are caused by operation not written in this manual.
- The DF700 Maintenance Manual may be revised without prior notice.
- The subsystem is a "class 1 laser system" which emits no hazardous laser beam.
  Be sure to operate it according to this manual. Do not perform any operations other than those written in this manual. Otherwise, unexpected failures or accidents may be caused.
  The subsystem is a "class 1 laser system" which emits no hazardous laser beam.
  The subsystem complies with FDA radiation performance standards 21CFR subchapter J.

General Cautionary Notes

- It is feared that user data is lost unless the power is turned off correctly following the specified procedure.
- The Disk Drives are precise components. Never apply them any shock nor vibration.
- When replacing the batteries, turn off the AC Power Unit Switch of the subsystem, charge the batteries for six hours or longer, and then return the subsystem to the customer.
- In order to protect parts from the electrostatic discharge, every worker must put a wrist band on his/her wrist before starting installation or maintenance work and start the work after connecting the grounding clip to a metallic portion of the frame. (The wrist band must be put on when connecting the LAN cable.)
- Do the work with the wrist band put on. Do not put off the wrist band till the work is finished.
- When handling a part, hold it in the way that fingertips of the hand putting the wrist band on touch a metallic portion of the part.
  (The above is necessary in order to discharge the charged static electricity and prevent a charge caused by handling.)
- Be sure to touch the subsystem with the wrist band put on. If you touch the subsystem without putting on the wrist band, the static electricity charged on your body flows to the subsystem in an instant because no resistance exists between your body and the subsystem causing a subsystem trouble.

Note

EMI Regulation

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference in which case the user will be required to correct the interference at his own expense. Testing was done with shielded cables. Therefore, in order to comply with the FCC regulations, you must use shielded cables with you installation.

EMI Regulation Labels Affixed on the Subsystem.

The EMI test was done in the following configuration.
If a trouble occurs in another configuration, a user may be requested to take appropriate preventive measures.

- DF700-RKM/RKS/RKXS+H1J
- DF700-RKM/RKS+RKAJ+H2J
- DF700-RKXS+RKAJAT+H2J
- DF700-RKM/RKS+RKAJ(×2)+RKAJAT+U7
- DF700-RKXS+RKAJAT(×3)+U7
- DF700-RKM/RKS/RKXS+RKNAS(×2)+U7
- DF700-RKH/RKHE+RKAJ(×1)+RKAJAT(×2)+U7

Model Name Conversion

Throughout this document, product model name is written as "DF700". When you want to use this document for the HT-4064 series, please conversion the model name "DF700" with "HT-4064".

Table 1 Conversion Table for Model Name and Other Model Name

The model name which is used in this document	The model name replace to DF700	Type
DF700-××××	HT-4064-××××	Rackmount model (DF700-RKM) Rackmount model (DF700-RKAJ) Rackmount model (DF700-RKAJAT) Rackmount model (DF700-RKS) Rackmount model (DF700-RKXS) Rackmount model (DF700-RKH) Floor model (RKM + H1J) Floor model (RKS+ H1J) Floor model (RKXS+ H1J) Floor model (RKM + RKAJ + H2J) Floor model (RKS + RKAJ + H2J) Floor model (RKM + RKAJAT + H2J) Floor model (RKS + RKAJAT + H2J) Floor model (RKXS + RKAJAT + H2J)
DF-F700-××××	HT-F4064-××××	Optional component Accessory component

This manual also describes the subsystems of the DF600 series model names. Read this manual by converting the description of the following abbreviated model names.

Table 2 Table for Conversion of Abbreviated Model Names

Abbreviated model name	DF model name	HT model name
RKA	DF600-RKA	HT-4063-RKA
RKAJAT	DF600-RKAJAT	HT-4063-RKAJAT
RKAJATL	DF600-RKAJATL	HT-4063-RKAJATL

*1 : The RKAJAT exists in both the DF600 series model name and the DF700 series model name. In this manual, the work is the same for both of them.

The subsystem name is described as SANRISE in this manual.
When using it as a manual of Hitachi Data Systems Corporation (HDS), read it as follows, and use it.

Table 3 Table of subsystem names reading in different ways

The model name which is used in this document	Model name for Hitachi Data Systems Corporation (HDS)
SANRISE 9900V	Lightening 9900V
SANRISE Universal Storage Platform (USP)	TagmaStore Universal Storage Platform (USP)
SANRISE Adaptable Modular Storage (AMS)	TagmaStore Adaptable Modular Storage (AMS)
SANRISE Workgroup Modular Storage (WMS)	TagmaStore Workgroup Modular Storage (WMS)

Copyright © 2005, 2006, Hitachi, Ltd.

The following two types of Basic Chassis exist in the SANRISE AMS1000.

- DF-700-RKH (abbr.: RKH)
- DF-700-RKHE (abbr.: RKHE)

This manual does not describe the RKHE except for the following differences.
When the RKHE is used, it becomes the same procedure as the RKH. Therefore, read the RKH as the RKHE excluding the part described in parallel and use it.

Table 4 Differences between the RKH and the RKHE

Chassis Name	Installed Control Unit Model Name	Processor (Control CPU)	Control Memory (L2 Cache Memory)
RKH	DF-F700-F1JH	POWER PC 7447A (1.4GHz)	512 K bytes
RKHE	DF-F700-F2JH	POWER PC 7448 (1.7GHz)	1 M bytes

Manual Composition

This Maintenance Manual is composed of 13 volumes, that is, Maintenance Manuals- for Theory, for Maintenance, for Installation, Microprogram, System Parameter, Addition/ Subtraction/Relocation, Troubleshooting, Messages, Replacement, Parts Catalog, and for WEB. Each volume and chapter has table of contents to help readers to find just the page they want. Besides, glossary a contained in each appendix.

For the composition of the each volume, refer to the following.

Maintenance Manual - for Safety Summary :
This "Safety Summary" volume describes the cautionary notes to handle the maintenance work safely.

1 About the symbols ..... SAFE 0020
2 General Safety Guidelines ..... SAFE 0020
3 Hazard Warning Statements ..... SAFE 0070
4 Warning Labels Affixed on the Subsystem ..... SAFE 0170

Maintenance Manual - for Theory :
This "Theory" volume describes the cautionary/prohibited notes in the maintenance work, the outline of the subsystem, and the configuration, etc.

Chapter 1. Warranty and Service ..... THEO 01-0000
Chapter 2. Outline of Subsystem ..... THEO 02-0000
Chapter 3. Major Specifications of the Subsystem ..... THEO 03-0000
Chapter 4. Theory of Operation ..... THEO 04-0000
Chapter 5. Outline of P.P ..... THEO 05-0000

Maintenance Manual - for Installation :
This "Installation" volume describes the setting of the subsystem and the installation of the parts, etc.

Chapter 1. Before Starting Installation Work ..... INST 01-0000
Chapter 2. Installing Floor Model ..... INST 02-0000
Chapter 3. Installing Rackmount Model ..... INST 03-0000

Maintenance Manual - for Microprogram :
This "Microprogram" volume describes the new and update installation of the microprogram.

Chapter 1. Installation of Microprogram ..... MICRO 01-0000
Chapter 2. Procedure for Recovery from a Failure ..... MICRO 02-0000
Chapter 3. Procedure for Isolating Cause of Disk Drive Failure when "Install partially complete " Message Is Output ..... MICRO 03-0000

Copyright © 2005, Hitachi, Ltd.

Maintenance Manual - for System Parameter :
This "System Parameter" volume describes the setting of the system parameter of the subsystem, etc.

Chapter 1. Setting (Storage Navigator Modular) ..... SYSPR 01-0000
Chapter 2. Setting Host Group/Targets ..... SYSPR 02-0000
Chapter 3. Setting the RAID/LU/Spare Disk ..... SYSPR 03-0000
Chapter 4. Setting Configuration Information ..... SYSPR 04-0000
Chapter 5. Setting Host Connection Parameters ..... SYSPR 05-0000
Chapter 6. Setting an Extra-cost Optional Feature ..... SYSPR 06-0000
Chapter 7. System Parameter Setting List ..... SYSPR 07-0000

Maintenance Manual - for Addition/Subtraction/Relocation :
This "Addition/Subtraction/Relocation" volume describes the addition, subtraction and relocation related to the setting of the subsystem.

Chapter 1. Adding Optional Components ..... ADD 01-0000
Chapter 2. Subtracting Optional Components ..... ADD 02-0000
Chapter 3. Relocation/Removal Work ..... ADD 03-0000

Maintenance Manual - for Troubleshooting :
This "Troubleshooting" volume describes the trouble analysis of the subsystem, etc.

Chapter 1. Flowchart for troubleshooting ..... TRBL 01-0000
Chapter 2. Before Maintenance Work ..... TRBL 02-0000
Chapter 3. Before Starting WEB Connection ..... TRBL 03-0000
Chapter 4. Trouble Analysis by WEB connection ..... TRBL 04-0000
Chapter 5. Procedure for Investigating Disk Array Subsystem Regarding Fibre Channel Failure ..... TRBL 05-0000
Chapter 6. Details of Recovery Methods ..... TRBL 06-0000
Chapter 7. Collecting Error Information ..... TRBL 07-0000
Chapter 8. Trouble Analysis by LED Indication ..... TRBL 08-0000
Chapter 9. Data Collection when a Failure Occurs in Program Product (P.P.) ..... TRBL 09-0000
Chapter 10. Trouble Analysis by Failure Monitoring Function ..... TRBL 10-0000
Chapter 11. Procedure for Determining Failure of Network Side in NAS System ..... TRBL 11-0000
Chapter 12. Procedure for the iSCSI System Failure Determination on the Disk Array Subsystem Side ..... TRBL 12-0000
Chapter 13. Procedure for Determining Failure of Local Tape in NAS System ..... TRBL 13-0000

Copyright © 2005, 2006, Hitachi, Ltd.

Maintenance Manual - for Messages:
This “Message” volume describes the content of the message which occurs at the time of the subsystem failure.

Chapter 1. Before Starting Trouble Analysis ..... MSG 01-0000
Chapter 2. CUDG Detected Messages ..... MSG 02-0000
Chapter 3. Failure Messages ..... MSG 03-0000
Chapter 4. Progress Message ..... MSG 04-0000
Chapter 5. Flash Detected Messages ..... MSG 05-0000
Chapter 6. Warning Messages ..... MSG 06-0000
Chapter 7. Web Error Messages ..... MSG 07-0000
Chapter 8. Storage Navigator Modular Error Messages ..... MSG 08-0000
Chapter 9. Failure Analysis by Sense Data ..... MSG 09-0000
Chapter 10. ACE Tool Error Message ..... MSG 10-0000
Chapter 11. List of the NAS BIOS POST Codes and the Subcodes ..... MSG 11-0000
Chapter 12. Failure Factor Codes of the Modular Volume Migration ..... MSG 12-0000

Maintenance Manual - for Replacement :
This “Parts Replacement” volume describes the replacement work of each part and the periodic maintenance, etc.

Chapter 1. Before Starting Maintenance Work ..... REP 01-0000
Chapter 2. Parts Replacement ..... REP 02-0000
Chapter 3. Periodic Maintenance ..... REP 03-0000
Chapter 4. Maintenance Tools ..... REP 04-0000
Chapter 5. Recycling ..... REP 05-0000

Maintenance Manual - for Parts Catalog :
This “Parts Catalog” volume describes each part installed in the subsystem.

Chapter 1. Parts Catalog ..... PARTS 01-0000

Maintenance Manual - for WEB :
This “WEB” volume describes the operating procedure for WEB.

Chapter 1. Before Using Web ..... WEB 01-0000
Chapter 2. The Normal Mode Operation Procedure ..... WEB 02-0000
Chapter 3. The Maintenance Mode Operation Procedure ..... WEB 03-0000

Copyright © 2005, 2006, Hitachi, Ltd.

[System Parameter]

Chapter 1. Setting (Storage Navigator Modular) ..... SYSPR 01-0000
1.1 Procedure for connecting Storage Navigator Modular with the subsystem ..... SYSPR 01-0010
1.2 Setting the LAN Port Number ..... SYSPR 01-0100
Chapter 2. Setting Host Group/Targets ..... SYSPR 02-0000
2.1 Before setting host group/Targets ..... SYSPR 02-0000
2.2 Setting of option ..... SYSPR 02-0010
2.3 Setting LU mapping ..... SYSPR 02-0100
2.4 Setting Target Information ..... SYSPR 02-0180
2.5 Setting CHAP Authentication ..... SYSPR 02-0210

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 3. Setting the RAID/LU/Spare Disk ..... SYSPR 03-0000
3.1 Preparation of RAID/LU setting ..... SYSPR 03-0030
3.2 RAID group setting ..... SYSPR 03-0050
3.3 Setting of LU ..... SYSPR 03-0140
3.4 Setting of Spare Disk ..... SYSPR 03-0350
3.5 Checking the status of Disk Drive ..... SYSPR 03-0400
3.6 Checking the Disk Drive which configures the RAID Group ..... SYSPR 03-0420
3.7 Allocation of the system LU/user LU of the NAS ..... SYSPR 03-0440
3.7.1 Setting, change or deletion the system LU allocation ..... SYSPR 03-0440
3.7.2 Setting, change or deletion the user LU allocation ..... SYSPR 03-0480
3.8 Setting the command device indispensable as the system LU of the NAS ..... SYSPR 03-0520
3.9 Restrictions of the operatio opportunity for the system LU/user LU of the NAS ..... SYSPR 03-0560
Chapter 4. Setting Configuration Information ..... SYSPR 04-0000
4.1 Before setting configuration information ..... SYSPR 04-0000
4.2 Setting the subsystem configuration information ..... SYSPR 04-0020
Chapter 5. Setting Host Connection Parameters ..... SYSPR 05-0000
5.1 Simple setting for Connecting to the Host Computer ..... SYSPR 05-0000
5.2 Simple setting for Connecting to the Host Computer ..... SYSPR 05-0040
5.3 When using the subsystem in Drive Detach Mode ..... SYSPR 05-0050
Chapter 6. Setting an Extra-cost Optional Feature ..... SYSPR 06-0000
Chapter 7. System Parameter Setting List ..... SYSPR 07-0000

[Addition/Subtraction/Relocation]

Chapter 1. Adding Optional Components ..... ADD 01-0000
1.1 Before Starting Addition of Optional Components ..... ADD 01-0000
1.2 Procedures for Adding Optional Components ..... ADD 01-0010
1.2.1 Unpacking ..... ADD 01-0090
1.3 Mounting on Rack Frame ..... ADD 01-0100
1.3.1 Work immediately after abnormal termination ..... ADD 01-0110
1.3.2 Device ID setting ..... ADD 01-0121
1.4 Adding Optional Components ..... ADD 01-0130
1.4.1 Subsystems optional components for addition ..... ADD 01-0130
1.4.2 Adding a Control Unit ..... ADD 01-0140
1.4.3 Adding a Disk Drive ..... ADD 01-0190
1.4.4 Adding a Cache Unit ..... ADD 01-0380

Safety Summary

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

⚠ SAFETY SUMMARY

The hazard warnings which appear on the warning labels on the machine or in the manual have one of the following alert headings consisting of a safety alert symbol and a signal word, DANGER, WARNING, or CAUTION.

1. ⚠ About the symbols

⚠	This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.
⚠ **DANGER :**	Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
⚠ **WARNING :**	Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
⚠ **CAUTION :**	Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.
CAUTION :	Indicates a potentially hazardous situation which, if not avoided, may result in property damage.

2. ⚠ General Safety Guidelines

Read the following safety guidelines carefully and follow them when you conduct maintenance of the machine.

Before starting maintenance

- Maintenance of the machine must be done only by trained and qualified engineers.
- Read and follow the safety guidelines and procedures in this manuals.
- In this manual and on the machine, hazard warnings are provided to aid you in preventing or reducing the risk of death, personal injury, or product damage. Understand and follow these hazard warnings fully.
- When warning labels become dirty or start peeling off, replace them.
- Keep in mind that the hazard warnings in this manual or on the machine cannot cover every possible case, as it is impossible to predict and evaluate all circumstances beforehand. Be alert and use your common sense.
- This disk array is a “class 1 laser system” which emits no hazardous laser beam.
  Be sure to operate it according to this manual. Do not perform any operations other than those written in this manual. Otherwise, unexpected failures or accidents may be caused.

⚠ SAFETY SUMMARY (Continued)

During work

- For each procedure, follow the given method and sequence of steps.
- Use the spare, consumables, and materials for maintenance which are specified in the manual; otherwise, personal injury or damage of the machine, as well as deterioration of the product's quality, may result.
- Use the special tools and instruments specified for the work in the manual or commercially available tools and instruments which fit the purpose.
- Use measurement instruments and powered tools which are properly calibrated or periodically inspected.
- Keep the maintenance area neat and tidy.
- Always put away parts, materials, or tool when not in use.
- Wear an eye protector where liquid may splash or anything may fly about.
- When lifting anything heavy, lift it using your legs with your back kept erect, to prevent injury to your back or spine.
  When lifting anything, for the weight of which CAUTION is indicated, use a proper lifting tool or have somebody help you.
- Keep a soldering iron and its stand away from you to prevent accidental contact and burns.
- When using sharp objects or cutting tools, make sure that no part of your body lies in the path of the blade, or point.
- Before finishing your work, check if the subsystem is returned to its original state.
  (Make sure that all parts removed during maintenance have been in stalled back in their original positions in the machine. Make sure that no tool or foreign material left in the machine.)

⚠ SAFETY SUMMARY (Continued)

Prevention of electric shocks

- Before starting work, make sure that, unless otherwise specifically instructed, there is no potential electric hazard in the maintenance area such as insufficient grounding or a wet floor.
- Before starting work, note where the emergency power-off switches are located and make sure you know how to operate them.
- Unless otherwise specifically instructed, cut off all power sources to the machine before staring maintenance. Just switching off the machine power supplies is usually not enough. When power is fed from a wall or floor outlet, unplug the power supply cord, or turn off the switch on the power distribution panel or board.
  When the power supply has a lockout device(*1), lock it up after the powering off and keep the key.
  Attach a notice on the panel or board prohibiting the use of the switch.
  If the machine power has been already turned off, make sure yourself that these conditions are satisfied.
  *1 The following is a portion of 29 CFR 1910.147 "The control of hazardous energy (lockout/tagout)," in the OSHA (Occupational Safety & Health Administration U.S Department of Labor USA) Regurations.
  - *Lockout device. A device that utilizes a positive means such as a lock, either key or combination type, to hold an energy isolating device in a safe position and prevent the energizing of a machine or equipment. Included are blank flanges and bolted slip blinds.*
  - *Energy isolating device. A mechanical device that physically prevents the transmission or release of energy, including but not limited to the following: A manually operated electrical circuit breaker; a disconnect switch, a manually operated switch by which the conductors of a circuit can be disconnected from all ungrounded supply conductors, and, in addition, no pole can be operated independently; a line valve; a block; and any similar device used to block or isolate energy. Push buttons, selector switches and other control circuit type devices are not energy isolating devices.*
- Do not touch any uninsured conductor or surface, where so instructed, which remains charged for a limited time after the external power supply to the machine is disconnected.
- When working on a machine which has a grounding terminal, make sure that the terminal is properly connected to the facility's ground.
- When working close to a hazardously energized part, do not work alone; work with another person who can immediately turn off the power in an emergency.

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- Do not wear any metallic item such as a wrist watch with a metallic surface, or metallic accessories.
  If you wear eyeglasses with a metallic frame, take care not to let the frame touch an uninsured surface.
- Make sure that your hands and arms are dry.
- Unless otherwise specifically instructed, use only one hand when it is necessary to work near an exposed live electric circuit.
  This prevents the completion of the circuit through both hands even if you accidentally touch the circuit.
- Do not use a dental mirror near an exposed live electric circuit.
  The mirror surface is conductive and can become hazardous even if it is made of plastic.
- Unless otherwise specifically instructed, do not supply power to any subassembly such as a power supply unit or a motor while it is removed from the machine.

Preventing being caught by rotating or moving parts

- Tuck in your tie, scarf, shirt, or any other loose clothing so that it will not be caught by a rotating or moving part.
- Tie up long hair.
- Unless otherwise specifically instructed, do not supply power to any device with rotating or moving parts which are not properly covered.
- When instructed to supply power to any device with rotating or moving parts whose covers have been removed, work with another person who can immediately turn off the power in an emergency.

Procedure in an emergency

For electric shock

- Do not panic. Do not become another victim through contact with the injured person.
- First, shut off the electric current passing through the victim.
  Use the emergency power-off switch, if there is one, or otherwise, a normal power-off switch. If this cannot be done, push the victim away from the source of the electric current by using a nonconductor object such as a dry wooden stick.
- Then, call an ambulance.
- If the victim is unconscious, artificial respiration may be necessary.
  A proper method for performing artificial respiration or resuscitation should be learned beforehand.
- If the victim's heart is not beating, cardiac resuscitation should be performed by a trained and qualified person.

Copyright © 2005, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

For outbreak of fire

- First shut off all the power from the machine using the emergency power-off switch.
- If the fire continues burning after the power is shut off, take suitable actions including the use of a fire extinguisher or a call for the fire department.

⚠ SAFETY SUMMARY (Continued)

3. ⚠ Hazard Warning Statements

The following are the hazard warning statements contained in this manual.

3.1 ⚠ DANGER statements

- Do not disassemble the case, do not modify it, or do not peel off the label. There are high voltage parts inside: If you attempt any of these actions, you may get an electrical shock or burn.

(REP 05-0000)

- Do not disassemble the battery; this may cause short circuits inside or outside of the battery. If the components are exposed to the air, the battery may cause overheat, burst or ignite. Disassembling the battery may expose you to its alkaline solution, which can be dangerous.

(REP 05-0000)

- Do not cut the output cable. Do not modify the connector. If you attempt any of these actions, you may get an electrical shock or burn. A short-circuit may cause abnormal chemical reactions inside the battery which leads to overheating, bursting or ignition.

(REP 05-0000)

- Follow the instructions when you recharge the battery pack. If you recharge it in a way different from specified here, it may cause the following problems: The battery may become charged excessively; excessive current may be produced; or the battery cannot be recharged. As a result, the battery may leak, become overheated, burst, or ignite.

(REP 05-0000)

- Do not use excessive force when you connect the battery pack to the charger or other devices. If you cannot connect it easily, check the positive and negative are correct for the connector. If you connect the battery in reverse, it will be charged incorrectly and abnormal chemical reactions may occur inside. As a result, the battery may become overheated, burst or ignite.

(REP 05-0000)

- Do not connect the battery to a power receptacle. If you apply an excessive amount of voltage to the battery, it may produce excessive current making the battery overheat, burst or ignite.

(REP 05-0000)

Copyright © 2005, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- Do not use or leave the battery where the temperature can become high, such as, near a fire or a heating element. High temperatures may damage the battery's separator, which may cause short circuit, making it overheat, burst or ignite.

(REP 05-0000)

- Do not incinerate the battery pack or heat it. If you do so, the insulator may melt, the safety fuse/
mechanism may be damaged, or the electrolyte may gush out. As a result, the battery may become burst, explode or ignite.

(REP 05-0010)

- Do not connect the negative terminal to the positive with metal wire. Do not carry or store the battery with other metal parts. This may cause a short circuit or produce excessive current which can cause the battery to leak, overheat, burst or ignite.

(REP 05-0010)

- Do not let the battery become wet by soaking it in the water or seawater. If the battery gets wet, a short circuit may occur and an excessive amount of current may be produced causing abnormal chemical reactions inside. As a result, the battery may become overheated, burst or ignite.

(REP 05-0010)

- Do not nail the battery, hit it with a hammer, or stamp on it. The battery may be broken or dented and a short circuit may occur inside. As a result, the battery may become overheated, burst or ignite.

(REP 05-0010)

- Do not solder directly to the battery. If you do so, heat will melt the insulator and damage the safety fuse/mechanism. As a result, the battery may leak or may become overheated, burst or ignite.

(REP 05-0010)

- Do not recharge the battery where there is a high temperature, such as near a fire. This may cause abnormal chemical reactions inside the battery and it may become overheated, burst or ignite. High temperatures may also cause deterioration of performance/life of the battery.

(REP 05-0010)

Copyright © 2005, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

3.2 ⚠ WARNING statements

- If the Subsystem falls when the elevator of the lifter is at a high position, a personal injury will be caused.
  Perform the positioning, fastening, or other handlings very carefully.

  (INST 03-0430)

- Do not place the battery pack in the microwave oven or under high pressure. Either of these actions will rapidly heat the battery or break its seals: As a result, the battery may become overheated, burst or ignite.

  (REP 05-0020)

- If you find anything strange or unusual with the battery when you use/carry/store it, remove the battery from the device and stop using it. For example, strange smells, strange colors, or deformation are a sign you must stop using the battery.

  (REP 05-0020)

- If it takes longer than the specified time to complete recharging, stop recharging the battery: Otherwise, the battery may become overheated, burst or ignite.

  (REP 05-0020)

- If the battery leaks and gets into your eyes, immediately flush your eyes with clean water (tap water) and do not rub your eye. Then visit the doctor immediately. If you do not seek any treatment for your eyes, problems may occur later. Because the battery uses highly concentrated alkaline as electrolyte, it may burn or you may lose your sight if it contacts your skin or eyes. If the battery's liquid contacts your skin or eyes, you must flush them with plenty of clean water and visit the doctor at once.

  (REP 05-0020)

3.3 ⚠ CAUTION statements

- Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

  (INST 01-0100, INST 01-0130)
  (REP 02-1041, REP 02-1043, REP 02-1240, REP 03-0060)

- Attach or remove the Rear Cover carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

  (INST 01-0120)

- Do not lean against the rear cover. The cover comes off, and it causes the injury.

  (INST 01-0120)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- Open or close the door carefully following the procedure. Otherwise, you may hurt you fingers by pinching them.

(INST 01-0150)

- The unpacking should be done by two or more personnel to prevent turning over of the subsystem or being caught under the subsystem.

(INST 02-0020, INST 03-0310)

- Perform the work with enough care because the Floor (RKM+H1H/RKS+ H1J/RKXS+H1J) Model, Floor (RKM+RKAJ+H2J/RKM+RKAJAT+H2J/RKS+RKAJ+H2J/RKS+RKAJAT+H2J/ RKXS+RKAJAT+H2J) Model, and Floor Model are heavy; their masses are about 70 kg and 115 kg respectively.

(INST 02-0020)

- When moving the subsystem, remove the skirts and raise the leveling bolts. Otherwise, an accident such as a falling may be caused because of contact with the floor or catching of a part.

(INST 02-0020)

- When moving the subsystem across a difference in floor level, etc., use a gangway, which forms a slope with an inclination angle of less than eight degrees.

(INST 02-0020)

- Masses of RKM is approximately 58 kg, and RKS/RKXS is approximately 56 kg.
  When raising each of them, take measures to prevent it from slipping because the slipping may cause a personnel injury owing to a pinching.

(INST 02-0060)

- When raising the subsystem, it is dangerous to do it by using the handles. Be sure to raise the subsystem by holding its front and rear portions made of sheet metal.

(INST 02-0060, INST 02-0100)

- Masses of RKM is approximately 58 kg, RKS/RKXS is approximately 56 kg, and RKAJ/RKAJAT 40 kg is approximately.
  When raising each of them, take measures to prevent it from slipping because the slipping may cause a personnel injury owing to a pinching.

(INST 02-0100)

- Do not block the vent holes. Or else, temperature rise inside the subsystem may cause a failure or even a fire.

(INST 02-0140)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- Work carefully because the mass of the single RKM is about 58 kg, RKS/RKXS is about 56 kg, RKH is about 47 kg, RKAJ/RKAJAT is about 40 kg.

  (INST 03-0310, INST 03-0420, INST 03-0430)

- Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

  (INST 02-0340, INST 03-0710, INST 03-0730, INST 03-0770)
  (ADD 01-0480, ADD 03-0040, ADD 03-0090)

- Do not put your hands at both ends of the skirt when installing the front skirt. The fingers and the like are pinched between the side skirts, and it causes the injury.

  (INST 02-0350)

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.

  (INST 03-0420, INST 03-0430)

- Be sure to perform the operation with two or more workers.

  (INST 03-0420, INST 03-0430)
  (REP 02-0950, REP 02-0990)

- Operate the valve slowly when opening it. If it is opened quickly, the elevator of the lifter descends rapidly and may cause personal injury.

  (INST 03-0430)

- Be sure to install it in order from the bottom to prevent the falling of the rack when you install the subsystem on the rack.

  (INST 03-0430)

- Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the subsystem enters the rack frame across the end of it. Otherwise, falling of the subsystem may be caused.

  (INST 03-0440)

- The cable of PDB is a fixed type. Do not loosen the installation part. If it is loosened, the connected part is damaged, and it causes an electric shock or fire.

  (INST 03-0730)

- Do not disassemble or remodel parts for maintenance. Otherwise, a failure or a serious accident may be caused. Be sure to replace parts in units of formally defined maintenance part.

  (REP 01-0000)

- When replacing the power supply, do it in haste after preparing a replacement power supply and arranging cables, etc. so that they do not disturb the replacement.

  (REP 01-0000)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- A closed type nickel-hydrogen battery can cause an electric shock or explosion if it is handled wrongly. Observe the following requirements for handling.
  - Do not disassemble or remake the battery.
  - Do not deform the battery.
  - Do not connect plus and minus poles with a metallic article such as a wire.
  - Do not reverse the connections of plus and minus poles.
  - Do not peel off the covering tube.
  - Do not connect the battery directly to the outlet.
  - Do not connect the battery to anything other than this subsystem for charging/discharging.
  - Do not leave the battery in a hot place. Store it in a dark and cool place.
  - Do not discard a used battery at the site where it was removed for replacement.

  (REP 02-0240)

- Since each fan is rotating with high-speed, be careful not to be caught by it.

  (REP 02-0300, REP 03-0020, REP 03-0040)

- Be sure to keep the front bezel and rear panel clean. Or else, the ventilation is deteriorated so that the temperature inside the subsystem may rise causing a failure or even a fire.

  (REP 03-0030, REP 03-0060)

- Be careful not to move the subsystem during cleaning.

  (REP 03-0030, REP 03-0060)

- If a battery is handled wrongly, it is feared that an explosion is caused.

  (REP 03-0070)

- Do not disassemble the battery, or a burn or electric shock may be caused.

  (REP 03-0070)

Copyright © 2005, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

3.4 ⚠ CAUTION statements

- Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

  (ADD 01-0140, ADD 01-0380, ADD 01-0390, ADD 01-0400, ADD 01-0410, ADD 01-0420, ADD 01-0422, ADD 01-0430, ADD 01-0432, ADD 02-0160, ADD 02-0280, ADD 02-0340, ADD 02-0390, ADD 02-0400, ADD 02-0440, ADD 02-0460, ADD 02-0480, ADD 02-0500)
  (REP 02-0390, REP 02-0420, REP 02-0470, REP 02-0510, REP 02-0520, REP 02-0540, REP 02-0570, REP 02-0610, REP 02-0640, REP 02-0660, REP 02-0690, REP 02-0720, REP 02-0750, REP 02-1060, REP 02-1090, REP 02-1120, REP 02-1210)

- Use care with the top cover of NAS chassis (around the warning label), otherwise you can get burned.

  (REP 02-1050, REP 02-1060, REP 02-1090, REP 02-1120, REP 02-1210)

3.5 ⚠ CAUTION statements

- When doing a hot replacement of a part, do not wear metallic accessories or a watch so as to avoid an electric shock. Be careful not to touch any of live parts with a screwdriver, etc.

  (REP 01-0000)

- If you touch a live part, it is feared that you receive an electric shock.

  (REP 03-0030, REP 03-0060)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

3.6 CAUTION statements

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.

  (INST 01-0000, INST 01-0100, INST 01-0130, INST 02-0200, INST 02-0250, INST 02-0270, INST 03-0330, INST 03-0490)
  (ADD 01-0140, ADD 01-0210, ADD 01-0380, ADD 01-0400, ADD 01-0420, ADD 01-0430, ADD 02-0160, ADD 02-0210, ADD 02-0280, ADD 02-0390, ADD 02-0440, ADD 02-0480, ADD 03-0000)
  (REP 01-0010, REP 02-0070, REP 02-0390, REP 02-0540, REP 02-0660, REP 02-0770, REP 02-0830, REP 02-0910, REP 02-0950, REP 02-0990, REP 02-1041, REP 02-1043, REP 02-1060, REP 02-1090, REP 02-1120, REP 02-1140, REP 02-1210, REP 02-1240)

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.

  (INST 01-0000, INST 02-0200, INST 02-0250, INST 02-0270, INST 03-0330, INST 03-0490)
  (ADD 01-0140, ADD 01-0210, ADD 01-0380, ADD 01-0400, ADD 01-0420, ADD 01-0430, ADD 02-0160, ADD 02-0210,ADD 02-0280, ADD 02-0390, ADD 02-0440, ADD 02-0480, ADD 03-0000)
  (REP 01-0010, REP 02-0070, REP 02-0390, REP 02-0540, REP 02-0660, REP 02-0770, REP 02-0830, REP 02-1060, REP 02-1090, REP 02-1120, REP 02-1140, REP 02-1210)

- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

  (INST 01-0000, INST 03-0330, INST 03-0490)
  (ADD 03-0000)
  (REP 01-0010)

- Since front bezels of the RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.

  (INST 01-0100)
  (REP 02-1041)

- When installing or removing the Front Bezel, try not to operate the main switch incorrectly with the hook or the ON/OFF button of the Front Bezel.

  (INST 01-0100, INST 01-0130)
  (REP 02-1041, REP 02-1043)

- Since front bezels of the RKH/RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.

  (INST 01-0130)
  (REP 02-1043)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

(INST 02-0200)
(ADD 01-0140, ADD 01-0380, ADD 01-0400, ADD 01-0420, ADD 01-0430, ADD 02-0160, ADD 02-0280, ADD 02-0390, ADD 02-0440, ADD 02-0480)
(REP 02-0390, REP 02-0540, REP 02-0660)

- When you install an ENC Unit, support its metal part with your hand that has the wrist strap. By so doing, you can discharge the static electricity from your body may change the parts.

(INST 02-0250)

- When you install are RKNAS, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

(REP 02-1060, REP 02-1090, REP 02-1120, REP 02-1210)

- Disk Drives are precision components. Be careful not to expose drives to hard shock.

(INST 02-0270)
(ADD 01-0210, ADD 02-0210)
(REP 02-0070)

- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

(INST 02-0270)
(ADD 01-0210)
(REP 02-0070)

- Take full care to connect cables correctly.

(INST 02-0300, INST 03-0610, INST 03-0740)

- Press the rail against the rack frame as much as possible to secure the rail to the rack frame. If there is a gap between the rail and the rack frame, the rail may interfere with the equipment.

(INST 03-0200, INST 03-0250, INST 03-0300)

- When you remove a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

(ADD 02-0210)

- For the system Disk Drives (The Disk Drives #0 to #4 of the RKM/RKS/RKXS or the Disk Drives #0 to #4 of the RKAJ corresponding to the unit ID#0 connected to the RKH) regardless of the data Disk Drives, the Spare Drives and the Disk Drives which do not configure the RAID group, do not remove the Disk Drives #0 and #1 at the same time with the subsystem power turned on. There is a possibility of downing the subsystem if removing them.

(REP 02-0070)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- When only two Disk Drives (the Disk Drives #0 and #1) are installed in the RKM/RKS or the RKAJ corresponding to the unit ID#0 connected to the RKH, do not remove these two at the same time.
  There is a possibility of downing the subsystem if removing them.

  (REP 02-0070)

- For RKXS in which only three Disk Drives (Disk Drive #0 to #2) are installed, do not remove these three at the same time. Be careful that the subsystem may go down if they are removed.

  (REP 02-0070)

- The replacement of the component is restricted in time. This operation requires referring to the manual. If the subsystem is left with this component removed for more than 10 minutes, it will stop by detecting the thermal alarm.

  (REP 02-0300, REP 02-0340)

- When the CALM LED on the Control Unit is on while the ALM LED of the Fan Assembly is on, be sure to solve the trouble of the Control Unit first.

  (REP 02-0300)

- When a trouble of the Power Unit is detected due to a trouble of the Fan Assembly, the Power Unit does not need to be replaced. When a trouble of the Power Unit is detected during replacement of the Fan Assembly, pull out and then insert the Power Unit.

  (REP 02-0340)

- When replacing the Fan Assembly, do it in haste after preparing a replacement Fan Assembly and arranging cables, etc. so that they do not disturb the replacement.

  (REP 02-0300)

- When replacing the Power Unit, do it in haste after preparing a replacement Power Unit and arranging cables, etc. so that they do not disturb the replacement.

  (REP 02-0340)

- When you install an ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. By so doing, you can discharge the static electricity from your body may change the parts.

  (REP 02-0830)

- When you install a Disk Drive or Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

  (REP 02-0950)

- When you install a Disk Drive or ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

  (REP 02-0990)

Copyright © 2005, 2006, Hitachi, Ltd.

⚠ SAFETY SUMMARY (Continued)

- When a device is kept with power-off for more than three months, the battery may be excessively discharged, and it may cause an unrecoverable damage for RKM/RKS. In such a storing condition, either charge the battery at least once every three months for more than six (6) hours, or switch off the battery. Even though the battery is switched off, to prevent damages from natural discharge, the battery must be charged once every six months for more than six (6) hours.
  When the battery without the switch is installed, charge it once every six months for more than six (6) hours.

  (REP 03-0070)

- When a device is kept with power-off for more than six months, the battery may be excessively discharged, and it may cause an unrecoverable damage for RKXS/RKH. In such a storing condition, the battery must be charged once every six months for more than six (6) hours.

⚠ 注　意

この装置は、ニ系列の電源構成になっています。
感電防止の為、該当する電源を交換する時は事前に該当する電源ケーブルを分離してください。

⚠ CAUTION

This subsystem has dual power supply system. When replacing the power supply, disconnect the power cable connected beforehand so as to avoid an electric shock.

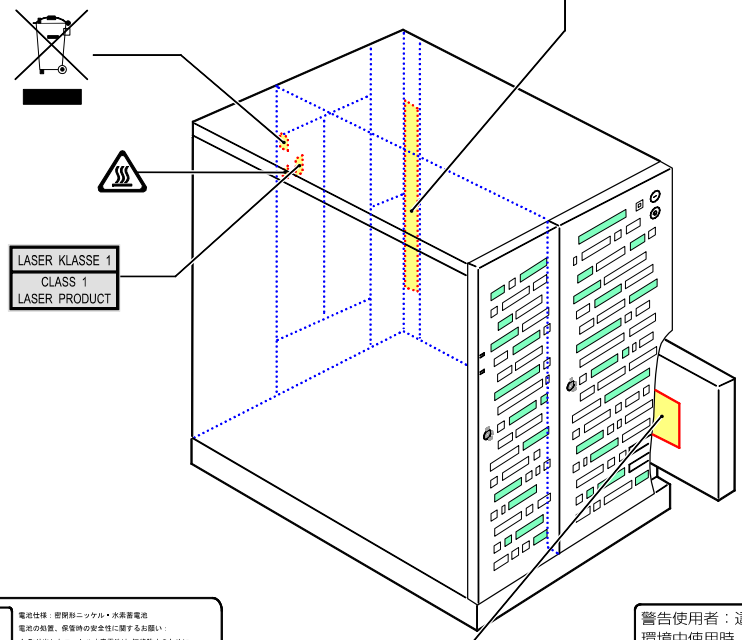
⚠ AVERTISSEMENT

Ce sous-system a double systeme d' alimentation en courant.
Quand on remplace l' alimentation en courant, debrancher le cable d' alimentation en courant connecte a l' avance af in d' eviter un choc electrique.

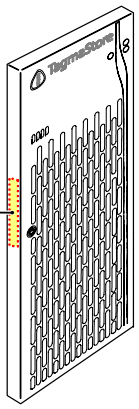
注　意

マニュアルに基づいて交換して下さい。
このディスクアレイ装置内のＨＤＵ、ＰＣＢ、バッテリー等の部品交換時に、適切な手順を行わない場合、構成情報が失われ、ユーザデータを破壊します。

CAUTION



See the manual for replacement. Replacement of the components (HDU, PCB, Battery etc.) in this unit without procedures in the manuals may destroy configuration information and user data.



注　意

部品交換に時間制限有、マニュアル参照要。
各部品を抜去した状態で放置するとサーマルアラームを検知し、装置が停止します。

CAUTION

Time restriction for replacement of the component. Be sure to see the manual.
If the subsystem is left with each component removed, it will stop by defecting the thermal alarm.

⚠ SAFETY SUMMARY (Continued)

4.8 Rackmount model (RKAJ)

⚠ 注　意

この装置は、ニ系列の電源構成になっています。
感電防止の為、該当する電源を交換する時は事前に該当する電源ケーブルを分離してください。

⚠ CAUTION

This subsystem has dual power supply system. When replacing the power supply, disconnect the power cable connected beforehand so as to avoid an electric shock.

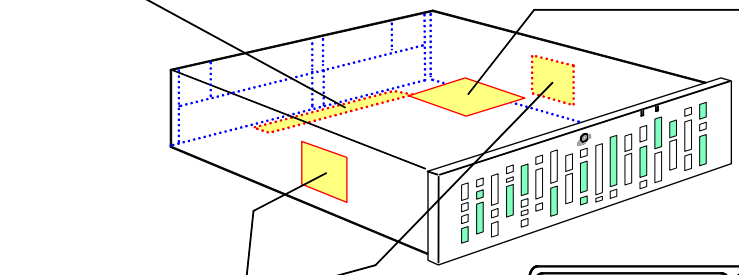
⚠ AVERTISSEMENT

Ce sous-system a double systeme d' alimentation en courant.
Quand on remplace l' alimentation en courant, debrancher le cable d' alimentation en courant connecte a l' avance af in d' eviter un choc electrique.

注　意

マニュアルに基づいて交換して下さい。
このディスクアレイ装置内のＨＤＵ、ＰＣＢ、バッテリー等の部品交換時に、適切な手順を行わない場合、構成情報が失われ、ユーザデータを破壊します。

CAUTION



See the manual for replacement.
Replacement of the components (HDU, PCB, Battery etc.) in this unit without procedures in the manuals may destroy configuration information and user data.

注　意

部品交換に時間制限有、マニュアル参照要。
各部品を抜去した状態で放置するとサーマルアラームを検知し、装置が停止します。

CAUTION

Time restriction for replacement of the component. Be sure to see the manual.
If the subsystem is left with each component removed, it will stop by defecting the thermal alarm.

⚠ CAUTION

Careful of the drop.
It is heavy.

Do not release hand off after red line clears rack.
The subsystem mass approximately 40kg.

⚠ 注　意

落下注意
重量物注意

上の線を超えて本装置を引き出した場合、落下の危険がありますので、手を離さないで下さい。
装置質量は約40kgです。

CAUTION

When you carry the subsystem, do not hold its front and rear sides because it may be deformed.
Hold its left and right sides.

注　意

運搬時は、装置前面および後面を持たないでください。
変形する恐れがありますので、側面を持ってください。

⚠ CAUTION

Careful of the drop.
It is heavy.

Do not release hand off after red line clears rack.
The subsystem mass approximately 40kg.

Chapter 2. Outline of Subsystem

This chapter explained about the outline of the subsystem which composes a disk array system. In this chapter, it mechanical and power supplying system structures of each model are explained separately.

2.1 What is RAID

To put RAID to practical use, some techniques such as striping, mirroring, and parity disk are used.

- Striping
  It means to store data spreading it on several Disk Drives. Since a datum is written on several Disk Drives, time required to access each Disk Drive is shortened and thus, time required for reading or writing is shortened.
- Mirroring
  It means to copy all the contents of one Disk Drive to one or more Disk Drives at the same time in order to enhance reliability.
- Parity disk
  It is a data writing method used when configure RAID with three or more Disk Drives.
  Parity of data in the corresponding positions of two or more Disk Drives is generated and stored on another Disk Drive.

Copyright © 2005, Hitachi, Ltd.

2.1.1 Application of RAID technology

When one I/O processing spans multiple Disk Drives (when the stripe size is too small) during transaction processing in RAID 5, the performance cannot be exhibited sufficiently.

Therefore, the stripe size of 64 k bytes is set as a default value in this subsystem. When the Cache Partition Manager function of the priced option is used in the microprogram revision 0733/A-x or more, the stripe size can be changed to 256 k bytes or 512 k bytes for each LU. Lump writing of data on the Disk Drive and pre-reading of old data are performed by use of the cache memory so as prevent occurrence of write penalty as far as possible.

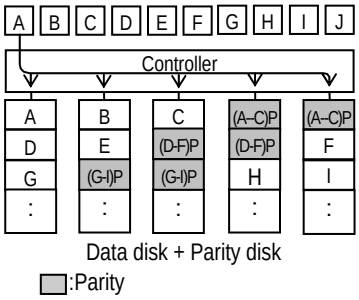
- Write penalty
  In the RAID 5 configuration, 3 to 16 Disk Drives compose one parity group (2D+1P to 15D+1P); in the RAID 6 configuration, 4 to 30 Disk Drives compose one parity group (2D+2P to 28D+2P). Since parity data is generated from 2 to 15 data disks in the group, when partial writing of one stripe in the group occurs in the transaction processing, it is necessary to generate the corresponding parity data in the group once again. For RAID 5, since parity data is calculated by the following calculation formula, "data before update", "parity before update" and "data after update" are necessary to create the parity.

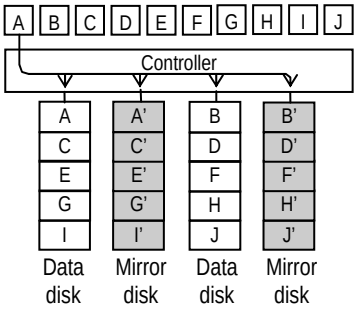
  RAID 5:
  [New parity] = ([Data before update] EOR [Data after update]) EOR [Parity before update]

  RAID 6:
  [New P parity] = ([Data before update] EOR [Data after update]) EOR [P parity before update]
  [New Q parity] = [Coefficient parity] AND ([Data before update] EOR [Data after update]) EOR [Q parity before update]

Copyright © 2005, 2006, Hitachi, Ltd.

2.1.2 RAID levels





It is necessary to understand the characteristics of each RAID level to make the environment most suitable for the system you want to construct.
The SANRISE AMS/WMS series support RAID 1, RAID 5 (2D+1P to 15D+1P), RAID 6 (2D+2P to 28D+2P) and RAID 1+0 (2D+2D to 8D+8D), and also support RAID 0 (2D to 16D) if the RKM/RKS/RKAJ/RKA is connected.

Table 2.1.1 Outline of RAID Levels

Level	Configuration	Characteristics	
RAID 0		Outline	RAID 0 stripes data across Disk Drives (five Disk Drives in the DF700) to attain higher throughput.
		Advantages	Because Disk Drives having redundant data is not needed, Disk Drives can be used efficiently.
		Disadvantage	Data is lost in any failure of the Disk Drive.
RAID 1		Outline	RAID 1 provides data redundancy by copying all the contents of two Disk Drive to another (mirroring). Read/write performance is a little better than the individual Disk Drive.
		Advantages	Data is not lost even if a failure occurs in any Disk Drive. Performance is not lowered even when a Disk Drive fails.
		Disadvantage	RAID 1 is expensive because it requires twice the Disk capacity.
RAID 5		Outline	RAID 5 consists of three or more Disk Drives. It uses one of them as a parity disk and writes divided data on the other Disk Drives. Recovery from a failure of a data is possible by utilizing the parity data. Since the parity data is stored on all the Disk Drives, a bottleneck of the parity disk does not occur.
		Advantages	When reading data, RAID 5 stripes data across Disk Drives in the same way as that in RAID 0 to attain higher throughput.
		Disadvantage	When writing data, since parity data is required to be updated, performance of writing small random data is lowered although there is no problem regarding writing of continuous data. The performance is also lowered when a Disk Drive fails.

*1 : Only the RAID levels supported by DF700 are explained.

Copyright © 2005, 2006, Hitachi, Ltd.

Level	Configuration	Characteristics	
RAID 6	Data block  Data disk + Parity disk :Parity	Outline	RAID 6 consists of four or more disk drives. Two independent disk drives of them are used as parity disk drives and data is scattered and written to the rest of them. The parity data enables data to be restored even when the two disk drives fail at the same time.
		Advantages	RAID 6 has ability to withstand failures that is superior to RAID 5 because one data block has two parities.
		Disadvantage	The performance is lowered because the number of disk drives is increased by one in comparison with that of RAID 5. The performance is lowered when one or two disk drives is/are failed.
RAID 1+0	Data block  	Outline	RAID 1+0 provides data redundancy like RAID 1 by copying all the contents of two Disk Drive to another. Different from RAID 1, data striping is performed over two to eight (RKS is seven) sets of two Disk Drives.
		Advantages	Data is not lost even if any Disk Drive fails. Besides, since RAID 1+0 stripes data, it can make the performance of dealing with small size random accesses higher comparing with RAID 1. Performance is not lowered even when a Disk Drive fails.
		Disadvantage	RAID 1+0 is expensive because it requires twice the disk capacity.

2.2 Outline of the Subsystem

2.2.1 Outline of functions

(1) Fibre/iSCSI model

DF700 subsystem has two models: floor model and rackmount model.

There are eight types of the floor model : one is a combination of the RKM and the floor standing kit (hereafter referred to as Floor (RKM+H1J) Model) and one is a combination of the RKM, the RKAJ, and the floor standing kit (hereafter, referred to as Floor (RKM+RKAJ+H2J) Model) and one is a combination of the RKM, the RKAJAT, and the floor standing kit (hereafter, referred to as Floor (RKM+RKAJAT+H2J) Model) and one is a combination of the RKS and the floor standing kit (hereafter referred to as Floor (RKS+H1J) Model) and one is a combination of the RKS, the RKAJ, and the floor standing kit (hereafter, referred to as Floor (RKS+RKAJ+H2J) Model) and one is a combination of the RKS, the RKAJAT, and the floor standing kit (hereafter, referred to as Floor (RKS+RKAJAT+H2J) Model) and one is a combination of the RKXS and the floor standing kit (hereafter, referred to as Floor (RKXS+H1J) Model) and one is a combination of the RKXS, the RKAJAT, and the floor standing kit (hereafter, referred to as Floor (RKXS+RKAJAT+H2J) Model).

The rackmount model is a subsystem which is used in the form of a combination of the DF700-RKH/DF700-RKM/ DF700-RKS/ DF700-RKXS (hereafter, referred to as RKH/RKM/RKS/RKXS.), the DF700-RKAJ/DF700-RKAJAT (hereafter, referred to as RKAJ/RKAJAT) and the DF600-RKA (hereafter, referred to as RKA).(‡1)(‡2)

For an external power supplying, RKH, RKM, RKS, RKXS, RKA, RKAJ, and RKAJAT are supplied from AC power supply.

Features of the subsystem are explained below.

- The RKH is CTU (Control Unit subsystem) that does not install the Disk Drive. The RKH(‡4) is a subsystem which connects the RKAJ/RKAJAT/RKA, configures a subsystem, and performs the RAID control of the Disk Drive to be installed in them by the Control Unit. The subsystem can connect up to 30 RKAJs(‡4)/RKAs (Disk Drives (for FC): A maximum of 450), up to 28 RKAJATs (Disk Drives <For Serial-ATA: A maximum of 420>, and in this case, RKAJ(‡4)/RKAs is one to two).
- Each of the RKM, Floor (RKM+H1J) Model, RKS, and Floor (RKS+H1J) Model, RKXS, and Floor (RKXS+H1J) Model is a subsystem that has up to 15 Disk Drives installed and controls the Disk Drives as components of RAID with controllers.
- Each of the Floor (RKM+RKAJ+H2J) Model, Floor (RKM+RKAJAT+H2J) Model, Floor (RKS+RKAJ+H2J) Model, Floor (RKS+RKAJAT+H2J) Model, and Floor (RKXS+RKAJAT+H2J) Model is a subsystem that has up to 30 Disk Drives installed and controls the Disk Drives as components of RAID with controllers.
- The RKAJ/RKAJAT/RKA(‡3) mounts up to fifteen Disk Drives and can be used being connected with the RKH(‡4), RKM, RKS, RKXS.(‡2)
- The Fibre Channel (Non-OFC) and iSCSI (1000 Base-T) are adopted in the interface with the host computer. Also, the RKH can be used by combining two types of the host interfaces from the Fibre Channel, iSCSI and NAS (the NAS interface can be used from the microprogram revision 0732/A or more).
- The RKM, RKS, RKXS, RKAJ, RKAJAT and RKA(‡3) are models to be mounted on a 19-type rack frame, however, them can also be used as floor model when combined with the optional kit.

‡1 : The two or more RKHs/RKMs/RKSs cannot be connected to the one system.

‡2 : RKAJ/RKA cannot be connected to RKXS.

‡3 : The RKA/RKM/RKS can be connected with the microprogram from the revision 0720/A or more, and the RKH can be connected from the revision 0731/A or more (The RKHE can be applied from the microprogram revision 0760/A).

Copyright © 2005, 2006, Hitachi, Ltd.

‡4 : The Chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only.

Copyright © 2005, 2006, Hitachi, Ltd.

- A system (‡1) which can connect up to 30 RKAJs/RKAJATs/RKAs (‡3) to one RKH(‡4) using the special cables, and makes 450 Disk Drives one set by the Control Unit of the RKH can be configured. Also, when the SATA Disk Drives are connected, the system (‡1) which makes 30 FC Disk Drives and 420 SATA Disk Drives one set can be configured.
- Up to the 14 RKAJs/RKAJATs/RKAs(‡3) can be connected to the one RKM by the exclusive cables and a system(‡1) with a set of the 225 Disk Drives controlled by the controller of the RKM can be constructed. When the SATA Disk Drives are connected, a system(‡1) with a set of the 15 FC Disk Drives and the 210 SATA Disk Drives can be constructed.
- Up to the 6 RKAJs/RKAJATs/RKAs(‡3) can be connected to the one RKS by the exclusive cables and a system(‡1) with a set of the 105 Disk Drives controlled by the controller of the RKS can be constructed. When the SATA Disk Drives are connected, a system(‡1) with a set of the 15 FC Disk Drives and the 90 SATA Disk Drives can be constructed.
- Up to six RKAJATs can be connected to an RKXS using the special cables, and a system with a set of 105 Disk Drives can be constructed by the Control Unit of RKXS.
- A special rack frame (DF-F700-U7) is provided, which can mount a various combination of the RKH/RKM/RKS/RKXS (4 U units high) and RKAJ/RKAJAT/RKA(‡3)(s) (3 U units high) up to a height of 38 U units.(‡2)
- The Fibre Channel interface is adopted, and it can be transferred between the hosts with the maximum of 400 M bytes/s (in case of the RKS/RKXS, the FC Interface Board is added). The iSCSI interface connection can be transferred between the hosts at the maximum of 100 M bytes/s.
- The Fibre Channel interface provides 2 ports per Control Unit (RKH/RKM).
- Although the Fibre Channel interface of the RKS/RKXS installs only one port per Control Unit, it is extending one port to two connectors by configuring the Mini-Hub in the Control Unit. When the FC Interface Board is added, it installs two ports per Control Unit.
- The Fibre Channel interface of the RKH is the four ports per Control Unit installation (at the time of the FC Interface Board addition).
- If the microprogram revision 0750/A or more is applied by the iSCSI interface connection, it is possible to communicate with twice the number of the hosts at the maximum compared to the previous revision (the maximum of 128 hosts for the revision less than 0750/A and the maximum of 255 hosts for the revision 0750/A or more).
  The registration of the CHAP User and the definition of the iSCSI target are also extended to be able to define approximately twice the number compared to the previous revision.
- The RKHE which improved the performance of the RKH is applied from the microprogram revision 0760/A.

‡1 : The two or more RKHs/RKMs/RKSs cannot be connected to the one system.

‡2 : RKAJ/RKA cannot be connected to RKXS.

‡3 : The RKA/RKM/RKS can be connected with the microprogram from the revision 0720/A or more, and the RKH can be connected from the revision 0731/A or more (The RKHE can be applied from the microprogram revision 0760/A).

‡4 : The Chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Scalability

- Various systems that meet the wide range of needs can be constructed from the single RKM with up to 15 Disk Drives to a system in which the number of Disk Drives can be increased up to 225 (15 FC Disk Drives and 210 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 14 RKAJs/RKAJATs/RKAs(‡2) are connected to the RKM.(‡1)
- Various systems that meet the wide range of needs can be constructed from the single RKS with up to 15 Disk Drives to a system in which the number of Disk Drives can be increased up to 105 (15 FC Disk Drives and 90 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 6 RKAJs/RKAJATs/RKAs(‡2) are connected to the RKS.(‡1)
- Various systems that meet the wide range of needs can be constructed from the single RKXS with up to 15 Disk Drives to a system in which the number of Disk Drives can be increased up to 105 when up to 6 RKAJATs are connected to the RKXS.(‡1)
- Various systems that meet the wide range of needs can be constructed in which the number of Disk Drives can be increased up to 450 (30 FC Disk Drives and 420 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 30 RKAJs/RKAJATs/RKAs(‡2) are connected to the RKH(‡3).(‡1)
- By using the rack frame (U7) exclusive to DF700, you can construct a system conforming to your demand.
- The Spare Disk Drives, which can be set up to 15 in one system and up to 30 in case of the RKH, do not choose the positions to be installed.
  You can use the system effectively by mounting each Spare Disk in a Disk Drive slot left unused as a result of a system construction.
- From the host computer, the subsystem can be used not only as a single large scale Disk Drive but also as 4,096 logical disks (LUs) at the maximum (RKM: 2,048 logical disks (LUs) at the maximum/RKS/RKXS: 512 logical disks (LUs) at the maximum).
- The flexible system, which the Fibre Channel connectors of SW become connectable for the number of the connectors, can be constructed for the Fibre Channel device subsystem including the host computer and the DF700 by connecting to the Fabric switch (hereafter, it is called SW).

(b) Multi-RAID configuration

- Four RAID levels, that is, RAID 0, RAID 1, RAID 5, RAID 6, and RAID 1+0 can be set up. (When the RKAJAT connected: RAID 1, RAID 5, and RAID 1+0 can be set up)
- Because RAID 1, RAID 5, and RAID 1+0 are provided with redundancy by virtue of mirror disk(s) and parity disk(s), they do not lose data even when a failure occurs in one of Disk Drives, and moreover, data can be read/written from/onto them as if there existed no failure.
- Since RAID 6 has redundancy by virtue of its two parity disks, it not only prevents data to be lost even when up to two Disk Drives fail at the same time but also allows data to be read/written as if no failure occurred.
- With RAID 1+0 of DF700, you can construct a flexible system conforming to your demands from a system configured with 4 data disks (2D+2D) to that with 16 data disks (8D+8D).

‡1 : The two or more RKHs/RKMs/RKSs/RKXSs cannot be connected to the one disk subsystem.

‡2 : The RKM can be connected with the microprogram from the revision 0720/A or more, and the RKH can be connected from the revision 0731/A or more (The RKHE can be applied from the microprogram revision 0760/A).

Copyright © 2005, 2006, Hitachi, Ltd.

‡3 : The Chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only.

Copyright © 2005, 2006, Hitachi, Ltd.

- With RAID 5 of DF700, you can construct a flexible system conforming to your demands from a system configured with 3 data disks (2D+1P) to that with 16 data disks (15D+1P).
- With RAID 6 of DF700, you can construct a flexible system conforming to your demands from a system configured with 4 data disks (2D+2P) to that with 30 data disks (28D+2P).

(c) High-speed data transfer

- The subsystem can read and write data at a high-speed by activating Disk Drives in parallel.
- With the Fibre Channel connection, the subsystem can transfer data between the host computer and the subsystem at a maximum speed of 400 M bytes/s (RKS/RKXS is 200 M bytes/s). Enough throughput can be got when connecting devices and making a multiple access.
- With the iSCSI connection, the subsystem can transfer data between the host computer and the subsystem at a maximum speed of 100 M bytes/s. Enough throughput can be got when connecting devices and making a multiple access.
- By using a non-volatile large-capacity cache memory (RKH is 2,048 M bytes/CTL to 8,192 M bytes/CTL, RKM is 1,024 M bytes/CTL to 4,096 M bytes/CTL, RKS is 2,048 M bytes/CTL, RKXS is 512 M bytes/CTL or 1,024 M bytes/CTL), speed-up of command execution at the time of read/write hit was achieved.

(d) Large capacity

- A maximum of 450 subsystems can be connected. The subsystems provide a maximum of 129.4 T bytes disk capacity at RAID 0. Further, when the RKAJAT is connected, the maximum disk capacity of 154.2 T bytes is realized (in the case of RAID 5).

(e) High data availability

- With the redundant RAID configuration (RAID 1,RAID 5, or RAID 1+0), the subsystem can continuously read or write data without shutting down the subsystem by using the parity and/or mirror disks even when a Disk Drive failed.
- The redundant RAID 6 configuration can prevent a system from stopping and allows data to be read/written continuously by means of the parity disks when failures occur in up to two Disk Drives at the same time.

(f) High data reliability

- The Controller of the DF700 adds the original 8-byte data assurance codes to data from a host computer by automatically generating them, writes them in the Disk Drive together with the data, and checks them when reading the data, and thus the data reliability is improved.
- On the data bus in the controller, the automatic generation of the data assurance codes and the check are executed to enhance data reliability in data distribution/concentration control which is peculiar to the disk array.

(g) Diagnostic and maintenance functions

- Diagnosis and maintenance of the subsystem can be done on a screen of a PC connected to the subsystem via a LAN.
- Status of the subsystem can be checked and a faulty part can be identified by the Storage Navigator Modular.
- Diagnosis of the subsystem can be done from a distant place by using the remote maintenance function (SNMP).

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Maintenance

- Adding Disk Drive and maintenance can be performed without powering off the system.
- All the subject components for maintenance can be replaced without powering off the subsystem. (Excluding the Basic Chassis of Rack Mount Style and Additional Chassis of Rack Mount Style.)
- When the correction copy which originates in the blockade of the dynamic sparing or the data Disk Drive is completed, if the capacity and the rotational speed are the same of the data Disk Drive and the Spare Disk Drive of the recovery destination and both of them are not the Disk Drives of the RKA, the copy back does not operate even though the blocked Disk Drive is replaced because the attributes of the data Disk Drive and the Spare Disk Drive are switched.

  Therefore, the influence to the customer's business is suppressed because there is no deterioration of the host I/O performance by the copy back start after the Disk Drive replacement, and the maintenance time is satisfied with the level of the replacement time of the Disk Drive, and the maintenance cost can be reduced.

  In the following cases, the copy backless does not operate, and the copy back surely operates after the Disk Drive replacement.

  - When the capacity or the rotational speed of the failed Disk Drive and the Spare Disk Drive which recovered the data differs
  - When either one of the failed Disk Drive and the Spare Disk Drive which recovered the data is the Disk Drive of the RKA

Copyright © 2005, 2006, Hitachi, Ltd.

(2) NAS model

The NAS model is only a rackmount model.

The subsystem is used by further connecting the DF700-RKNAS2G/RKNAS4G (called RKNAS2G/RKNAS4G hereafter, and these two are generically called RKNAS) to the existing rackmount model combining the RKAJ/RKAJAT/RKA with the RKH/RKM/RKS/RKXS.

The RKH, RKM, RKS, RKXS, RKAJ, RKAJAT, RKA and RKNAS are the models whose power supply fed from the outside is the AC power supply.

- The interface with the host computer adopts the LAN (GbE) and can be accessed by the NFS/CIFS protocol. Also, the RKH can be used by combining two types of the host interfaces from the Fibre Channel, iSCSI and NAS (the NAS interface can be used from the microprogram revision 0732/A or more). (The RKHE can be applied from the microprogram revision 0760/A)
- The Fibre Channel interface cannot be used in the RKNAS2G/RKNAS4G.
- A system similar to the rackmount model of the Fibre model can be constructed by combining the Disk Drives in the similar method of the rackmount model of the Fibre model.
- One RKNAS has GbE (Copper) x 4 ports of the LAN in the host interface and used by configuring a pair of the NAS cluster with two RKNASs. It becomes a configuration such as a pair of the NAS clusters (two RKNASs) is connected to one RKH/RKM/RKS/RKXS.
- A pair of the NAS clusters (two RKNASs) is connected to each Control Unit of the RKH/RKM/RKS/RKXS by using the PCI Express cable and the CTRL cable.
- The RKNAS2G installs the Cache memory of 2 G bytes and can be connected only to the RKS and RKXS.
- The RKNAS4G installs the Cache memory of 4 G bytes and can be connected only to the RKH and RKM.

Features of the subsystem are explained below.

(a) Scalability

- Various systems that meet the wide range of needs can be constructed from the single RKM with up to 15 Disk Drives to a system in which the number of Disk Drives can be increased up to 225 (15 FC Disk Drives and 210 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 14 RKAJs/RKAJATs/RKAs(‡2) are connected to the RKM.(‡1)
- Various systems that meet the wide range of needs can be constructed from the single RKS with up to 6 Disk Drives to a system in which the number of Disk Drives can be increased up to 105 (15 FC Disk Drives and 90 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 6 RKAJs/RKAJATs are connected to the RKS.(‡1)
- Various systems that meet the wide range of needs can be constructed from the single RKXS with up to 15 Disk Drives to a system in which the number of Disk Drives can be increased up to 105 when up to 6 RKAJATs are connected to the RKXS.(‡1)
- Various systems that meet the wide range of needs can be constructed in which the number of Disk Drives can be increased up to 450 (30 FC Disk Drives and 420 SATA Disk Drives, in the case where the SATA Disk Drives are connected) when up to 30 RKAJs/RKAJATs/RKAs(‡2) are connected to the RKH(‡3).(‡1)

‡1 : The two or more RKHs/RKMs/RKSs/RKXs cannot be connected to the one disk subsystem.

‡2 : It is connectable to the Microprogram revision 0720/A or more for the RKM and the Microprogram revision 0731/A or more for the RKH (The RKHE can be applied from the microprogram revision 0760/A).

Copyright © 2005, 2006, Hitachi, Ltd.

‡3 : The chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only.

Copyright © 2005, 2006, Hitachi, Ltd.

- By using the rack frame (U7) exclusive to DF700, you can construct a system conforming to your demand.
- The Spare Disk Drives, which can be set up to 15 in one system and up to 30 in case of the RKH, do not choose the positions to be installed.
  You can use the system effectively by mounting each Spare Disk in a Disk Drive slot left unused as a result of a system construction.
- From the host computer, the subsystem can be used not only as a single large scale Disk Drive but also as 4,096 logical disks (LUs) at the maximum (RKM: 2,048 logical disks (LUs) at the maximum / RKS/RKXS: 512 logical disks (LUs) at the maximum).
- The data sharing can be easily performed from two or more different types of servers connected through the LAN by using the NFS/CIFS protocol of the LAN (GbE) interface.

(b) Multi-RAID configuration

- The multi RAID configuration similar to the rackmount model of the Fibre model can be achieved.

(c) High-speed data transfer

- The subsystem can read and write data at a high-speed by activating Disk Drives in parallel.
- With the Fibre Channel connection, the subsystem can transfer data between the host computer and the subsystem at a maximum speed of 400 M bytes/s (RKS/RKXS is 200 M bytes/s). Enough throughput can be got when connecting devices and making a multiple access.
- By using a non-volatile large-capacity cache memory (RKH is 2,048 M bytes/CTL to 8,192 M bytes/CTL, RKM is 1,024 M bytes/CTL to 4,096 M bytes/CTL, RKS is 2,048 M bytes/CTL, RKXS is 512 M bytes/CTL or 1,024 M bytes/CTL), speed-up of command execution at the time of read/write hit was achieved.

(d) Large capacity

- The Disk Drive capacity similar to the rackmount model of the Fibre model can be achieved.

(e) High data availability

- The high data availability similar to the rackmount model of the Fibre model can be achieved.

(f) High data reliability

- The high data reliability similar to the rackmount model of the Fibre model can be achieved.

(g) Diagnostic and maintenance functions

- Diagnosis and maintenance of the subsystem can be done on a screen of a PC connected to the subsystem via a LAN.
- Status of the subsystem can be checked and a faulty part can be identified by the Storage Navigator Modular.
- Diagnosis of the subsystem can be done from a distant place by using the remote maintenance function (SNMP).
- The failure of the file system can be monitored by using the NAS Manager Modular from the PC connected to the DF700 with the LAN. Also, the data in the subsystem can be protected from the virus by performing the virus scan in cooperation with the scan server installed on the LAN.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Maintenance

- The addition and the maintenance of the disk subsystem can be done without turning off the power supply of the system.
- All the parts for the maintenance target can be replaced without turning off the power supply of the subsystem.
- All the parts for the maintenance target can be replaced without stopping the operation from the host computer. Depending on the replacement parts, the operation from the host computer can be continued by performing the failover and failback between the NAS clusters (two RKNASs).
- When the correction copy which originates in the blockade of the dynamic sparing or the data Disk Drive is completed, if the capacity and the rotational speed are the same of the data Disk Drive and the Spare Disk Drive of the recovery destination and both of them are not the Disk Drives of the RKA, the copy back does not operate even though the blocked Disk Drive is replaced because the attributes of the data Disk Drive and the Spare Disk Drive are switched.

  Therefore, the influence to the customer's business is suppressed because there is no deterioration of the host I/O performance by the copy back start after the Disk Drive replacement, and the maintenance time is satisfied with the level of the replacement time of the Disk Drive, and the maintenance cost can be reduced.

  In the following cases, the copy backless does not operate, and the copy back surely operates after the Disk Drive replacement.

  - When the capacity or the rotational speed of the failed Disk Drive and the Spare Disk Drive which recovered the data differs
  - When either one of the failed Disk Drive and the Spare Disk Drive which recovered the data is the Disk Drive of the RKA

2.2.2 Differences between the DF700 and DF600

Differences between the subsystem and DF600 are explained below.

- Capability of installing up to 15 Disk Drives in the basic frame
  The RK/RKS of the DF600 can install up to 14 Disk Drives, whereas the both RKM and RKS of the DF700 can install up to 15 Disk Drives.
- Capability of connecting the additional frame to the RKS
  The additional frame cannot be connected to the RKS of the DF600, whereas up to 6 additional frames (RKAJs/RKAJATs) can be connected to the RKS of the DF700.
- The Mini-HUB is adopted as the Fibre Channel interface of the RKS/RKXS.
  The Fibre Channel Interface of the RKS of the DF600 was one connector per Control Unit, but the Fibre Channel interface of the RKS/RKXS of the DF700 became two connectors per Control Unit because the Mini-HUB is configured in the Control Unit even though the FC Interface Board is not added.
  The number of connectors of two connectors, which can be used, is determined by the Topology of the Fibre Channel to be connected and the transfer rate.
  The Point-to-Point Topology is used at the connection through the SAN Switch, etc., and it can use only one connector (0A-0 and 1A-0) of two connectors per Control Unit.
  Next, the transfer rate auto (auto negotiation) can use only one connector (0A-0 and 1A-0) of two connectors per Control Unit.
  The translation rate1Gbps and 2 Gbps can use both of two connectors.
- The FC interface board can be added in the RKS/RKXS
  The DF600-RKS had one port per Control Unit, and the FC Interface Board could not be added to the Control Unit, but the DF700-RKS/RKXS of the microprogram revision 0726/A or more has the FC Interface Board added to the Control Unit and one port per Control Unit can be added as two ports per Control Unit.
  Also, the DF600-RKS is 2 Gbps Fibre Channel Optical (Non-OFC) for the type of the Fibre Channel interface, but the DF700-RKS/RKXS becomes 4 Gbps Fibre Channel Optical (Non-OFC) when the FC Interface Board is added.
- Adoption of high-speed RISC processor
  The microprocessor for the RKM of the DF700, it was changed from POWER PC 7455 (677 MHz) for the RKM of the DF600 to POWER PC 7447A (1.0 GHz) that is faster and has higher performance. It is POWER PC7447A (500 MHz) as for the RKS/RKXS. It is POWER PC7447A (1.4 GHz) as for the RKH. It is POWER PC7448 (1.7 GHz) as for the RKHE.
- With the Fibre Channel connection, the subsystem can transfer data between the host computer and the subsystem at a maximum speed of 400 M bytes/s (RKS/RKXS is 200 M bytes/s).
  Enough throughput can be got when connecting devices and making a multiple access.
- Adoption of RAID 6
  The DF600 supports RAID 0, RAID 1, RAID 5, and RAID 1+0, whereas the DF700 supports RAID 6 in addition to the above.

Copyright © 2005, 2006, Hitachi, Ltd.

- Duplicated power supply
  In the DF700 like the DF600, the power supply which integrates functions of the IN BOX and the Power Unit is duplicated as a standard configuration.

- Adoption of Fibre Channel Disk Drive
  The Disk Drives with the Fibre Channel interface are adopted in the same way as the DF600. The maximum number of Disk Drives that can be connected to the RKM of the DF700 is 225, which is equivalent to that for the RK of the DF600, that is, 224. This enables users to construct various RAID configurations. The maximum number of Disk Drives that can be connected to the RKS is 14 for the DF600, whereas it is 105 for the DF700; it also makes it possible to construct various RAID configurations.
  The maximum number of the Disk Drives which can be connected to the RKH of the DF700 is 450, almost equal to the RKH of the DF600, and various RAID configurations can be constructed.

- Adoption of SATA Disk Drive (DF700-RKAJAT model only)
  The Disk Drives with the SATA interface are adopted for the RKS/RKM of the DF700 in the same way as the RK of the DF600.
  The maximum number of SATA Disk Drives that can be connected to the RKM of the DF700 is 210, which is equivalent to that for the RK of the DF600. This enables users to construct various RAID configurations. The Disk Drives cannot be connected to the RKS of the DF600, whereas the RKS of the DF700 can connect up to 90 Disk Drives. This also enables users to construct various RAID configurations.
  The maximum number of the SATA Disk Drives which can be connected to the RKH of the DF700 is 420, as same as the RKH of the DF600, and various RAID configurations can be constructed.

- The model only for the SATA Disk Drive is adopted. (DF700-RKXS model)
  There was no model only for the SATA Disk Drive in DF600. In DF700, SATA Disk Drive is adopted for the RKXS Basic Chassis and up to six Additional Chassis for SATA Disk Drive (RKAJAT) can be connected, so that it became possible to configure more various systems.

- Adoption of NAS Unit (DF700-RKNAS model)
  There was no NAS model for the DF600. However, by combining the RKNAS with the Basic Chassis of the DF700 (RKH/RKM/RKS/RKXS), the data sharing can be easily performed from two or more different types of servers connected through the LAN by using the NFS/CIFS protocol of the LAN (GbE) interface. (The DF700-RKM/RKS/RKXS can be used from the microprogram revision 0726/A. Also, the DF700-RKH can be used from the microprogram revision 0732/A, and the DF700-RKHE can be used from the microprogram revision 0760/A.)

- The iSCSI Interface Board can be added in the RKH/RKM/RKS/RKXS
  There was no iSCSI model in the DF600, but the iSCSI Interface Board is added in the Control Unit, and two iSCSI interfaces/CTL can be added in the DF700 with the microproram revision 0730/B or more. Also, the maximum transfer speed of the iSCSI interface becomes the maximum of 100 M bytes/s (The RKHE can be applied from the microprogram revision 0760/A).

- Two types of the host Interface Boards can be installed in the RKH.
  There was only the Fibre Channel of the host interface in the DF600, but there are three types of the host interfaces, the Fibre Channel, iSCSI and NAS, in the DF700. The RKH can be used by combining two types of the host interfaces from the Fibre Channel, iSCSI and NAS

Copyright © 2005, 2006, Hitachi, Ltd.

(the NAS interface can be used from the microprogram revision 0732/A or more). (The RKHE can be applied from the microprogram revision 0760/A)

2.3 Subsystem Structure

For a single unit of Rackmount model, there are RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKA. Floor model or Rackmount model are configured by combining single units.

RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKA has a Power Unit power-supplied from AC power supply.

(1) RKM, RKS, RKXS, RKAJ, RKAJAT, Floor (RKM+H1J) Model, Floor (RKM+RKAJ+H2J) Model, Floor (RKS+H1J) Model, Floor (RKS+RKAJ+H2J) Model, Floor (RKXS+H1J) Model, Floor (RKXS+RKAJAT+H2J) Model

The subsystem can be composed of a combination of the RKM/RKS and RKAJ (s) or RKXS and RKAJAT.

There are eight types of the floor model :

- The one is a combination of the RKM and the floor standing kit (Floor (RKM+H1J) Model)
- The one is a combination of the RKM, the RKAJ, and the floor standing kit (Floor (RKM+RKAJ+H2J) Model) and one is a combination of the RKM, the RKAJAT, and the floor standing kit (Floor (RKM+RKAJAT+H2J) Model)
- The other is a combination of the RKS and the floor standing kit (Floor (RKS+H1J) Model) and one is combination of the RKS
- The RKAJ, and the floor standing kit (Floor (RKS+RKAJ+H2J) Model) and one is a combination of the RKS, the RKAJAT, and the floor standing kit (Floor (RKS+RKAJAT+H2J) Model)
- The other is a combination of the RKXS and the floor standing kit (Floor (RKXS+H1J) Model)
- The one is combination of the RKXS, the RKAJAT, and the floor standing kit (Floor (RKXS+RKAJAT+H2H) Model).

The rackmount model that the RKM is the Basic Chassis can make the system configuration which connects the RKM (one unit) and the maximum of ten units of the RKAJ/RKAJAT/RKA (Disk Drive: Maximum of 165 units) to one rack when the U7 rack frame is used.
The system configuration, which connects the maximum of 14 units of the RKAJ/RKAJAT/RKA (Disk Drive: Maximum of 225 units) to the maximum of two racks, can be made.
The rackmount model that the RKS is the Basic Chassis can make the system configuration which connects the RKS (one unit) and the maximum of six units of the RKAJ/RKAJAT (Disk Drive: Maximum of 105 units) to one rack when the U7 rack frame is used.
The rackmount model that the RKXS is the Basic Chassis can make the system configuration which connects the RKXS (one unit) and the maximum of six units of the RKAJAT (Disk Drive: Maximum of 105 units) to one rack when the U7 rack frame is used.
The rackmount model that the RKH is the Basic Chassis can make the system configuration which connects the RKH (one unit), the RKAJ (one unit), and the maximum of nine units of the RKAJ/RKAJAT/RKA (Disk Drive: Maximum of 165 units) to one rack when the U7 rack frame is used.
The system configuration, which connects the maximum of 30 units of the RKAJ/RKAJAT/RKA (Disk Drive: Maximum of 450 units) to the maximum of three racks, can be made.
However, the maximum connection number of the RKAJAT is 28 units.

Racks heights are measured in meters, EIA units, and “U”. 1EIA unit equals 1U, which equals 44.45 mm.

2.3.4 Configuration of rackmount model with U7 rack frame

(1) Configuration of rackmount model with U7 rack frame

The DF-F700-U7 is an exclusive rack frame for mounting up to a height of 38 U (EIA Standard). (1 RKM and 10 RKAJs)

It consists of a rack frame main body and PDBs to be used to supply AC power to power supply units of the mounted RKM(s), RKS(s) and RKAJ(s). The four PDBs are installed to allow the power system to be duplicated.

Up to the eleven RKAJs/RKAs can be mounted through an addition of the UPDU7 (optional).

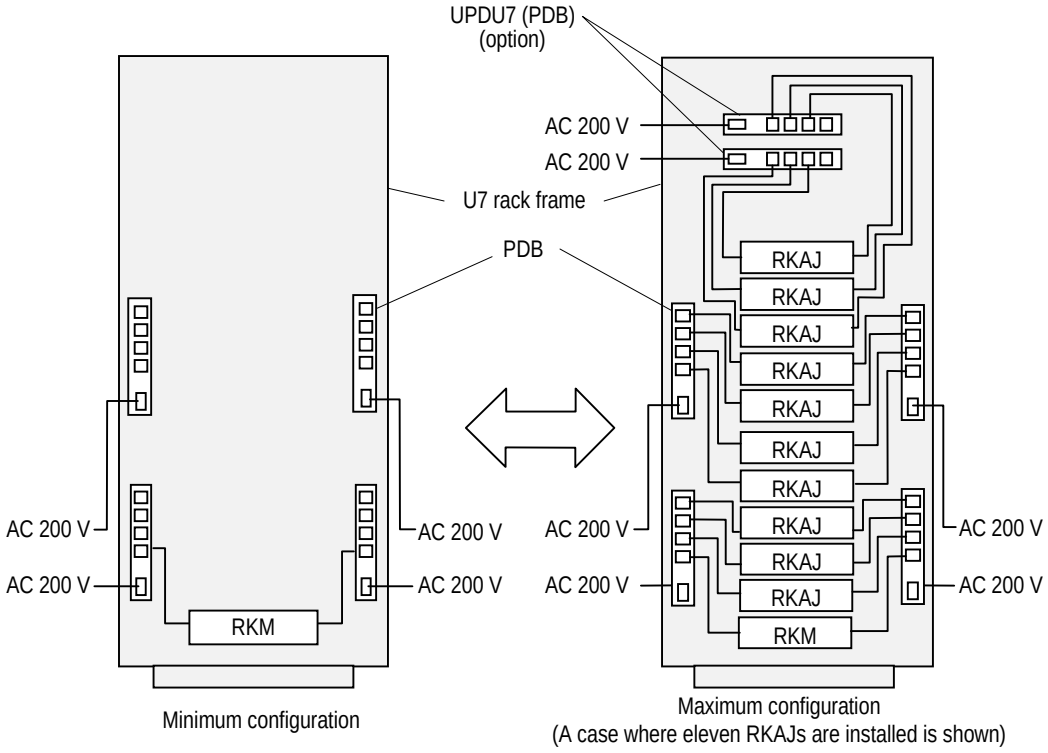

Figure 2.3.14 System Configuration of Rackmount Model with U7 Rack Frame

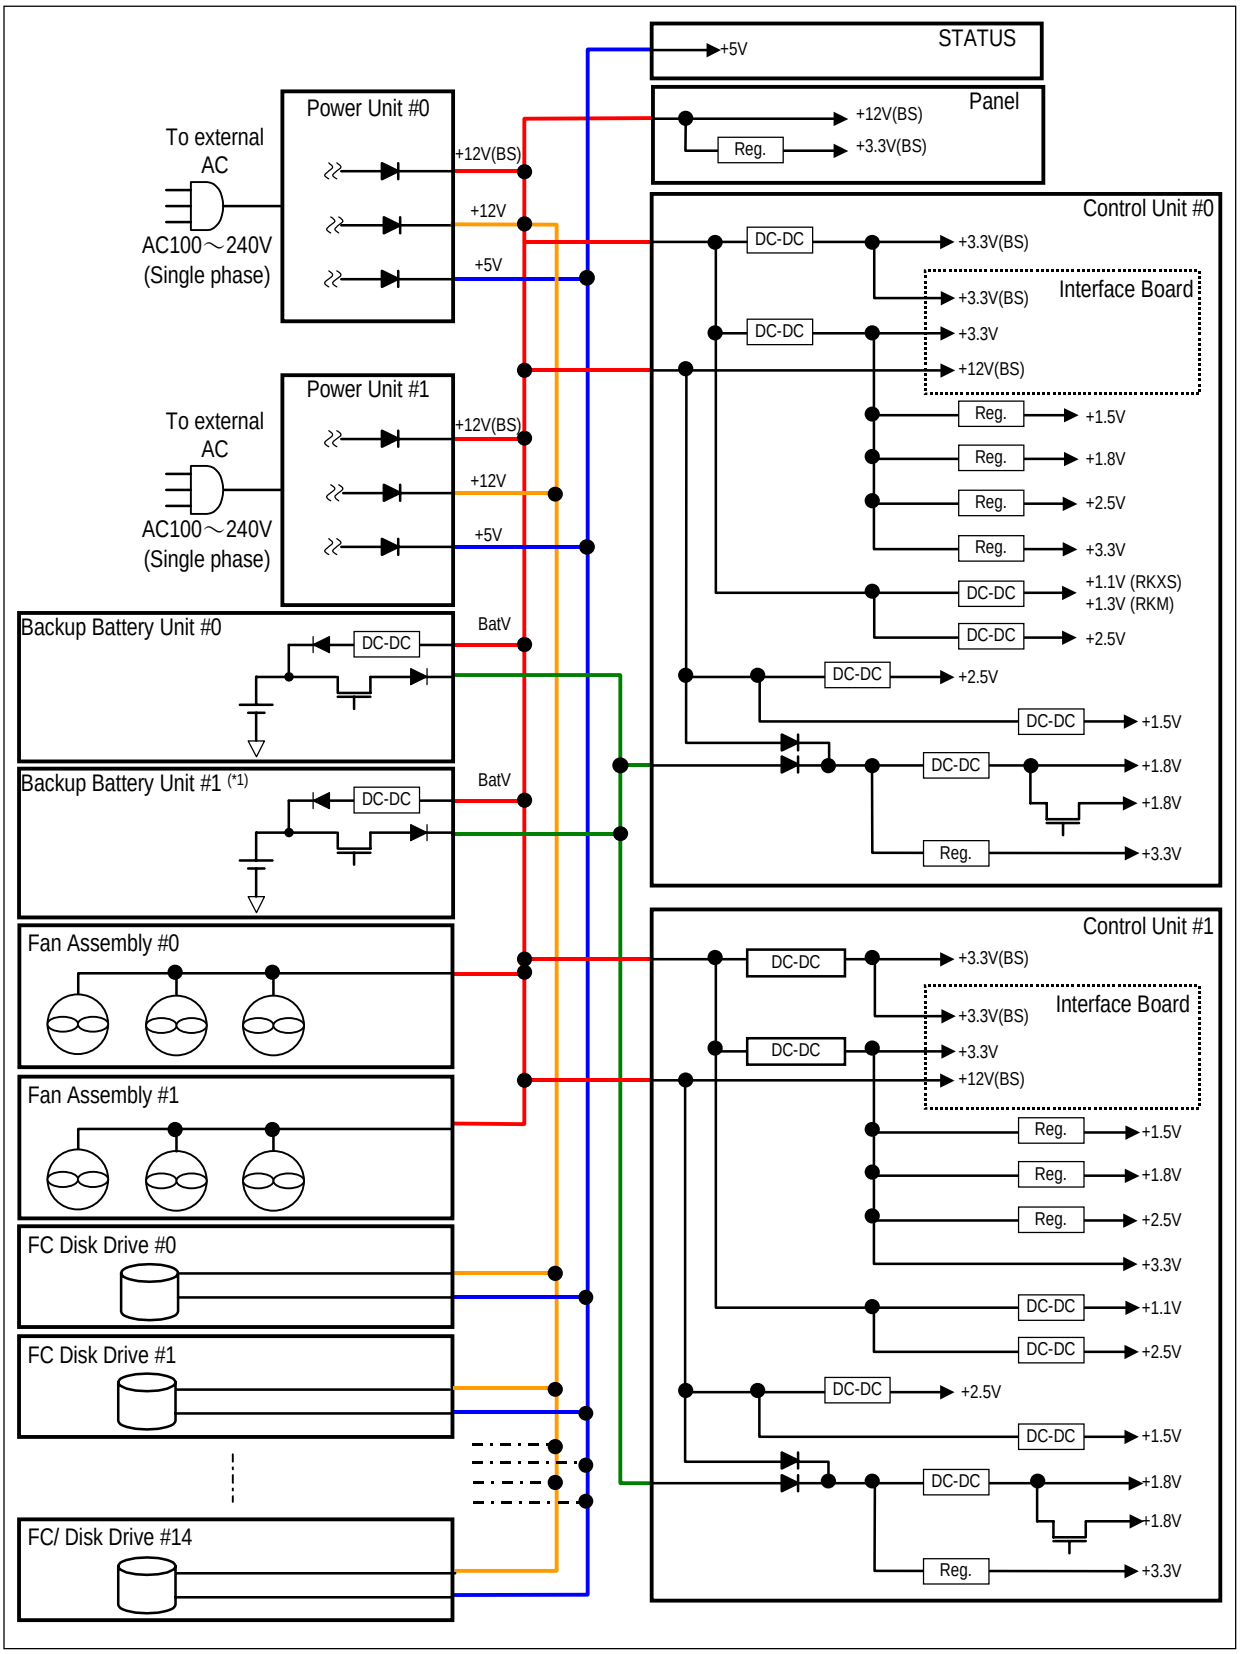
2.4 Configuration of Internal Power Supply System



For a single unit of Rackmount model, there are RKH/RKM/RKS/RKXS/RKAJ/RKAJAT/RKA Floor model or Rackmount model are configured by combining single units.

There is an RKNAS as an optional subsystem of the rackmount model.
RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKA/RKNAS has a Power Unit power-supplied from AC.

(1) Internal power supply system configuration (RKM/RKS/RKXS/RKH/RKAJ/RKAJAT)
Figure 2.4.1, Figure 2.4.2, Figure 2.4.2.1, Figure 2.4.3, and Figure 2.4.4 shows the connection diagrams of the internal power supply system of the RKM, RKS, RKXS, RKH, RKAJ, and RKAJAT respectively.
Input power to the RKM, RKS, RKXS, RKH, RKAJ and RKAJAT is supplied from the Power Unit.
Even if the main switch is off, each voltage (BS) is supplied. To turn off each voltage (BS), the AC Power unit switch of the Power Unit needs to be turned off (‡1).
Two Power Units are installed as the standard to duplicate the power supply system.
Accordingly, the subsystem can continue its operation even when a failure occurs in one of the Power Unit or power cables.
Further, part replacement can be done while the subsystem is operating.

‡1 : In the situation where the main switch is turned off, do not leave the components removed from the subsystem for a long time. The power supply alarm can be given because of an abnormal alarm.

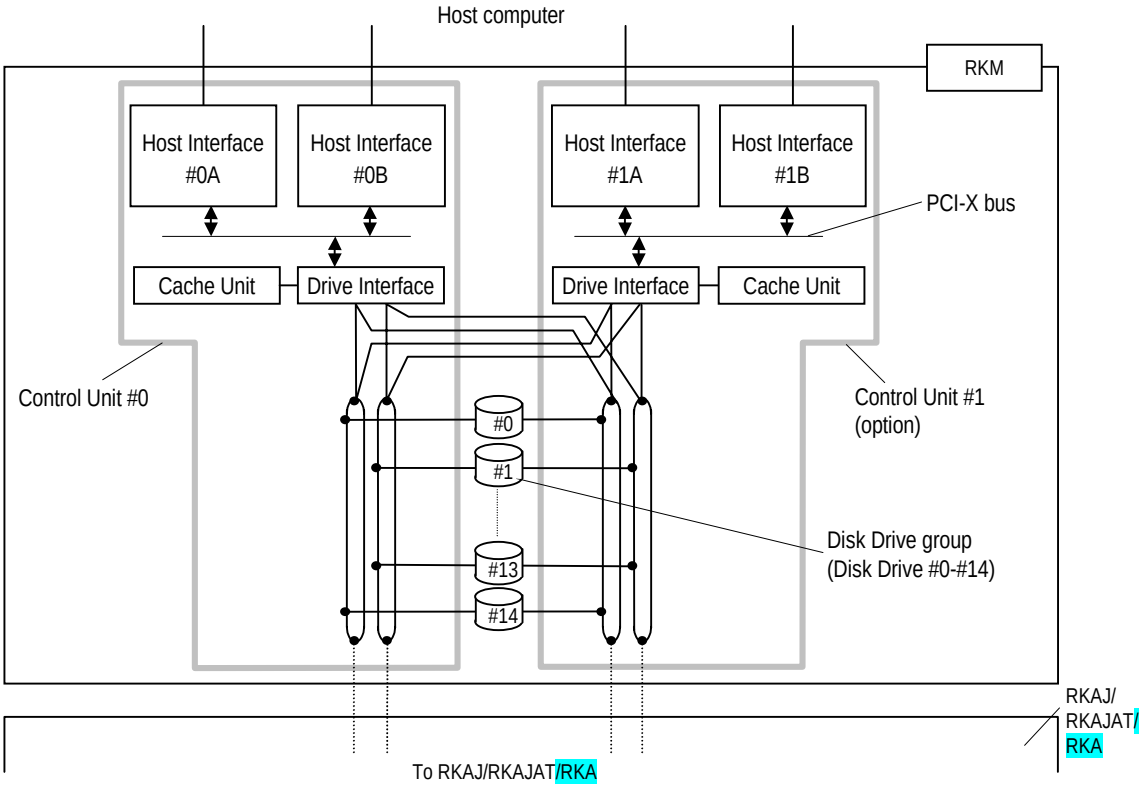
2.5 Configuration of Internal Data System

Figure 2.5.1, Figure 2.5.2, Figure 2.5.3, Figure 2.5.4, Figure 2.5.5, Figure 2.5.5.1, Figure 2.5.6, and Figure 2.5.7 shows the connection block diagram of the internal data system of the RKM, RKS, RKXS, RKH, RKAJ, RKAJAT, RKA and RKNAS respectively.
Figure 2.5.8 shows the connection block diagram of the internal data system of the RKM+RKAJAT+RKAJ respectively.
Figure 2.5.9 shows the connection block diagram of the internal data system of the RKS+RKAJAT+RKAJ respectively.
Figure 2.5.10 shows the connection block diagram of the internal data system of the RKXS+RKAJAT respectively.
Figure 2.5.10.1 shows the connection block diagram of the internal data system of the RKH+RKAJ respectively.
Figure 2.5.11 shows the connection block diagram of the internal data system of the RKNAS4G+RKM+RKAJ respectively.
Figure 2.5.12 shows the connection block diagram of the internal data system of the RKNAS2G+RKS+RKAJ respectively.
Figure 2.5.13 shows the connection block diagram of the internal data system of the RKNAS2G+RKXS+RKAJAT respectively.
Figure 2.5.13.1 shows the connection block diagram of the internal data system of the RKNAS4G+RKH+RKAJ.

(1) Host interface

In the DF700, the PCI-X bus is adopted for the connection of the host interface and the Control Unit, and the Fibre Channel interface or the iSCSI interface is supported in standard.
In the Fibre Channel configuration, one Control Unit can have up to two ports. With the dual Controller configuration, the subsystem can have up to four Fibre Channel ports.
(The RKS/RKXS in which the Interface Board is not installed has the Fibre Channel one port on the Control Unit, but it will be the Fibre Channel two connectors per Control Unit using the Mini-HUB, and the maximum of the Fibre Channel four connectors at the time of the dual system.)



(2) Cache memory backup

The Cache Unit is backed up by the battery. Therefore, data in the Cache Unit is maintained even when a sudden power failure or a power supply unit failure occurs.

(3) Spare Disks

When a spare Disk Drive is set in a group of Disk Drives, even if a failure occurs in the Disk Drive, the same operation as before can be performed through reconstruction of data to the Spare Disk Drive. Up to 15 (for the RKH, up to 30) Spare Disk Drives can be set.

2.6 Configuration of Built-in Software

2.6.1 Block diagram of built-in software configuration

The built-in software configuration is shown in Figure 2.6.1.
For the shaded portions in the figure, detailed explanations are given on the succeeding pages.

*1 : The SNMP information can be used when the SNMP function is validated by the P-002D-J200.

Figure 2.6.1 Software Structure

(1) Microprograms

- These are programs that control.
- Their version numbers are controlled in the format of 07xxxxxx.
- There are types of microprograms shown below corresponding to as many usages.

No.	Type of usage	Version	Supplying media
1	Fibre Channel, NAS, iSCSI	07xxxxxx (×:Optional)	One CD

- "/xx" in the version number may not be added or may be controlled by the other method.

(2) Flashprograms

- These are programs to start up the subsystem after powering on.

(2-1) Fixed part Flash program

No.	Name	Type
1	Fixed part Flash program	07xxxxxx (×:Optional)

(2-2) Main part Flash program

No.	Name	Type
1	Main part Flash program (Fibre Channel) (*1)	07xxxxxx (×:Optional)
	*1 : This program and the microprogram are controlled unitarily.	

(3) ENC/SENC firmware

- The version of the firmware can be see using Storage Navigator Modular or through the Web.

(3-1) ENC firmware

- This firmware controls the RKAJ/RKA.

(3-2) SENC firmware

- This firmware makes a change from the S-ATA to the FC.
- This firmware controls the RKAJAT.

(4) NAS Unit software

- This software controls the NAS Unit.
- The version can be referred to from the NAS Setup of the Storage Navigator Modular.

(5) NAS Unit firmware

- This firmware controls the NAS Unit.
- The version can be referred to from the Storage Navigator Modular.

(6) Disk firmware

- You can also refer to even a version of firmware which the disk has independently. (You can do it by means of a simplicity trace.)

(7) Parameter Information

The parameters are classified into the following three types for operating the subsystem.

(7-1) System parameters

- Parameters necessary for the subsystem start-up process from the turning on of the main switch to the coming on of the READY LED (green) are called system parameters.
  For the details of it, refer to the for System Parameter "Chapter 1. Setting (Storage Navigator Modular)" (SYSPR 01-0000).
- The system parameters are stores in the flash memory.
  Back up of the system parameter is automatically performed to the drive in the changing opportunity.

Copyright © 2005, 2006, Hitachi, Ltd.

(7-2) Configuration information

- This is a piece of information on the configuration, such as the RAID configuration and LU capacity, for the subsystem to record user data.
- The configuration information exists on the Disk Drives when the subsystem main switch is turned off, and is spread onto the RAM at the time when the main switch is turned on. When it is changed, that on the Disk Drives are also changed.

(7-3) SNMP information

The SNMP information is a parameter for making the SNMP agent support function work effectively.

- When the SNMP information makes the SNMP agent support function effective, it edits the template on the SNMP EVA FD and registers the template with the subsystem.
  To update the information, edit the SNMP information on the SNMP EVA FD and register it with the subsystem.
  For the details of it, refer to the "SNMP Agent Support Function User's Guide".

Copyright © 2005, Hitachi, Ltd.

2.6.2 Storages for parameters

The storages in which the parameters on the controller are stored are shown in Table 2.6.1.

Table 2.6.1 Storages for Parameter

No.	Parameter	Storage	Description
1	• Fixed part Flash program • Main part Flash program • System parameters	Flash memory	• The parameters are stored in the flash memory. No provision of storage against a power shut off is required for the parameters because the flash memory can retain information even if a power is shut off. • The parameters can be backed up to the following to provide against a trouble. Fixed part Flash program..... Cannot be backed up. Main part Flash program..... Automatically backed up to the system area. System parameters..... Automatically backed up to the system area.
2	• Microprogram • Configuration information • SNMP information	System area	• Generally, information in a RAM is erased when the main switch is turned off. Therefore, the subsystem also stores the parameters used on the RAM on the Disk Drive. (An area is reserved in the Disk Drive to store them. The area is called system area.)

3.1 Basic Specifications of the Subsystem

(1) Floor (RKM+H1J) Model/Floor (RKM+RKAJ+H2J) Model/Floor (RKM+RKAJAT+H2J) Model

Table 3.1.1 Basic Specifications

Item \ Model			Floor model		
			Floor (RKM+H1J) Model	Floor (RKM+RKAJ+H2J) Model	Floor (RKM+RKAJAT+H2J) Model
Configuration	Configuration		1 RKM + H1J Floor setting kit (Optional)	1 RKM + 1 RKAJ + H2J Floor setting kit (Optional)	1 RKM + 1 RKAJAT + H2J Floor setting kit (Optional)
	Subsystem appearance				
Disk Drive used	Disk Drive size (W×D×H) (mm)		101.6×146.1×25.4		
	Data capacity(*1) (G byte)		71.3/143.3/287.6 G byte		71.3/143.3/287.6 G byte (RKM) 245.7/393.4/491.9 G byte (RKAJAT)
	Rotational speed (min^{-1})		71.3/143.3/287.6 G byte : 10,000 71.3/143.3 G byte : 15,000		71.3/143.3/287.6 G byte : 10,000 (RKM), 71.3/143.3 G byte : 15,000 (RKM), 245.7/393.4/491.9 G byte : 7,200 (RKAJAT)
	Maximum mountable quantity (unit)		15	30	
Host interface	Host interface		4 G bps Fibre Channel Optical (Non-OFC)/ 1 G bps iSCSI [1000Base-T](*5)		
	Data transfer speed (i.e. maximum speed for transfer to host)		400 M bytes/s (Fibre Channel)/ 100 M bytes/s (iSCSI)(*5)		
	Number of ports	Single controller	Fibre Channel : 2/ iSCSI: 2(*5)		
		Dual controller	Fibre Channel : 4/ iSCSI: 4(*5)		
	Transferred block size (bytes)		512		
RAID specifications (*2)	RAID level(*3)		0/1/5/6/1+0		
	RAID configuration (unit of addition)	RAID 0	2D to 15D	2D to 16D	—
		RAID 1	1D+1D		
		RAID 5	2D+1P to 14D+1P	2D+1P to 15D+1P	
		RAID 6	2D+2P to 13D+2P	2D+2P to 28D+2P	
		RAID 1+0	2D+2D to 7D+7D	2D+2D to 8D+8D	

*1 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

*2 : D : Data disk
P : Parity disk

*3 : Although the subsystem with a configuration of RAID 6, RAID 5, RAID 1, or RAID 1+0 provides data reliability enhanced by means of redundancy, a possibility remains that user data is lost owing to an unexpected failure of a host computer or hardware/software of the subsystem itself.
Therefore, users are requested to back up all data for restoration in case where the original data is lost.

*4 : D : Data disk
P : Parity disk

*5 : It indicates the value of when the iSCSI interface board is added to the control unit.

	Control method		Read LRU/Write after		
	Battery backup		Provided		
	Backup duration(*2) (h)		24 (When cache of 4,096 M bytes/CTL)		
Maintenance specifications/anti-fault specifications	Parts to which hot replacement is applicable(*3)		•Control Unit •Disk Drive •Power Unit (RKM) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI) and Host Connector	•Control Unit •Disk Drive •Power Unit (RKM) •Power Unit (RKAJ) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI) and Host Connector •ENC Unit	•Control Unit •Disk Drive •Power Unit (RKM) •Power Unit (RKAJAT) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI) and Host Connector •SENC Unit

*1 : Power requirement in the case of the maximum configuration is shown. When planning facilities such as the uninterrupted power supply (UPS), specify the power factor as 100% for calculation. Value at 100 V/200 V is shown.
(Example : 300 W=300 VA)
The actual required power may exceed the value shown in the table when the tolerance is included.

*2 :
- The backup time of the data on the Cache memory is indicated (in the case of the battery full charge).
- In the battery that exceeds the periodic replacement cycle, the backup time may become remarkably short.
- Non-volatility of data in the cache memory is ensured against power trouble such as a sudden power failure. It transfers data in the Cache memory to Disk Drives by turning off the power normally, and prevents the battery charge from being wasted.
- When the subsystem enters the Cache Backup mode, a warning (lighting of the orange LED) informing of a voltage drop of the battery may be issued when the subsystem is started. It shows that the remaining capacity of the battery is not sufficient, and in this state, the subsystem operates disabling the Write Cache function automatically.
  When the battery is charged, the warning indication disappears, and the subsystem continues the operation enabling the Write Cache function. The warning indication disappears within six hours at the latest. Even when the warning is being indicated, normal functional operation is assured although the operation is performed in the Write-Through mode and the R/W performance is lowered because the Write Cache function is disabled.
- Since battery is subject to effect of environmental temperature, avoid using a battery in unnecessarily continuous operation at high temperature.
- If the subsystem is not energized for more than three months, the over discharging of the battery occurs and it may cause the battery an unrecoverable damage. In this case, the battery must be energized more than 6 hours at least once three months, or store the subsystem with the switch of the battery turned off. Even when the switch is turned off, the battery discharges naturally. Even in this case, however, charge the battery once per six months for longer than 6 hours because spontaneous discharge is done.
  When the battery without the switch is installed, charge it once every six months for more than six (6) hours.
- To minimize the deterioration of battery, use and keep a battery at the lowest temperature possible.

*3 : Only the trained service personnel can perform a hot replacement.

*4 : The battery in the Backup Battery unit is a part to be recycled.

Table 3.1.2 Basic Specifications

Item \ Model			Floor model		
			Floor (RKS+H1J) Model	Floor (RKS+RKAJ+H2J) Model	Floor (RKS+RKAJAT+H2J) Model
Configuration	Configuration		1 RKS + H1J Floor setting kit (Optional)	1 RKS + 1 RKAJ + H2J Floor setting kit (Optional)	1 RKS + 1 RKAJAT + H2J Floor setting kit (Optional)
	Subsystem appearance				
Disk Drive used	Disk Drive size (W×D×H) (mm)		101.6×146.1×25.4		
	Data capacity(*1) (G byte)		71.3/143.3/287.6 G byte		71.3/143.3/287.6 G byte (RKS) 245.7/393.4/491.9 G byte (RKAJAT)
	Rotational speed (min^{-1})		71.3/143.3/287.6 G byte : 10,000 71.3/143.3 G byte : 15,000		71.3/143.3/287.6 G byte : 10,000 (RKS), 71.3/143.3 G byte : 15,000 (RKS), 245.7/393.4/491.9 G byte : 7,200 (RKAJAT)
	Maximum mountable quantity (unit)		15	30	
Host interface	Host interface		2 G bps Fibre Channel Optical (Non-OFC)/ 4 G bps Fibre Channel Optical (Non-OFC)(*4) 1 G bps iSCSI [1000Base-T](*7)		
	Data transfer speed (i.e. maximum speed for transfer to host)		200 M bytes/s (Fibre Channel)/ 400 M bytes/s (Fibre Channel)(*6) 100 M bytes/s (iSCSI)(*7)		
	Number of Host connector	Single controller	Fibre Channel : 2(*5)		
		Dual controller	Fibre Channel : 4(*5)		
	Transferred block size (bytes)		512		
RAID specifications (*2)	RAID level(*3)		0/1/5/1+0		
	RAID configuration (unit of addition)	RAID 0	2D to 15D	2D to 16D	—
		RAID 1	1D+1D		
		RAID 5	2D+1P to 14D+1P	2D+1P to 15D+1P	
		RAID 6	2D+2P to 13D+2P	2D+2P to 28D+2P	
		RAID 1+0	2D+2D to 7D+7D	2D+2D to 8D+8D	

*1 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

*2 : D : Data disk
P : Parity disk

*3 : Although the subsystem with a configuration of RAID 6, RAID 5, RAID 1, or RAID 1+0 provides data reliability enhanced by means of redundancy, a possibility remains that user data is lost owing to an unexpected failure of a host computer or hardware/software of the subsystem itself.
Therefore, users are requested to back up all data for restoration in case where the original data is lost.

*4 : It indicates the value of when the FC interface board is added to the control unit.

*5 : When the FC Interface Board is not added to the Control Unit, one Mini-HUB is configured every two connectors.

*6 : The case where the FC Interface Board is added to the Control Unit is shown, and the maximum transfer rate for the host may be temporarily set to 400 Mbytes/s (Fibre Channel) according to the conditions of the host I/O.

*7 : It indicates the value of when the iSCSI interface board is added to the control unit.

Physical specifications	Start-up time (min)			Standard : 4(*1)		
	Chassis size (W×D×H) (mm)			(260×737×540)	(309×737×540)	
	Mass(*2) (kg)			70 approx.	115 approx.	
	Acoustic noise(*3) (dB)			56 approx.	59 approx	
	EIA Standard for unit (U) (*4, *5)			—		
Input power specifications	Input voltage (V)			AC 100/200 (100 to 120/200 to 240)		
	Frequency (Hz)			50/60 ± 1		
	Number of phases, cabling			Single-phase with protective grounding		
	Steady-state current(*6)(*7) AC 100 to 120/200 to 240 (A)			4.0×2/2.0×2	4.0×2+2.6×2/2.0×2+1.3×2	4.0×2+2.4×2/2.0×2+1.2×2
	Breaking current (A)			16.0		
	Required power	Steady state (VA)		800 or less	1,320 or less	1,280 or less
		Starting state(*8) (VA)		800 or less	1,360 or less	1,280 or less
	Heat value (normal) (kJ/h)			2,880 or less	4,755 or less	4,610 or less

*1 : The start-up time may be longer than four minutes depending on the configuration.
*2 : Value of maximum configuration (in the case where all the mountable Disk Drives and Control Unit are mounted).
*3 : A noise emitted at the time of start is not included.
*4 : Can be mounted on the Hitachi special rack frame (U7). For the mounting, special rails for the rack frame and decoration panel(s) are required separately depending on the number of the mounted subsystem(s).
*5 : Racks height are measured in meters, EIA units, and "U". 1EIA unit equals 1U, which equals 44.45 mm.
*6 : For the both systems, plan the facilities for supplying power to the subsystem according to the specifications for the single power supply because when a failure occurs, only the one power supply operates.
*7 : The current value in the operation by a single power supply unit is same as that in the operation by both power supply units.
*8 : Power requirement in the case of the maximum configuration is shown. When planning facilities such as the uninterrupted power supply (UPS), specify the power factor as 100% for calculation. Value at 100 V/200 V is shown. (Example : 300 W=300 VA) The actual required power may exceed the value shown in the table when the tolerance is included.

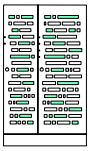
	Display function	•Status LEDs (POWER, READY, WARNING, and ALARM) •LED of maintenance part		
Insulation performance	Insulation withstand voltage	AC 1,500 V (10 mA, 1 min)	AC 1,500 V (100 mA, 1 min)	
	Insulation resistance	DC 500 V, 10 MΩ or more		



*1 : • The backup time of the data on the Cache memory is indicated (in the case of the battery full charge).
- In the battery that exceeds the periodic replacement cycle, the backup time may become remarkably short.
- Non-volatility of data in the cache memory is ensured against power trouble such as a sudden power failure. It transfers data in the Cache memory to Disk Drives by turning off the power normally, and prevents the battery charge from being wasted.
- When the subsystem enters the Cache Backup mode, a warning (lighting of the orange LED) informing of a voltage drop of the battery may be issued when the subsystem is started. It shows that the remaining capacity of the battery is not sufficient, and in this state, the subsystem operates disabling the Write Cache function automatically.
  When the battery is charged, the warning indication disappears, and the subsystem continues the operation enabling the Write Cache function. The warning indication disappears within six hours at the latest. Even when the warning is being indicated, normal functional operation is assured although the operation is performed in the Write-Through mode and the R/W performance is lowered because the Write Cache function is disabled.
- Since battery is subject to effect of environmental temperature, avoid using a battery in unnecessarily continuous operation at high temperature.
- If the subsystem is not energized for more than three months, the over discharging of the battery occurs and it may cause the battery an unrecoverable damage. In this case, the battery must be energized more than 6 hours at least once three months, or store the subsystem with the switch of the battery turned off. Even when the switch is turned off, the battery discharges naturally. Even in this case, however, charge the battery once per six months for longer than 6 hours because spontaneous discharge is done.
  When the battery without the switch is installed, charge it once every six months for more than six (6) hours.
- To minimize the deterioration of battery, use and keep a battery at the lowest temperature possible.

*2 : Only the trained service personnel can perform a hot replacement.
*3 : The battery in the Backup Battery unit is a part to be recycled.

Cache specifications	Capacity (M bytes/CTL)		1,024 to 2,048	—		1,024 to 4,096	
	Control method		Read LRU/ Write after	—		Read LRU/Write after	
	Battery backup		Provided	—		Provided	
	Backup duration(*2) (h)		24 (When cache of 2,048 M bytes/CTL)	—		24 (When cache of 4,096 M bytes/CTL)	
Maintenance specifications /anti-fault specifications	Parts to which hot replacement is applicable (*3)		•Control Unit •Disk Drive •Power Unit (RKM) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI/NAS) and Host Connector	•Disk Drive •Power Unit (RKAJ) •ENC Unit	•Disk Drive •Power Unit (RKAJAT) •SENC Unit	•Control Unit •Disk Drive •Power Unit (RKM/RKAJ/RKAJAT/RKA) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI/NAS) and Host Connector •ENC Unit •SENC Unit •PDB	

*1 : Power requirement in the case of the maximum configuration is shown. When planning facilities such as the uninterrupted power supply (UPS), specify the power factor as 100% for calculation. Value at 100 V/200 V is shown. (Example : 300 W=300 VA)
The actual required power may exceed the value shown in the table when the tolerance is included.

*2 :
- The backup time of the data on the Cache memory is indicated (in the case of the battery full charge).
- In the battery that exceeds the periodic replacement cycle, the backup time may become remarkably short.
- Non-volatility of data in the cache memory is ensured against power trouble such as a sudden power failure. It transfers data in the Cache memory to Disk Drives by turning off the power normally, and prevents the battery charge from being wasted.
- When the subsystem enters the Cache Backup mode, a warning (lighting of the orange LED) informing of a voltage drop of the battery may be issued when the subsystem is started. It shows that the remaining capacity of the battery is not sufficient, and in this state, the subsystem operates disabling the Write Cache function automatically.
  When the battery is charged, the warning indication disappears, and the subsystem continues the operation enabling the Write Cache function. The warning indication disappears within six hours at the latest. Even when the warning is being indicated, normal functional operation is assured although the operation is performed in the Write-Through mode and the R/W performance is lowered because the Write Cache function is disabled.
- Since battery is subject to effect of environmental temperature, avoid using a battery in unnecessarily continuous operation at high temperature.
- If the subsystem is not energized for more than three months, the over discharging of the battery occurs and it may cause the battery an unrecoverable damage. In this case, the battery must be energized more than 6 hours at least once three months, or store the subsystem with the switch of the battery turned off. Even when the switch is turned off, the battery discharges naturally. Even in this case, however, charge the battery once per six months for longer than 6 hours because spontaneous discharge is done.
  When the battery without the switch is installed, charge it once every six months for more than six (6) hours.
- To minimize the deterioration of battery, use and keep a battery at the lowest temperature possible.

*3 : Only the trained service personnel can perform a hot replacement.

*4 : The battery in the Backup Battery unit is a part to be recycled.

		RAID 1+0	2D+2D to 7D+7D	2D+2D to 8D+8D		
Internal logic specifications	Control CPU		It is the same as 'With U7 rack frame'	—		POWER PC 7447A (500 M Hz)
	Control memory			—		• Flash memory : 16 M bytes • L2 Cache memory : 512 k bytes • SDRAM : 1 G bytes
	Data assurance method			—		• Data bus : Parity • Cache memory :ECC (1 bit for correction, 2 bits for detection) • Disk Drive : Data assurance code
Physical specifications	Start-up time (min)		Standard : 4(*4)			
	Chassis size (W×D×H) (mm)		(483×650×174)	(483×650×129)		(610×808×1,880)
	Mass(*5) (kg)		56 approx.	40 approx.	40 approx.	500 approx.
	Acoustic noise(*6) (dB)		57 approx.	60 approx		63 approx.
	EIA Standard for unit (U) (*7)		4	3		Max. 38
Input power specifications	Input voltage (V)		AC 100/200 (100 to 120/200 to 240)			AC 200 (200 to 240)
	Frequency (Hz)		50/60 ± 1			
	Number of phases, cabling		Single-phase with protective grounding			
	Steady-state current(*8) AC 100/200 (A)		4.0×2/2.0×2	2.6×2/1.3×2	2.4×2/1.2×2	-/20.0(One PDB)

*1 : Although the subsystem with a configuration of RAID 6, RAID 5, RAID 1, or RAID 1+0 provides data reliability enhanced by means of redundancy, a possibility remains that user data is lost owing to an unexpected failure of a host computer or hardware/software of the subsystem itself.
Therefore, users are requested to back up all data for restoration in case where the original data is lost.

*2 : D : Data disk
P : Parity disk

*3 : It is recommended to use the RAID configuration within 6D+1P.

*4 : The start-up time may be longer than four minutes depending on the configuration.

*5 : Value of maximum configuration (in the case where all the mountable Disk Drives and Control Unit are mounted).

*6 : A noise emitted at the time of start is not included.

*7 : Racks height are measured in meters, EIA units, and "U". 1EIA unit equals 1U, which equals 44.45 mm.

*8 : The current value in the operation by a single power supply unit is same as that in the operation by both power supply units.

Host interface	Host interface		1 G bps Ethernet
	Data transfer speed (i.e. maximum speed for transfer to host)		100 M bytes/s
	Number of ports	Single controller	—
		Dual controller	8 (4/1RKNAS)
Internal logic specifications	Control CPU		Intel LV-Xeon2.8GHz
	Control memory		Bios : 1 M bytes L2 Cache memory : 1 M bytes
	Data assurance method		Data bus : Through-parity Cache memory :ECC (1 bit for correction, 2 bits for detection)
Physical specifications	Start-up time (min)		Standard : 3(*1)
	Chassis size (W×D×H) (mm)		(483×650×43)
	Mass(*2) (kg)		15 approx.
	Acoustic noise(*3) (dB)		60 approx.
	EIA Standard for unit (U) (*4)		1
Input power specifications	Input voltage (V)		AC 100/200 (100 to 120/200 to 240)
	Frequency (Hz)		50/60 ± 1
	Number of phases, cabling		Single-phase with protective grounding
	Steady-state current(*5) AC 100/200 (A)		2.0/1.4
	Breaking current (A)		10.0
	Required power	Steady state (VA)	280 or less
		Starting state (*6) (VA)	280 or less
	Heat value (normal) (kJ/h)		1,010 or less

*1 : The start-up time may be longer than three minutes depending on the configuration.
*2 : Value of maximum configuration (in the case where all the mountable Disk Drives and Control Unit are mounted).
*3 : A noise emitted at the time of start is not included.
*4 : Racks height are measured in meters, EIA units, and "U". 1EIA unit equals 1U, which equals 44.45 mm.
*5 : The current value in the operation by a single power supply unit is same as that in the operation by both power supply units.
*6 : Power requirement in the case of the maximum configuration is shown. When planning facilities such as the uninterrupted power supply (UPS), specify the power factor as 100% for calculation. Value at 100 V/200 V is shown.
(Example : 300 W=300 VA)
The actual required power may exceed the value shown in the table when the tolerance is included.

(8) Rackmount (RKH+RKAJ/RKAJAT/RKA) Model

Table 3.1.8 Basic Specifications

Item \ Model		Rackmount model				
		RKH	RKAJ	RKAJAT	RKH + RKAJ/RKAJAT + 19-type rack frame With U7 rack frame	
					One rack	Three racks
Configuration	Configuration	1 RKH	1 RKAJ	1 RKAJAT	1 RKH+RKAJ/RKA (10units)/ RKH+RKAJ (1unit) +RKAJAT (9units)(*1) (Maximum configuration) + U7 rack frame (Optional)	1 RKH+RKAJ/RKA (30units)/ RKH+RKAJ/RKA (2units) +RKAJAT (28units) (Maximum configuration) + U7 rack frame (3units) (Optional)
	Subsystem appearance					
Disk Drive used	Disk Drive size (W×D×H) (mm)	—	101.6×146.1×25.4			
	Data capacity (*2) (G byte)	—	71.3/143.3/287.6	245.7/393.4/491.9	71.3/143.3/245.7/287.6/393.4/491.9	
	Rotational speed (min^{-1})	—	71.3/143.3/287.6 G byte :10,000 71.3/143.3 G byte :15,000	7,200	RKAJ/RKA: 10,000 (71.3/143.3/287.6 G byte) 15,000 (71.3/143.3 G byte) RKAJAT: 7,200 (245.7/393.4/491.9G byte)	
	Maximum mountable quantity (*3) (unit)	—	15		150	450
Host interface	Host interface	4 G bps Fibre Channel Optical (Non-OFC)/ 1 G bps iSCSI [1000Base-T](*4)	—		4 G bps Fibre Channel Optical (Non-OFC)/ 1 G bps iSCSI [1000Base-T](*4)	
	Data transfer speed (i.e. maximum speed for transfer to host)	400 M bytes/s (Fibre Channel)/ 100 M bytes/s (iSCSI)(*4)	—		400 M bytes/s (Fibre Channel)/ 100 M bytes/s (iSCSI)(*4)	
	Number of ports / Dual controller	Fibre Channel : Max.8/ iSCSI: 4(*4)	—		Fibre Channel : Max.8/ iSCSI: 4(*4)	
	Transferred block size (bytes)	512				

*1 : When nine or more RKAJ/RKAJATs/RKAs are mounted on U7 rack, optional PDU/PDB is necessary.
*2 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.
*3 : Can be mounted on the Hitachi special rack frame (U7). For the mounting, special rails for the rack frame and decoration panel(s) are required separately depending on the number of the mounted subsystem(s).
*4 : It indicates the value of when the iSCSI interface board is mounted/added to the control unit.

*1 : Although the subsystem with a configuration of RAID 6, RAID 5, RAID 1, or RAID 1+0 provides data reliability enhanced by means of redundancy, a possibility remains that user data is lost owing to an unexpected failure of a host computer or hardware/software of the subsystem itself.
Therefore, users are requested to back up all data for restoration in case where the original data is lost.

*2 : D : Data disk
P : Parity disk

*3 : It is recommended to use the RAID configuration within 6D+1P.

*4 : The start-up time may be longer than five minutes depending on the configuration.

*5 : Value of maximum configuration (in the case where all the mountable Disk Drives and Control Unit are mounted).

*6 : A noise emitted at the time of start is not included.

*7 : Racks height are measured in meters, EIA units, and "U". 1EIA unit equals 1U, which equals 44.45 mm.

*8 : The current value in the operation by a single power supply unit is same as that in the operation by both power supply units.

	Backup duration(*2) (h)		48 (When cache of 2,048 M bytes/CTL)	—		48 (When cache of 8,192 M bytes/CTL)	
Maintenance specifications /anti-fault specifications	Parts to which hot replacement is applicable (*3)		•Control Unit •Disk Drive •Power Unit (RKH) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI/NAS) and Host Connector	•Disk Drive •Power Unit (RKAJ) •ENC Unit	•Disk Drive •Power Unit (RKAJAT) •SENC Unit	•Control Unit •Disk Drive •Power Unit (RKH/RKAJ/RKAJAT/RKA) •Cache Unit •Fan Assembly •Backup Battery Unit(*4) •Interface Board (FC/iSCSI/NAS) and Host Connector •ENC Unit •SENC Unit •PDB	

*1 : Power requirement in the case of the maximum configuration is shown. When planning facilities such as the uninterrupted power supply (UPS), specify the power factor as 100% for calculation. Value at 100 V/200 V is shown.
(Example : 300 W=300 VA)
The actual required power may exceed the value shown in the table when the tolerance is included.

*2 :
- The backup time of the data on the Cache memory is indicated (in the case of the battery full charge).
- In the battery that exceeds the periodic replacement cycle, the backup time may become remarkably short.
- Non-volatility of data in the cache memory is ensured against power trouble such as a sudden power failure. It transfers data in the Cache memory to Disk Drives by turning off the power normally, and prevents the battery charge from being wasted.
- When the subsystem enters the Cache Backup mode, a warning (lighting of the orange LED) informing of a voltage drop of the battery may be issued when the subsystem is started. It shows that the remaining capacity of the battery is not sufficient, and in this state, the subsystem operates disabling the Write Cache function automatically.
  When the battery is charged, the warning indication disappears, and the subsystem continues the operation enabling the Write Cache function. The warning indication disappears within six hours at the latest. Even when the warning is being indicated, normal functional operation is assured although the operation is performed in the Write-Through mode and the R/W performance is lowered because the Write Cache function is disabled.
- Since battery is subject to effect of environmental temperature, avoid using a battery in unnecessarily continuous operation at high temperature.
- When a device is kept with power-off for more than six months, the battery may be excessively discharged, and it may cause an unrecoverable damage. In such a storing condition, the battery must be charged once every six months for more than six (6) hours.
- To minimize the deterioration of battery, use and keep a battery at the lowest temperature possible.

*3 : Only the trained service personnel can perform a hot replacement.

*4 : The battery in the Backup Battery unit is a part to be recycled.

Chapter 4. Theory of Operation

This chapter explains the flow and format of data. It also explains the data processing.

4.1 Power On/Off Sequence

4.1.1 IMPL sequence

The procedure for processing the IMPL executed when the subsystem is started is explained below. The IMPL sequence is broadly divided into four processes and they are executed sequentially.

(1) Boot loader
After the boot loader is booted from the flash memory, it executes the minimum CUDG and hardware initialization. Then, it loads the local memory loader from the flash memory to the local memory and transfers the control to the local memory loader.

(2) Local memory loader
The local memory loader performs the CUDG and hardware initialization which are necessary for loading the OS load module. It loads the OS load module in the local memory after the spin-up of all Disk Drives of the RKH, RKM, RKS, RKXS, RKAJ, RKAJAT and RKA is completed. And then, the local memory loader passes the control to the OS.

(3) OS
The OS initializes the table on the local memory for the communication between the tasks using the root task of the OS and generates the DF initialization task.

(4) DF initialization task
After making the initial setting of the hardware and the DF table, DF initialization task generates DF task. The load of the CUDG and the takeover information is executed in the DF task, and then the loop diagnosis on the Disk Drive side and the load of pinned data are performed.

4.1.2 Disk Drive powering on sequence

If all the Disk Drive motors are rotated at the same time an overcorrect may be caused. To avoid it, the drives are started in the following sequence.

(1) Disk Drive starting sequence (RKM/RKS/RKXS/RKAJ/RKAJAT/RKA)

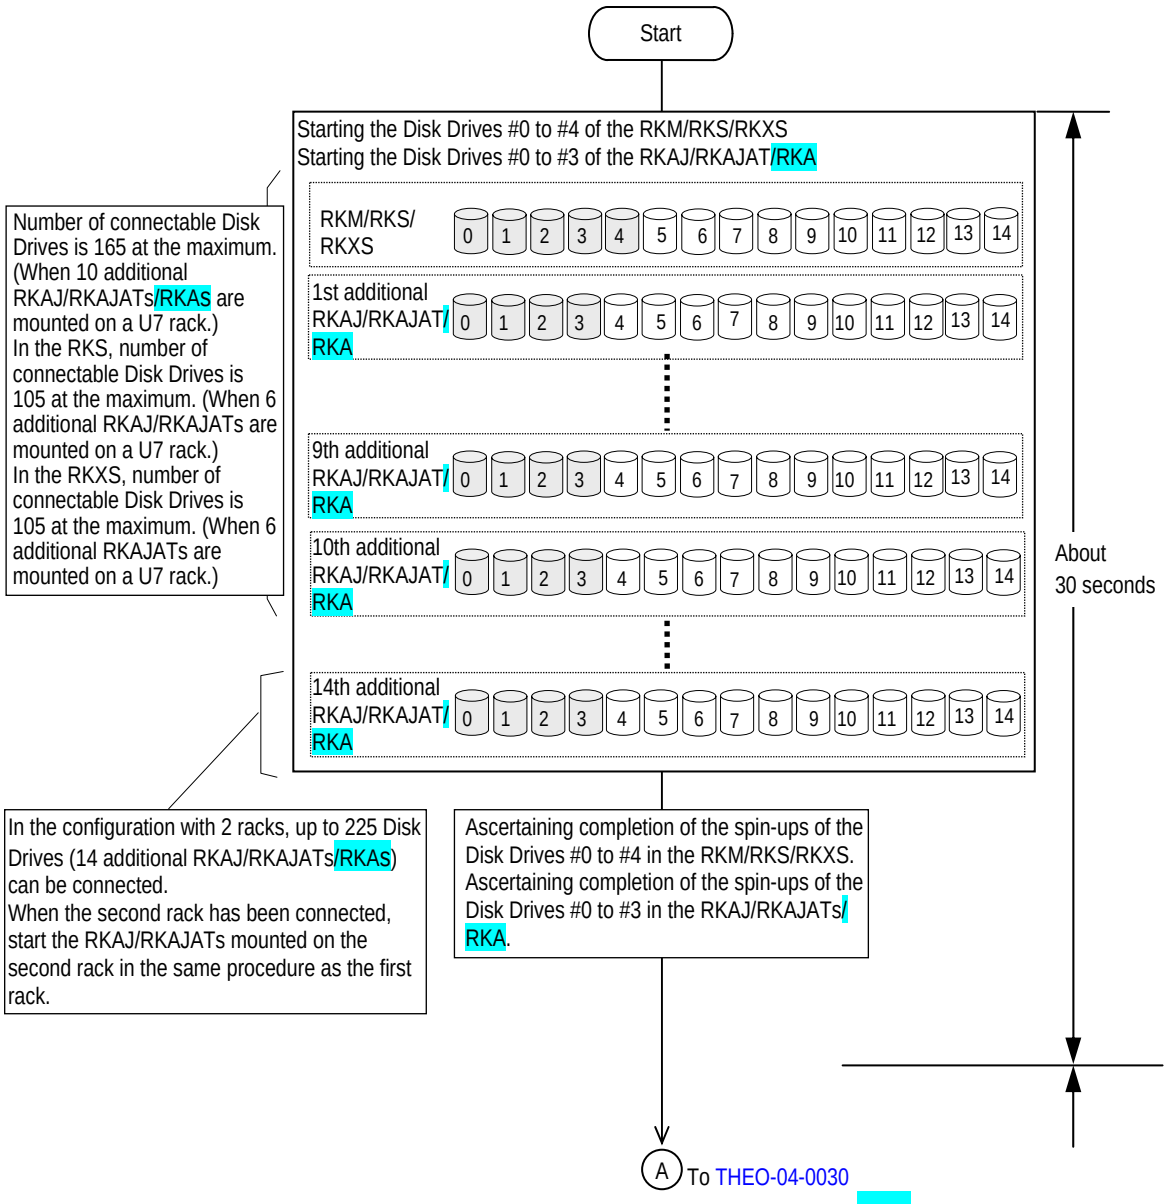

Figure 4.1.2(1/3) Disk Drive Starting Sequence (RKM/RKS/RKXS/RKAJ/RKAJAT/RKA)

4.1.3 Sequential shutdown

If the subsystem receives instructions of a stop (remote control) by having turned off the power supply of the host computer and a stop (local control) by having turned off the main switch, when the NAS Unit is connected, the shutdown instruction is issued to the NAS Unit. By receiving it, the power supply of the NAS Unit is turned off after terminating the job which the NAS OS is executing.
After that, the termination status of the processing, which is beginning or executing, is monitored for all the logical devices.
After ascertaining completion of all of them, it executes the destaging.
When doing the above, if a track failed to be destaged (pinned data) occurs, it stores the Pin information in the system area on the system disk.
Then, after the take-over information is stored in the system area of the system disk and the power supplying from the Backup Battery Unit is shut off, the subsystem is notified of the permission for powering off.
The AC Power Unit Switch of the subsystem becomes able to be turned off after receiving the permission.

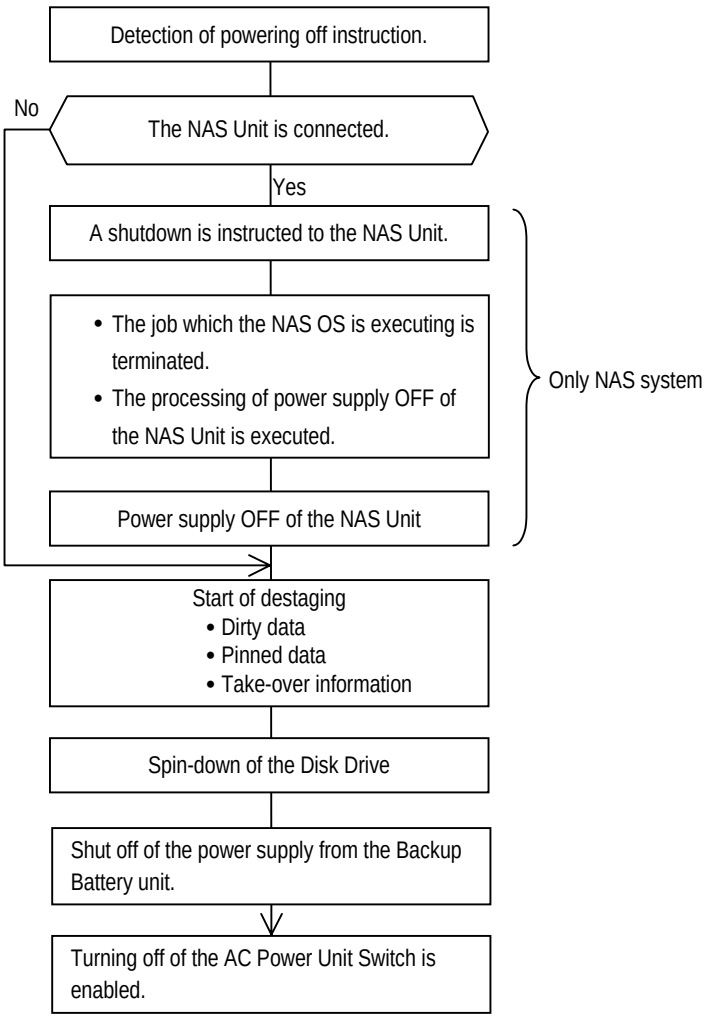

Figure 4.1.3 Flow Chart of Sequential Shutdown

4.2 Data Format

Figure 4.2.1 shows the data format.

To the sub-block, the check code the address assurance code (LA), write sequence (WR_SEQ), reserve (RSV) and data assurance code (LRC), is added.

The physical format on the physical disk is that recorded in the data field in units of 520 bytes.

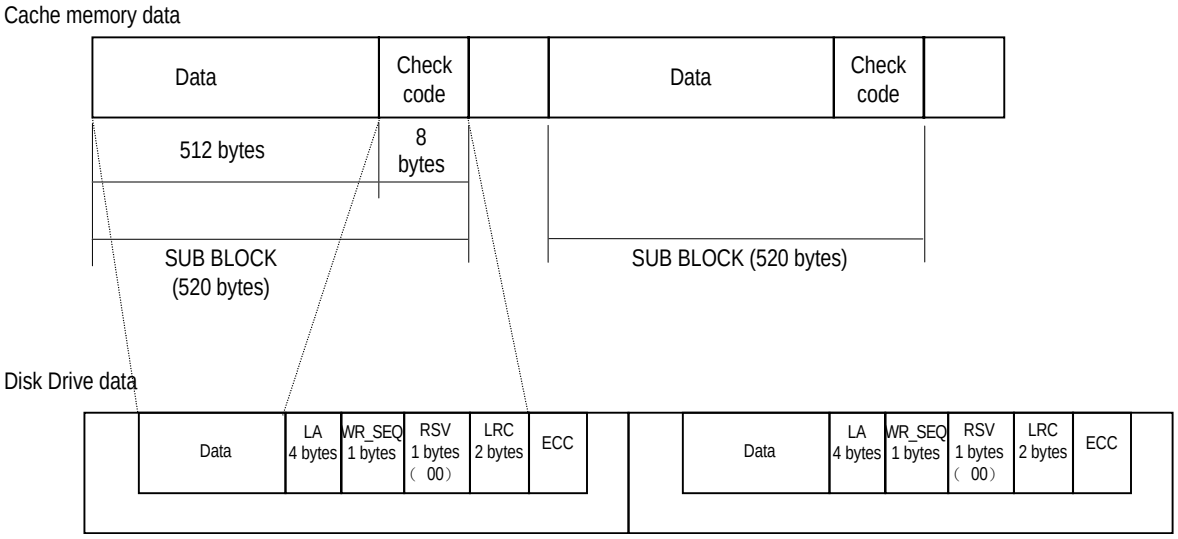

Figure 4.2.1 Data Format

Copyright © 2005, Hitachi, Ltd.

4.3 Read/Write Operation

4.3.1 Command execution

In the subsystem, all R/W commands are executed via the Cache memory.

- When the data is on the Cache memory at reading, the data on the Cache memory is transferred to the host computer (Read hit processing). The data when the NAS Unit is connected is transferred to the host computer via the NAS Unit.
- Only when the data is not on the Cache memory at reading, the data is transferred to the host computer directly from the Disk Drive (Read miss processing). The data when the NAS Unit is connected is transferred to the host computer via the NAS Unit. The data is left in the Cache memory then, the read hit operation can be performed at the time of the next reading.
- To improve the responding performance of the write processing, the write-after processing that returns the completion report to the host computer when the data writing to the Cache memory is completed is performed. When the NAS Unit is connected, a completion report is returned to the host computer via the NAS Unit. After that, the Controller generates the parity and writes the data on the Disk Drive asynchronously.
- Data in the Cache memory is backed up by batteries. Thus, a data loss caused by a power failure, etc. can be prevented.
- The Write-Through means the operation to write the write data to the Disk Drive and respond to the host computer immediately after the subsystem received the write data from the host computer.
  Therefore, the response time of the command to the host computer delays when the subsystem executes the Write-Through.
  When the NAS Unit is connected, the completion report is returned to the host computer via the NAS Unit.
  The conditions that the subsystem executes the Write-Through are as follows.
  - When the LU Cache warning of the system parameter is disable (default) and the subsystem receives the write data in the PIN area
  - When the write special response mode of the system parameter is enable (However, the write command for the LUs of RAID 1 and RAID 1+0 are excluded.)
  - When the forced write through mode of the system parameter is valid and a blockade of the Control Unit (it is not this condition in the single controller configuration) or a power unit failure occurred.
  - When the Backup Battery Unit (ASSY) that can operate normally is lost
  - When a failure occurs in the battery backup circuit (except when the Control Unit is blocked)

Data flows are shown in Figure 4.3.1.

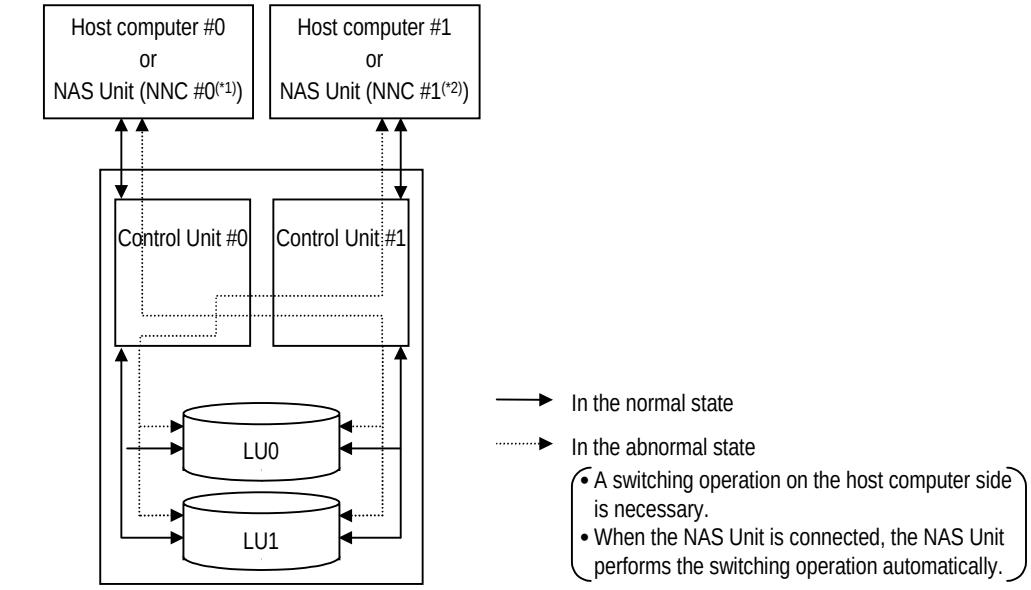
4.3.2 Dual system configuration

(1) Feature of dual system



(a) The flexible system can be configured by virtue of the two Control Units installed.
This allows the system configuration, which fits the host computer operation, to be provided.
For details, refer to Item (2), "Dual system configuration".

(b) Data is duplicated and written on the Cache memories on the two Control Units respectively.
The duplication makes it possible to continue the operation and assure user data even when a Controller failure occurs.

(2) Dual system configuration

The Dual Active mode makes the two controllers operate in parallel.
In this system configuration, it allocates the controlled LU to each Control Unit. For the method of accessing to the LU, which is not controlled, from the Control Unit, there are two ways, "reallocating to the Control Unit in charge of the LU" and "requesting to the Control Unit in charge of the LU", and it is determined by the access frequency of each Control Unit.

In the Dual system configuration, it executes the processing by requesting it to the Control Unit in charge of the LU when accessing to the LU, which is not controlled, from the Control Unit.
If no access is made from the controller that controls the LU within one minute, however, re-assignment of the LU to the controller is made.
Incidentally, when one of the dual controller attempts to access an LU that is out of its control, the performance will be lowered because it accomplished the access by making a request to another controller that controls the LU for the access.

*1 : In the case of the RKH, NNC #1.
*2 : In the case of the RKH, NNC #3.

Figure 4.3.2 System Configuration

4.4 Cache Memory Control

4.4.1 Purpose of Cache memory

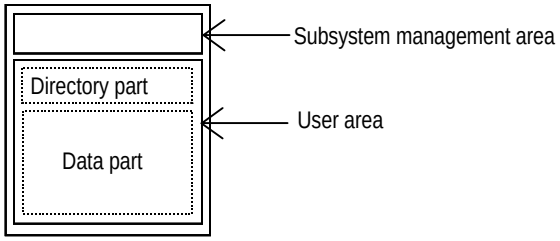
(1) Mitigation of the write penalty (overheads for generating the parity which is unique to RAID) that accompanies the write-after operation
The write data received here is nonvolatile with the batteries to prevent the data loss due to the power failure before it is written in the Disk Drive. Also, the write data is double written in the Cache memories of both Control Units, and the data loss can be prevented at the time of a Control Unit failure by becoming the dual controller configuration (optional).

(2) Speed-up of sequential reading operation by means of pre-fetch
The reading performance is enhanced as follows. The subsystem studies the received commands and when it perceives that it is receiving read commands to read data from continuous addresses, it executes the pre-fetch operation to read the next read data from a Disk Drive before receiving the next read command. Thus the subsystem makes it possible to read from the cache memory when it receives the read command from a host.

(3) Faster sequential read operation
Performance of the sequential read operation is improved through impounding some amount of write data in the Cache memory at the sequential access and destaging it out to an HDD at once.

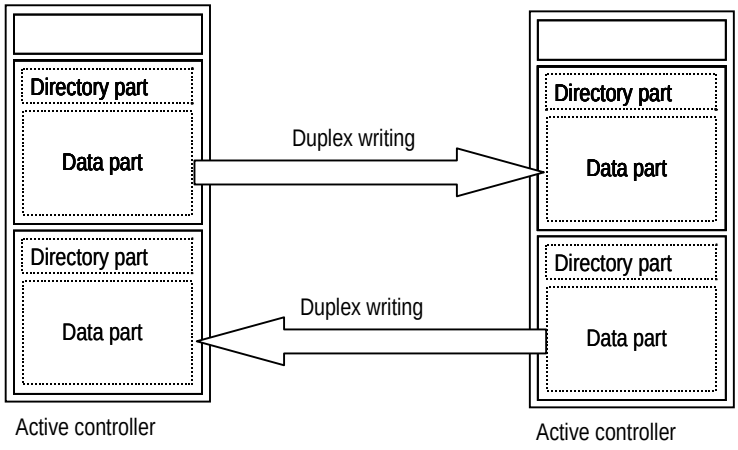
(4) Achieving the cache read hit at executing a highly local job by the LRU algorithm
Further, a one-hundred percent cache hit rate can be realized by virtue of the Cache Residency Manager function (see "4.5 (7) Cache Residency Manager" (THEO 04-0170).).

Copyright © 2005, 2006, Hitachi, Ltd.



4.4.2 Cache memory configuration

The cache memory consists of the following components.



- Subsystem management area
- Directory part
- Data part

The cache memory configuration corresponding to each subsystem configuration is shown below.

a. For the single controller configuration

b. For the dual controller configuration (in the Dual Active mode)

Copyright © 2005, Hitachi, Ltd.

4.4.3 Cache memory structure

(1) Cache memory structure

The Cache memory consists of a directory section for controlling data and a data section for storing user data.

(2) Data part

The data in the Cache memory is controlled by dividing it into the segments with the fixed length of 16 k bytes (a default value). However, when the Cache Partition Manager function is used, the segment length can be changed to 4 k bytes or 8 k bytes. Also, the segment length can be changed to any of 64 k bytes, 256 k bytes or 521 k bytes in the microprogram revision 0733/A-x or more.

The minimum unit of data is sub-block (logical block of 512 bytes). When the segment length is 16 k bytes, one segment is 32 sub-blocks. Data storage is done in units of sub-block.

When a command to write data of one logical block (512 bytes) is received, for example, a segment is secured and the received write data is stored in one of the sub-blocks in the segment. The data area is also used as a work area while of the parity generation.

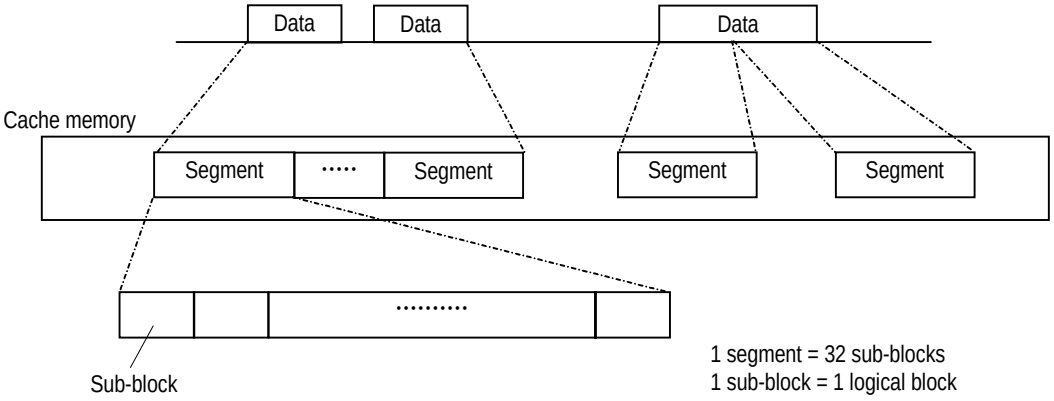


Figure 4.4.1 Data Structure in Cache Memory

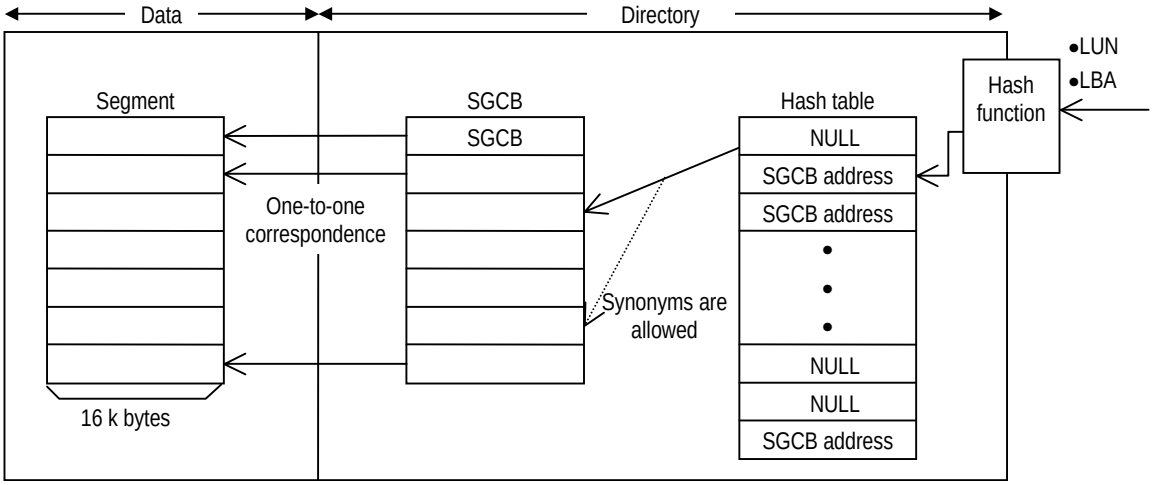
Copyright © 2005, 2006, Hitachi, Ltd.

(3) Directory part

The directory consists of a hash table for deciding hit or miss and SGCBs for controlling the segments. The SGCB has a one-to-one correspondence with the segment and has a pointer to the segment concerned and information regarding the status of the segment concerned.
The hash table stores the segment management information addresses.
When the segment management information is NULL, an error is occurs.



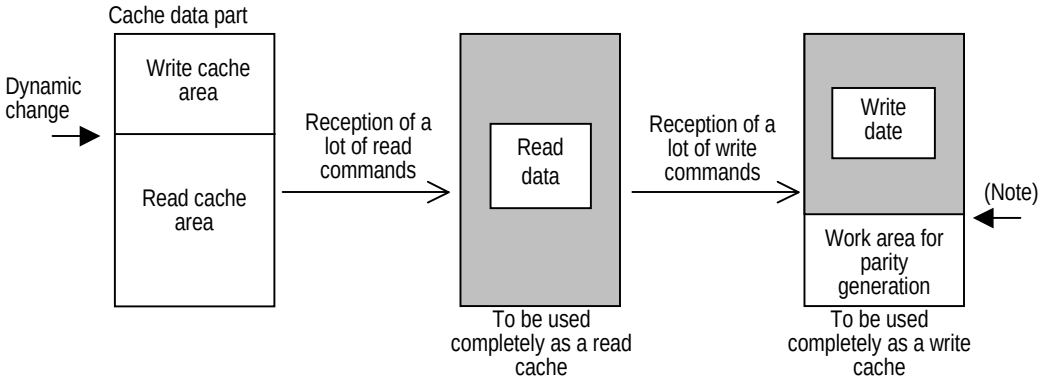


Figure 4.4.2 Control Structure in Cache Memory

Copyright © 2005, Hitachi, Ltd.

4.4.4 Basic operation of cache control

The following dynamic optimizing operation is performed in the cache control.

(1) Dynamic optimization of read/write cache area assignment
The read and write cache areas are not fixed but dynamically assigned according to an I/O instruction from a host.

NOTE : No wider write cache data area than the threshold value is assigned in order to secure the area for parity generation.

(2) Dynamic optimization of destaging algorithm
The optimum destaging algorithm is selected automatically according to a writing pattern given by a host computer. (Refer to Subsection "4.4.5 Destaging operation" (THEO 04-0140).)

(3) Dynamic optimization of staging algorithm
The optimum staging algorithm is selected automatically through a study of a read command issued by a host computer. (Refer to Subsection "4.4.6 Staging operation (Writing to the Cache memory)" (THEO 04-0150).)

Copyright © 2005, Hitachi, Ltd.

4.4.5 Destaging operation

Write data transferred from a host computer is stored in the cache memory and written to a Disk Drive asynchronously. This operation to write data to a Disk Drive asynchronously is called destaging operation.

In the destaging operation, random and sequential accesses are discriminated and written to a Disk Drive in a way optimum for each of them.

(1) Destaging of random data

Data is destaged in units of LBA. Old data and its parity to be destaged are staged from a disk. A new parity is generated from new data, the old data, and the old parity and then the new data and new parity are destaged in units of LBA.

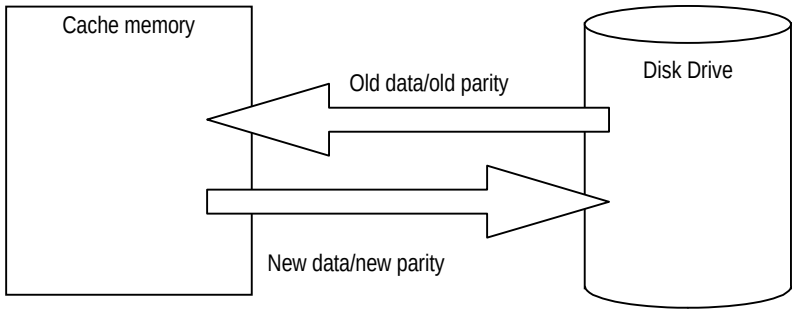

Figure 4.4.3 Destaging of Random Data

(2) Destaging of sequential data

Data is destaged in units of stripe. A new parity is generated from write data, and then new data and the new parity are destaged in units of stripe.

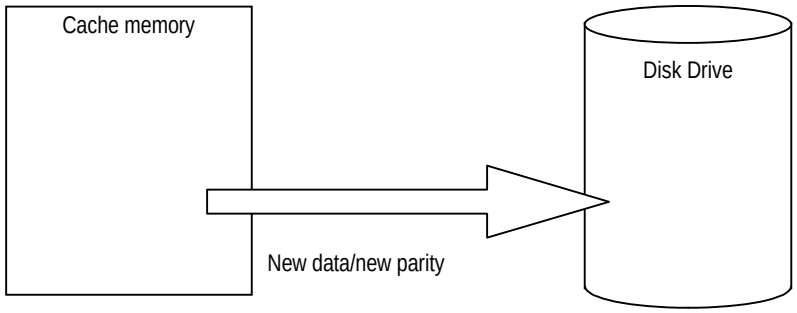

Figure 4.4.4 Destaging of Sequential Data

Copyright © 2005, Hitachi, Ltd.

4.4.6 Staging operation (Writing to the Cache memory)

(1) Random reading

The LRU (Least Recently Used) method is used for assigning the Cache memory to improve the hit rate.

(2) Sequential reading

According to the learning of received commands, in case of a command to read back data from consecutive addresses is received, a pre-fetch read data from the next area of the HDD is performed prior to the following read command. When the following read command is received, the data is read back from the Cache memory, so that the read performance is improved.

4.5 Optional Functions

(1) ShadowImage in-system replication

This subsystem provides the ShadowImage in-system replication function as an optional function.

To use the ShadowImage in-system replication, the P-002D-J311 (the P-002D-J311W for RKS/RKXS) is required separately.

The ShadowImage in-system replication controls LU copying done within one and the same subsystem. It can create a copy (secondary volume) of an LU within one and the same subsystem keeping the redundancy that the source LU (primary volume) has.

(For the details, refer to the manual supplied with the P-002D-J311 or the P-002D-J311W.)

(2) TrueCopy remote replication

The subsystem provides the TrueCopy remote replication as an optional function. To use the TrueCopy remote replication, the P-002D-J312 (the P-002D-J312W for RKS/RKXS) is required separately.

The TrueCopy remote replication supports the mode, in which data of disk subsystems connected via the Fibre Channel interface are equalized, by always synchronizing their data. Besides, the function makes the copying speed higher by transferring differential data only.

(For the details, refer to the manual supplied with the P-002D-J312 or the P-002D-J312W.)

(3) TrueCopy Extended Distance (‡1)

The subsystem provides the TrueCopy Extended Distance as an optional function. To use the TrueCopy Extended Distance, the P-002D-J315 is required separately.

TrueCopy Extended Distance supports the mode, in which data of disk subsystems connected via the Fibre Channel interface are equalized, by always synchronizing their data periodically. Besides, the function makes the copying speed higher by transferring differential data only.

(For the details, refer to the manual supplied with the P-002D-J315.)

(4) Copy-on-write SnapShot

This subsystem provides the Copy-on-write SnapShot as an optional function.

To use the Copy-on-write SnapShot, the P-002D-J310 (the P-002D-J310W for RKS/RKXS) is required separately.

Copy-on-write SnapShot is a function to internally retain a logical duplication of the primary volume data at the time of the command instruction.

Copy-on-write SnapShot can create up to 14 duplication volumes per primary volume and manage data in two or more generations within the disk subsystem.

(For the details, refer to the manual supplied with the P-002D-J310 or the P-002D-J310W.)

(5) Data Retention Utility

This subsystem provides the Data Retention Utility as an optional function.

To use the Data Retention Utility, the P-002D-J309 (the P-002D-J309W for RKS/RKXS) is required separately.

Data Retention Utility is an option for protecting a logical unit (LU) against an illegal access from a host computer by setting an access attribute to LU.

(For the details, refer to the manual supplied with the P-002D-J309 or the P-002D-J309W.)

‡1 : This is supported in the microprogram revision 0735/A or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(6) LUN Manager

The subsystem provides the LUN Manager as an optional function.
To use the LUN Manager, the P-002D-J308 (the P-002D-J308W for RKS/RKXS) is required separately.
The LUN Manager enables the subsystem to make a suitable response to each connected host even within the same port by grouping the connected hosts within a port and setting the logical unit mapping and the Host Connection mode for each host group.
(For the details, refer to the manual supplied with the P-002D-J308 or the P-002D-J308W.)

(7) Cache Residency Manager

This subsystem provides the Cache Residency Manager as an optional function.
To use the Cache Residency Manager, the P-002D-J305 is required separately.
The Cache Residency Manager to make the data of the specified LU resident in the Cache memory installed in the Control Unit, and to execute all the accesses from the server related to the LU concerned by cache hit without generating any access of the Disk Drive.
(For the details, refer to the manual supplied with the P-002D-J305.)

(8) SNMP Agent Support Function

This subsystem provides the SNMP Agent Support Function as an optional function.
To use the SNMP Agent Support Function, the P-002D-J303 is required separately.
The SNMP Agent Support Function reports occurrences of failure to the workstation for monitoring the network via the SNMP (Simple Network Management Protocol) of the open platform. It reports conditions of command operation (such as a number of command receptions and number of cache hits) of the disk array subsystem.
It enables you to refer to the conditions of command operation depending on a type of access from a host and you can utilize it as information for tuning subsystem performance.
(For the details, refer to the manual supplied with the P-002D-J303.)

(9) LUN Expansion

This subsystem provides the LUN Expansion as an optional feature.
To use the LUN Expansion, the P-002D-J304 is required separately.
The LUN Expansion is that to expand a size of an LU (volume) accessed by a host computer by combining LUs (volumes) internally.
(For the details, refer to the manual supplied with the P-002D-J304).

(10) Password Protection

The subsystem provides the Password Protection as an optional function.
To use the Password Protection, the P-002D-J302 is required separately.
The Password Protection prevents any DF700 from being concurrently accessed by users by limiting users of Storage Navigator Modular to be permitted to access the DF700. It can suspend the information provided from the DF700 to the user who has no access authority, and avoid the case that two or more users update the configuration information at the same time.
(For the details, refer to the manual supplied with the P-002D-J302.)

Copyright © 2005, 2006, Hitachi, Ltd.

(11) Performance Monitor

This subsystem provides the Performance Monitor as an optional function.
To use the Performance Monitor, the P-002D-J306 is required separately. Performance Monitor acquires information on performance of the subsystem and utilization rates of resources. Further, the information acquired is displayed with line graphs in the Monitor. (For the details, refer to the manual supplied with the P-002D-J306.)

(12) Cache Partition Manager

The subsystem provides the Cache Partition Manager as an optional function. To use the Cache Partition Manager, the P-002D-J307 is required separately.
Cache Partition Manager is a function to tune the cache memory and has the following functions. (For the details, refer to the manual supplied with the P-002D-J307.)

- A function to partition the cache memory and to make each LU's domain exclusive
- A function to be able to change the segment length from 16 k bytes of a default value to 4 k bytes or 8 k bytes for each partition to the partitions other than the master partitions
  It can also be changed to 64 k bytes, 256 k bytes or 512 k bytes in the microprogram revision of 0733/A-x or more.
- Function which can change the stripe size from the default value of 64 k bytes to 256 k bytes or 512 k bytes for each LU in the microprogram revision 0733/A-x or more.

(13) NAS Manager Modular 1000 Suite/NAS Manager Modular 500 Suite/NAS Manager Modular 200 Suite/NAS Manager Modular 100 Suite

This subsystem provides the NAS Manager Modular Suite as an optional function.
This function is supported in the microprogram revision 0726/A-x or more for the RKM/RKS/RKXS and in the microprogram revision 0732/A-H or more for the RKH.
To use the NAS Manager Modular Suite, the P-9P13-J8D00S(RKH)/P-9P13-J8D01S(RKM)/P-9P13-J8D02S(RKS)/P-9P13-J8D03S(RKXS) are required separately.
The NAS Manager Modular Suite is the utility bringing the four functions such as the NAS Data Control Modular, the NAS File Sharing Modular, the NAS Manager Modular and the NAS Sync Image Modular together.

- NAS Data Control Modular
  The NAS Data Control Modular is a function to achieve the interface of the NAS OS and the Disk Drive control processor among the NAS OS programs.
- NAS File Sharing Modular
  This means the basic functions such as the kernel of the NAS OS, the file system, the file sharing, etc. among the NAS OS programs.
  These functions are bundled with the NAS Manager Modular Suite free of charge.
- NAS Manager Modular
  The NAS Manager Modular is a function to achieve the operation, control, and failure monitoring of the NAS Modular system (for the details, refer to the manual supplied with the P-9P13-J8D00S(RKH)/P-9P13-J8D01S(RKM)/P-9P13-J8D02S(RKS)/P-9P13-J8D03S(RKXS)).
- NAS Sync Image Modular
  The NAS Sync Image Modular is a function to create the snapshot to be able to recover the data to the past status even if the client erroneously changed the data of the file system shared in the NAS Modular system (for the details, refer to the manual supplied with the P-9P13-J8D00S(RKH)/P-9P13-J8D01S(RKM)/P-9P13-J8D02S(RKS)/P-9P13-J8D03S(RKXS)).

Copyright © 2005, 2006, Hitachi, Ltd.

(14) NAS Backup Restore Modular

This subsystem provides the NAS Backup Restore Modular as an optional function.
This function is supported in the microprogram revision 0726/A-x or more for the RKM/RKS/RKXS and in the microprogram revision 0732/A-H or more for the RKH.
To use the NAS Backup Restore Modular, the P-9P13-J8D004/P-9P13-J8D014/P-9P13-J8D024/P-9P13-J8D034 are required separately.
The NAS Backup Restore Modular is a function to protect the data shared in the NAS Modular system.
The NAS Backup Restore provides the following functions to protect the data.

- Snapshot function
- Backup/restore function
- Remote copy function

By using each function, the data can be reproduced at the file system level irrespective of the operating conditions of the application (for the details, refer to the manual supplied with the P-9P13-J8D004/P-9P13-J8D014/P-9P13-J8D024/P-9P13-J8D034).

(15) NAS Anti Virus Agent Modular

This subsystem provides the NAS Anti Virus Agent Modular as an optional function.
This function is supported in the microprogram revision 0726/A-x or more for the RKM/RKS/RKXS and in the microprogram revision 0732/A-H or more for the RKH.
To use the NAS Anti Virus Agent Modular, the P-9P13-J8D005/P-9P13-J8D015/P-9P13-J8D025/P-9P13-J8D035 are required separately.
The NAS Anti Virus Agent Modular is a function to check the Virus of the data sent from the CIFS client (for the details, refer to the manual supplied with the P-9P13-J8D005/P-9P13-J8D015/P-9P13-J8D025/P-9P13-J8D035).

(16) Modular Volume Migration

This subsystem prepares Modular Volume Migration as an optional function.
P-002D-J316 (the P-002D-J316W for RKS/RKXS) is separately required to use Modular Volume Migration.
Modular Volume Migration is a function to transfer the LU to other RAID groups in the disk array subsystem with the Read operation and the Write operation from the host continued.
This function is supported in the microprogram revision 0760/A-x or more (refer to the attached manual of P-002D-J316 or the P-002D-J316W for more details).

(17) Account Authentication

This subsystem prepares Account Authentication as an optional function.
P-002D-J317 is separately required to use Account Authentication.
Account Authentication controls the login authentication to the array subsystem and the access to the subsystem resource by using the account information that the user registered beforehand. The user ID, the password, and the information on the roll classification are included in the account information, and the login authentication is performed with the user ID and the password, and right or wrong of the update setting and the information reference to each resource of the subsystem is decided by the roll classification.

Copyright © 2005, 2006, Hitachi, Ltd.

Therefore, the illegal access to the DF700 can be prevented (refer to the attached manual of P-002D-J317 for more details).

Copyright © 2005, 2006, Hitachi, Ltd.

(18) Audit Logging

This subsystem prepared Audit Logging as an optional function.
P-002D-J318 is separately required to use Audit Logging.
Audit Logging is a function to generate the log of the event when the user performs the setting operation, configuration change, etc. for the DF700.
The log is generated in the syslog form, and it is immediately output to the server for syslog that the user set (refer to the attached manual of P-002D-J318 for more details).

(19) Power Saving

This subsystem prepares Power Saving as an optional function.
P-002D-J319 is separately required to use Power Saving.
Power Saving is the function to reduce the electric power consumption of the DF700 by spinning down (rotation stop of the Disk Drives) the Disk Drives which configure the RAID Group that the user specified (refer to the manual attached to P-002D-J319 for the details).

Copyright © 2005, 2006, Hitachi, Ltd.

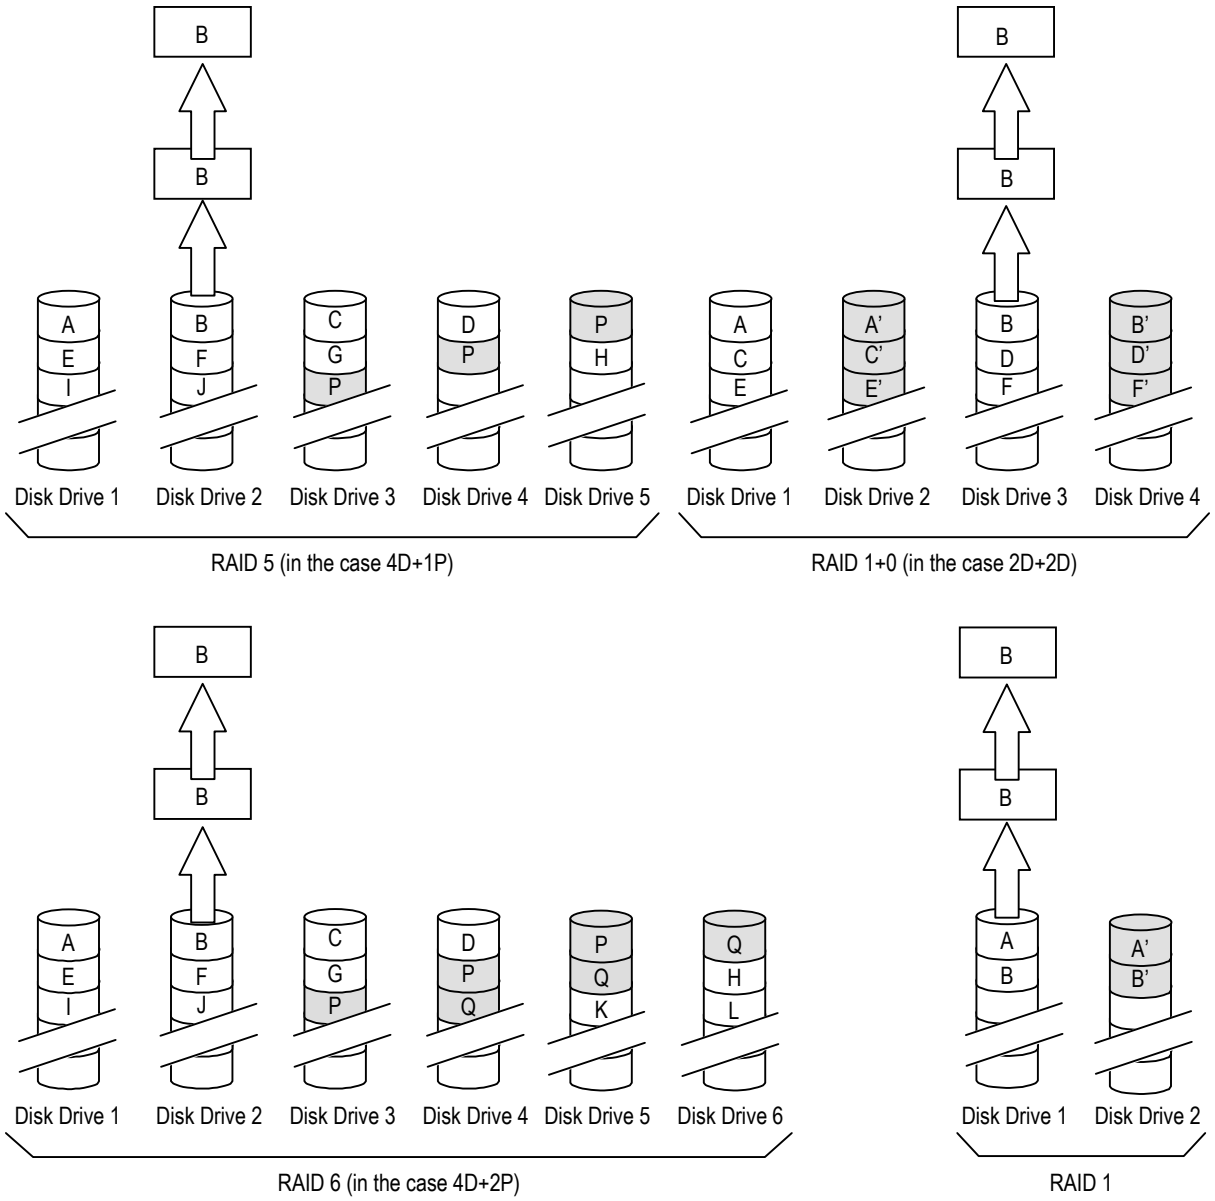
4.6 Operation Against Disk Failure Occurs

(1) I/O operation against Disk Drive failure

In the subsystem with the RAID1, RAID5, or RAID1+0 configuration, even when a failure occurs in one Disk Drive and data cannot be read from it, the target data can be recovered by means of using data on the other normal Disk Drives.

In the case of RAID1 and RAID1+0, data on the mirror Disk Drive is used, and in the case of RAID5, data on the other Disk Drive on the same stripe is used. By means of these measures, even when a Disk Drive failure occurs, reading/writing can be done as before.

Even when failures occur in two Disk Drives at the same time and reading from them becomes impossible, the RAID 6 configuration can restore the data concerned utilizing data stored in normal Disk Drives.



In the RAID 6 configuration, each Disk Drive utilizes data in the other Disk Drives in the same stripe. If failures occur in two Disk Drives, reading/writing can be done in the same way as before the failures by virtue of the above.

Figure 4.6.2 shows the outline of the data reading operation performed when a Disk Drive failure occurs.

(2) Data assurance when a disk failure occurs

The subsystem can have a Spare Disk (s) optionally. Data on a Disk Drive which is blocked owing to its failure or a Disk Drive in which a number of error occurrence has exceeded the specified value is automatically reconstructed on the Spare Disk.

The data to be copied on the Disk Drive to restructure data in the Spare Disk Drive is the data on the logical unit which an LU format is already completed.

This operation is performed in the background without making the host computer conscious of it, so that I/O request can be accepted continuously. When the failed Disk Drive is replaced, the data saved on the Spare Disk is copied to the new Disk Drive.

The data recovery processing to the Disk Drive of the Dynamic sparing function, Correction copy function and Copy back function operates to one set of the Disk Drives. After the data recovery to one set of the Disk Drives is completed, the data recovery is started to one another set. Also, these three functions do not operate at the same but serve as operation of the order of ① Correction copy function, ② Copy back function, and ③ Dynamic sparing function. For example, when two sets of the Disk Drives are blocked in the RAID Group of the RAID level 6, the Correction copy function does not recover two sets of the blocked data at the same time, but recovers one set at a time.

(a) Dynamic sparing

Errors which occur during ordinary reading/writing operation are controlled for each Disk Drive. When a number of error occurrences of a Disk Drive exceeds the specified value, data on the Disk Drive is automatically copied onto the Spare Disk because it is determined that there exists a risk that a failure (an uncorrectable error) will occur in the Disk Drive. This function is called a dynamic sparing function.

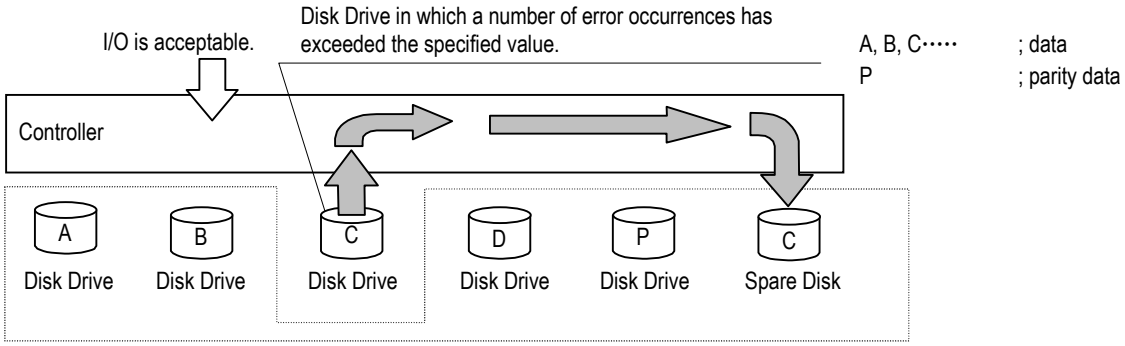

Figure 4.6.3 Dynamic Sparing

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Correction copy

In the subsystem with the RAID 5 and RAID 6 configuration, when a failure occurs in a Disk Drive and data reading/writing from on it cannot be done, the data on the failed Disk Drive is restored using those on the other data Disk Drives and the parity Disk Drive, and then copied onto the Spare Disk. In the subsystem with the RAID 1 or RAID 1+0 configuration, when the same situation as above occurs, data on the mirror Disk Drive is copied onto the Spare Disk. In the RAID 0 configuration, the correction copy cannot be done.

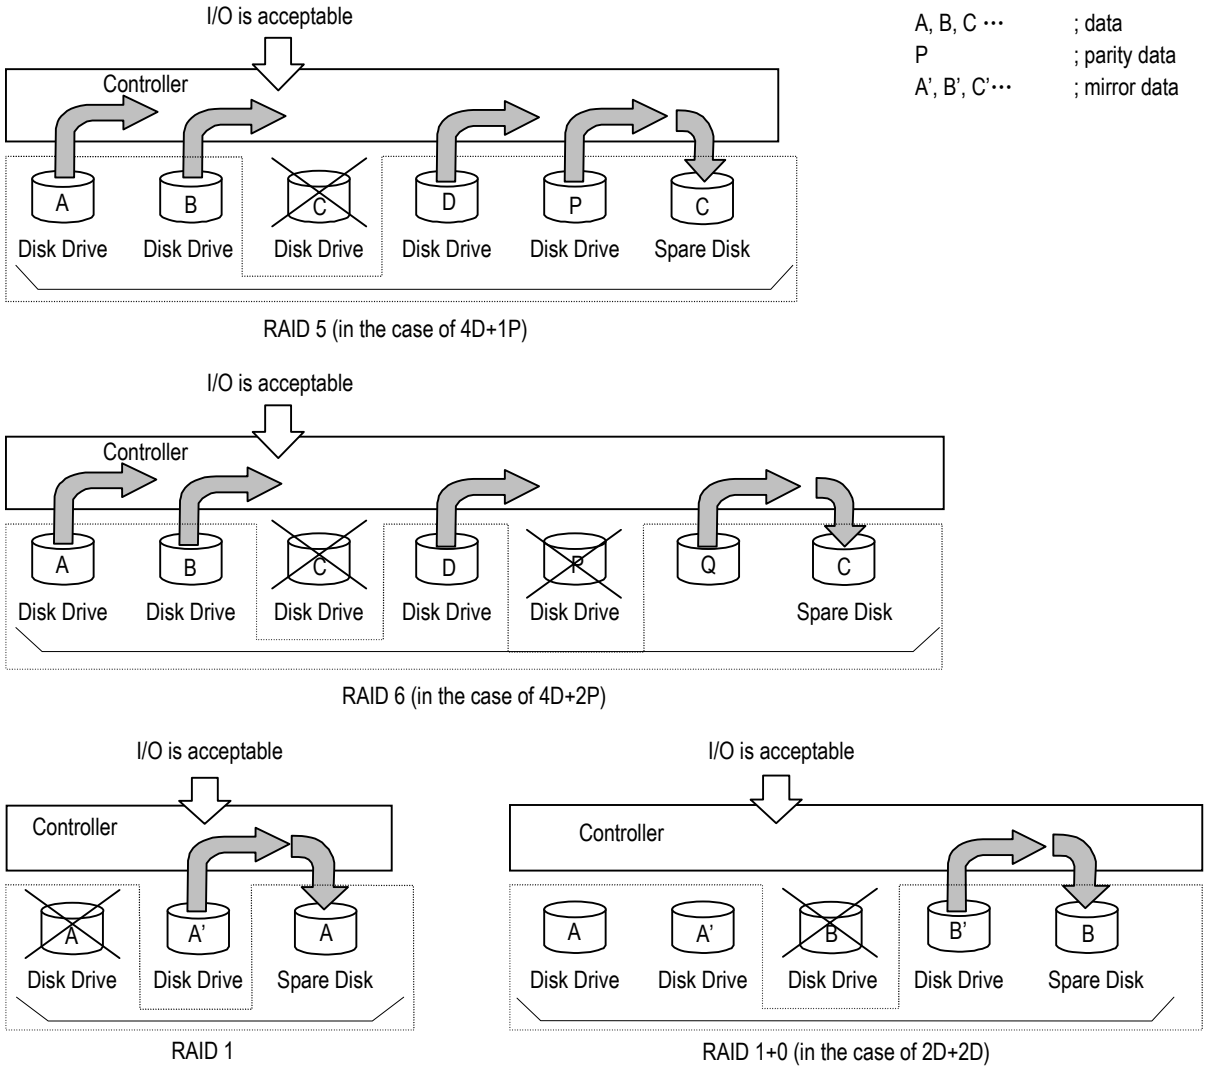

Figure 4.6.4 Correction Copy

Copyright © 2005, Hitachi, Ltd.

(3) Operation after replacing the failed Disk Drive

Copy back is the processing returned to the original status by copying the data in the Spare Disk to the replaced Disk Drive after replacing the failed Disk Drive when the data is reconstructed in the Spare Disk Drive by the dynamic sparing or the correction copy.

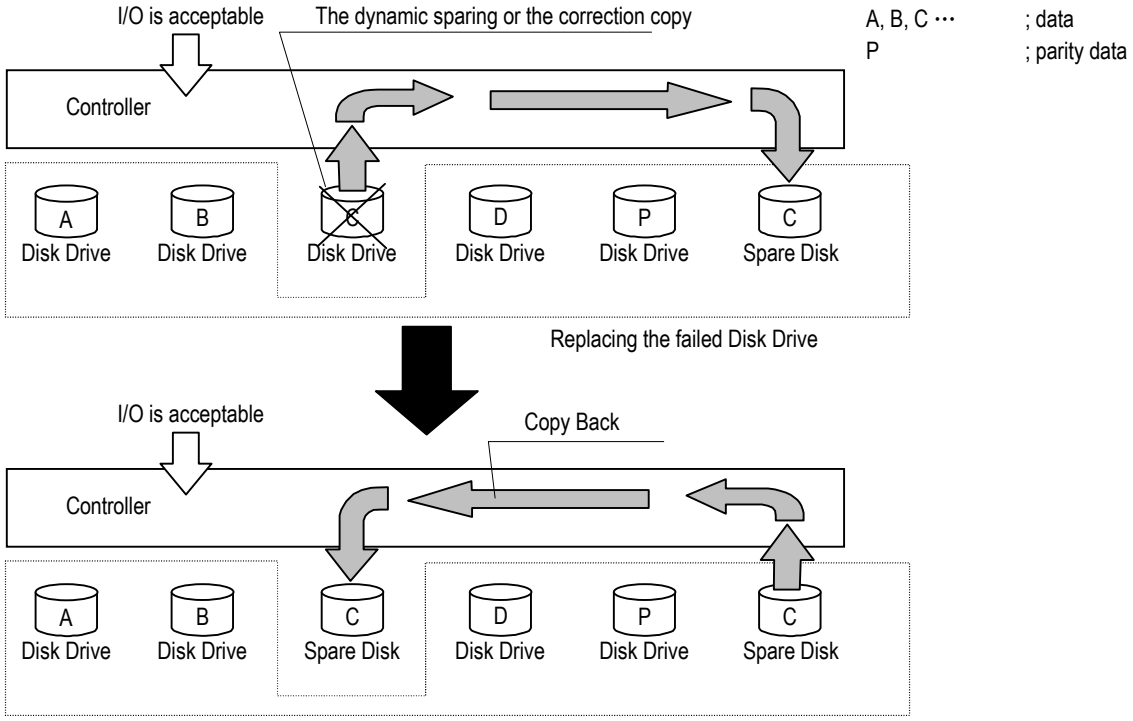

Figure 4.6.5 Copy back

The Copy back may or may not operate depending on the relationship among the setting value of "Spare Drive", the Spare Disk which recovered the data, and the failed Disk Drive.
The setting value of "Spare Drive" and the operation specification are shown in Table 4.6.1.

Copyright © 2005, 2006, Hitachi, Ltd.

Table 4.6.1 Setting of "Spare Drive" and the Operation Specification (FC Disk Drive)

The first parameter (Spare Drive)	The second parameter (Applying No Copy back Mode on All the Units)	Operation specification
Fixing (Fixed)	-	If the failed Disk Drive is replaced, the data saved in the Spare Disk Drive is copied back to the replaced Disk Drive (refer to Figure 4.6.5). The location of the Disk Drive which configures the RAID Group never changes from the time of creating the RAID Group. Therefore, this parameter is set when fixing the location of the Disk Drive which configures the RAID Group.
Variable (Variable)(*1) (This is set in default.)	Microprogram revision less than 0740/C	
	-	Although the dynamic sparing or the correction copy is completed, the data saved in the Spare Disk Drive is not copied to the replaced Disk Drive if the capacity and the rotational speed of the failed Disk Drive and the Spare Disk Drive which recovered the data are the same and both of them are not the Disk Drives of the RKA. The Copy backless operates because the replaced Disk Drive becomes a new Spare Disk Drive (refer to Figure 4.6.7). In the following cases, the Copy backless does not operate, and the Copy back surely operates after replacing the failed Disk Drive. •- When the capacity or the rotational speed of the failed Disk Drive and the Spare Disk Drive which recovered the data differs • When either of the failed Disk Drive and the Spare Disk Drive which recovered the data is the Disk Drive of the RKA
	Microprogram revision 0740/C or more	
	Disable (Default)	The operation specification is the same as the one of the microprogram revision less than 0710/C.

*1 : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

Copyright © 2006, Hitachi, Ltd.

The first parameter (Spare Drive)	The second parameter (Applying No Copy back Mode on All the Units)	Operation specification
Variable (Variable) (*1) (This is set in default.)	Microprogram revision 0740/C or more	
	Enable	The Copy backless operates after completing the dynamic sparing or the correction copy when the capacity of the failed Disk Drive and the Spare Disk Drive which recovered the data is the same (refer to Figure 4.6.7). The Disk Drive of the RKA is the target of the Copy backless. When the capacity of the failed Disk Drive and the Spare Disk Drive which recovered the data differs, the Copy backless does not operate, and the Copy back surely operates after replacing the failed Disk Drive. This parameter is set when making the Disk Drive of the RKA a target of the Copy backless. However, it is required to observe the restrictions on the operation shown below when setting this parameter. Basically, observe the operational restriction shown in (a). In an unavoidable case, observe the operational restriction shown in (b). (a) The FC Disk Drive to be installed in the subsystem must be unified to the Disk Drive of the same rotational speed. (b) When the FC Disk Drives whose rotational speeds are different exist in the subsystem, the I/O performance for the FC Disk Drives to be installed in the subsystem, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance must be all designed as the FC Disk Drives of 10,000 min^{-1} rotation. When the FC Disk Drives of 10,000 min-1 rotation and 15,000 min-1 rotation are mixed in the subsystem, if the Copy backless operates, the RAID Group may be configured of the FC Disk Drives of 10,000 min^{-1} rotation and 15,000 min^{-1} rotation. If this condition occurs, the FC Disk Drives of 10,000 min^{-1} rotation are newly added to the Disk Drives which configure the RAID Group even though the RAID Group is created by the FC Disk Drives of 15,000 min^{-1} rotation, and the I/O performance for the LU created in the RAID Group, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance are deteriorated. Also, when the setting is changed to “Invalid”, investigate if there is a RAID Group in which the FC Disk Drives of different rotational speeds are mixed, and check that there is no problem on the I/O performance, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance.
*1 : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.		

Table 4.6.1.1 Setting of “Spare Drive” and the Operation Specification (SATA Disk Drive)

The first parameter (Spare Drive)	The second parameter (Applying No Copy back Mode on All the Units)	Operation specification
Fixing (Fixed)	-	If the failed Disk Drive is replaced, the data saved in the Spare Disk Drive is copied back to the replaced Disk Drive (refer to Figure 4.6.5). The location of the Disk Drive which configures the RAID Group never changes from the time of creating the RAID Group. Therefore, this parameter is set when fixing the location of the Disk Drive which configures the RAID Group.
Variable (Variable) (*1) (This is set in default.)	Disable (Default)	Although the dynamic sparing or the correction copy is completed, the data saved in the Spare Disk Drive is not copied to the replaced Disk Drive if the capacity and the operational condition (720 hours/month operation supported or 330 hours/month operation supported) of the failed Disk Drive and the Spare Disk Drive which recovered the data are the same and both of them are not the Disk Drives of the RKA. The Copy backless operates because the replaced Disk Drive becomes a new Spare Disk Drive (refer to Figure 4.6.7).
	Enable	

Copyright © 2006, Hitachi, Ltd.

*1 : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKXS, the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

Copyright © 2006, Hitachi, Ltd.

(3-1) When "Spare Drive" is fixed

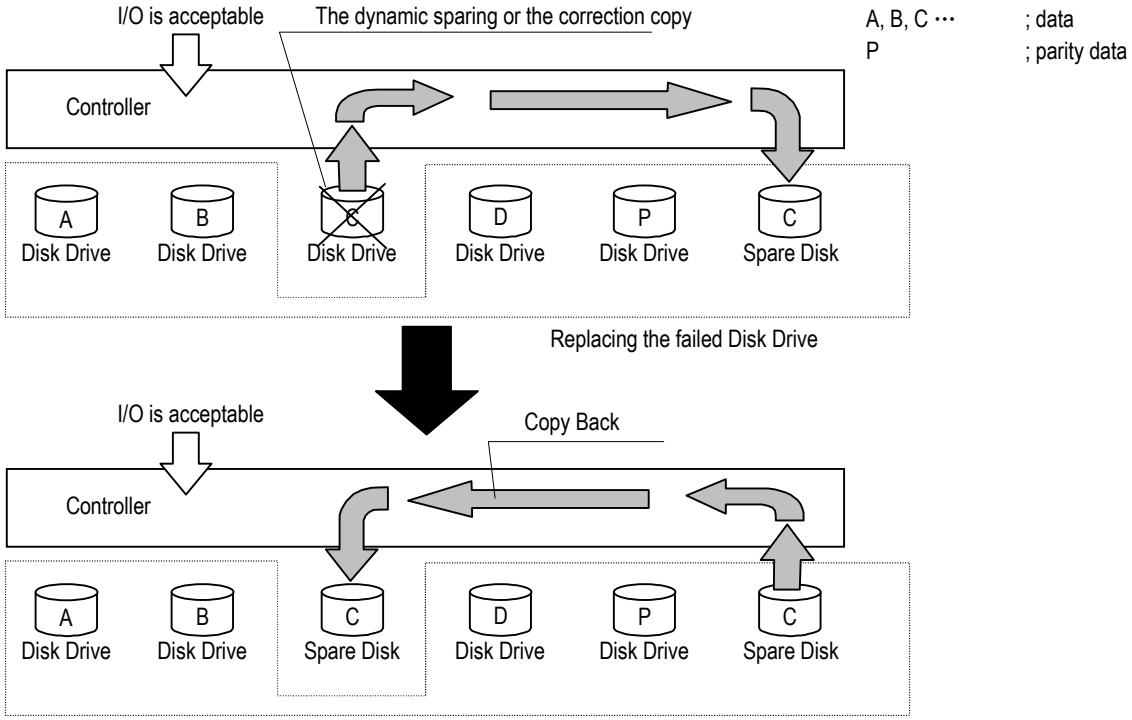

Figure 4.6.6 Copy back

Copyright © 2006, Hitachi, Ltd.

(3-2) When "Spare Drive" is variable

(When "Spare Drive" is variable and "Applying No Copy Back Mode on All the Units" is disabled in the microprogram revision 0740/C or more)

(a) When both of the failed Disk Drive and the Spare Disk Drive are not the Disk Drives of the RKA and the rotational speed, the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive are the same, the Copy backless operates at the time of completing the Disk Drive restoration (the dynamic sparing or the correction copy).

The Copy back does not operate if the failed Disk Drive is replaced.

NOTE : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS/RKXS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

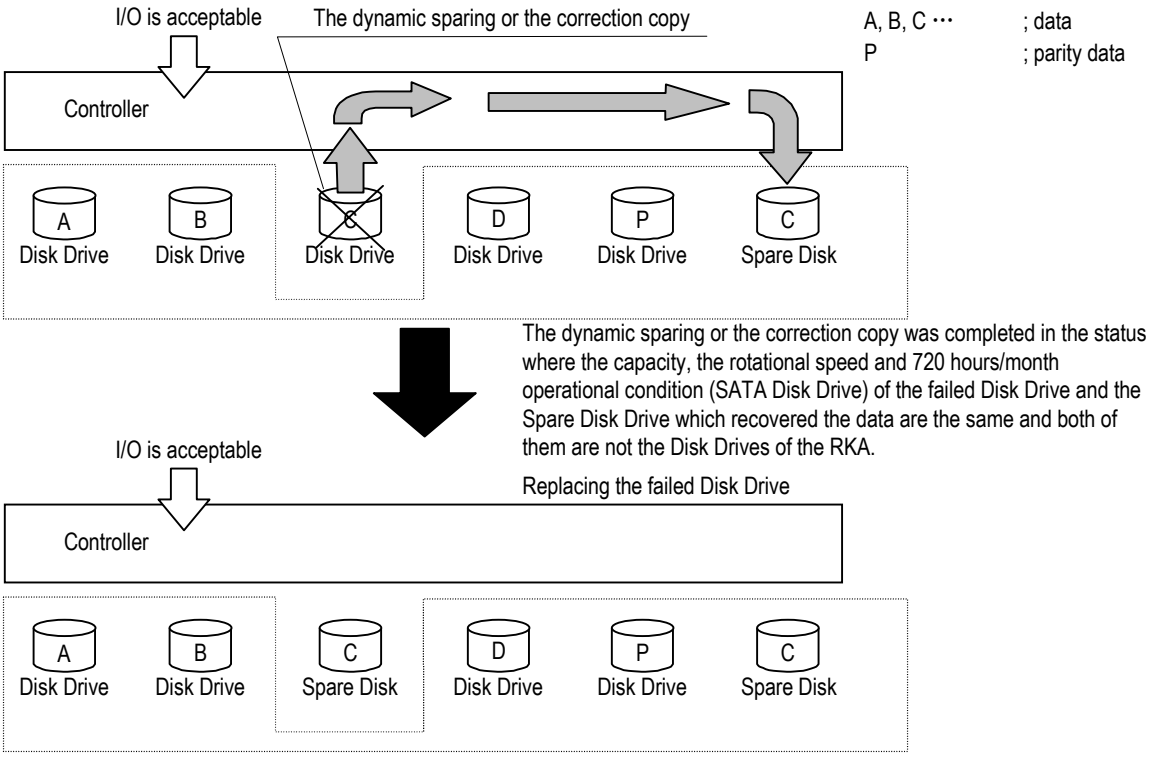

Figure 4.6.7 Copy backless

Copyright © 2006, Hitachi, Ltd.

(b) When either of the failed Disk Drive and the Spare Disk Drive is the Disk Drive of the RKA, or the rotational speed, the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive differ, the Copy backless does not operate and the copy back operates after replacing the failed Disk Drive at the time of completing the Disk Drive restoration (the dynamic sparing or the correction copy).

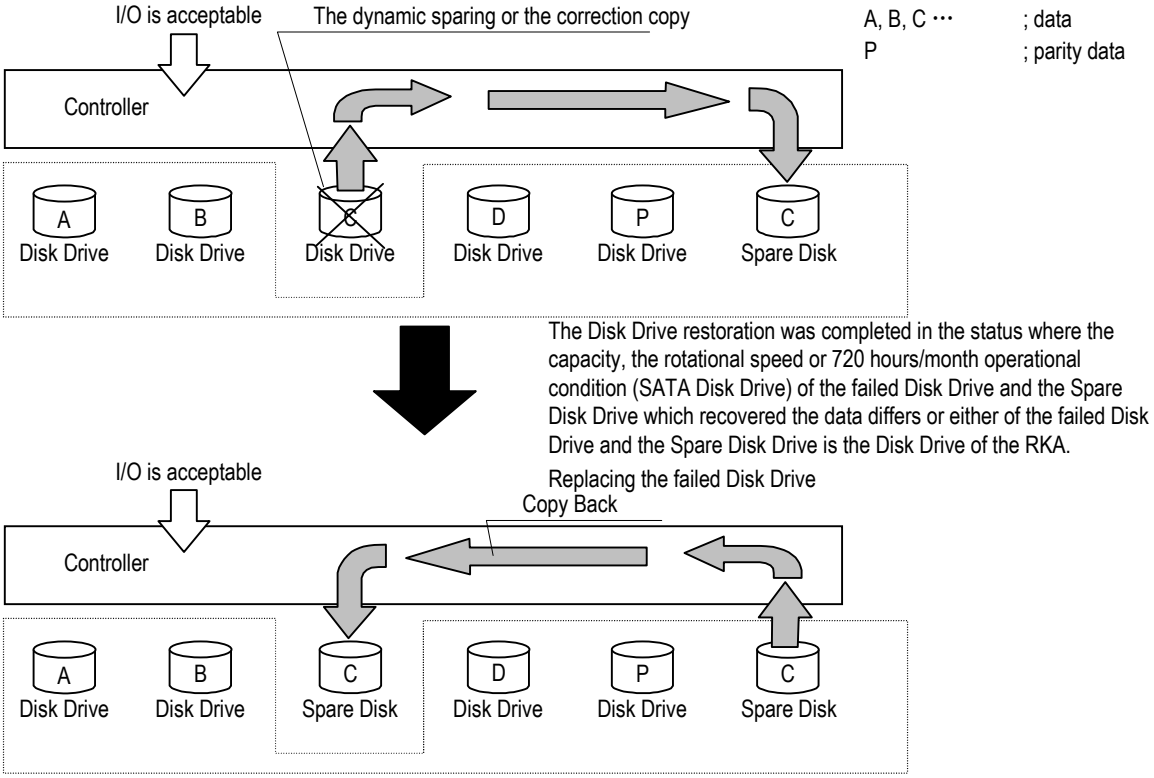

Figure 4.6.8 Copy back

Copyright © 2006, Hitachi, Ltd.

(c) The combination of the failed Disk Drive which becomes the copy backless and the Spare Disk Drive

The Copy backless operates depending on the types of the failed Disk Drive and the Spare Disk Drive and the relation between the rotational speed, the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive.
The relation between the failed Disk Drive and the Spare Disk Drive is shown in Table 4.6.2 to Table 4.6.4.

Table 4.6.2 Availability of the Copy Backless Operation between the Disk Drives of the RKM/RKS/RKAJ

Attribute				Spare Disk				
	Chassis			RKM/RKS/RKAJ				
Failed Disk Drive (FC)	RKM/RKS/RKAJ	Capacity [G bytes]		73		146		300

(3-3) When "Spare Drive" is variable and "Applying No Copy Back Mode on All the Units" is enabled in the microprogram revision 0740/C or more

(a) When the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive is the same, the Copy backless operates and the Copy back does not operate after replacing the failed Disk Drive at the time of completing the Disk Drive restoration (the dynamic sparing or the correction copy).

NOTE : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS/RKXS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

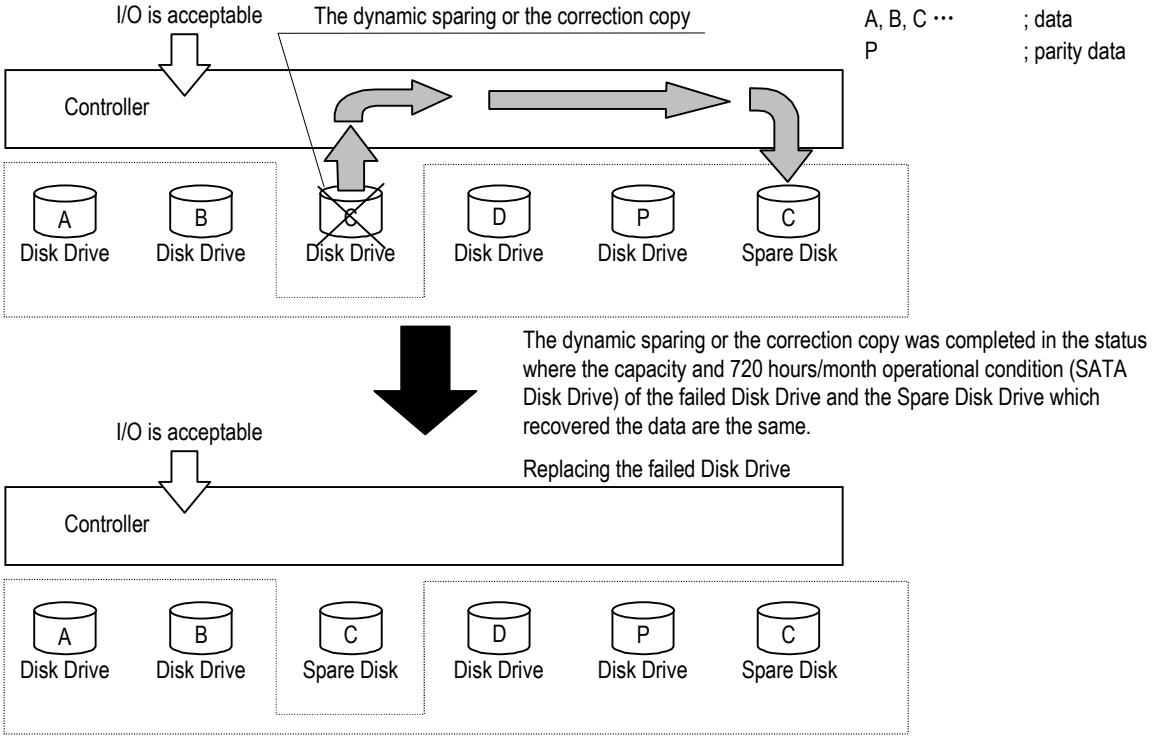

Figure 4.6.9 Copy backless

Copyright © 2005, 2006, Hitachi, Ltd.

(b) When the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive differs, the Copy backless does not operates and the Copy back operates after replacing the failed Disk Drive at the time of completing the Disk Drive restoration (the dynamic sparing or the correction copy).

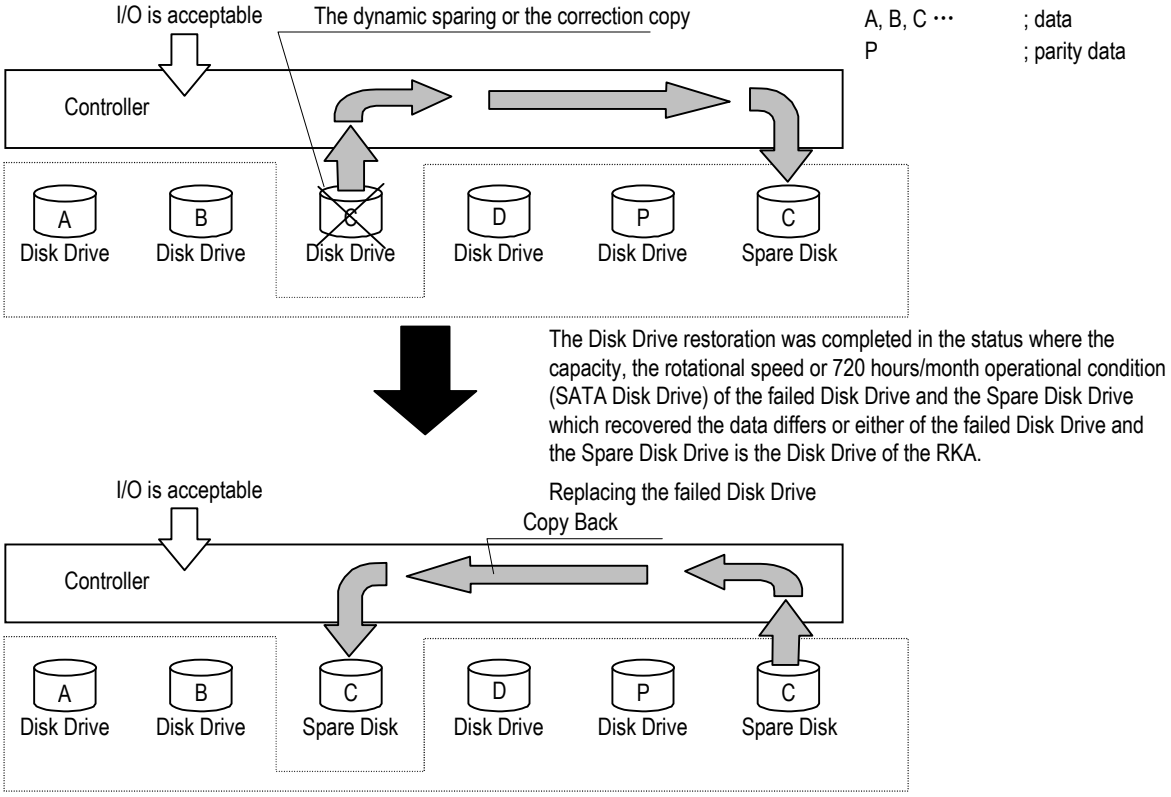

Figure 4.6.10 Copy back

Copyright © 2006, Hitachi, Ltd.

(c) The combination of the failed Disk Drive which becomes the copy backless and the Spare Disk Drive

The Copy backless operates depending on the types of the failed Disk Drive and the Spare Disk Drive and the relation between the rotational speed, the capacity and 720 hours/month operational condition (SATA Disk Drive) of the failed Disk Drive and the Spare Disk Drive.
The relation between the failed Disk Drive and the Spare Disk Drive is shown in Table 4.6.5 to Table 4.6.7.

Table 4.6.5 Availability of the Copy Backless Operation between the Disk Drives of the RKM/RKS/RKAJ

Attribute				Spare Disk				
	Chassis			RKM/RKS/RKAJ				
Failed Disk Drive (FC)	RKM/RKS/RKAJ	Capacity [G bytes]		73		146		300
			Rotational speed [min^{-1}]	10,000	15,000	10,000	15,000	10,000
		73	10,000	○	○	×	×	×
			15,000	○	○	×	×	×
		146	10,000	-	-	○	○	×

(4) Method for selecting a Spare Disk

When data is restored to a Spare Drive in the case where two or more Spare Drives are installed, the Spare Drive is selected according to priorities of the following items.

Priority item	Description	Degree of priority
Drive type	It is judged whether the drive that requires restoration is FC or S-ATA and only a drive of the same type is used.	High ↑
Drive capacity	A spare disk with the same capacity as a RAID group to be restored is used preferentially. When a drive with the same capacity does not exist, a drive with the most approximate and larger capacity is selected preferentially.	↕
The loop of the drive interface	The Spare Disk Drive in the same loop as the Disk Drive targeted for the restoration is used preferentially.	Low ↓

4.7 Setting RAID Group

You can set the RAID group and RAID level shown below by using the setting function.

(1) RAID level

The range of the RAID levels supported by the DF700 is shown in the table below.

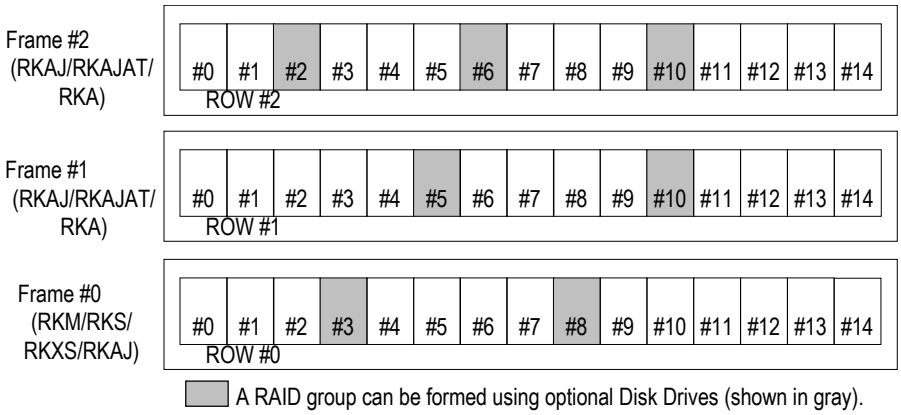
Table 4.7.1 Range of Supported RAID Levels

No.	RAID level	Supported range			Remarks
		RKM + RKAJ/RKA	RKS + RKAJ	RKM/RKS + RKAJ/ RKAJAT/RKA, RKXS+RKAJAT	
1	RAID 0	2D to 16D	2D to 16D	2D to 16D: RKM/RKS/RKAJ/RKA Not supported: RKXS/RKAJAT	The stripe size is 64 k bytes in default. When the Cache Partition Manager is unlocked in the microprogram revision 0733/A or more, it can be changed to 256 k bytes or 512 k bytes.
2	RAID 1	1D+1D	1D+1D	1D+1D	
3	RAID 5	2D+1P to 15D+1P	2D+1P to 15D+1P	2D+1P to 15D+1P	
4	RAID 6	2D+2P to 28D+2P	2D+2P to 28D+2P	2D+2P to 28D+2P	
5	RAID 1+0	2D+2D to 8D+8D	2D+2D to 8D+8D	2D+2D to 8D+8D	

(2) Selection of Disk Drives

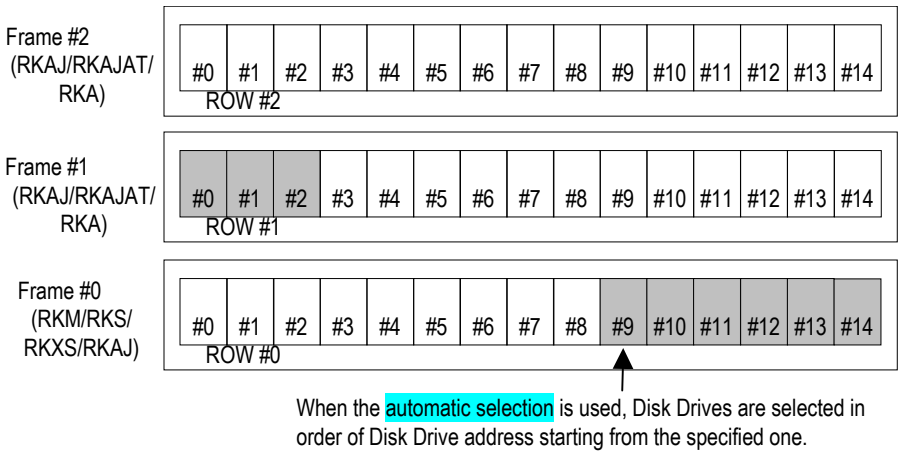
Disk drives for a RAID group

It is possible to create the RAID Group by selecting either one optional Disk Drive of FC and SATA among the Disk Drives which are not set in the RAID Group or the Spare Disks and not blocked.



However, the Disk Drives of the even-numbered slots are allocated in Loop #0 and the Disk Drives of the odd-numbered slots are allocated in Loop #1 in the Basic Chassis and the Additional Chassis, so that it is recommended to evenly select the Disk Drives of the even-numbered slots and the odd-numbered slots in the chassis as the Disk Drives which configure the RAID Group in consideration of the load distribution of the back-end path.

When selecting the Disk Drives to configure the RAID Group manually, it is recommended to continuously select the Disk Drives in the Basic Chassis and the Additional Chassis (either one Disk Drive of FC and SATA which are not set in the RAID Group or the Spare Disks and not blocked) with Storage Navigator Modular.



When using the automatic selection, the Disk Drives for the RAID width (number of Disk Drives in the parity group) × depth (number of parity groups) are allocated from the specified first Disk Drive by the numerical order (in ascending order) in device # order as the RAID Group configuration.

Copyright © 2005, 2006, Hitachi, Ltd.

(2-1) Selection of optional Disk Drives

(2-2) Automatic selection

Copyright © 2005, 2006, Hitachi, Ltd.

(3) User data area

All the Disk Drives allocated to a RAID group are managed as those having the same capacity because of the full mapping.

The size of the user data in one Disk Drive is the specified Disk Drive capacity from which the system area capacity is subtracted and rounded with 0x0800.

Expression:

User data size = ((LAST LBA + 1) - Data portion beginning LBA) & 0xFFFFF800

When the capacity of the Disk Drives installed within the range where the RAID group is allocated is smaller than the specified Disk Drive capacity, the RAID group cannot be defined.

4.8 Online Verify

(1) Outline of Function

The online verify function executes verification of the disk medium surface, detects a disk medium fault, and recovers the data by reassignment to prevent an occurrence of data loss caused by a disk medium fault.

(2) Online Verify Specification

Check results of the online verify for each state of the check object and action against error are shown in Table 4.8.1.

Table 4.8.1 Check results and action against the error according to the state of the check object (1/2)

Check object	LU state		Check results	Retry	Action against error
RAID-0	LU undefined		Correctable error, uncorrectable error	Yes (*1)	The alternate sector is assigned.
			Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.)
	LU defined	Unformatted	Correctable error, uncorrectable error	Yes (*1)	The alternate sector is assigned.
			Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.)
		Normal / blocked	Correctable error	Yes (*2)	The alternate sector is assigned, and the writing is performed. (*3)
			Uncorrectable error, hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.)
RAID-1/1+0/5/6	LU undefined		Correctable error, uncorrectable error	Yes (*1)	The alternate sector is assigned.
			Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.) (*4)
	LU defined	Unformatted	Correctable error, uncorrectable error	Yes (*1)	The alternate sector is assigned.
			Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.)(*4)
		Normal / blocked	Correctable error, uncorrectable error	Yes (*2)	The data is restored, the alternate sector is assigned, and the writing is performed. (*3)
			Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.) (*4)

*1 : Retry one time by the VERIFY command.

*2 : When there is staging data or no data on the cache, retry two times by the READ command. When there is dirty data, pin data, or write incomplete data on the cache, retry two times by the VERIFY command. When errors occur in both retries, recover the data. If there is no error in both retries, it is treated as normal.

*3 : (a) If the data recovery fails, ignore the faulty sector and go to the next LBA.
(b) Even if the alternate sector assignment fails, execute the recovery data write & verify function. When returned due to sector exhaustion, block the corresponding drive and go to the next drive.
(c) If the write & verify of the recovered data fails, leave the recovered data as dirty data and go to the next LBA.

*4 : Error count is managed. (When this error occurs at a disk drive twice within 24 hours, the disk drive is blockaded in case of redundant composition.)

Copyright © 2006, Hitachi, Ltd.

Table 4.8.1 Check results and action against the error according to the state of the check object (2/2)

Check object	LU state	Check results	Retry	Action against error
RAID undefined	LU undefined	Correctable error, uncorrectable error	Yes (*1)	The alternate sector is assigned.
		Hardware error, other errors	None	Ignore the error and continue the processing. (The test is continued from the next LBA. At this time, the Disk Drive is not blocked.) (*2)
System area (*3)	–	Correctable error, uncorrectable error, hardware error, other errors	None	Blocked system area. Immediately after the blockade, it is recovered by the automatic operation of the system copy. (The retrials are to be made up to ten times.)

*1 : Retry one time by the VERIFY command.
*2 : Error count is managed. (When this error occurs at a disk drive twice within 24 hours, the disk drive is blockaded in case of redundant composition.)
*3 : The system drive of the RKXS is only the target of the online verify.

(3) Online Verify Starting Timing

The online verify function is active from becoming ready to scheduled stop. The start of the online verification after being READY is resumed from the position when the planned shutdown was normally performed last time. The operation of the online verification can be set to disable or enable by the Storage Navigator Modular.

However, the online verify function is not executed during the drive recovery operation or the copy operation of ShadowImage in-system replication/TrueCopy remote replication/Copy-on-Write Snapshot/TrueCopy Extended Distance with the copying pace set to 15.

(4) Online Verify by Dual Controller

In the dual controller configuration, the controller 0 takes charge of the even number Chassis (Basic Chassis, Additional Chassis #2, 4, …, 14), and the controller 1 takes charge of the odd number Chassis (Additional Chassis #1, 3, …, 13). When online verify function is completed, it will be executed again from the beginning.

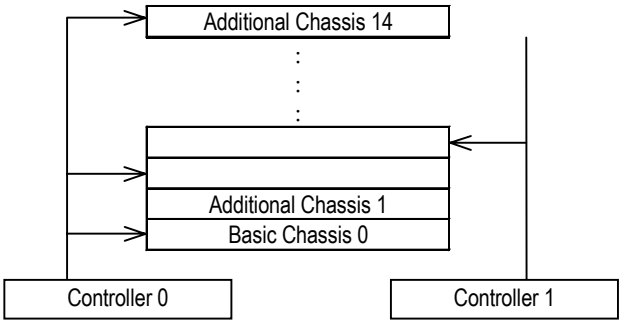

Figure 4.8.1 Online Verify by Dual Controller

Copyright © 2006, Hitachi, Ltd.

(5) Online Verify Execution Timing

The 1/6-thinned-out processing of the FC drives is performed in the SATA drives. However, when the SATA drives are the system drives, the online verification for the system area is performed every time.

Table 4.8.2 Online Verify Execution Timing

No.	Drive Type	Area	Online Verify Execution Timing	Remarks
1	FC	System area (*1)	Not performed	
2		User data area	Performed every time	
3	SATA (720 hours/month operation impossible)	System area (*1)	Performed every time	
4		User data area	Performed with 1/6-thinned-out operation	ATE250R, ATE400R
5	SATA (720 hours/month operation supported)	System area (*1)	Performed every time	The Disk Drive other than the above-mentioned whose microprogram revision is 0750/A or more.
6		User data area	Performed every time	

*1 : The system drive (HDU#0 to#4) of the basic cabinet is only the target of the online verify.

‡1 : When the online verification processing is executed for all the chassis, the 1st, 2nd, 3rd, and the following rounds of the processing are performed for the chassis with the FC drives, whereas the 2nd through 6th rounds are not executed for the chassis with the SATA drives and the processing is resumed from the 7th round. That is to say, only the round of 6n+1 ("n" is an integer of 0 or more) is executed.
However, the processing is executed for the SATA drives, which can be supported for 720 hours/month operation, in the same way as that for the FC drives.

4.9 Setting of LAN interface

LAN interface and the setting on DF700 are shown below.

(1) Type of LAN interface

The subsystem installs following LAN interfaces;

Parts	Name of LAN port	Use
Controller	Maintenance port	For maintenance operation
	User management port	For customer
NAS unit	Maintenance LAN port	For maintenance operation
	Management LAN port	For customer
	Data LAN port	For customer
iSCSI interface board	iSCSI port	For customer

(2) Setting item of LAN interface

When you use LAN interface of subsystem, following setting should be correct between subsystem and device connected to the subsystem.

○ : Setting item of subsystem
✧ : Setting item of device connected to the subsystem
× : Not required

Setting item		IP address, subnet mask, default gateway	Negotiation	LAN port number	MTU
Maintenance port of controller	Using WEB	○	✧ (Auto negotiation)	×	✧ (1500)
	Using SNM(*1)	×	✧ (Auto negotiation)	○	✧ (1500)
User management port of controller	Using WEB	○	○	×	✧ (1500)
	Using SNM(*1)	○	○	○	✧ (1500)
Maintenance LAN port of NAS unit		○(*2)	✧ (Auto negotiation)	×	✧ (1500)
Management LAN port of NAS unit		○	○	×	○
Data LAN port of NAS unit		○	○	×	○
iSCSI port		○	✧ (1000Mbps/ Full duplex)	○	✧ (1500)

*1 : Storage Navigator Modular

*2 : When the subsystem has NAS unit, the network address of IP address of Maintenance LAN port of NAS unit is set same as Maintenance port.

Copyright © 2006, Hitachi, Ltd.

(a) Setting of IP address, subnet mask and default gateway

Set IP address, subnet mask and default gateway to each LAN port.

(a-1) Setting of the subsystem shipped from the factory

Setting item		IP address	Subnet mask	Default gateway
Maintenance port of controller	CTL0	10.0.0.16	255.255.255.0	0.0.0.0
	CTL1	10.0.0.17		
User management port of controller	CTL0	192.168.0.16		
	CTL1	192.168.0.16		
Maintenance LAN port of NAS unit	NNC0	10.0.0.10		
	NNC1	10.0.0.11		
	NNC2	10.0.0.12		
	NNC3	10.0.0.13		
Management LAN port of NAS unit	NNC0	192.168.1.1		
	NNC1	192.168.1.2		
	NNC2	192.168.1.5		
	NNC3	192.168.1.6		
Data LAN port of NAS unit		(Not assigned the interface information of NAS unit)		
iSCSI port	Port 0A	192.168.0.200	255.255.255.0	0.0.0.0
	Port 0B	192.168.0.201		
	Port 1A	192.168.0.204		
	Port 1B	192.168.0.205		

(a-2) Notes on Setting

If you use DHCP mode for user management port, IP address, subnet mask and default gateway are assigned automatically from DHCP server. In this case, you cannot set above parameters.

If you set these parameters, be careful about the followings.

(i) For the head value of IP address, '0', '127' and '255' cannot be specified.
You cannot set 0.xxx.xxx.xxx, 127.xxx.xxx.xxx and 255.xxx.xxx.xxx.
The The following IP address is reserved on NAS unit. So, you cannot assign following IP address for management LAN port of controller and data LAN port of NAS unit.
- 172.29.1.xxx
- 172.29.2.xxx
- 172.29.3.xxx
- 172.29.4.xxx

(ii) Set correct subnet mask.
You cannot use discontinuous one-bit IP address for example 255.0.255.0.

(iii) Set a host address of IP address and default gateway address which is not 0 or 255.
For example, when subnet mask is 255.255.255.0, you cannot set like 192.168.0.0 and 192.168.0.255 for IP address and default gateway address.

Copyright © 2006, Hitachi, Ltd.

(iv) Set the same network address for IP address and default gateway.
If no default gateway address for management port is specified, set "0.0.0.0".
If no default gateway address for user management port of NAS unit is specified, it is no need to set.
For example, when subnet mask is 255.255.255.0 and IP address is 192.168.0.16, you cannot set 192.168.1.1 for default gateway.

(v) When you set following IP address, you cannot set same network address.
Set individual network address for each IP address.
- Maintenance port of controller / User management port of controller
- Maintenance LAN port of NAS unit / Management LAN port of NAS unit
- Maintenance LAN port of NAS unit / Data LAN port of NAS unit
- Management LAN port of NAS unit / Data LAN port of NAS unit

For example, when subnet mask is 255.255.255.0 and IP address of maintenance port is 10.0.0.16, you cannot set 10.0.0.xxx for user port.

(vi) When the network address of the LAN device, which is connected via the Gateway in the extension of the user management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
If this is the case, set network address other than maintenance port in the LAN device which is connected via the Gateway in the extension of the user management port, or set maintenance port other than the network address of LAN device which is connected via the Gateway. (Refer to System Parameter "4.2 (3) Setting of LAN" (SYSPR 04-0080).)

(a-3) Method of setting
- User management port of controller
  Refer to System Parameter "4.2 (3) Setting of LAN" (SYSPR 04-0080).
- Maintenance port of controller and Maintenance LAN port of NAS unit
  Refer to System Parameter "4.2 (4) Setting of Maintenance LAN" (SYSPR 04-0100).
- Management LAN port of NAS unit
  Refer to System Parameter "4.2 (16) Setting of NNC LAN" (SYSPR 04-0280).
- Data LAN port of NAS unit
  Refer to NAS Manager Modular User's Guide.
- iSCSI port
  Refer to System Parameter "4.2 (10) Setting of iSCSI" (SYSPR 04-0191).

Copyright © 2006, Hitachi, Ltd.

(b) Setting of negotiation

Set negotiation to each LAN port.

(b-1) Setting of the subsystem shipped from the factory

Setting item	Negotiation
Maintenance port of controller	Auto negotiation (10M/100Mbps, Half/Full duplex)
User management port of controller	Auto negotiation (10M/100Mbps, Half/Full duplex)
Maintenance LAN port of NAS unit	Auto negotiation (10M/100M/1000Mbps, Half/Full duplex)
Management LAN port of NAS unit	Auto negotiation (10M/100M/1000Mbps, Half/Full duplex)
Data LAN port of NAS unit	(Not assigned the interface information of NAS unit)
iSCSI port	1000Mbps, Half duplex

(b-2) Microprogram revision and Storage Navigator Modular for Setting

Microprogram revision and Storage Navigator Modular for setting negotiation is shown below.

○ : Settable, × : Unsettable

Microprogram revision	Less than 0726/B	0726/B or more, less than 0730A	0730/A or more, less than 0750/A	0750/A or more
Storage Navigator Modular	Less than 2.60	2.60 or more, less than 3.00	3.00 or more, less than 5.00	5.00 or more
Maintenance port of controller	× (Auto negotiation (10M/100Mbps, Half/Full duplex))			
User management port of controller	× (Auto negotiation (10M/100Mbps, Half/Full duplex))			○
Maintenance LAN port of NAS unit	× (NAS unit is not supported)	× (Auto negotiation (10M/100M/1000Mbps, Half/Full duplex))		
Management LAN port of NAS unit	× (NAS unit is not supported)	○		
Data LAN port of NAS unit	× (NAS unit is not supported)	○		
iSCSI port	× (iSCSI is not supported)		× (1000Mbps, Half duplex)	

(b-3) Notes on Setting

Conform the negotiation of subsystem to the negotiation of the device connected to LAN port. If the negotiation of subsystem is different from the negotiation of the device connected to LAN port, the throughput or response performance of network communication may decrease and the control Unit may not communicate the destination device across a network.

(b-4) Method of setting

- User management port of controller
  Refer to System Parameter "4.2 (3) Setting of LAN" (SYSPR 04-0080).
- Management LAN port of NAS unit
  Refer to System Parameter "4.2 (16) Setting of NNC LAN" (SYSPR 04-0280).
- Data LAN port of NAS unit
  Refer to NAS Manager Modular User's Guide.

Copyright © 2006, Hitachi, Ltd.

(c) Setting of LAN port number

Set LAN port number to use when connecting.

(c-1) Setting of the subsystem shipped from the factory

Setting item	LAN port number
Maintenance port of controller	2000
User management port of controller	
iSCSI port	3260

(c-2) Microprogram revision and Storage Navigator Modular for Setting

Microprogram revision and Storage Navigator Modular for setting negotiation is shown below.

○ : Settable, × : Unsettable

Microprogram revision	Less than 0726/E	0726/E or more, less than 0730A	0730/A or more
Storage Navigator Modular	Less than 2.61	2.61 or more, less than 3.00	3.00 or more
Maintenance port of controller	(Same as LAN port number of User management port of controller)		
User management port of controller	× (2000)	○	
iSCSI port	× (iSCSI is not supported)		○

(c-3) Notes on Setting

(i) When you change LAN port number, confirm that the LAN port number is not used.
If you set LAN port number that one already uses, the control Unit may not communicate the destination device across a network.

(ii) If you change LAN port number, you have to change setting of LAN port number on your PC.
In case of User management port of controller, edit “Service” file on PC using Storage Navigator Modular.
In case of iSCSI port, change the setting of LAN port number on iSCSI initiator.

(c-4) Method of setting

- User management port of controller
  Refer to System Parameter “4.2 (3) Setting of LAN” (SYSPR 04-0080).
- iSCSI port
  Refer to System Parameter “4.2 (10) Setting of iSCSI” (SYSPR 04-0191).

Copyright © 2006, Hitachi, Ltd.

(d) Setting of MTU

Set packet size of sending (MTU : Max Transfer Unit) to each LAN port.

(d-1) Setting of the subsystem shipped from the factory

Setting item	Negotiation
Maintenance port of controller	1500
User management port of controller	
Maintenance LAN port of NAS unit	
Management LAN port of NAS unit	
Data LAN port of NAS unit	(Not assigned the interface information of NAS unit)
iSCSI port	1500

(d-2) Microprogram revision and Storage Navigator Modular for Setting

Microprogram revision and Storage Navigator Modular for setting MTU is shown below.

○ : Settable, × : Unsettable

Microprogram revision	Less than 0726/B	0726/B or more, less than 0730A	0730/A or more
Storage Navigator Modular	Less than 2.60	2.60 or more, less than 3.00	3.00 or more
Maintenance port of controller	× (1500)		
User management port of controller	× (1500)		
Maintenance LAN port of NAS unit	× (NAS unit is not supported)	× (1500)	
Management LAN port of NAS unit	× (NAS unit is not supported)	○	
Data LAN port of NAS unit	× (NAS unit is not supported)	○	
iSCSI port	× (iSCSI is not supported)		× (1500)

(d-3) Notes on Setting

Conform the MTU of subsystem to the MTU of the device connected to LAN port.
If the MTU of subsystem is different from the MTU of the device connected to LAN port, the control Unit may not communicate the destination device across a network.

(d-4) Method of setting

- Management LAN port of NAS unit
  Refer to System Parameter "4.2 (16) Setting of NNC LAN" (SYSPR 04-0280).
- Data LAN port of NAS unit
  Refer to NAS Manager Modular User's Guide.

Chapter 5. Outline of P.P.

5.1 P.P.s Required for Maintenance

P.P.s included in DF700 required for maintenance are divided mainly into three categories depending on the related part.

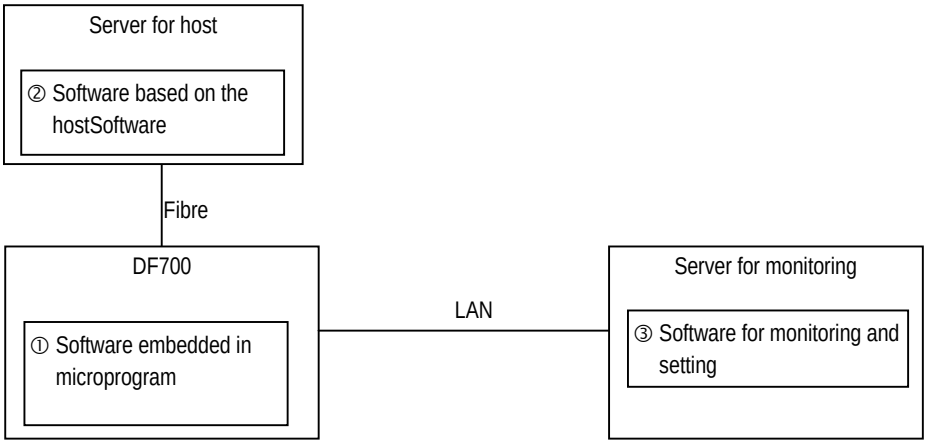

Figure 5.1.1 P.Ps required for maintenance and its related parts (Fibre model)

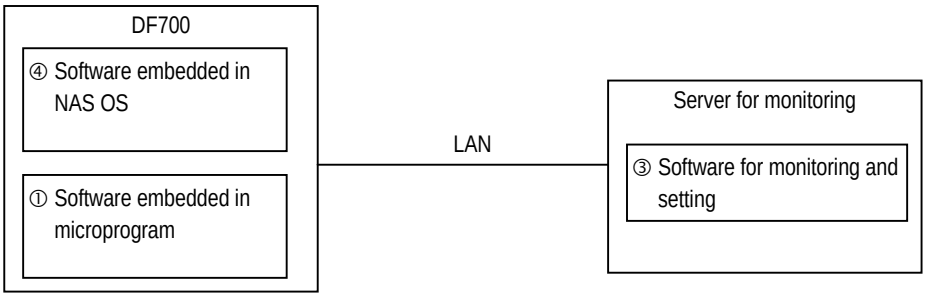

Figure 5.1.2 P.Ps required for maintenance and its related parts (NAS model)

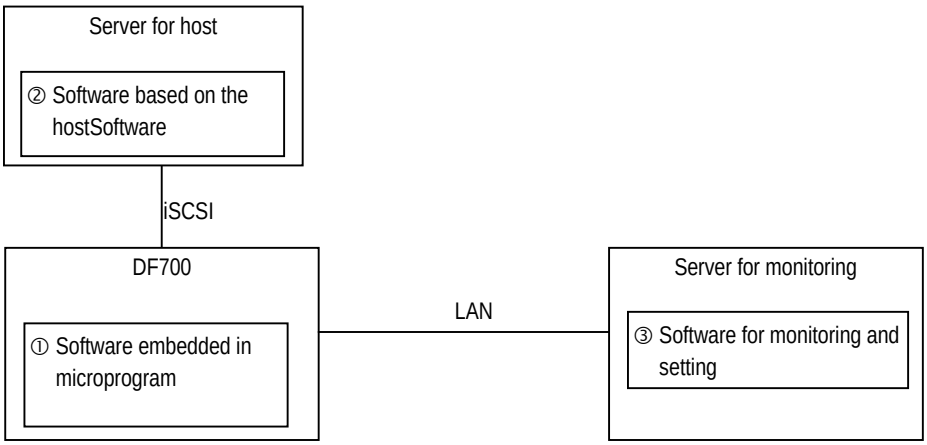

Figure 5.1.3 P.Ps required for maintenance and its related parts (iSCSI model)

Copyright © 2005, Hitachi, Ltd.

① Software embedded in microprogram:
Is software embedded in microprogram in DF700. This software will be enabled by unlocking.

② Software based on the host:
Is software performed and installed on server for host connected to the DF700 with Fibre Channel/iSCSI interface.

③ Monitoring, setting software:
Is software performed and installed on the monitoring server / PC connected to the DF700 with a LAN.

④ Software embedded in NAS OS:
It is the software installed in the NAS OS of the DF700-RKNAS, and becomes effective if the key is opened and it is installed separately.

The P.Ps required for maintenance are shown in Table 5.1.1.

Table.5.1.1 The P.Ps Required for Maintenance

No.	Program product	Type	Object for maintenance	Related part			The title of manual

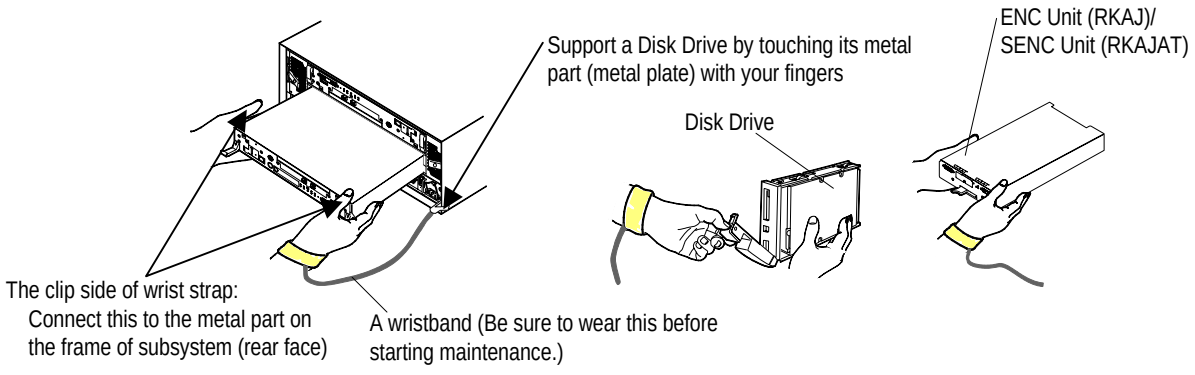
Chapter 1. Before Starting Installation Work

1.1 Before Starting Installation Work

Take notice of the following when performing a installation work for the subsystem. Read and understand them well before performing the installation.



(1) Note at the time of the unpacking
- Unpack it indoor.
  Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
- Work on the unpacking in the place where a rapid difference of temperature does not occur. It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

(2) Note on installing and removing parts
Generally, each part is equipped with high-precision components. Remove and install the part gently so as not to give it any shock.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

Be sure to wear the wristband, connect its lead wire to the subsystem enclosure before starting the work, and do not remove them until the work is completed.
When installing a Disk Drive, Control Unit and ENC Unit/SENC Unit, hold it with your hand wearing the wristband having fingers contact metallic portions on the sides of the part.

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Note on cable routing

(a) Handling of cables on the floor

- Protect cables which cannot be accommodated by the subsystem and thus laid on the floor or cables which cross a passage with cable protecting, etc.
- Do not make inter-device cables apart from the floor but lay them on the floor.

(b) Handling of under-floor cables when the subsystem is installed on the free access floor.

- Give excess lengths to cables routed under the floor so that they can easily be laid on the slab. Do not make them to be hung dangling.

(c) How to route cables

- Give adequate margin of length to cables to withstand earthquakes, etc.
- Route cables giving them excess lengths lest they should disturb replacement of part to be done for maintenance.
- Make power cable and power cable apart each other. When they have to be positioned close each other, do not make them run in parallel but make them cross each other.
- When using cable protecting duct, be careful not to damage or break cables by catching them.

(d) Be sure to insert or pull out a cable connector holding it with your hand. If you pull a cable, a trouble may be caused.

(e) When bending the FC I/F cable and RC (ENC) cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(4) Installation of the adaptable microprogram

It is required to install the adaptable microprogram depending on the parts to be installed. Check the adaptable microprogram revision referring to Microprogram "1.9 Adaptable microprogram revision" (MICRO 01-0360).

(5) Note on restarting

When restarting the subsystem, turn on the main switch after waiting more than one minute after the main switch is turned off (after the POWER LED goes out).

If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.

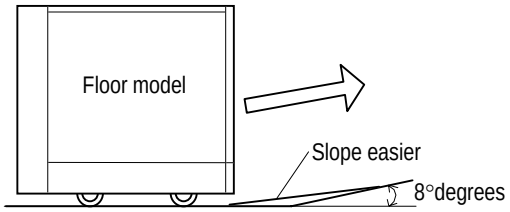
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

Copyright © 2005, 2006, Hitachi, Ltd.

(6) Note on completing a maintenance work

Close all the external covers when a maintenance work is completed.



It is required to make all the external covers closed to operate the subsystem properly.

(Be sure to close all the external covers during operation because it is indispensable to maintain the performance of the subsystem including prevention of adverse effects caused by radio frequency energy.)

(7) Note on moving the Floor Model

The allowable maximum inclination angle at the end of the slope for the Floor Model is eight degrees.

When moving the Floor Model through a slope steeper than the above or across a level difference of the floor, use a gangway, etc. to make the slope easier.

(8) Notes while the array subsystem is being started

Because the status where the array subsystem is being started is in the middle of the transition to the status of the subsystem power turned on (Ready status) from the status of the subsystem power turned off, do not perform the following work while the array subsystem is being started.

- Installing or removing the parts
- Inserting or pulling out the cables
- Restarting the array subsystem
- Setting the power control (local or remote)
- Setting the remote adaptors

Also, the setting function or the reference function using the Storage Navigator Modular cannot be executed to the array subsystem which is being started.

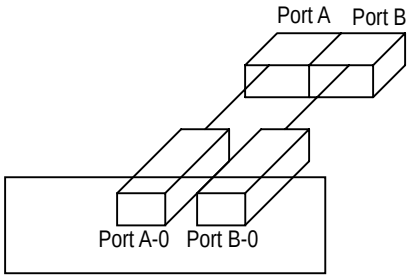
1.2 Fibre Channel Interface

1.2.1 Restrictions on Using the Fibre Channel Interface

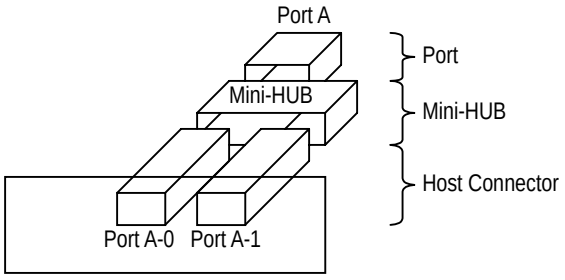
When using the 2G bps Fibre Channel interface or the 4G bps Fibre Channel interface as the 1G bps mode, GBIC used with HBA (Host Bus Adapter), SW that becomes a connection destination has the following restrictions. Otherwise, a Linkup malfunction may occur.

Restrictions:



(1) Vixel CD Laser is not supported. However, Vixel GBIC (VCSEL) is supported.
CD Laser or VCSEL is identified by first digit of the serial number.
[CD Laser] : 3****, 4****
[VCSEL] : 7**** or more

(2) Point to Point topology with 1G bps Qlogic X6729A or X6730A is not supported.



(3) Point to Point with Sun default 1G bps Fibre Channel Host Bus Adapter Board (Qlogic OEM product (X6929A/X6730A) which were mentioned (2)) is not supported.

1.2.2 Mini-HUB

When the Interface Board is not installed in the Control Unit of the RKS/RKXS, the host interface configures Mini-HUB in the Control Unit and extends one Port to two host connectors. However, the link status between the host and subsystem is recognized as one port.

FC connectors at the time of installing or adding the RKH FC Interface Board.
FC connectors at the time of installing the RKM FC Interface Board.
FC connectors at the time of adding the RKS/RKXS FC Interface Board.

FC connector when the RKS/RKXS FC Interface Board is not added

Copyright © 2005, 2006, Hitachi, Ltd.

1.2.3 Connection Specifications of RKS/RKXS

When the Interface Board is not installed in the Control Unit of the RKS/RKXS, the host connector which can be used for connecting to the upper device differs depending on the topology set to the Port of the RKS/RKXS and the connection destination of the Fibre Channel Interface Board, and it is shown as below.

Table 1.2.1 Available Host Connector of each topology setting and connection method

No.	Topology of RKS/RKXS	Transfer speed of RKS/RKXS	Direct Connection of Host	Switch Connection	Direct Connection of SANRISE UPS (*1) Direct Connection of SANRISE NSC (*2) Direct Connection of SANRISE 9900V
1	Loop	Auto	Host Connector #0	Not Support	Not Support
2		1Gbps/2Gbps	Host Connector #0 and #1	Not Support	Host Connector #0
3	Point-to-Point	Auto/1Gbps/2Gbps	Not Support	Host Connector#0	Not Support

*1 : SANRISE USP:It is the abbreviation of SANRISE Universal Storage Platform, and a high-ranking model of the SANRISE series.

*2 : SANRISE NSC:It is the abbreviation of SANRISE Network Storage Controller, and a high-ranking model of the SANRISE series.

When connecting directly to the host, the Loop topology is set to port.

- Connect it to the host connector 0 side, when transfer speed of RKS/RKXS is Auto (do not connect it to the host connector 1 side).
- Both host connector 0 and 1 is available, when transfer speed of RKS/RKXS is 1Gbps or 2Gbps.
- Port that set the Point-to-Point topology cannot be connected directly to the host, SANRISE USP, SANRISE NSC or SANRISE 9900V.

When connecting it to Switch, the Point-to-Point topology is set to port.

- Connect it to the host connector 0 side (do not connect it to the host connector 1 side).
- Port that set the Loop topology cannot be connected to Switch.

When connecting it to SANRISE USP, SANRISE NSC or SANRISE 9900V directly, set the Loop topology and the fixed speed (1 G bps, 2 G bps) to the Port.

- Connect it to the host connector 0 side (do not connect it to the host connector 1 side).
- Port that set the Point-to-Point topology cannot be connected to SANRISE USP, SANRISE NSC or SANRISE 9900V.
- It cannot be connected directly to SANRISE USP, SANRISE NSC or SANRISE 9900V with the Port which the transfer rate is set to “Auto”.

1.2.4 Fibre Channel Configuration of RKS/RKXS

The following Fibre Channel information is set to Port.
When the Interface Board is not installed in the Control Unit of the RKS/RKXS, the information of these items is not set to each host connector which connects the Fibre Channel of the RKS/RKXS.

Port Address/ Topology/ Transfer Rate/ Adding Host Group/ Host Group Options/ LU Mapping Information

Copyright © 2005, 2006, Hitachi, Ltd.

1.2.5 Attention of Host Directly Connection for RKS/RKXS

In the hardware configuration which does not install the interface board in the Control Unit of the RKS/RKXS, when making Port of the RKS/RKXS to Loop topology and linking the host with both of the host connector 0 side and 1 side, it needs to be careful about the following items.

- Exclusive Access of LU
  Each host connector of RKS/RKXS cannot be set LU mapping. It is necessary to set the access path between hosts and LUs according to the assignment of the LUs to the hosts using LUN Manager.
- Transfer Speed of Host
  Transfer speed of RKS/RKXS is set to the port. It is necessary to set the same transfer speed both host connectors.

1.3.2 Optional parts

Table 1.3.3 Optional Parts

No.	Classification	Model	Name	Constitution/Specification
1	Spare Disk Drive	-	Disk Drive	Name : Refer to the column of the Disk Drive.
2	Controller	DF-F700-F1JM	Controller (RKM)	Array Control Unit for duplication, Software P.P.
		-	Cache Unit	Name : Refer to the column of the Cache Unit.
		DF-F700-F1JS	Controller (RKS)	Array Control Unit for duplication, Software P.P. (Fibre I/F (2) is standard installation.)
		-	Cache Unit	Name : Refer to the column of the Cache Unit.
		DF-F700-F1JXS	Controller (RKXS)	Array Control Unit for duplication, Software P.P. (Fibre I/F (2) is standard installation.)
		-	Cache Unit	Name : Refer to the column of the Cache Unit.
3	Floor setting kit	DF-F700-H1J	Floor setting kit for RKM/RKS	Floor setting kit
		DF-F700-H2J	Floor setting kit for RKM+RKAJ/ RKS+RKAJ	Floor setting kit
4	Disk Drive for addition (RKM/RKS/RKXS/RKAJ/ RKAJAT)	-	Disk Drive	Name : Refer to the column of the Disk Drive.
5	FC Interface Board for addition	DF-F700-DJ4G2W (RKS/RKXS)	4G bps FC Interface Board	Name : Refer to the column of the Interface Board.
		DF-F700-DJ4G2H (RKH)	4G bps FC Interface Board	Name : Refer to the column of the Interface Board.
6	NAS Interface Board	DF-F700-DJNAS (RKM/RKS/RKXS)	NAS Interface Board	Name : Refer to the column of the Interface Board.
		DF-F700-DJNASH (RKH)	NAS Interface Board	Name : Refer to the column of the Interface Board.
7	iSCSI Interface Board	DF-F700-DJSC2 (RKM/RKS/RKXS)	iSCSI Interface Board	Name : Refer to the column of the Interface Board
		DF-F700-DJSC2H (RKH)	iSCSI Interface Board	Name : Refer to the column of the Interface Board
8	Rack frame	DF-F700-U7	Rack frame	Rack frame
9	PDB	DF-F700-UPDU7	PDB	Power distribution box for U7 rack. PDB (1), Bracket (2), Cable clamp (1)
10	Remote adapter	DF-F700-VR4A	Remote adapter (Main unit)	Adapter for PS interlock control (Power cables for 100V and 200V each are standard equipment)
		DF-F700-VR4H	Remote adapter (Hub)	Hub for remote adapter (Power cables for 100V and 200V each are standard equipment)
11	Upgrade kit	DF-F700-RSUPS	Upgrade kit (for single controller)	Kit for upgrading RKS single controller to RKM single controller. RKM (1), Control Unit (1), Interface Board (1) (including Host Connector (2))
		DF-F700-RSUPD	Upgrade kit (for dual controller)	Kit for upgrading RKS dual controller to RKM dual controller. RKM (1), Control Unit (2), Interface Board (2) (including Host Connector (4))
		DF-F700-F2JH	Upgrade kit	Kit for upgrading RKH to RKHE. Control Unit (DF-F700-F2JH) (2)
12	Unit addition support kit	DF-F700-K1BUP	Unit addition support kit	Support kit for connecting SANRISE 9500V additional subsystems (RKA and RKAJAT/ RKAJATL) with SANRISE AMS/WMS Series. CD (1)(including ENC/SENC firmware), 1 m ENC cable (4)

1.3.3 Accessory parts

Table 1.3.4 Accessory Parts

No.	Classification	Model	Name	Constitution/Specification
1	Power cable(*1)	DF-F700-J1H	Power cable	2.5 m, 2-pole power cable with grounding terminal (AC 125 V, 13 A or 15 A)
		DF-F700-J2H	Power cable	2.5 m, 2-pole power cable with grounding terminal (AC 250 V, 13 A or 15 A)
		DF-F700-J2H5	Power cable	5.0 m, 2-pole power cable with grounding terminal (AC 200 V, 13 A or 15 A)
		DF-F700-J2H10	Power cable	10.0 m, 2-pole power cable with grounding terminal (AC 200 V, 13 A or 15 A)
2	Fibre channel interface cable	DF-F700-KB5M	SC-LC Fibre I/F Cable	SC-LC Fibre I/F cable for Optical (5 m)
		DF-F700-KB10M	SC-LC Fibre I/F Cable	SC-LC Fibre I/F cable for Optical (10 m)
		DF-F700-KB20M	SC-LC Fibre I/F Cable	SC-LC Fibre I/F cable for Optical (20 m)
		DF-F700-KB50M	SC-LC Fibre I/F Cable	SC-LC Fibre I/F cable for Optical (50 m)
		DF-F700-KB1HM	SC-LC Fibre I/F Cable	SC-LC Fibre I/F cable for Optical (100 m)
		DF-F700-KC5M	LC-LC Fibre I/F Cable	LC-LC Fibre I/F cable for Optical (5 m)
		DF-F700-KC10M	LC-LC Fibre I/F Cable	LC-LC Fibre I/F cable for Optical (10 m)
		DF-F700-KC20M	LC-LC Fibre I/F Cable	LC-LC Fibre I/F cable for Optical (20 m)
		DF-F700-KC50M	LC-LC Fibre I/F Cable	LC-LC Fibre I/F cable for Optical (50 m)
		DF-F700-KC1HM	LC-LC Fibre I/F Cable	LC-LC Fibre I/F cable for Optical (100 m)
3	Remote adapter cable	DF-F700-VRC2	Remote adapter cable	For control of Remote adapter, 2 m
		DF-F700-VRC5	Remote adapter cable	For control of Remote adapter, 5 m
		DF-F700-VRC10	Remote adapter cable	For control of Remote adapter, 10 m
		DF-F700-VRC20	Remote adapter cable	For control of Remote adapter, 20 m
		DF-F700-VRC50	Remote adapter cable	For control of Remote adapter, 50 m
4	Tray for remote adapter	DF-F700-HVR4	Tray for remote adapter	Rail kit for mounting the Remote adapter on the U7 rack frame.
5	Rack rail (for Chassis)	DF-F700-URHT7	Rail for Mounting chassis	Rail Kit for U7 and HA8000/8500
		DF-F700-UR7	Rail for Mounting chassis	Rail Kit for U4J/EP8000/SUN/AP7000
		DF-F700-URNS7	Rail for Mounting chassis	Rail Kit for NSC
6	Rack rail (for NAS Unit)	DF-F700-URHTN7	Rail for Mounting NAS Unit	Rail Kit for U7
		DF-F700-URN7	Rail for Mounting NAS Unit	Rail Kit for U4J/EP8000/SUN/AP7000
		DF-F700-URRAN7	Rail for Mounting NAS Unit	Rail Kit for HA8000/8500
7	ENC cable	DF-F700-K5B	FC cable assembly	FC cable 5 m (2)
8	Decoration panel	DF-F700-U71D	Decoration panel	Panel to cover vacant space (1 EIA) of the U7 rack frame.

1.4 Installation Configuration of the Subsystem

The installation forms of DF700 have the floor model combining RKM/RKS/RKXS/RKAJ/RKAJAT and the Floor Standing Kit, and the rack-mount model mounted on the 19-inch rack frame.
As another rackmount model product, the RKH is provided.
The RKH is a subsystem with no Disk Drive installed in it.
The floor models have the types of which RKM/RKS/RKXS is alone, an RKAJ is added to RKM/RKS, and an RKAJAT is added to RKM/RKS/RKXS.
The rack-mount model uses the special U7 rack frame.
For a U7 rack frame, up to ten RKAJs (up to 165 Disk Drives) can be connected to an RKM.
The configuration, in which up to 14 RKAJs and an RKM (up to 225 Disk Drives) are connected to two U7 rack frames, can be formed as the subsystem.
RKAJ/RKAJAT can be mixed and connected to RKM/RKS, and the mixed configuration, in which up to 14 for an RKM and up to six for an RKS are connected, can be formed.
Up to six RKAJs (up to 105 Disk Drives) can be connected to an RKS.
Up to six RKAJATs (up to 105 Disk Drives) can be connected to an RKXS.
RKXS can be only connected to RKAJAT, and cannot be mixed and connected to RKAJ/RKAJAT.
In the case of one U7 rack frame, the maximum of nine RKAJs (the maximum of 150 Disk Drives) can be connected to the minimum configuration of AMS1000 configured with one RKAJ and one RKAJ.
Be sure to mount at least the one RKH and RKAJ.
The configuration, in which up to 29 RKAJs and an RKH (up to 450 Disk Drives) are connected to two U7 rack frames, can be formed as the subsystem.
RKAJ/RKAJAT can be mixed and connected to RKH, and the mixed configuration, in which up to 30 for an RKH are connected, can be formed.
However, the maximum connection number of the RKAJAT is 28 units.

1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem

1.5.1 How to attach/remove Front Bezel of Floor Model

⚠ CAUTION

Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Since front bezels of the RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.
- When installing or removing the Front Bezel, try not to operate the main switch incorrectly with the hook or the ON/OFF button of the Front Bezel.

A key is necessary to attach or remove the Front Bezel.

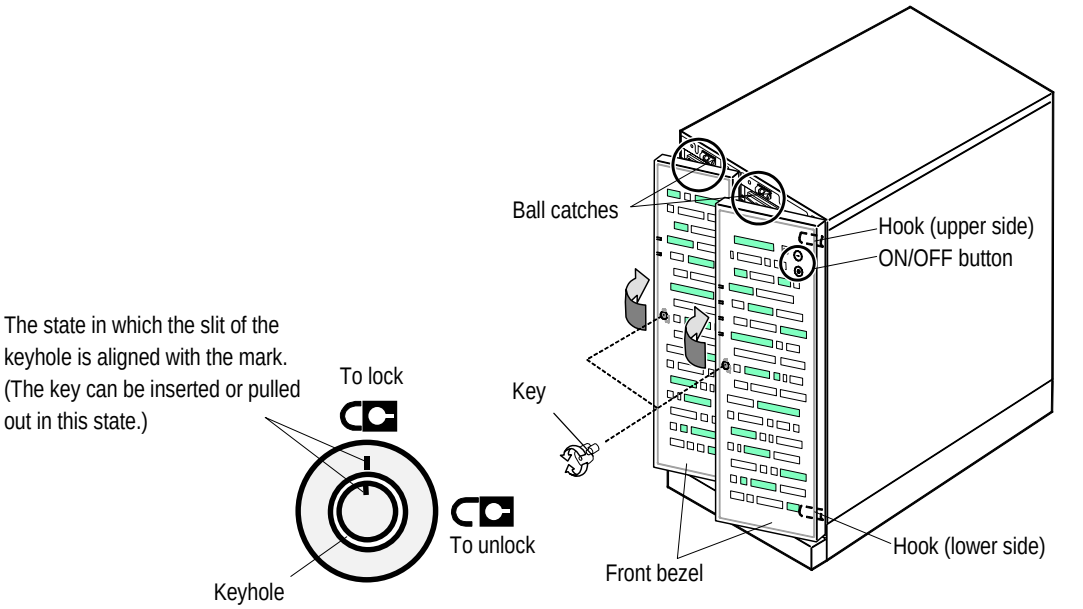
(1) Procedure for removal

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.
(b) Pull the Front Bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the Front Bezel from the slots on the subsystem main body by shifting the bezel to the left and remove the bezel.

(2) Procedure for attachment

(a) Hold the side of front bezel with your both hands.
(b) Hang the hook of the Front Bezel (lower side) on the hole in the bottom right part of the subsystem.
(c) Hang the hook of the Front Bezel (upper side) on the hole in the top right part of the subsystem.
(d) After making the hooks of the front bezel engaged, press the bezel against the main body until it is stopped.
(e) Fix the front bezel by turning the key.

Copyright © 2005, 2006, Hitachi, Ltd.



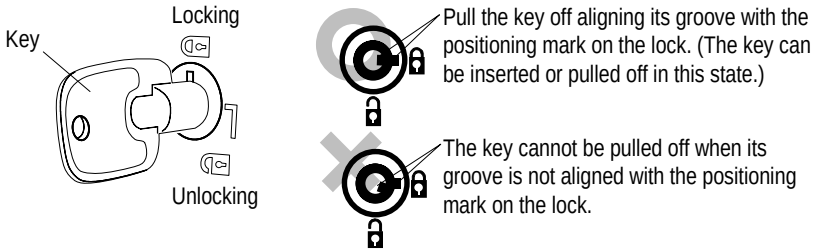


Figure 1.5.1 Procedure for Attaching/Removing Front Bezel

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

1.5.2 How to attach/remove Rear Cover of Floor Model

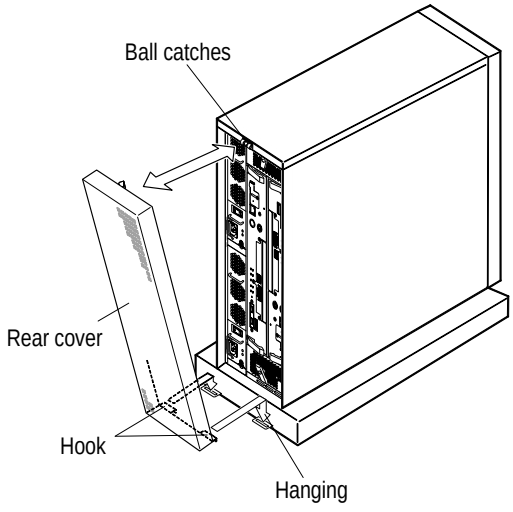
⚠ CAUTION

- Attach or remove the Rear Cover carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.
- Do not lean against the rear cover. The cover comes off, and it causes the injury.

(1) Procedure for removal

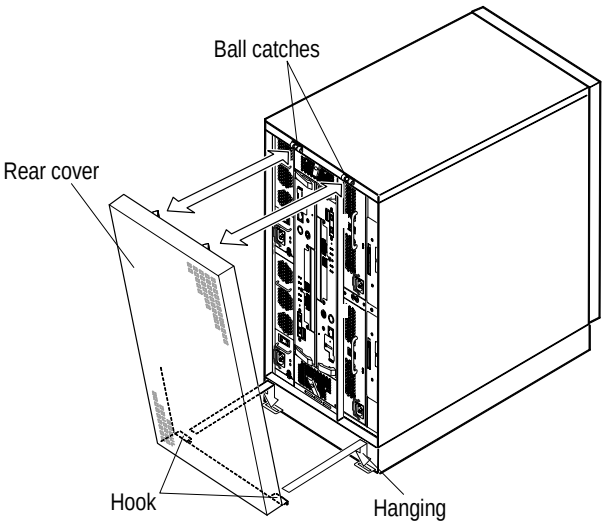
(a) Hold the rear cover with your both hands.

(b) When you disengage the rear cover from a ball catch by pulling the upper part of it toward you, you can remove the rear cover.



(2) Procedure for attachment

NOTE : When installing Rear Cover, be careful not to catch cables.



(a) Hold the rear cover with your both hands.

(b) Hang the hook under the rear cover.

(c) Fasten the rear cover by pressing it against the ball catch at the upper part of the subsystem main body.

1.5.3 How to attach/remove Front Bezel of the Rackmount Model

CAUTION

Attach or remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Since front bezels of the RKH/RKM/RKS/RKXS and the RKAJ/RKAJAT are different with each other in their size.
- When installing or removing the Front Bezel, try not to operate the main switch incorrectly with the hook or the ON/OFF button of the Front Bezel.

A key is necessary to attach or remove the Front Bezel.

(1-1) Basic subsystem and Additional subsystem

(1) Procedure for removal

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.

(b) Pull the front bezel toward you holding its sides to disengage it from the ball catches.

(c) Disengage the two hooks of the front bezel from the slots on the subsystem main body by shifting the bezel to the right and remove the bezel.

(2) Procedure for attachment

(a) Hold the side of Front Bezel with your both hands.

(b) Hang the hook of the Front Bezel (left side) on the hole in the bottom left part of the subsystem.

(c) Hang the hook of the Front Bezel (right side) on the hole in the bottom right part of the subsystem.

(d) After making the hooks of the front bezel engaged, press the bezel against the main body until it is stopped.

(e) Fix the front bezel by turning the key.

(1-2) NAS Unit

(1) Procedure for removal

(a) Pull the front bezel toward you holding its sides to disengage it from the ball catches.

(2) Procedure for attachment

(a) Hold the side of Front Bezel with your both hands.

(b) After making the hooks of the front bezel engaged, press the bezel against the main body until it is stopped.

1.5.4 How to open/close the Rear Door of U7 rack frame

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

For the procedure for removing and installing the Font Bezel, refer to "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100).

(1) Fit an Allen wrench in the key socket on the rear door, turn the Allen wrench in the direction shown by the arrow (⟶), and open the rear door slowly leaving the wrench as it is.
(2) To close the rear door, fit the Allen wrench in the key socket on the door, turn the wrench in the direction shown by the arrow (⟶), press the door against the main body leaving the wrench as it is, and then turn the wrench in the direction shown by the arrow (·····>) to return it to its original state.
(3) Make sure that the rear door is latched and cannot be opened.

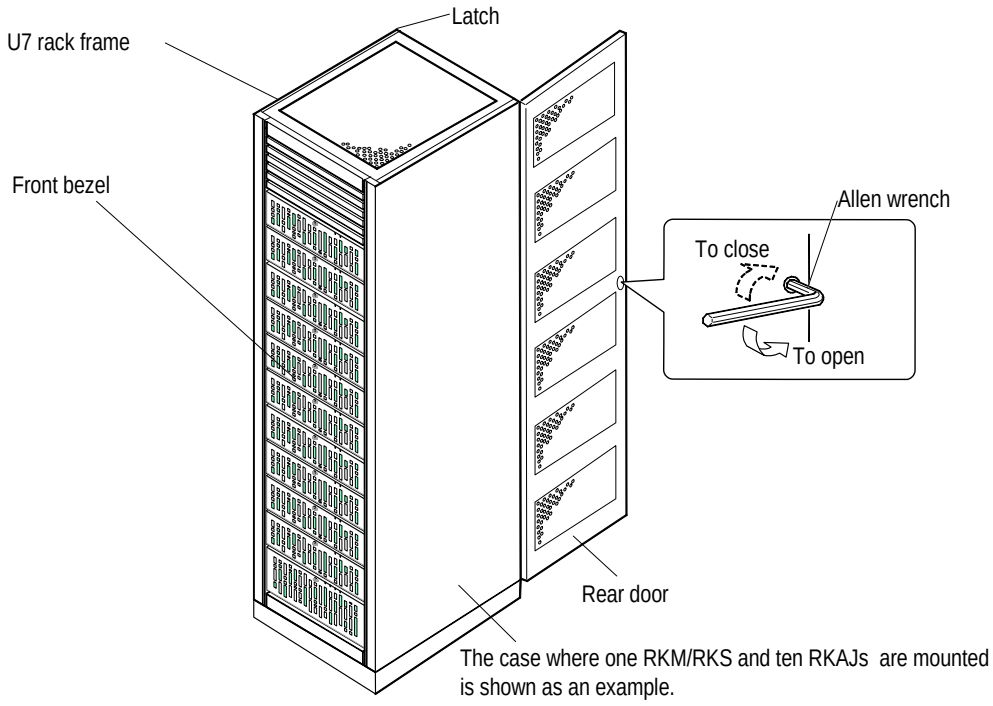

Figure 1.5.4 Procedure for Opening/Closing Rear Door

1.6 Device ID Setting and ENC Cable Connection

Set the specified device ID and connect the ENC cable by executing the ACE tool of Storage Navigator Modular. When an error message is displayed during operation of the ACE Tool, take recovery actions referring to Message "Chapter 10. ACE Tool Error Message" (MSG 10-0000).

1.6.1 Example of device ID and ENC cable connection

(1) For RKM+RKAJ

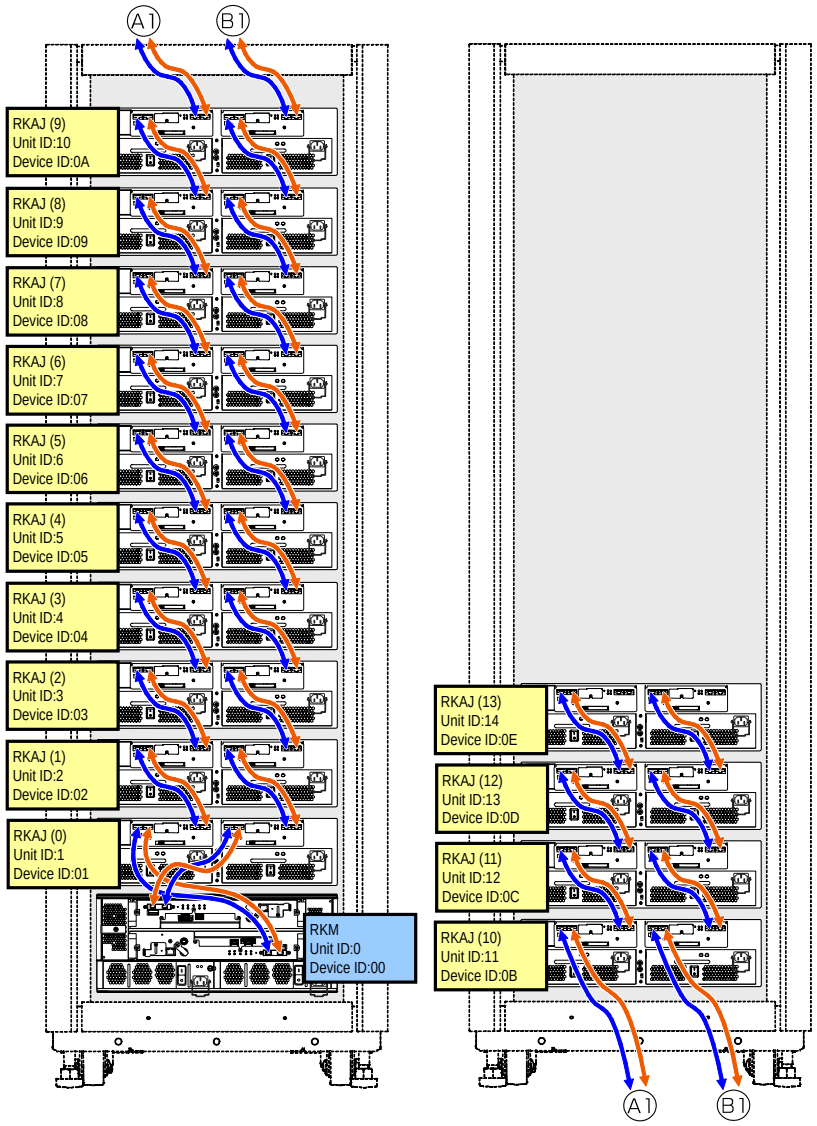

Figure 1.6.1 Example of RKM+RKAJ ENC cable connection (The figure shows an example in which the maximum configuration is installed in the U7 rack frame.)

	Unit ID	Device ID		Unit ID	Device ID		Unit ID	Device ID		Unit ID	Device ID
1st	#0	#00	5th	#4	#04	9th	#8	#08	13th	#12	#0C
2nd	#1	#01	6th	#5	#05	10th	#9	#09	14th	#13	#0D

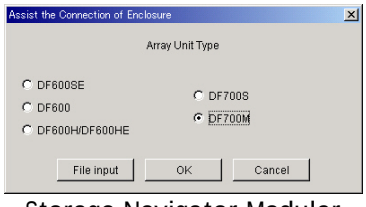
1.6.2 Checking methods of device ID and ENC cable connection when mounting the newly introduced rack

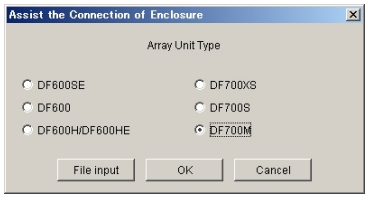
(1) Start Storage Navigator Modular and select [Tool] and [ACE Tool] in this order in the main window. The ACE Tool is started and a window for selecting a subsystem is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



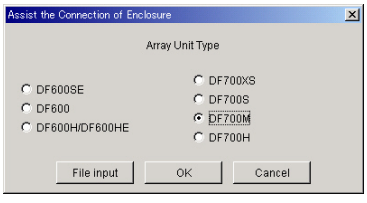
(2) Select the subsystem, and click the [OK] button.

NOTE : When selecting a subsystem in (1), this dialog is not displayed.

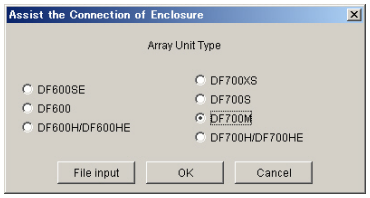


The Array Unit Type name to be selected varies depending on the Basic subsystem model name.

Basic subsystem model name	Array Unit Type name
DF700-RKM	DF700M
DF700-RKS	DF700S
DF700-RKXS	DF700XS
DF700-RKH	DF700H
DF700-RKHE	DF700HE
DF600-RK	DF600
DF600-RKH	DF600H
DF600-RKHE	DF600HE

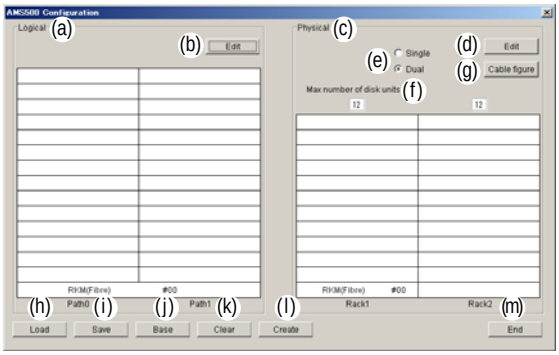


Storage Navigator Modular version is Ver.1.01 or less.

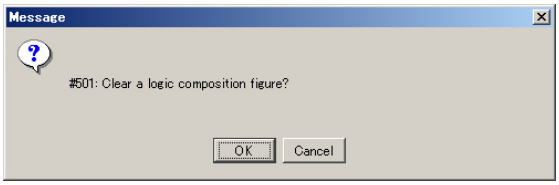


Storage Navigator Modular version is Ver.2.00 or more, Ver.3.10 less than.

Storage Navigator Modular version is Ver.3.10 or more, Ver.6.0 less than.



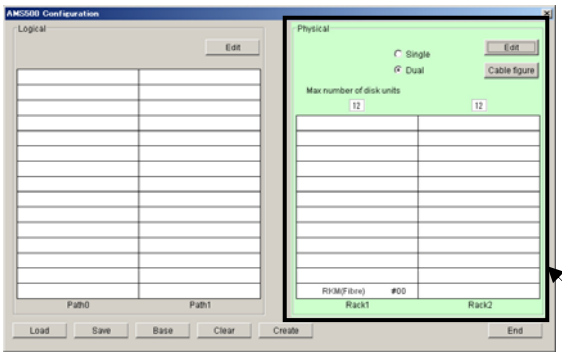
Storage Navigator Modular version is Ver.6.0 or more.



Copyright © 2005, 2006, Hitachi, Ltd.

(3) Set the subsystem to be configured in the frame part of the Physical.
Click the [Edit] button in the Physical part.

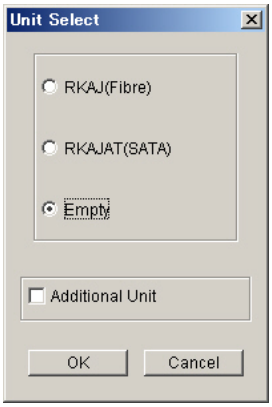
(a) [Logical] : The device ID can be checked per Path.
(b) [Edit in Logical] button : The chassis frame in Logical can be edited manually. If [Create] button is selected after the setting, the subsystem and the device ID are displayed in the Logical part and the Physical part.
(c) [Physical] : The device ID can be checked per Rack.
(d) [Edit in Physical] button : The chassis frame in Physical can be edited manually. If [Create] button is selected after the setting, the subsystem and the device ID are displayed in the Logical part and the Physical part.
(e) [Single, Dual in Physical] button : It selects the installation configuration of the Control Unit.
(f) [Max number of disk units] button : The maximum number of chassis frames per Rack can be specified.
(g) [Cable figure] button : The ENC cable connection figure is displayed.
(h) [Load] button : The configuration figure can be read.
(i) [Save] button : The configuration figure can be stored in files.
(j) [Base] button : The chassis frame type and the device ID are displayed automatically in the Logical part and the Physical part.
(k) [Clear] button : The subsystem and the device ID, which have been set, are cleared.
(l) [Create] button : The name and ID number of the subsystem are displayed in the Logical part and Physical part.
(m) [End] button : It returns to the device model selection window.



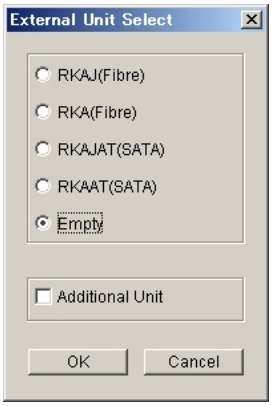
(4) Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) If the chassis frame section the Physical part is clicked, the “Unit Select” window is displayed. Select RKAJ (Fibre), RKA (Fibre), RKAJAT (SATA) or Empty and input the configuration. Check that the actual rack mounting position and the Physical part are the same.

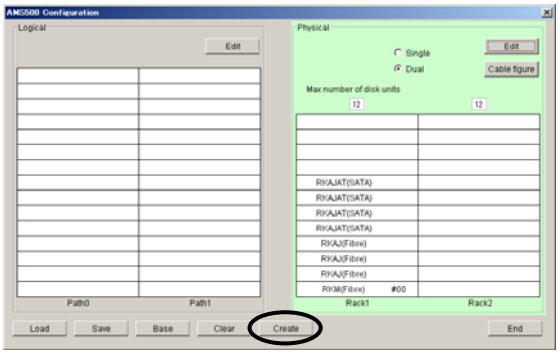


NOTE : The RKXS can be connected to the additional chassis, RKAJAT and RKAJATL. Use it by reading the RKAJATL as the RKAJAT.



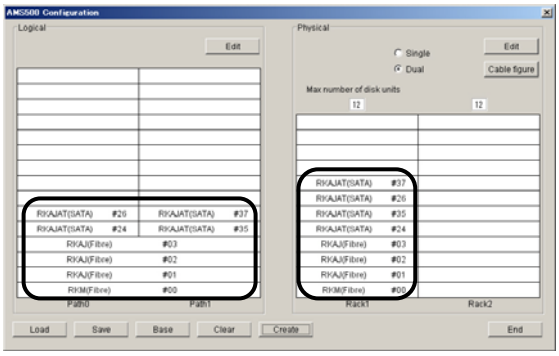
Physical part

Frame type selection window

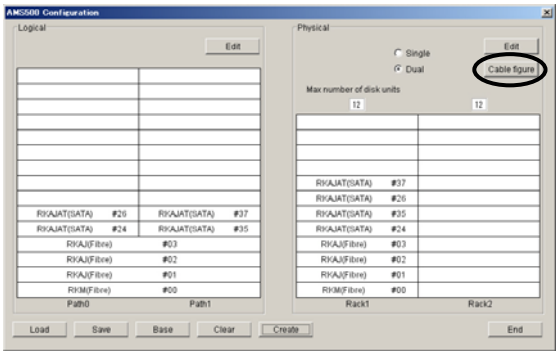


Storage Navigator Modular version is Ver.1.01 or less.

Storage Navigator Modular version is Ver.2.00 or more.



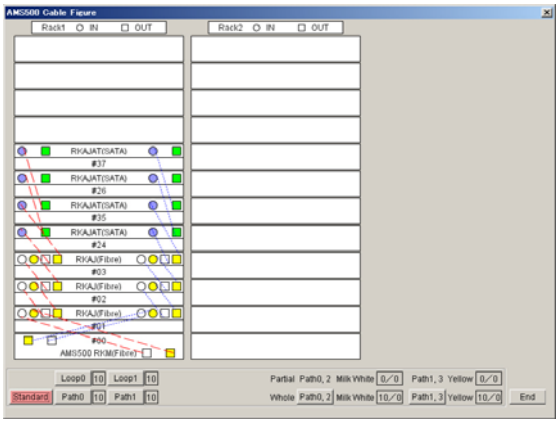
(6) Click the [Create] button.



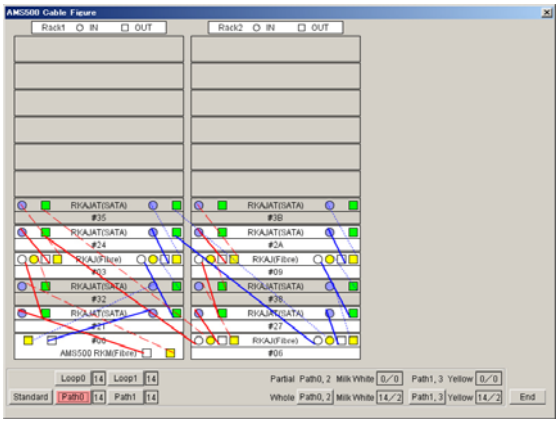
Copyright © 2005, 2006, Hitachi, Ltd.

(7) The device ID# is output in the Logical part and the Physical part window.

NOTE : The RKXS can be connected to the Additional Chassis, RKAJAT and RKAJATL. Use it by reading the RKAJATL as the RKAJAT.

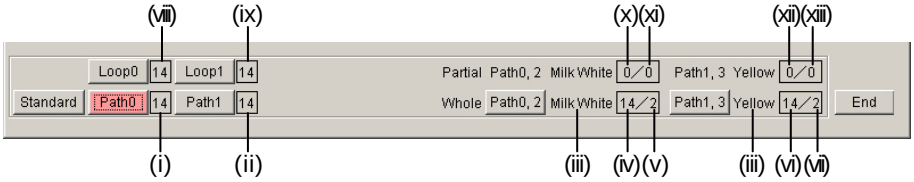


(8) Click the [Cable figure] button.



(9) The ENC cable connection diagram is displayed.
Refer to the ENC cable connection figure, and perform the ENC cable connection.

NOTE : The RKXS can be connected to the Additional Chassis, RKAJAT and RKAJATL. Use it by reading the RKAJATL as the RKAJAT.



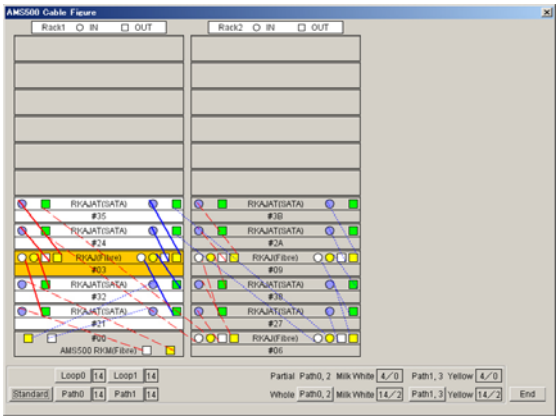
Copyright © 2005, 2006, Hitachi, Ltd.

(a) When Path 0 is selected, the Path 0 is highlighted and the disk units connected to its lines are displayed in white.

When the each [Path] button is clicked, the displayed lines connected to the path are highlighted, disk units connected to the lines are displayed in white, and disk units not connected to the lines are displayed in gray.
To cancel the highlighting, click the [Standard] button.

The explanations of the buttons are shown below.

[Explanation of each button]

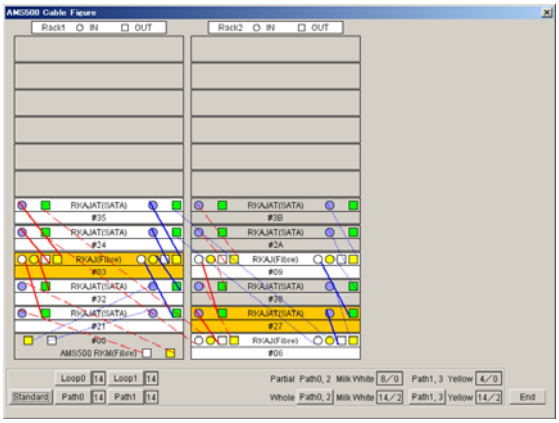


[Standard] button	: It returns the window line to the initial status (the highlighting is cancelled).
[Path0] button	: The line connected to Path0 is highlighted.
[Path1] button	: The line connected to Path1 is highlighted.
[Path2] button	: The line connected to Path2 is highlighted (it is not displayed in the 700M (RKM)).
[Path3] button	: The line connected to Path3 is highlighted (it is not displayed in the 700M (RKM)).
[Path0/2] button	: The lines connected to Path0 and Path2 are highlighted (Path2 does not exist in the 700M (RKM)).
[Path1/3] button	: The lines connected to Path1 and Path3 are highlighted (Path3 does not exist in the 700M (RKM)).
[Loop0] button	: The line connected to Loop0 is highlighted.
[Loop1] button	: The line connected to Loop1 is highlighted.

Copyright © 2005, Hitachi, Ltd.

[Explanation of the window display]

(i) The number of ENC cables of Path0 is displayed.
(ii) The number of ENC cables of Path1 is displayed.
(iii) The color of the binders attached to both ends of the ENC cable is displayed.
(iv) The number of ENC cables of Path0 is displayed.
(v) The number of ENC cables (long ENC cables) between the racks of Path0 is displayed.
(vi) The number of ENC cables of Path1 is displayed.
(vii) The number of ENC cables (long ENC cables) between the racks of Path1 is displayed.
(viii) The number of ENC cables of Loop0 is displayed.
(ix) The number of ENC cables of Loop1 is displayed.
(x) The number of the cables of the Path 0 connected to the selected disk unit or that of the Path 0 connected to the additional disk unit is displayed.
(xi) The number of the inter-rack cables (long ENC cables) of the Path 0 connected to the selected disk unit or that of the Path 0 connected to the additional disk unit is displayed.
(xii) The number of the cables of the Path 1 connected to the selected disk unit or that of the Path 1 connected to the additional disk unit is displayed.
(xiii) The number of the inter-rack cables (long ENC cables) of the Path 1 connected to the selected disk unit or that of the Path 1 connected to the additional disk unit is displayed.



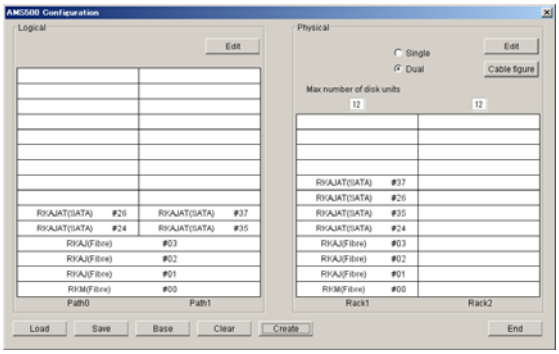
(b) When [RKAJ(Fibre) #03] is selected, the [RKAJ(Fibre) #03] disk unit is displayed in orange and disk units connected to the [RKAJ(Fibre) #03] disk unit are displayed in white.
Besides, the displayed ENC cables connected to the [RKAJ(Fibre) #03] disk unit are highlighted.

To cancel the selection of the disk unit, click the [Standard] button.

Copyright © 2005, Hitachi, Ltd.

(c) When [RKAJ(Fibre) #03] is selected and [RKAJAT(SATA) #27] is clicked while the control [Ctrl] key is pressed, the chassis frame connected to the [RKAJ(Fibre) #03 and RKAJAT(SATA) #27] chassis frame is displayed in white. Also, the connecting ENC cable from the [RKAJ(Fibre) #03 and RKAJAT(SATA) #27] chassis frame is highlighted.

Any of the following methods is able to cancel the selection of two or more chassis frames.



① Click the selected chassis frame again while the control [Ctrl] key is pressed.

② Click the [Standard] button.

③ Click another chassis frame while the control [Ctrl] key is not pressed.

(10) Click the [End] button in the ENC cable connection figure.
It returns to the Configuration window.

(11) Click the [End] button.

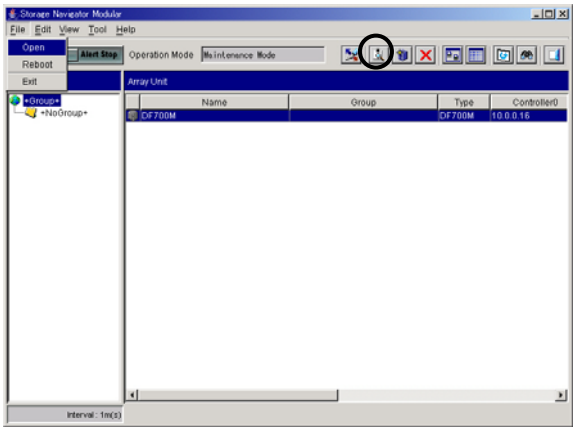
(12) Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

1.6.3 Procedure for making the configuration diagram when adding the disk unit(s)

When adding the disk unit(s) to the subsystem already installed, you can display the configuration of the existing subsystem using the following procedure in addition to the procedure explained above. The procedure is to get the configuration information with the configuration copying function of Storage Navigator Modular and to have the file read.

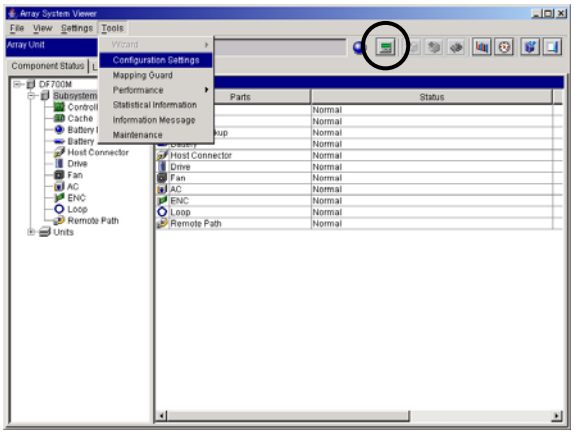
① Set up the specified device ID and connect the ENC cable by executing the ACE tool.



② If error messages are displayed during the operation, refer to Message "Chapter 10. ACE Tool Error Message" (MSG 10-0000) and perform the recovery method.

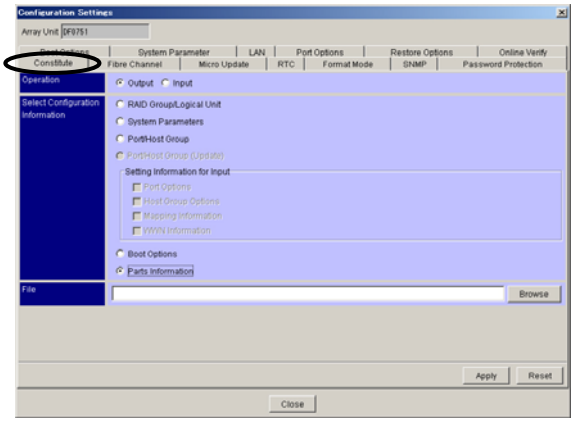
(1) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to System Parameter "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050).

(2) Click an icon of the disk array subsystem you want to set in the main window. There are three ways of the selection methods as shown below.

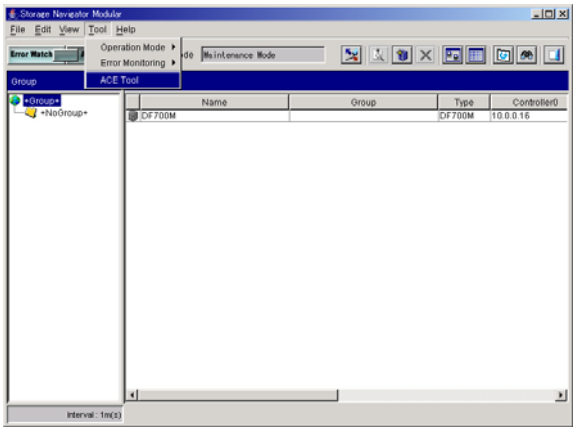


- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

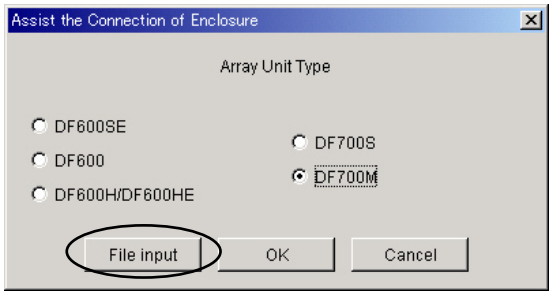


Copyright © 2005, Hitachi, Ltd.

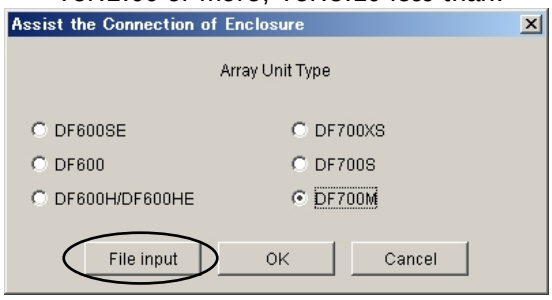


(3) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] in the tool bar.

(4) Click the [Constitute] tab.
Get the configuration information by selecting [Parts Information].

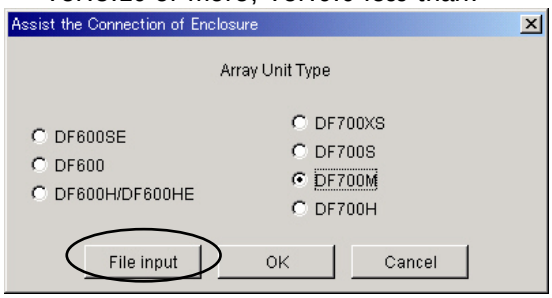


(5) Select [Tool] and [ACE Tool] in this order in the main window.
The ACE tool starts up and the "Array Unit Type" window is displayed.

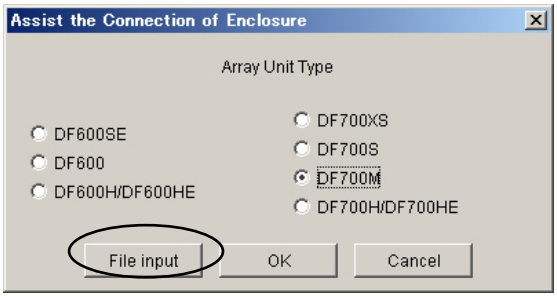


Copyright © 2005, Hitachi, Ltd.

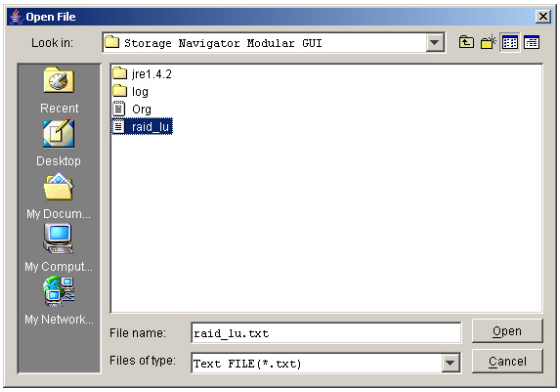
(6) Select the subsystem, and click the [File input] button.



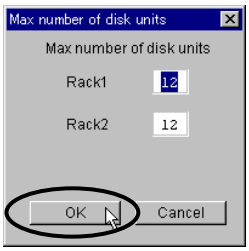
Storage Navigator Modular version is Ver.1.01 or less.



Storage Navigator Modular version is Ver.2.00 or more, Ver.3.10 less than.



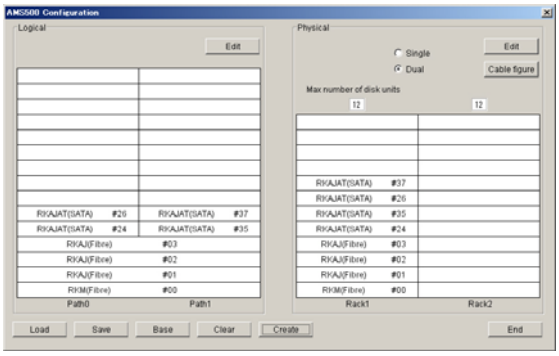
Storage Navigator Modular version is Ver.3.10 or more, Ver.6.0 less than.



Storage Navigator Modular version is Ver.6.0 or more.

(7) Have the file that has been got in Step (4) read.

(8) Enter the number of the disk units in each of the Rack boxes according to the actual state in which the disk units are installed. When the rack is not specified, the entries are made in regular order starting from Rack 1.



(9) Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) The device ID numbers are displayed in the Logical part and Physical part.

NOTE : The RKXS can be connected to the Additional Chassis, RKAJAT and RKAJATL. Use it by reading the RKAJATL as the RKAJAT.

The post-addition configuration can be derived from the diagrams above.
For the creation procedure, refer to "1.6.2 (3) Set the subsystem to be configured in the frame part of the Physical." (INST 01-0190) and add the chassis frame to be added by the connection tool and perform the specified device ID and ENC cable connection.

Copyright © 2005, 2006, Hitachi, Ltd.

1.7 Power On/Off Procedure

The Disk Drive may emit mechanical sound "click-clack" when the Disk Drive is started (spun up) immediately after the subsystem powering on and when the Disk Drive is powered off (spun down). However, since there is no problem if the WARNING LED (orange) or the ALARM LED (red) on the Basic Chassis is not lighting up or blinking at low speed, please use the subsystem as it is.
If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

1.7.1 Subsystem power on

(1) In the case of Floor model, make sure that the AC Power Unit Switch of the Power Unit is turned off.
In the case of Rackmount model, make sure that the circuit breaker is turned off.
(2) Check that the AC Input Power Switches of the RKNAS are turned off when the RKNAS is installed in the rack.
(3) Make sure that the main switch is turned off.
(4) All turn on the battery switch of the Backup Battery Unit on the front of the subsystem.
(In case of the Backup Battery Unit of REV.C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.)
(5) In the case of Rackmount model, turn on the circuit breaker of the PDB.
(6) Turn on all the AC Input Power Switches of the RKNAS.
(7) Turn on the AC Power Unit Switch of the Power Unit on the Basic and Additional Chassis. (‡1)
(8) Turn on the main switch.

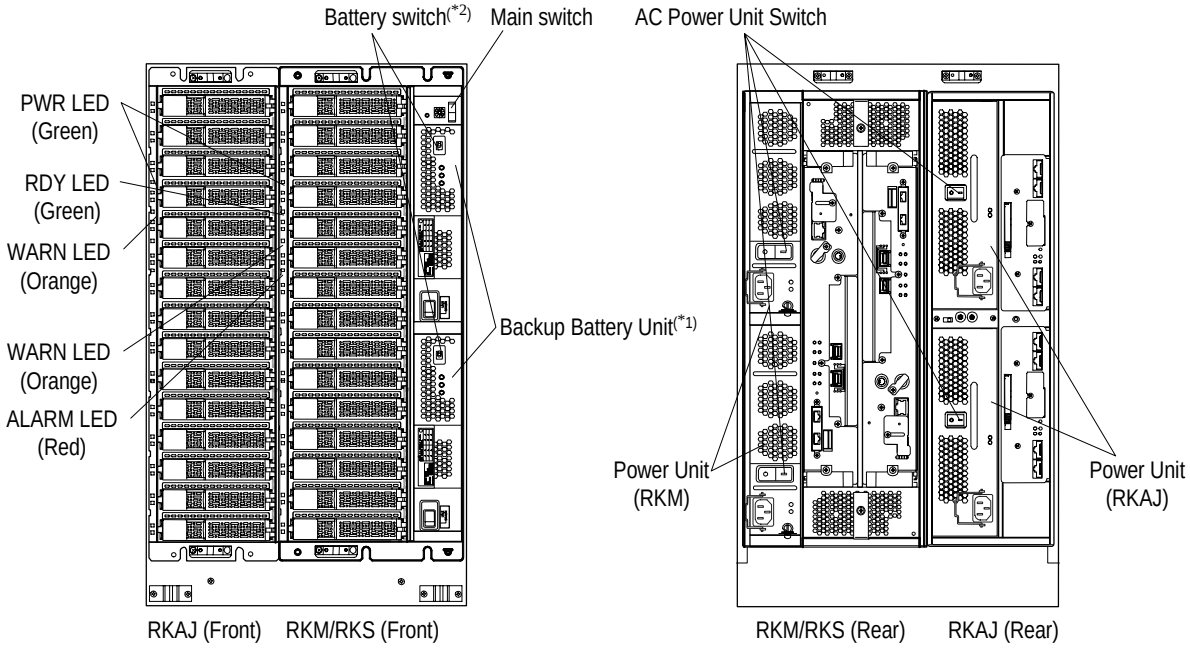
Copyright © 2005, 2006, Hitachi, Ltd.

‡1 : When the Disk Drives are not installed in the RKAJ/RKAJAT in the floor model (RKM/RKS+RKAJ+H2J, RKM/RKS+RKAJAT+H2J, or RKXS+RKAJAT+H2J), turn off the AC Input Power Switch of the RKAJ/RKAJAT always.

Copyright © 2005, 2006, Hitachi, Ltd.

(9) Check that the RDY LED (green) on the Basic subsystem lights up usually after about four minutes for the RKM/RKS/RKXS and five minutes for the RKH.
When doing this, when the RDY LED (green) on the front of the Basic Chassis is blinking at high-speed in the dual controller configuration, the RDY LED (green) on the front of the Basic Chassis lights up after it blinks at high-speed for the maximum of 30 to 50 minutes and 40 to 60 minutes for the RKH because the automatic download of the ENC/SENC firmware is operating.
Also, when the WARN LED (orange) on the front of the Basic Chassis is blinking at high speed in the single controller configuration, the RDY LED (green) on the front of the Basic Chassis lights up after the WARN LED (orange) on the front of the Basic Chassis blinks at high speed for the maximum of 30 to 85 minutes because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on is operating.
If the RDY LED (green) on the front of the Basic Chassis does not light up even if time passes, collect the full dump (refer to Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130)), turn off the main switch, turn off the AC Input Power Switches of all the subsystem, and then replace the Control Unit (refer to Replacement "2.5.5 (2) Procedure for replacement with the power turned off" (REP 02-0500)).

(10) Check that "I10000 Subsystem is ready" is displayed referring to the Information Message on WEB.



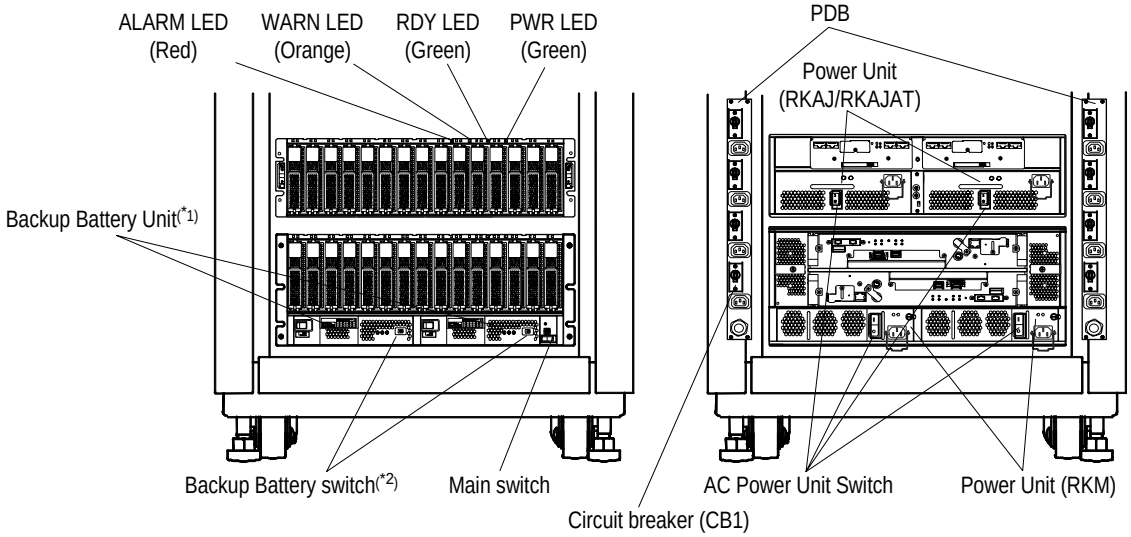
(11) Check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to the Information Message on WEB when the Basic Chassis is the RKH/RKHE.

(12) Check When the RKNAS is connected, check that the READY LED (green) on the NAS Unit lights on about another three minutes later.
However, there is the case that READY LED (green) on the NAS Unit illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320).).
If the ALARM LED (red) on the front of the Basic Chassis or the WARN LED (orange) on the front of the Basic Chassis and the Additional Chassis lights on or blinks at low speed, refer to Troubleshooting "8.1 Trouble Analysis by LED Indication of Front Bezel" (TRBL 08-0000).

NOTE : The EALM LED (red) on the Control Unit (on the rear side of the subsystem) may come on after powering on the subsystem. However, it is not a problem if the EALM LED (red) goes out until the RDY LED (green) comes on the front of the Basic Chassis.

(13) Check that "IZYR00 Automatic ENC microprogram download completed successfully" and "IZYS00 Automatic ENC microprogram download start" are displayed in Information Message on WEB.
When "IZYQ00 Automatic ENC microprogram download failed" is displayed in Information Message on WEB, perform the maintenance according to the recovery method of the message code. However, if [Unit Window] – [Tool] – [Maintenance] – [ENC Micro Update] – [Automatic Download] is set to [Disable] in Storage Navigator Modular, Procedure (13) is not necessary.

Copyright © 2005, 2006, Hitachi, Ltd.



*1 : Only one battery is installed in RKS/RKXS under the subsystem.

*2 : In case of the Backup Battery Unit of REV.C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS, there is no battery switch.

*3 : The figure shows RKM + RKAJ.

Figure 1.7.1 Location of Switches for Power On (Floor model)

*1 : Only one battery is installed in RKS/RKXS under the subsystem.

*2 : In case of the Backup Battery Unit of REV.C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, there is no battery switch.

*3 : The figure shows RKM + RKAJ.

Figure 1.7.2 Locations of Switches for Power On (Rackmount model)

Copyright © 2006, Hitachi, Ltd.

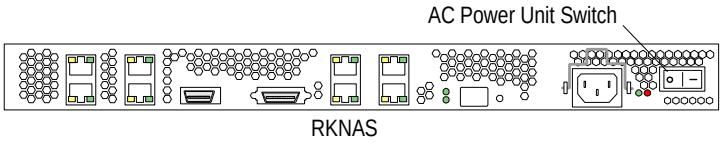


Figure 1.7.2.1 Locations of Switches for Power On (RKNAS)

Copyright © 2006, Hitachi, Ltd.

1.7.2 Subsystem power off (Sequential shutdown)

NOTE : • Do not perform the planned shutdown (power-off) while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, but for the maximum of 40 to 60 minutes in case of the RKH).

• In the case of the single controller configuration, do not perform the planned shutdown (power-off) while the WARN LED (orange) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 85 minutes).

• When Power Saving of the priced option is used, if you perform the planned shutdown of the system after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host when the subsystem power is turned on.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then perform the planned shutdown of the subsystem.
If the spin-down fails, execute the spin-down again.

(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the front of the subsystem is off. (‡1)
(3) Turn off the AC Power Unit Switch of the Power Unit on the Basic and Additional subsystem.
(4) Turn off all the AC Input Power Switches of the RKNAS when the RKNAS is installed in the rack.
(5) Turn off the battery switch of the Backup Battery Unit. (In case of the Backup Battery Unit of REV.C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.)
(6) All turn off the circuit breaker of the PDB.

‡1 : The PWR LED (green) of the RKA/RKAJ does not go out when the main switch is turned off in the Maintenance mode, however, this is not a problem.

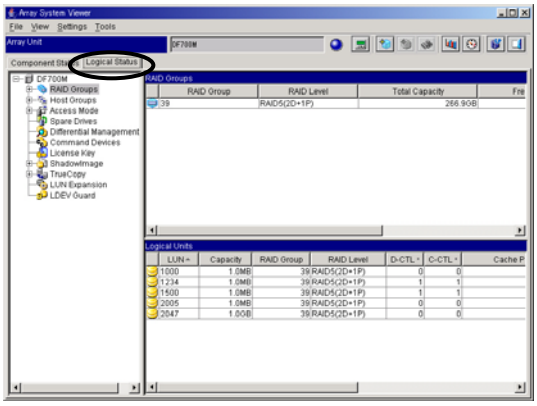
Copyright © 2005, 2006, Hitachi, Ltd.

1.7.3 Stop/Start/Restart of the NAS OS(‡1)

(1) Before performing Stop/Start/Restart of the NAS OS

NOTE : In the case of the mixed configuration of the Fibre Channel interface and the iSCSI interface, if stop/start/restart of the NAS OS is executed with the I/O load applied from the Fibre Channel/iSCSI interface, the processing may terminate abnormally (time-out).

(a) Check that the AC Input Power Switch of the RKNAS is turned on. If not, refer to "1.7.1 Subsystem power on" (INST 01-0290) and turn it on.

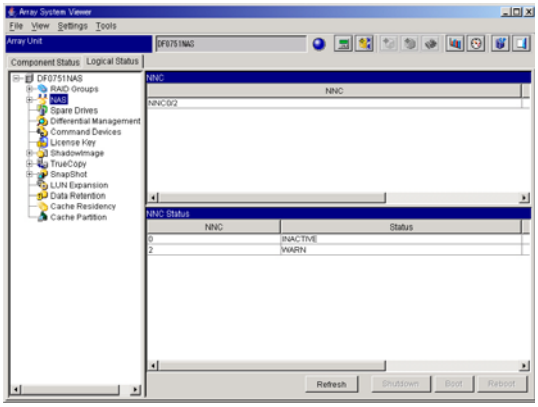


(b) Check that the Control Unit connected to the RKNAS to operate is not blocked. If blocked, perform the maintenance of the Control Unit to operate first.

(c) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode".

(d) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(e) Click the [Logical Status] tab in the unit window.

‡1 : Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(f) Click the [NAS] icon.

(g) Check the NAS Unit status.

○: Operation enabled -: Operation disabled(*3)

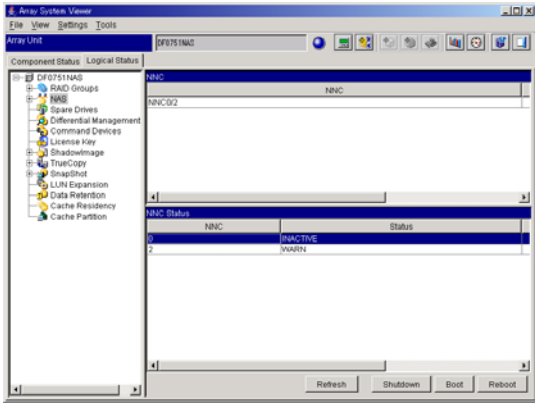
Image	Status	Stop	Start	Restart
NEW	• The NAS OS is not installed.	-	-	-
INST	• The NAS OS is in installation process.	-	-	-
ACTIVE	• The NAS OS is in operation and the Node is in operation.	○(*2)	○	○
STOP	• The NAS OS is normally stopped	-	○	○
DOWN	• The NAS OS is abnormally stopped	-	○	○
BOOT	• The NAS OS is in start process.	○	-	○
SHUTDOWN	• The NAS OS is in stop process.	-	○	○
INACTIVE	• The NAS OS is in operation and the Node is stopped.	○	○	○
DUMP	• A NAS Dump is being collected.	○	○	○
HUNGUP	• The NAS OS is hung-up.	-	○	○
WARN	• The NAS Manager is not installed, or the NAS OS is in operation and the status of the Node is unknown.	○	○	○
DISUSE	• The Control Unit is blocked, so the NAS OS of the NNC concerned cannot be used. (*1)	-	-	-

*1 : It is necessary to recover the blocked status of the Control Unit connected to the NAS Unit on the side where "DISUSE" is displayed.

*2 : Stopping the NAS OS can be executed only when both NAS Units status are "ACTIVE" in the cluster.

*3 : The button of the Storage Navigator Modular can be clicked, but the processing is not executed.

(h) Check the operation of each button.

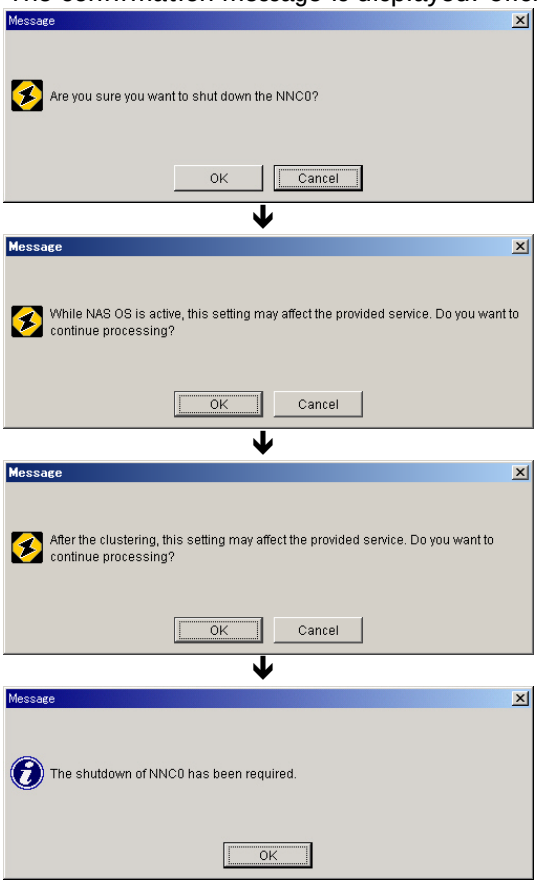


Button Name	Operation
Shutdown	Put the NAS OS into the stop status.
Boot	Start the NAS OS.
Reboot	Restart the NAS OS which is in the stop status. The operation is not different from the "Boot" button.
Refresh	Update the display information to the latest information.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Stopping the NAS OS

NOTE : • Do not stop the NAS OS without a customer's permission.
- When the status of the NNC (NAS Unit) to stop the NAS OS is "STOP" or "DOWN", the NAS OS has already stopped.
- Stopping the NAS OS can be executed only when both NAS Units status are "ACTIVE" in the cluster.
- The time that takes to stop the NAS OS differs depending on the setting status of the cluster.
  When the cluster is stopped, it is about one minute.
  When the cluster is started, it takes time (for the maximum of 60 minutes) in proportion to the number of resource groups.
- When stopping NAS OS from Storage Navigator Modular immediately after the power supply of the array subsystem was started or the cluster start of NAS was performed from NAS Manager Modular, check with the customer that the cluster and the resource group are available (the cluster status is "ACTIVE" and the resource group status is "Online" or "Offline"), and stop NAS OS.
  If NAS OS is stopped at the time other than the above-mentioned, the subsequent cluster operation and the resource group operation may not be able to be performed normally (example: when the cluster stop is performed from NAS Manager Modular in the NAS Unit of the one that is not stopped, the cluster stop may not be completed).
  In this case, restart the NAS Unit of the one that is not stopped from Storage Navigator Modular.



(a) Select the NNC (NAS Unit) to stop the NAS OS from the "NNC Status".

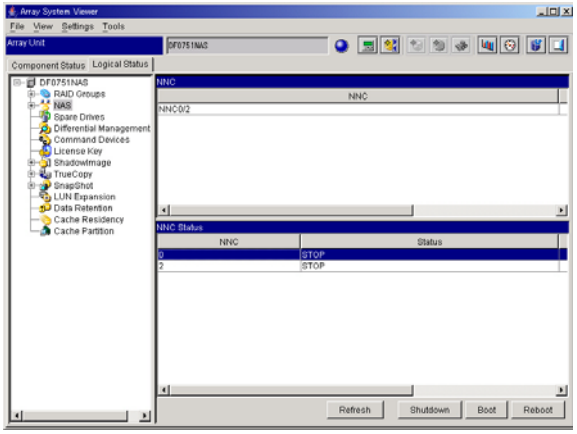
(b) Click the [Stop] button at the lower right of the window.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) The confirmation message is displayed. Click the [OK] button.

(d) Check that "Status" of the NNC (NAS Unit) which stopped the NAS OS is "STOP".

Copyright © 2006, Hitachi, Ltd.

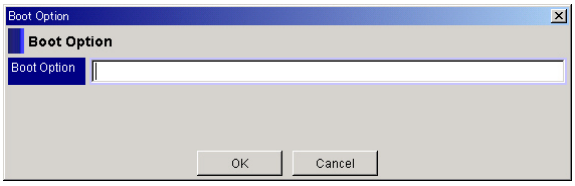


This page is for editorial purpose only.

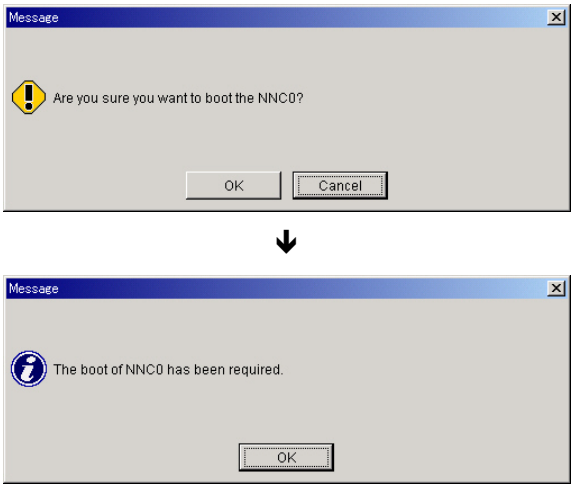
Copyright © 2006, Hitachi, Ltd.

(3) Starting the NAS OS

NOTE : When the status of the NNC (NAS Unit) to start the NAS OS is “NEW”, it cannot start because the NAS OS is not installed. When “Status” is other than “NEW”, “STOP”, and “DOWN”, the NAS OS has already started.
The time that takes to start the NAS OS is about three minutes regardless of the setting status of the cluster.



(a) Select the NNC (NAS Unit) to start the NAS OS from the “NNC Status”.

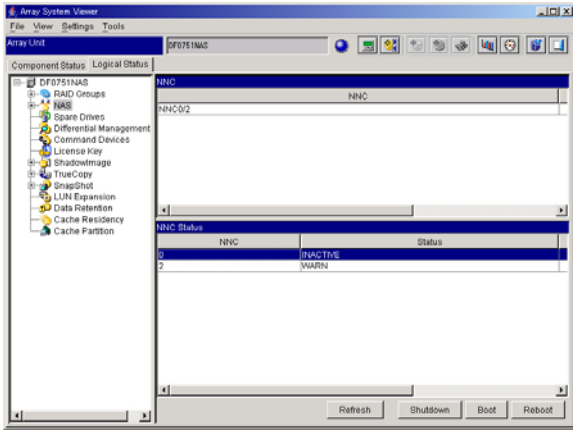


(b) Click the [Boot] button at the lower right of the window.

(c) The start option setting window is displayed. Click the [OK] button.

NOTE : When starting the NAS OS, do not specify any start option.

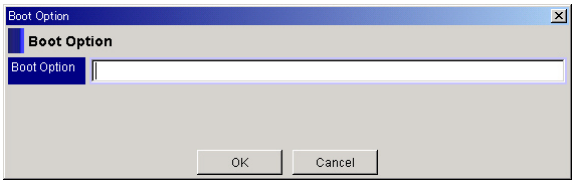
(d) The confirmation message is displayed. Click the [OK] button.



(e) Check that “Status” of the NNC (NAS Unit) which started the NAS OS is “INACTIVE” or “ACTIVE”. However, a NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to “1.7.3 Stop/Start/Restart of the NAS OS” (INST 01-0320).).

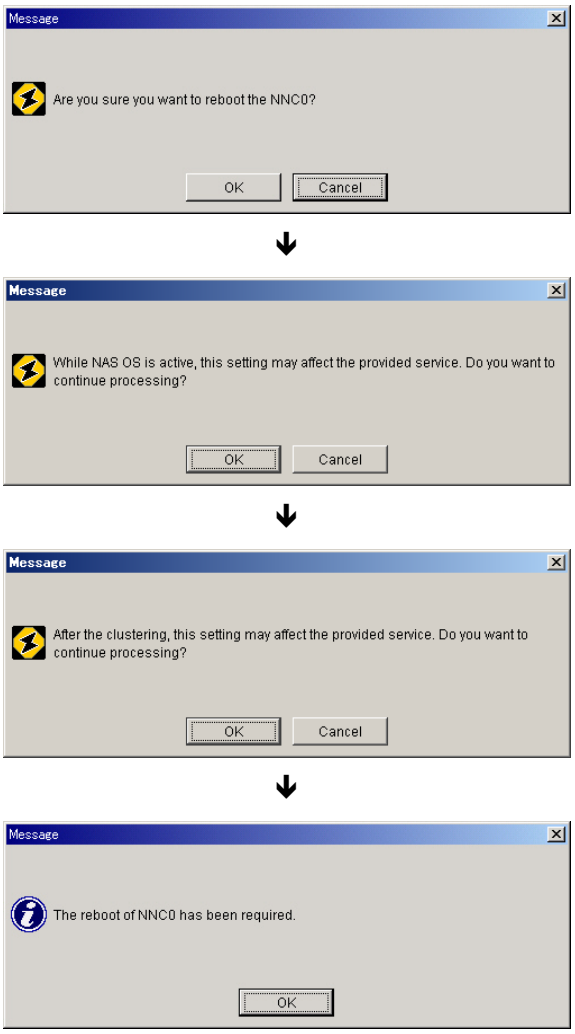
Copyright © 2005, 2006, Hitachi, Ltd.

(4) Restarting the NAS OS



NOTE : • Do not restart the NAS OS without a customer's permission.
- When the status of the NNC (NAS Unit) to restart the NAS OS is "STOP" or "DOWN", the NAS OS has already stopped. Please execute it according to "1.7.3 (3) Starting the NAS OS" (INST 01-0350).
- The time that takes to restart the NAS OS is the sum of the time applied for "1.7.3 (2) Stopping the NAS OS" (INST 01-0340) and "1.7.3 (3) Starting the NAS OS" (INST 01-0350).
- When restarting NAS OS from Storage Navigator Modular immediately after the power supply of the array subsystem was started or the cluster start of NAS was performed from NAS Manager Modular, check with the customer that the cluster and the resource group are available (the cluster status is "ACTIVE" and the resource group status is "Online" or "Offline"), and restart NAS OS.
  If NAS OS is restarted at the time other than the above-mentioned, the subsequent cluster operation and the resource group operation may not be able to be performed normally (example: when the cluster stop is performed from NAS Manager Modular in the NAS Unit of the one that is not restarted, the cluster stop may not be completed).
  In this case, restart the NAS Unit of the one that is not restarted from Storage Navigator Modular.

(a) Select the NNC (NAS Unit) to restart the NAS OS from the "NNC Status".



(b) Click the [Reboot] button at the lower right of the window.

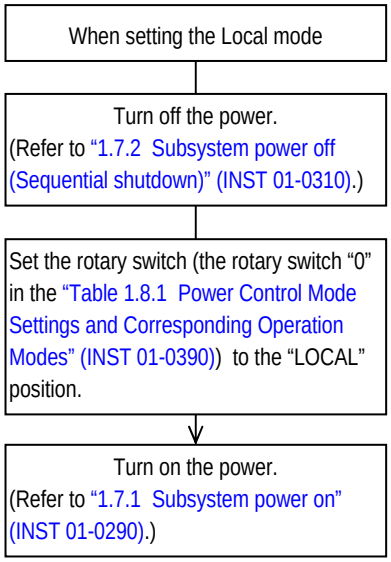
(c) The start option setting window is displayed. Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) The confirmation message is displayed. Click the [OK] button.

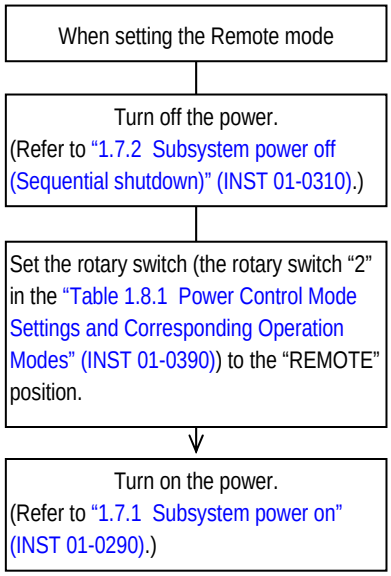
(e) Check that “Status” of the NNC (NAS Unit) which restarted the NAS OS is “INACTIVE” or “ACTIVE”.
However, a NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition (Refer to “1.7.3 Stop/Start/Restart of the NAS OS” (INST 01-0320).).

Copyright © 2005, Hitachi, Ltd.



1.8 Setting the Power Control Mode (Local/Remote Mode)

Set the mode of the power control. When the Remote mode is selected, the remote control to control turning on/off of the subsystem power by a host computer is enabled.



(1) Procedure for setting the Remote/Local mode

The remote adapter is not needed when the UPS with the interlocking function is used.

(a) Setting the Local mode

(b) Setting the Remote mode

Copyright © 2005, Hitachi, Ltd.

(2) Setting the Rotary switch

Set the mode of power control.

Either Local mode or Remote mode is set by the Rotary switch. Local/Remote mode settings and corresponding operation modes are shown in Table 1.8.1.

Table 1.8.1 Power Control Mode Settings and Corresponding Operation Modes

Rotary switch	Operation mode name	Operation mode
0	LOCAL	Local mode (Before shipment. When the remote adaptor is not used.)
1	—	—
2	REMOTE	Remote mode by means of the HOST AC (using a remote adapter)
3	—	—
4	UPS Interlock mode 1	Interlock mode 1 with an UPS exclusive for the subsystem To set the mode, connect AC#0 and AC#1 to the UPS and an external and an external AC power supply or the PDB of the U7 rack frame respectively.
5	UPS Interlock mode 2	Interlocking mode 2 with an UPS exclusive for the subsystem To set the mode connect AC#0 and AC#1 to the one UPS.(*1)
6	UPS Interlock mode 3	Interlocking mode 3 with an UPS exclusive for the subsystem To set the mode, connect each of AC#0 and AC#1 to the different UPSs. (*2)
7	—	—
8	—	—
9	—	—

: Do not make this setting when the UPS is not connected.

*1 : The duplication of the power supply system becomes unable to be done.

*2 : This cannot be used in the case of the single controller configuration.

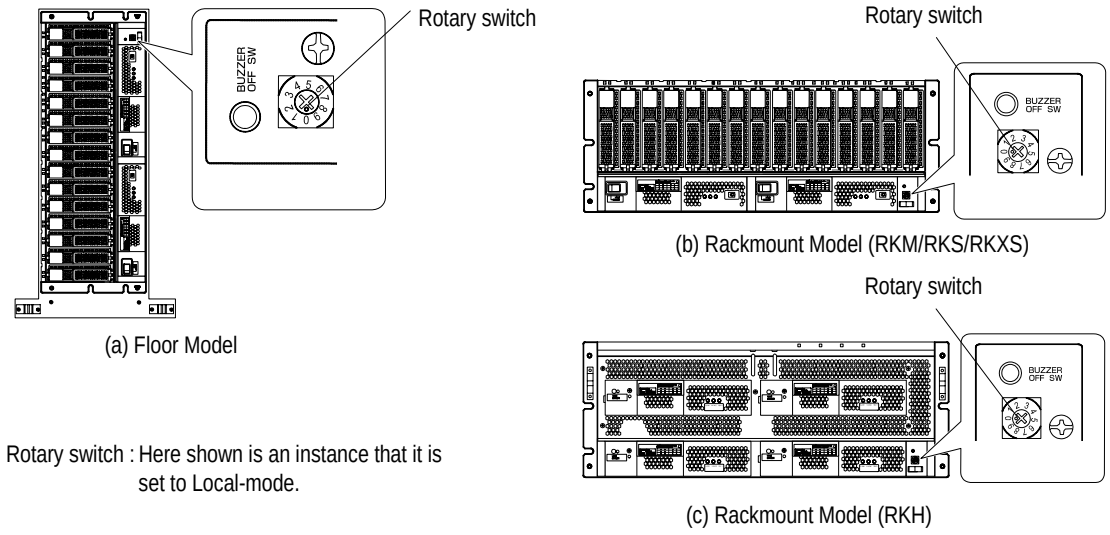


Figure 1.8.1 Location of Rotary Switch for Setting Power Control Mode

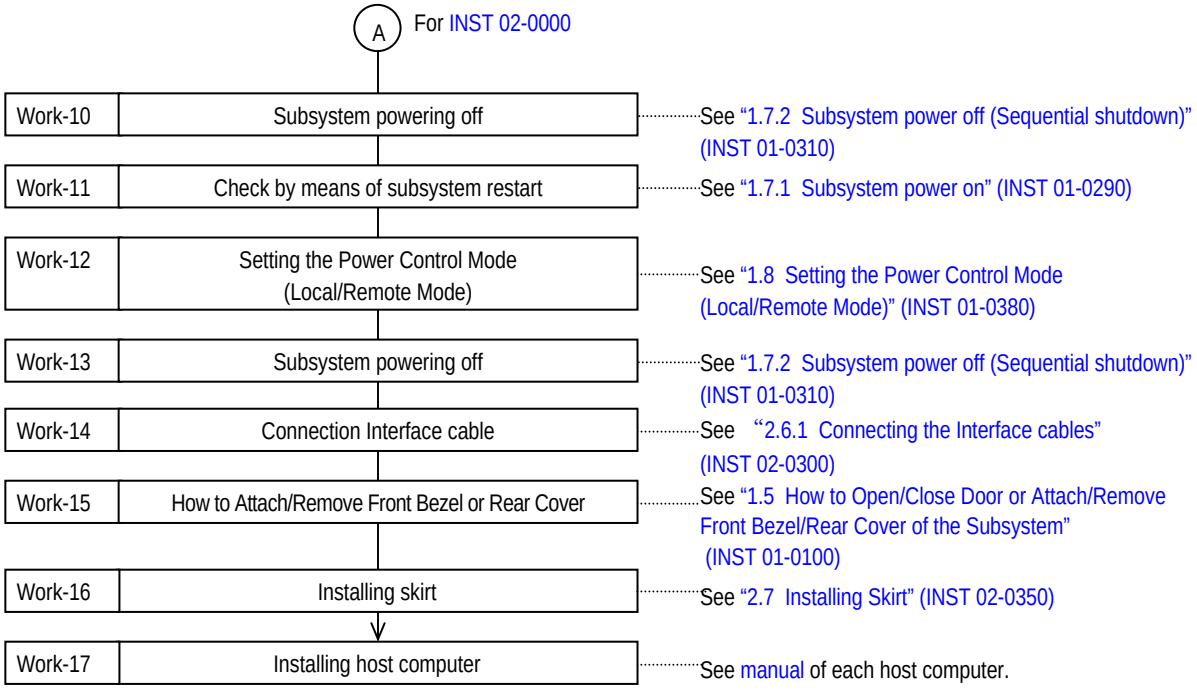
Chapter 2. Installing Floor Model

2.1 Procedures for Installing Floor Model

(1) Procedures for installing floor model



Before installing and moving subsystem, confirm the following work.

The following procedure is common with the system configuration in the Fibre Channel interface and the system configuration in the iSCSI interface.

‡1 : Normally, microprograms are installed when the subsystem is shipped from the factory.

Copyright © 2005, Hitachi, Ltd.

(2) Tool for installation work

Names and usages of tools to be used for installation are shown below.

Table 2.1.1 Tool for Installation Work

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
	Phillips screwdriver	No.2	For general works
	Slotted screwdriver	No.1	For Device ID Setting Switch
	Allen wrench	No.3	For installing the floor standing kits (H1J and H2J)
Tool of other	Wrist band	–	Band for protecting the subsystem from the static electricity
	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium II (233 MHz or more) is recommended), Memory 40 Mbytes or more (64 Mbytes or more is recommended)

Copyright © 2005, Hitachi, Ltd.

2.2 Unpacking the Subsystem

⚠ CAUTION

- The unpacking should be done by two or more personnel to prevent turning over of the subsystem or being caught under the subsystem.
- Perform the work with enough care because the Floor (RKM+H1H/RKS+H1J/RKXS+H1J) Model, Floor (RKM+RKAJ+H2J/RKM+RKAJAT+H2J/RKS+RKAJ+H2J/RKS+RKAJAT+H2J/RKXS+RKAJAT+H2J) Model, and Floor Model are heavy; their masses are about 70 kg and 115 kg respectively.
- When moving the subsystem, remove the skirts and raise the leveling bolts. Otherwise, an accident such as a falling may be caused because of contact with the floor or catching of a part.
- When moving the subsystem across a difference in floor level, etc., use a gangway, which forms a slope with an inclination angle of less than eight degrees.

(1) Unpacking

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

The procedure for unpacking the subsystem is shown below.

(a) Loosen the polyester bands.
(b) Remove the outer package and packing materials.
(c) Take the subsystem out of the polyethylene bag.
(d) Remove bands, etc. applied to the subsystem.

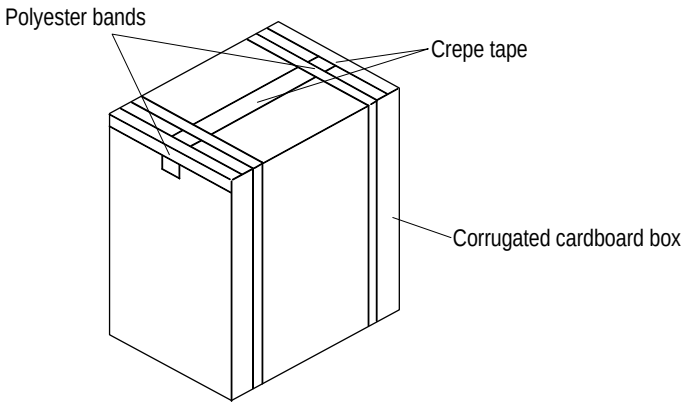


Figure 2.2.1 Packed Subsystem

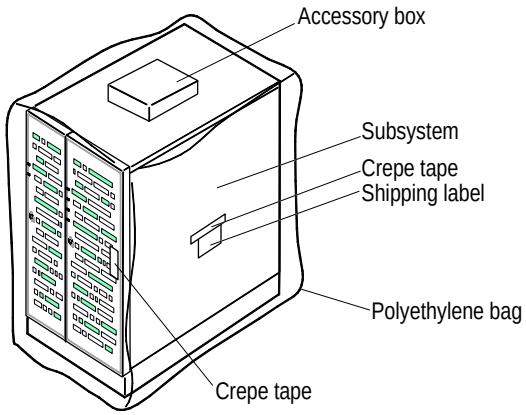
Copyright © 2005, 2006, Hitachi, Ltd.



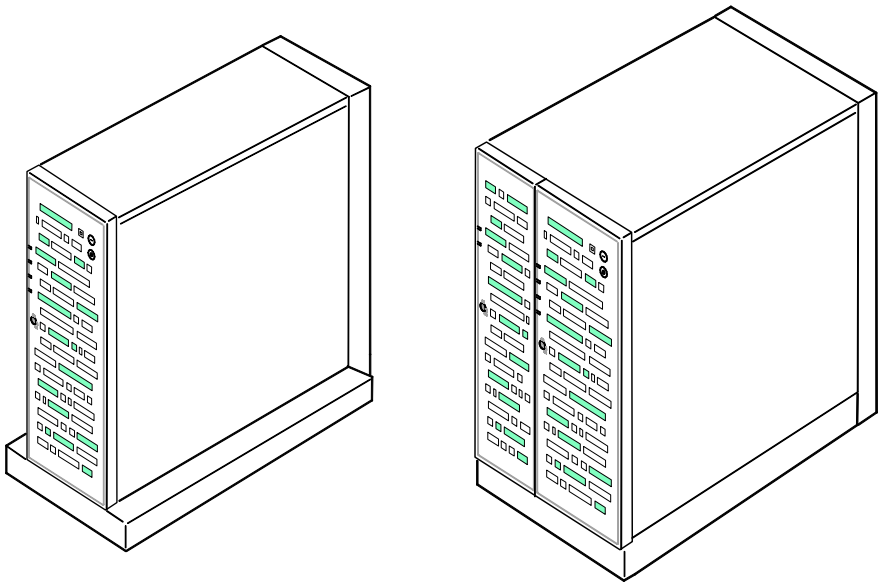


Figure 2.2.2 Packed Subsystem after Removing Other Package

(2) Inspecting the subsystem visually

Check the exterior of the subsystem visually for distortion or damage owing to the transport.

Floor (RKXS+RKAJAT+H2J) Model

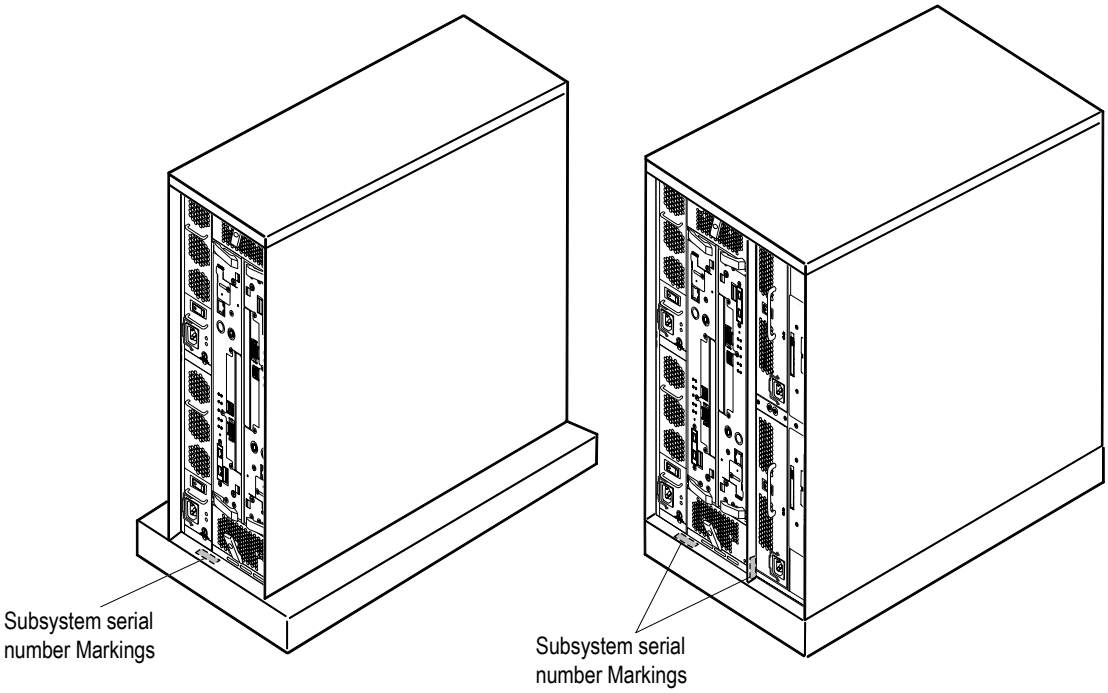

Figure 2.2.3 External Appearances of Floor Model Subsystem

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Checking contents of package

(a) Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

(b) The key for the front bezel(‡1) supplied with the subsystem must be kept by service personnel in order to prevent users from maintaining the subsystem.
The key for Front Bezel is used to mount and dismount Front Bezel.

2.3 Installing Floor Stand Kit

2.3.1 Installing Floor Stand Kit

NOTE : Be sure to remove the Disk Drives before installing the subsystem on the Floor stand kit. Do not installing floor stand kit the subsystem with the Disk Drives installed.

When the subsystem to be installed has already been made as the floor model, this work is not necessary. When the kit has already been installed, go to "2.4 Installing the Subsystem" (INST 02-0140).
When remaking the subsystem into the floor model, perform the work explained in "2.3.2 Procedure for installing Floor Stand Kit" (INST 02-0060).
It is required to install the floor standing kit, which is an optional component (see Table 2.3.1), to the RKM/RKS/RKXS or a combination of the RKM/RKS + RKAJ or the RKM/RKS + RKAJAT or the RKXS +RKAJAT to produce the floor model.

Table 2.3.1 Composition of Floor Stand Kit

Kit type	No.	Part No.	Part name	Quantity	Remarks
Floor stand kit H1J	1	2106507-A	CART	1	—
	2	3266239-A	Top cover	1	—
	3	3266232-A	Option bezel (Front cover)	1	—
	4	1507088-1	Side cover (R)	1	For right side

2.3.2 Procedure for installing Floor Stand Kit

(1) Floor (RKM+H1J) Model/Floor (RKS+H1J) Model/Floor (RKXS+H1J) Model

(a) Installing the CART

⚠ CAUTION

Masses of RKM is approximately 58 kg, and RKS/RKXS is approximately 56 kg. When raising each of them, take measures to prevent it from slipping because the slipping may cause a personnel injury owing to a pinching.

(i) Lock the cart to the floor.
Turn the leveling bolts in the direction shown by the arrow so that each clearance between the caster and the floor becomes about 2.5 mm.

(ii) Fix the left side handle with the label (handle).

(iii) Raise the RKM/RKS making its top facing left, and place it on the Cart.

⚠ CAUTION

When raising the subsystem, it is dangerous to do it by using the handles. Be sure to raise the subsystem by holding its front and rear portions made of sheet metal.

(iv) Fasten front and rear sides of the RKM/RKS to the cart each with four washer and socket bolts.

Copyright © 2005, 2006, Hitachi, Ltd.

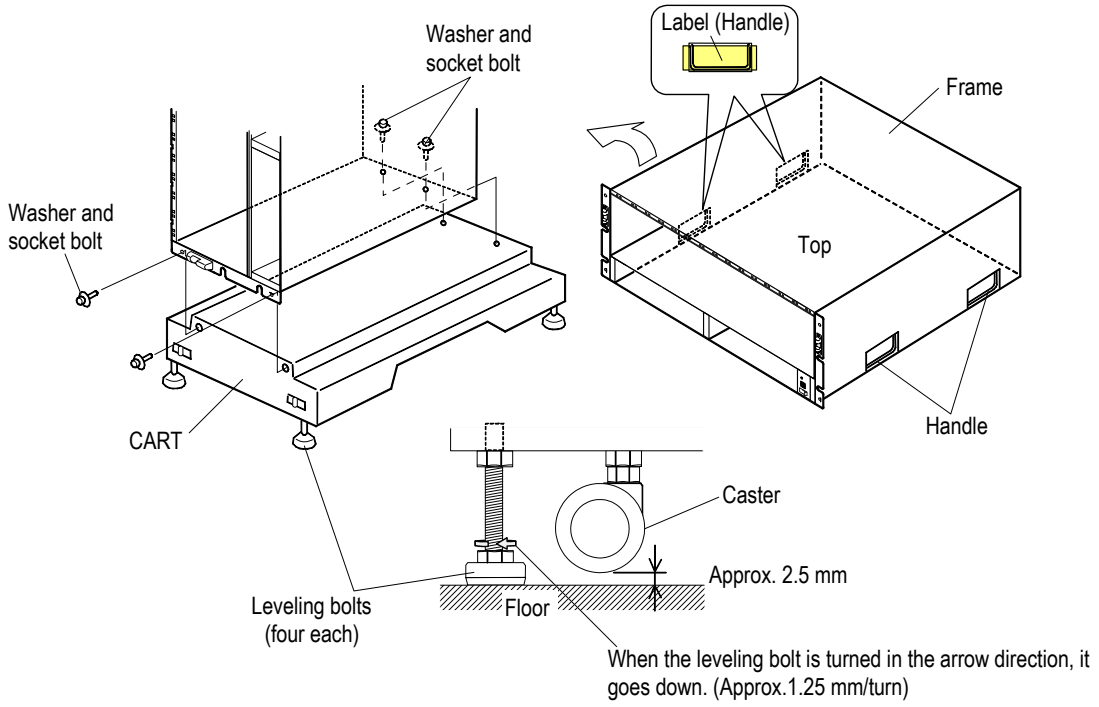

Figure 2.3.2 Installing CART

Copyright © 2005, Hitachi, Ltd.

(b) Installing the side covers

(i) Slide the side cover (L) in the direction shown by the arrow and fit its hook and center claw to the side panel of the frame.

(ii) Insert the three claws at the bottom of the side cover (L) into the three slots on the cart and then make the side cover (L) stand upright.

(iii) Press the front end of the side cover (L) against the subsystem main body so that there is no gap between them.

(iv) Fasten top of the side cover (L) to the frame with two washer and socket bolts①.

(v) Insert the three claws at the bottom of the side cover (R) into the three slots on the cart and then make the side cover (R) stand upright.

(vi) Press the front end of the side cover (R) against the subsystem main body so that there is no gap between them.

(vii) Fasten top of the side cover (L) to the frame with two washer and socket bolts①.

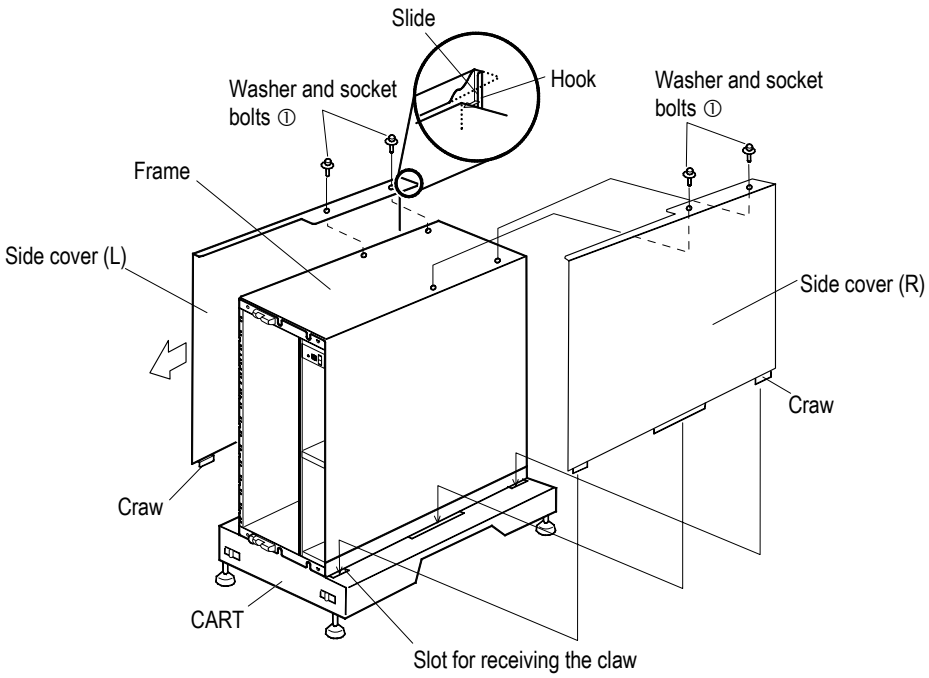

Figure 2.3.4 Installing Side Covers

Copyright © 2005, Hitachi, Ltd.

(c) Installing the top cover

(i) Place the top cover on the RKM/RKS main body.

(ii) Fasten its front and rear sides with four and one washer and socket bolts respectively.

(iii) Fasten the bracket to the upper rear side of the Option tray with two binding screws (M3×6).

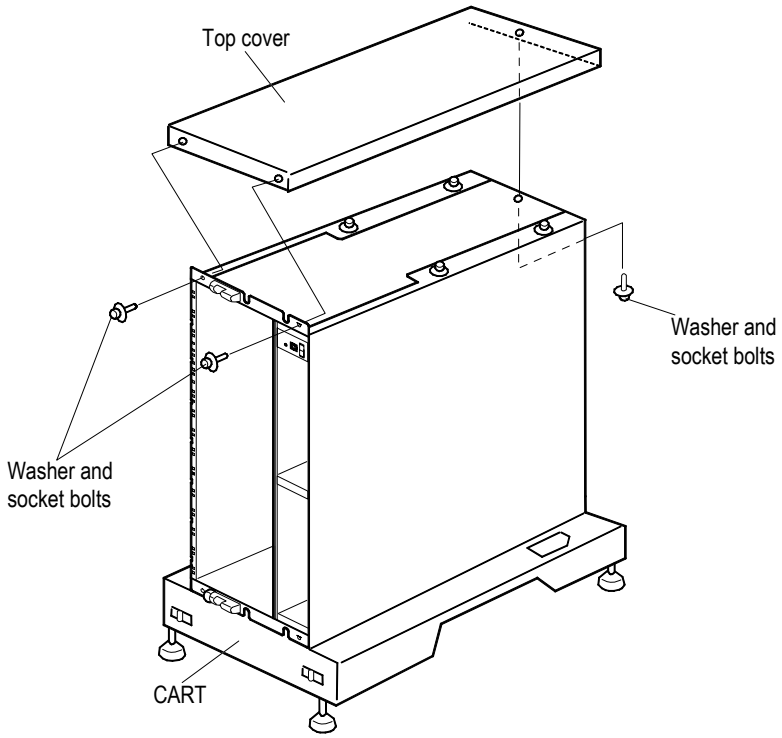

Figure 2.3.5 Installing Top Covers

Copyright © 2005, Hitachi, Ltd.

(2) Floor (RKM/RKS+RKAJ+H2J, RKM/RKS+RKAJAT+H2J, RKXS+RKAJAT+H2J) Model

(a) Installing the CART

CAUTION

- Masses of RKM is approximately 58 kg, RKS/RKXS is approximately 56 kg, and RKAJ/RKAJAT 40 kg is approximately.
  When raising each of them, take measures to prevent it from slipping because the slipping may cause a personnel injury owing to a pinching.

(i) Lock the cart to the floor.
Turn the leveling bolts in the direction shown by the arrow so that each clearance between the caster and the floor becomes about 2.5 mm.

(ii) Stick the EMI gasket on the front side surface of the basic subsystem (RKM/RKS/RKXS).

(iii) Fix the left side handle of the basic subsystem with the label (handle).

CAUTION

When raising the subsystem, it is dangerous to do it by using the handles. Be sure to raise the subsystem by holding its front and rear portions made of sheet metal.

(iv) Raise the basic subsystem, the additional subsystem (RKAJ/RKAJAT) making its top facing left, and place it on the cart.

(v) Fasten front and rear sides of the subsystem to the CART each with four washer and socket bolts.
When installing the subsystem on the cart, install the basic subsystem first, and then install the additional subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

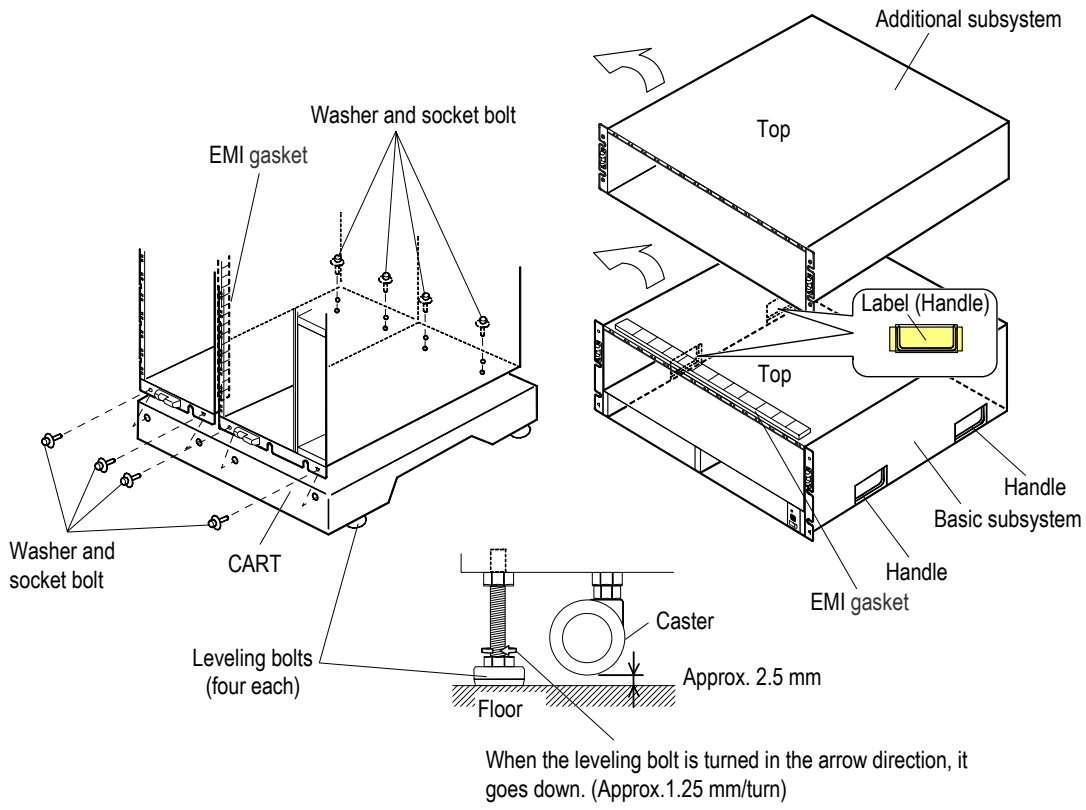

Figure 2.3.6 Installing CART

Copyright © 2005, Hitachi, Ltd.

(b) Installing the side covers

(i) Slide the side cover (L) in the direction shown by the arrow and fit its hook and center claw to the side panel of the additional subsystem.

(ii) Insert the three claws at the bottom of the side cover (L) into the three slots on the cart and then make the side cover (L) stand upright.

(iii) Press the front end of the side cover (L) against the subsystem main body so that there is no gap between them.

(iv) Fasten top of the side cover (L) to the additional subsystem with two washer and socket bolts①.

(v) Insert the three claws at the bottom of the side cover (R) into the three slots on the cart and then make the side cover (R) stand upright.

(vi) Press the front end of the side cover (R) against the subsystem main body so that there is no gap between them.

(vii) Fasten top of the side cover (L) to the basic subsystem with two washer and socket bolts①.

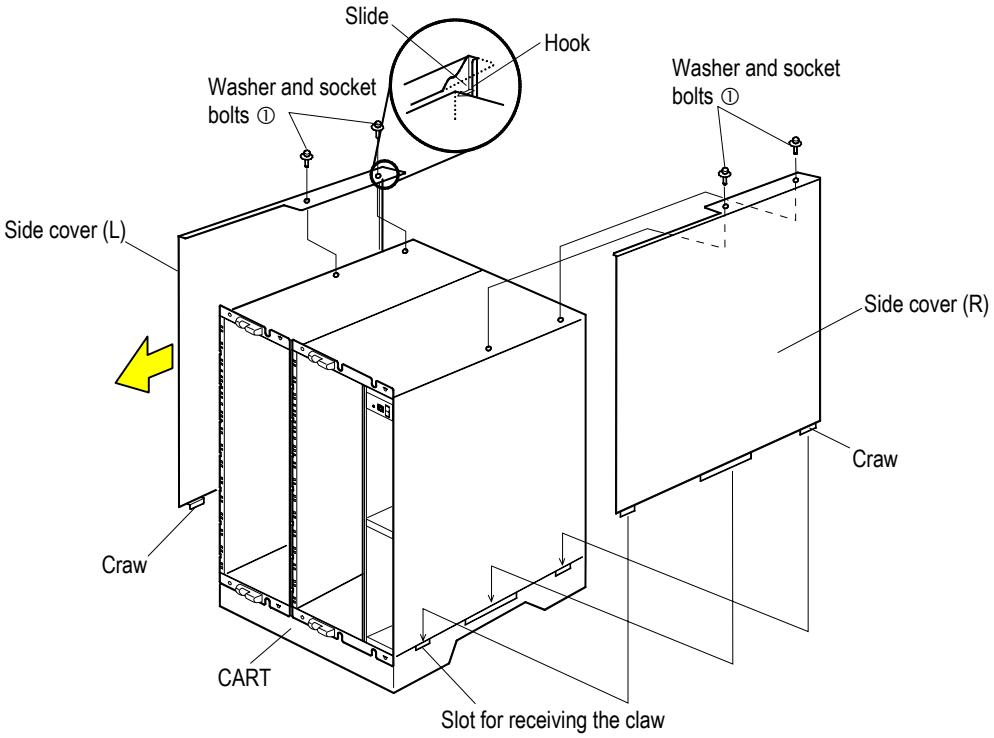

Figure 2.3.8 Installing Side Covers

Copyright © 2005, Hitachi, Ltd.

(c) Installing the top cover

(i) Place the top cover on the RKM/RKAJ main body.

(ii) Fasten its front and rear sides with six and two washer and socket bolts respectively.

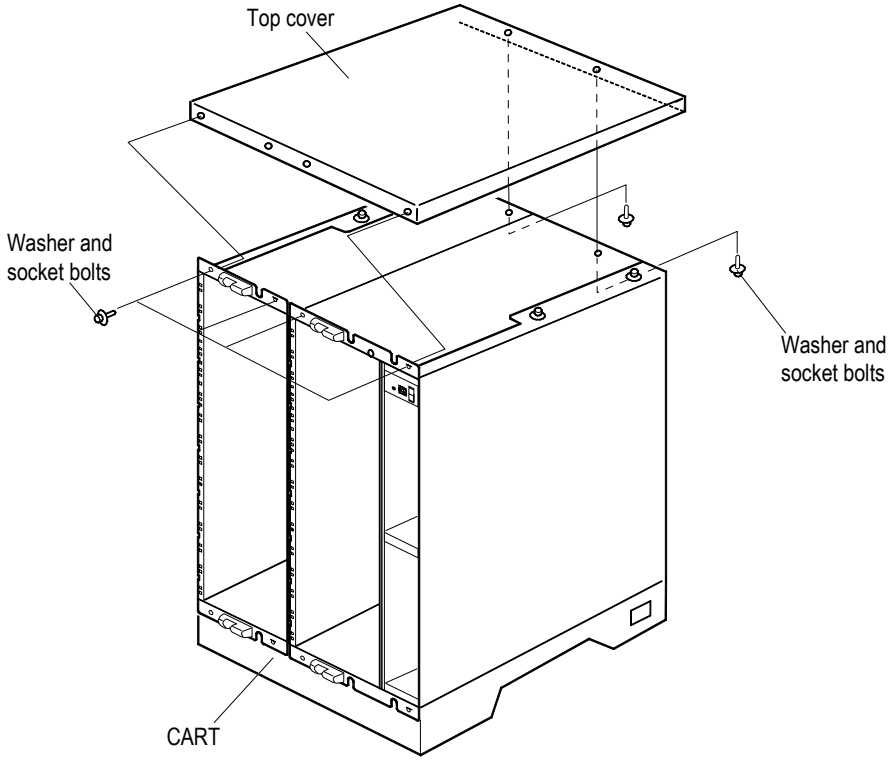

Figure 2.3.9 Installing Top Covers

Copyright © 2005, Hitachi, Ltd.

2.4 Installing the Subsystem

2.4.1 Subsystem floor-space and service clearance

CAUTION

Do not block the vent holes. Or else, temperature rise inside the subsystem may cause a failure or even a fire.

Install the subsystem so that the air intakes and the air exhaust remain clear. Figure 2.4.1 shows floor space and service clearance of the floor model

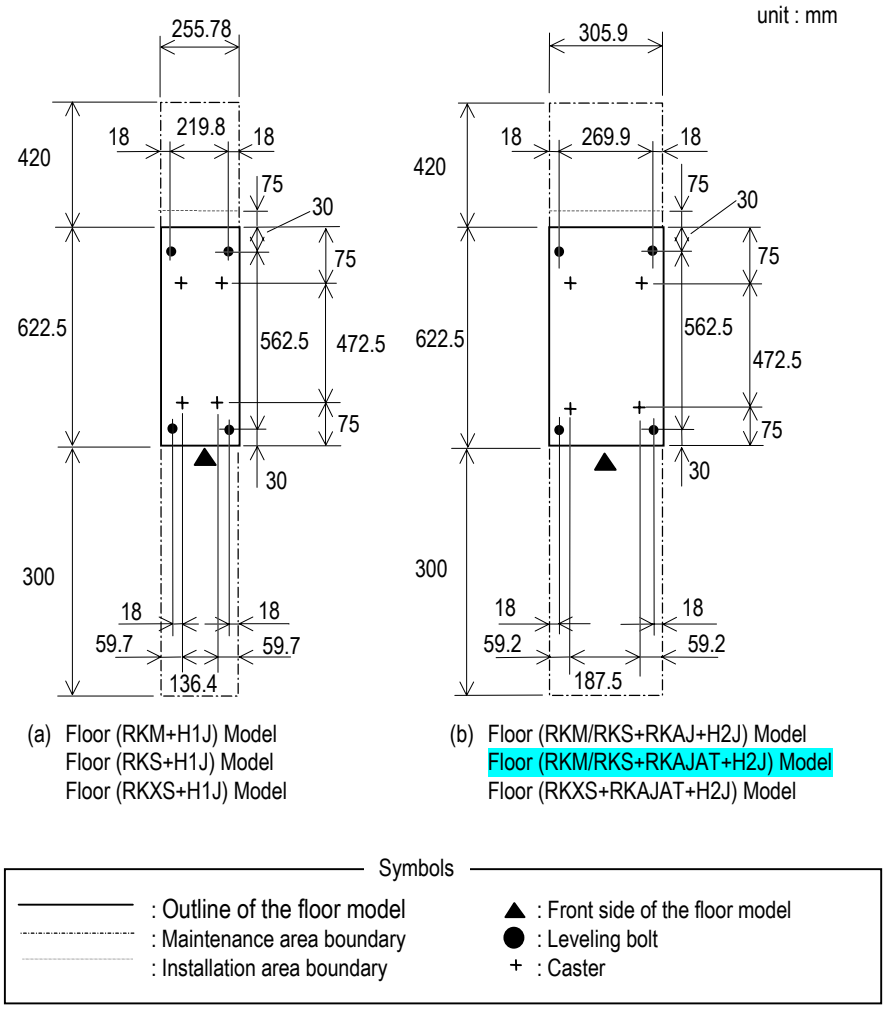

Figure 2.4.1 Floor space and service clearance of Floor Models

Copyright © 2005, 2006, Hitachi, Ltd.

2.4.2 Installing the subsystem

(1) Adjusting leveling bolts

(a) Be sure to remove the skirt when moving the subsystem.
Pull Front-skirt toward you and remove it. Then pull side-skirts toward you and remove them.

(b) Move the subsystem to the place where it is to be installed. When moving it, turn the leveling bolts to make the casters contact the floor.

(c) Adjust the leveling bolts so that the tilts of the subsystem to the front or rear, and left or right become 0±2 mm.

(d) Turn the leveling bolts in the direction shown by the arrow so that each clearance between the caster and the floor becomes about 2.5 mm.

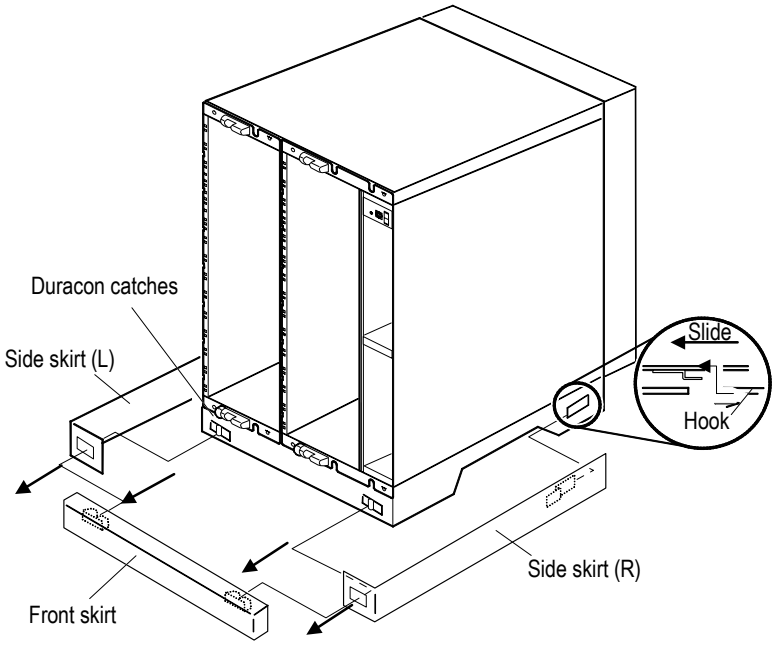

Figure 2.4.2 Removing Skirt

2.5 Installing Components

Install the components in the subsystem. When installing them, take care not to apply them any shock.
When some of the components have already been installed, check if they are firmly installed. If not, fasten them tightly.

The figures in this section are drawn for the procedure of Floor model (RKM/RKS+RKAJ+H2J). The procedure of other Floor models is similar to the case shown in the figures here.

When the front bezel is attached, remove it before installing a component. (See "1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100).)

Table 2.5.1 Components Required for the Floor (RKM+H1J/RKS+H1J)

No.	Component name	Model	Quantity	Remarks
1	Backup Battery Unit	—	1(*1)	—
2	Fan Assembly	—	2	—
3	Control Unit	DF-F700-F1JM	1 or 2(*2)	for RKM
		DF-F700-F1JS	1 or 2(*2)	for RKS
4	Cache Unit	DF-F700-C1GJ	1 or 2(*3)	The Cache Units with a model name selected from those shown on the left are installed.
		DF-F700-C2GJ		
5	FC Interface Board (RKM)	DF-F700-DJ4G2	1(*2) (*4)	4G bps FC Interface Board
6	FC Interface Board for addition	DF-F700-DJ4G2W	1(*2) (*4)	4G bps FC Interface Board (It is optional parts for RKS)
7	iSCSI Interface Board	DF-F700-DJSC2	1(*4)	iSCSI Interface Board
8	Power Unit	—	2	—
9	Disk Drive	DF-F700-AGF72	2 to 15(*2)	The Disk Drives with a model name selected from those shown on the left are installed.
		DF-F700-AGH72		
		DF-F700-AGF146		
		DF-F700-AGH146		
		DF-F700-AGF300		

*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the lower side of the subsystem.
*2 : When no component is installed, a dummy part is installed instead.
*3 : It is a number per Control Unit. But install one Cache memory per Control Unit in RKS.
*4 : It is a number per Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.5.2 Components Required for the (RKM/RKS+RKAJ+H2J)

No.	Component name	Model	Quantity	Remarks

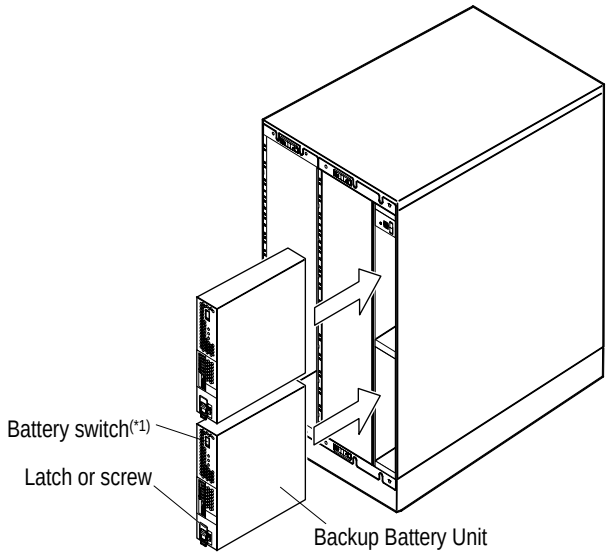
(1) Installing the Backup Battery Unit

(a) Make sure that the battery switch on the Battery Unit is turned off.

NOTE : In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS, this work is unnecessary because there is no battery switch.



(b) Insert the Backup Battery Unit into the specified position in the subsystem.

NOTE : There is only one Backup Battery Unit to be installed in the RKS/RKXS and install it in the lower side of the subsystem.

*1 : In case of the Backup Battery Unit of REV. C to be installed in the RKS and the Backup Battery Unit to be installed in the RKXS, there is no battery switch.

Figure 2.5.1 Installing Backup Battery Unit (RKS/RKXS)

*1 : In case of the Backup Battery Unit of REV. C to be installed in the RKM, there is no battery switch.

Figure 2.5.1.1 Installing Backup Battery Unit (RKM)

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Installing the Fan Assembly

This installing work is only applied to RKM/RKS/RKXS.

The two same Fan Assemblies are installed facing each other in the state in which each of them faces upper and lower. When installing them, make each of them face reverse direction correctly.

(a) Insert the Fan Assembly in the specified position in the subsystem, raise it by fitting the hook of the lever to the cutout of the subsystem, and tighten it with the fixing screw.

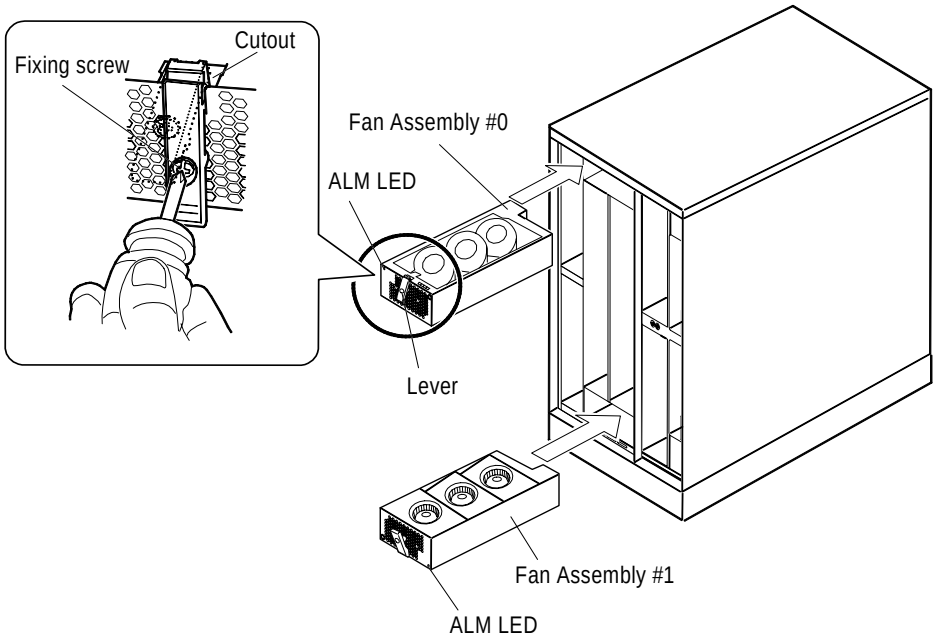


Figure 2.5.2 Installing Fan Assembly

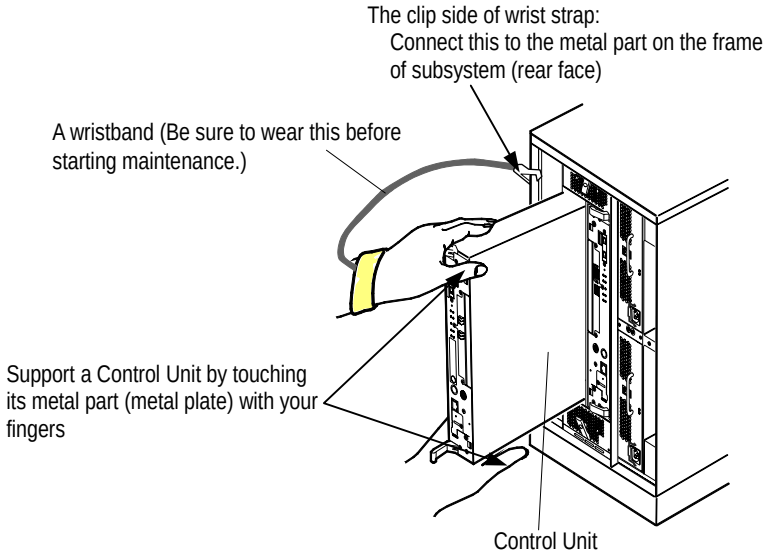
Copyright © 2005, 2006, Hitachi, Ltd.



(3) Installing the Control Unit, Cache Unit, and Interface Board

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

<Working Procedure>

(a) In the case of RKS/RKXS

(a-1) When the interface board is not installed in the Control Unit of the RKS/RKXS

(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.

• Be careful not to insert Cache Units at the reversed direction.

(iii) Make sure that the Cache Unit is firmly installed.

(iv) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(v) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover to the right and #1 with the cover to the left.

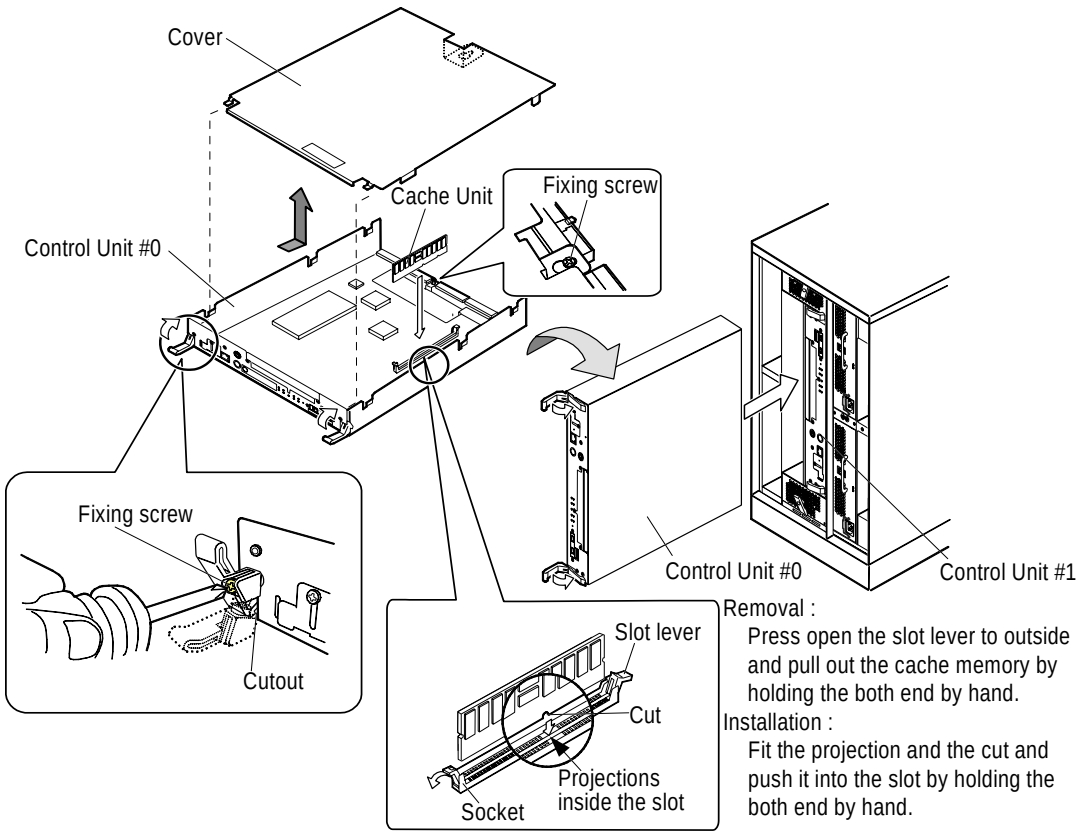


Figure 2.5.3 Installing Control Unit

Copyright © 2005, 2006, Hitachi, Ltd.

(a-2) When the interface board is installed in the Control Unit of the RKS/RKXS

(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Remove two host connectors for 2 G bps from the Control Unit.

• Pull it out after raising the lever for Type 1.

• Pull it out after pushing down the lever toward for Type 2.

After this, hand over the removed two host connectors for 2 G bps to the customer, and ask him/her to keep them carefully.

(iii) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). Insert the connectors surely.

Install the Interface Board making its sheet metal part face inside of the Control Unit.

(iv) Make sure that the Interface Board is firmly installed.

(v) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

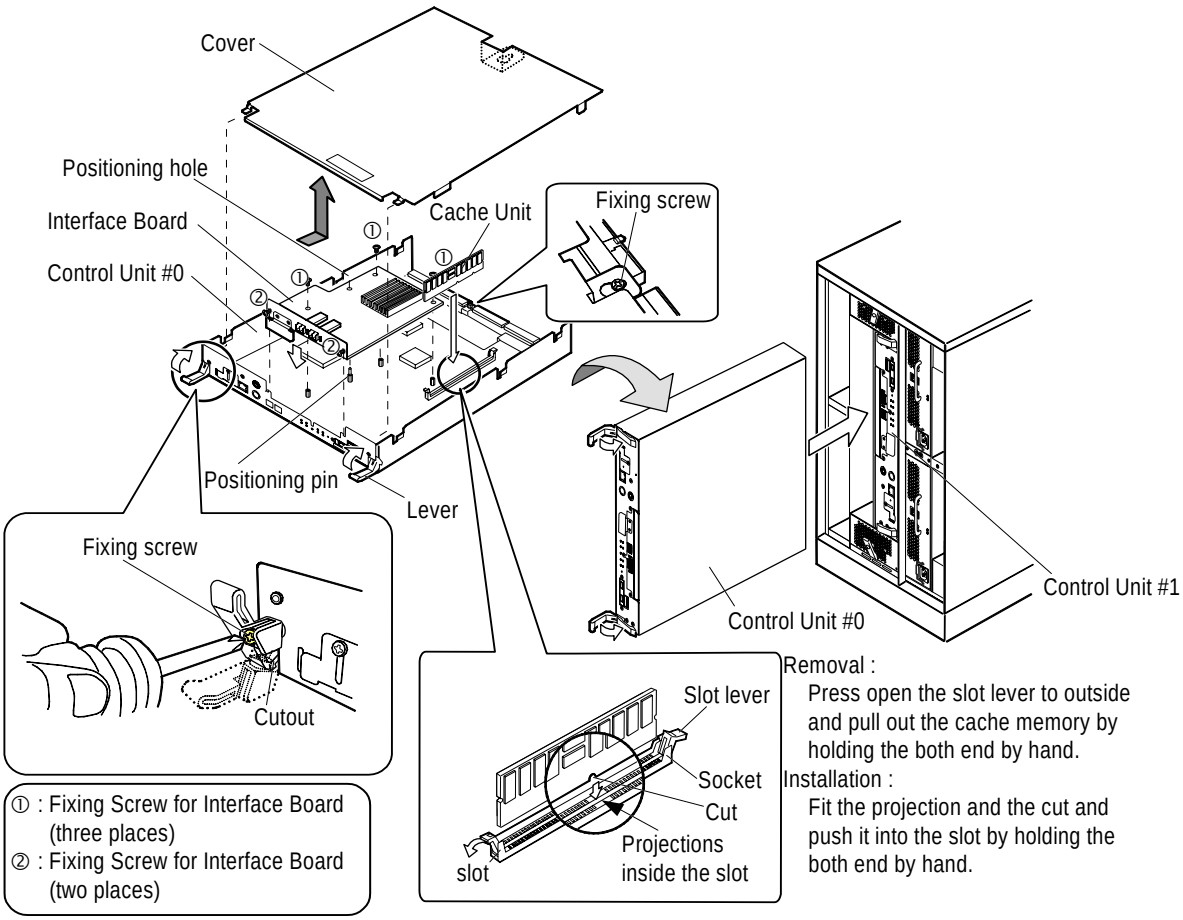
NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.

• Be careful not to insert the Cache Units in the reverse orientation.

• Insert the Cache Units in the cache slots in regular order starting from the slot #0.

• Insert the dust cover in the Cache slot in which the Cache memory is not installed.

(vi) Make sure that the Cache Unit is firmly installed.



(vii) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(viii) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.

In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover to the right and #1 with the cover to the left.

Copyright © 2005, Hitachi, Ltd.

*1 : The figure shows the case where the FC Interface Board is added to the Control Unit of the RKS.

Figure 2.5.3.1 Installing Control Unit, Cache Unit and Interface Board

Copyright © 2005, 2006, Hitachi, Ltd.

(b) In the case of RKM

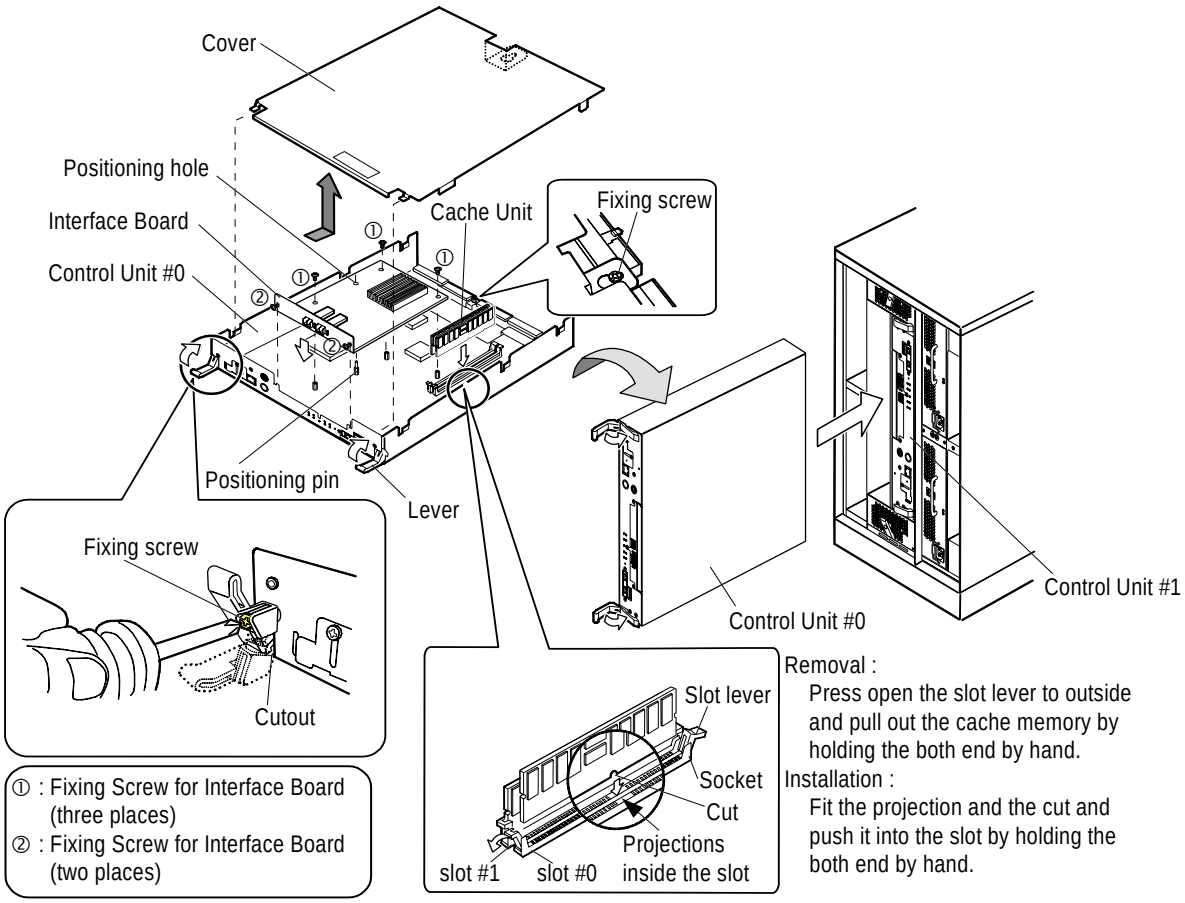
(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). Insert the connectors surely.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

(iii) Make sure that the Interface Board is firmly installed.

(iv) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Be careful not to insert the Cache Units in the reverse orientation.
• Insert the Cache Units in the cache slots in regular order starting from the slot #0.
• Insert the dust cover in the Cache slot in which the Cache memory is not installed.



(v) Make sure that the Cache Unit is firmly installed.

(vi) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(vii) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover to the right and #1 with the cover to the left.

Copyright © 2005, Hitachi, Ltd.

*1 : The figure shows the case where the FC Interface Board is installed in the Control Unit of the RKM.

Figure 2.5.3 Installing Control Unit, Cache Unit and Interface Board

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Installing Power Unit

(a) Power Unit of RKM/RKS/RKAJ

Since the Power Units of the basic subsystem (RKM/RKS/RKXS) and the additional subsystem (RKAJ/RKAJAT) are different from each other, install each of them in the specified location taking care not to install the wrong one.

(i) Make sure that the AC Power Unit Switch is turned off.

(ii) Shift the latch (fixing screw) of the Power Unit (basic subsystem) to the Release position, insert it slowly into the sheet metal slit part at the right of the power Unit, and then push it to the end.

(iii) Shift the latch (fixing screw) of the Power Unit (additional subsystem) to the Release position, insert it slowly into the sheet metal slit part at the right of the power Unit, and then push it to the end.

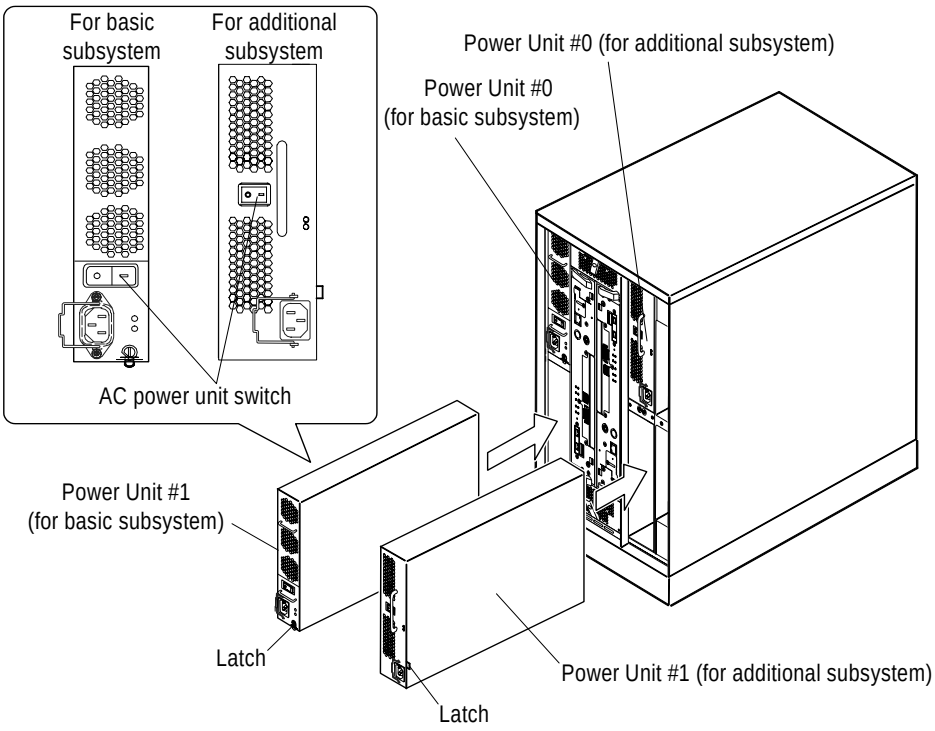


Figure 2.5.4 Installing Power Unit

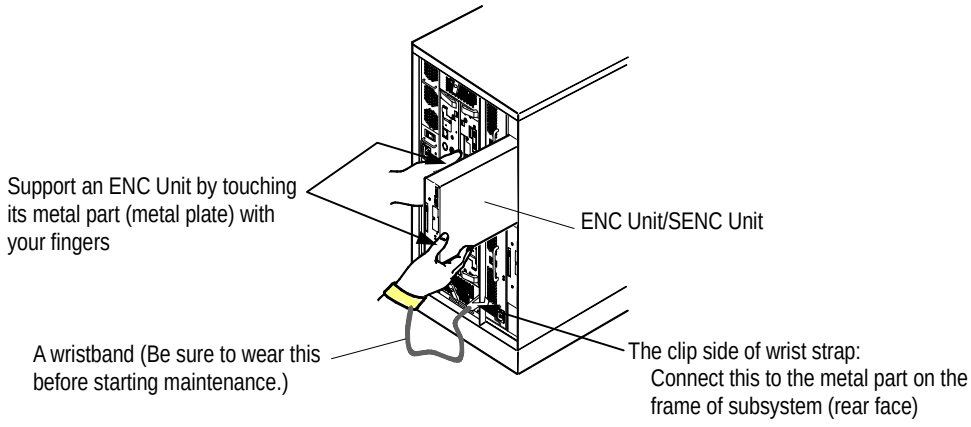
Copyright © 2005, 2006, Hitachi, Ltd.

(5) Installing the ENC Unit/SENC Unit



This installation work is only applied to Floor model (RKM/RKS+RKAJ+H2J, RKM/RKS+RKAJAT+H2J, RKXS+RKAJAT+H2J).

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install an ENC Unit, support its metal part with your hand that has the wrist strap. By so doing, you can discharge the static electricity from your body may change the parts.

The ENC Unit is a precision machine that may have troubles because of electrostatic discharge. Be sure to put on the wristband before starting work in order to protect ENC Units from electrostatic discharge.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert an ENC Unit into the subsystem, support the ENC Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Insert the ENC Unit/SENC Unit into the specified location in the subsystem with its lever being raised, then return the lever in the direction shown by the arrow (⟶).

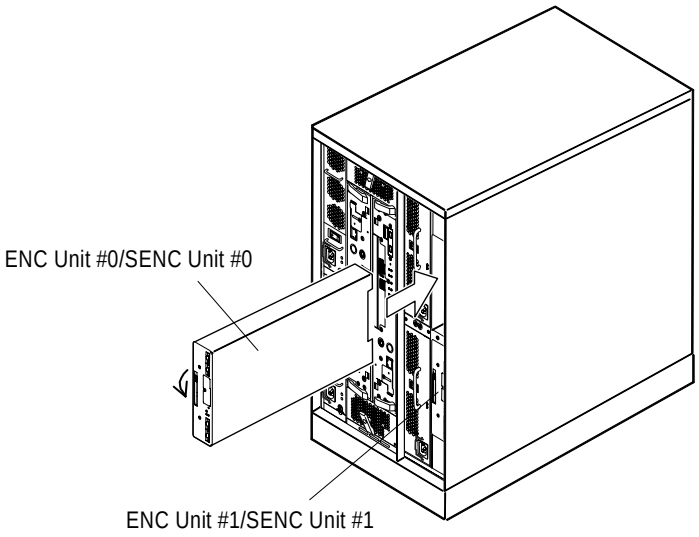


Figure 2.5.5 Installing ENC Unit/SENC Unit

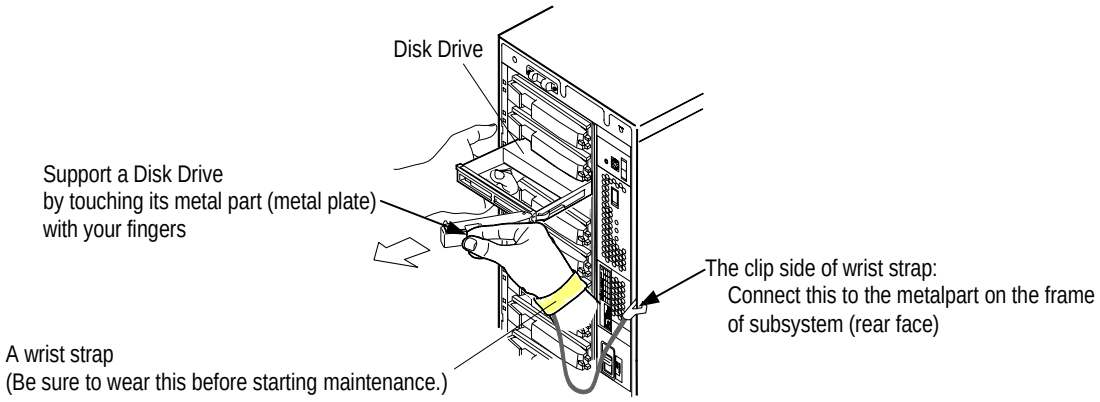
Copyright © 2005, 2006, Hitachi, Ltd.



(6) Installing the Disk Drive

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components. Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

The Disk Drive is a precision machine that may have troubles because of electrostatic discharge. Be sure to put on the wristband before starting work in order to protect Disk Drives from electrostatic discharge.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part). When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

(a) Pull the parts out of the Disk Drives safekeeping of component.
Be sure to install the removed Disk Drive to the original bay.

(b) Insert the Disk Drive into the position (address) where it was by holding it with the handle.

(i) Fit the Disk Drive in the guide rail of the RKAJAT and slide it in the direction shown by the arrow.

(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.

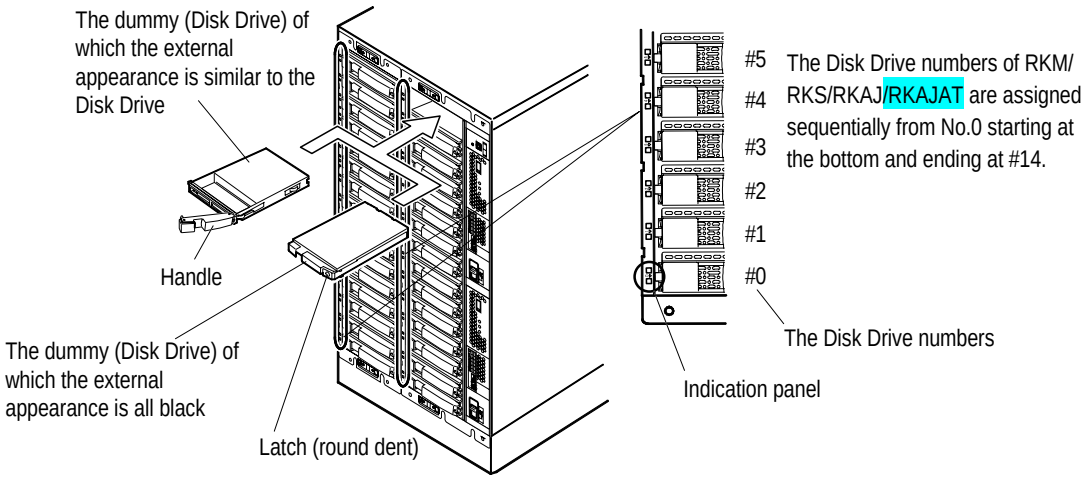
(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) Pull the handle lightly to make sure that the Disk Drive cannot be pulled out.

(d) Attach the dummy (Disk Drive) to the each Disk Drive slot in which no Disk Drive is installed.
There are two types of the dummies (Disk Drives), and the installation methods are different respectively.

- The dummy (Disk Drive) of which the external appearance is similar to the Disk Drive
  There is no label attached on the handle part.
  Install it in the same way as the Disk Drive.
- The dummy (Disk Drive) of which the external appearance is all black
  This is the dummy (Disk Drive) of the resin all-in-one molded piece (black) with no stopper and handle part.
  Insert it into the slot slowly so that the latch (round dent) part of the dummy (Disk Drive) comes to the right side.



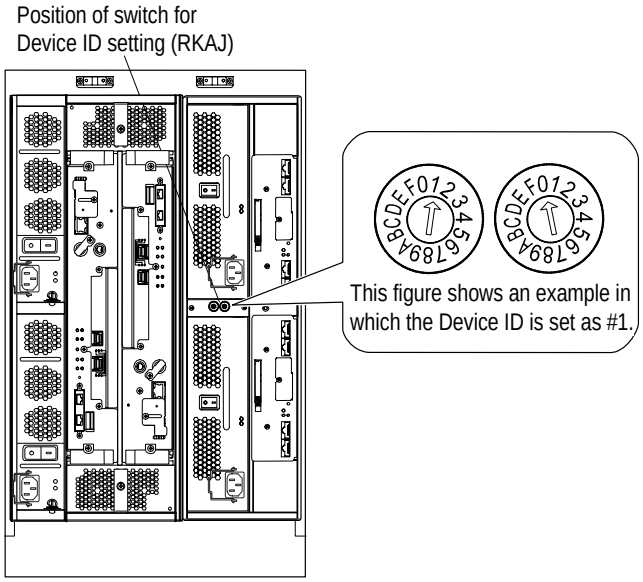


Figure 2.5.6 Installing the Disk Drive/Dummy (Disk Drive)

Copyright © 2005, 2006, Hitachi, Ltd.

(7) Setting Unit number

The device ID number of the RKM/RKS/RKXS has been set to #0. Set the Device ID number of the RKAJ to be connected to the RKM/RKS to #1.

Set #21 for RKAJAT of RKM/RKS/RKXS + RKAJAT. Set x in ascending order.

*1: The figure shows Floor (RKM+RKAJ+H2J) Model.

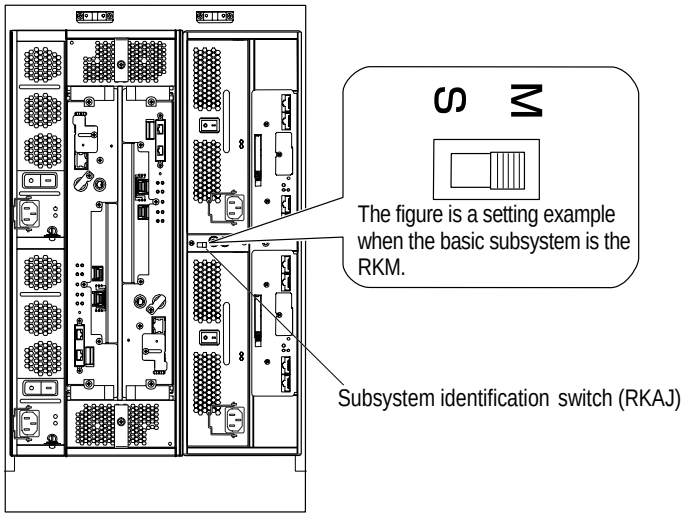

Figure 2.5.7 Position of Switch for Device ID Setting

(8) Setting the subsystem identification switch

Set only the RKAJ.

When the basic subsystem to be connected is the RKM, set it in the M side, and when it is the RKS, set it in the S side.

Check the RKM and RKS by the subsystem model names. (Refer to "2.2 (3) Checking contents of package" (INST 02-0040).)

*1: The figure shows Floor (RKM+RKAJ+H2J) Model.

Figure 2.5.8 Position of the subsystem identification switch

Copyright © 2005, 2006, Hitachi, Ltd.

2.6 Connecting Cables

CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "1.1 (3) Note on cable routing" (INST 01-0010).

The figures in this chapter are drawn for the procedure of Floor model (RKM/RKS+RKAJ+H2J). The cable connection procedure of other Floor model is similar to the case shown in the figures here.

Remove Rear-cover if installed.

2.6.1 Connecting the Interface cables

(1) Connecting the Fibre Channel Interface cables

Two types of cable are provided as the Fibre Channel Interface cables(‡1) to be used so that they fit to connector shapes of the RKM/RKS and host computer (or HBA (Host Bus Adapter), SW) to be connected.

Table 2.6.1 shows correspondences between the connector shapes and cable types. Choose the applicable cables from the table correctly.

Table 2.6.1 Types Cables to be Connected

Control Unit side (for RKM/RKS side)			Host computer side (HBA (Host Bus Adapter), SW)	Types Cables to be Connected	
Parts name of connected cable plug	Model	Connector form	Connector form	Cable connector shape	Model
Control Unit	DF-F700-F1JM (RKM) DF-F700-F1JS (RKS) DF-F700-F1JXS (RKXS)	LC	SC	LC-SC cable	DF-F700-KB×M(*1)
			LC	LC-LC cable	DF-F700-KC×M(*1)
Interface Board	DF-F700-DJ4G2	LC	SC	LC-SC cable	DF-F700-KB×M(*1)
			LC	LC-LC cable	DF-F700-KC×M(*1)

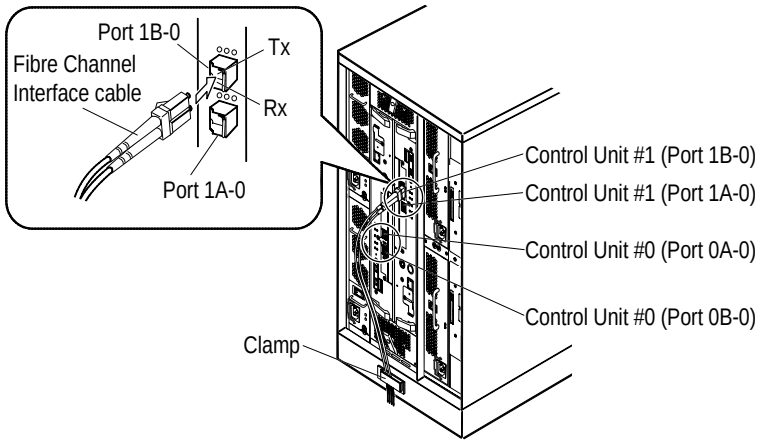
*1 : "x" denotes a valuable (1 to 5) that shows a cable length.

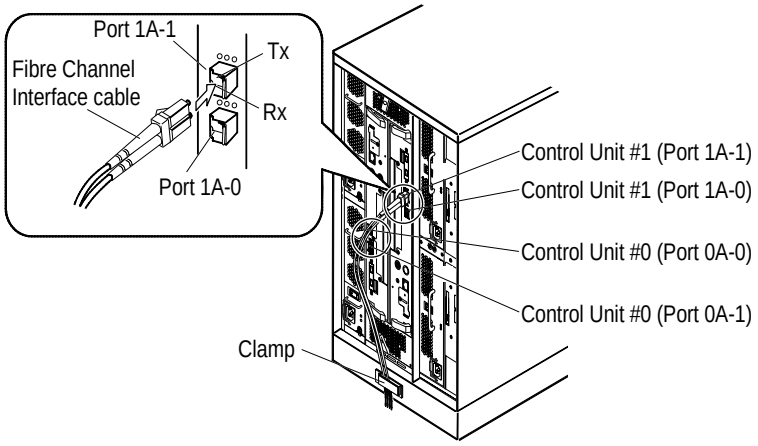
‡1 : When the multiple Interface Boards are used, make sure of the port corresponding to the host computer to be connected.

Copyright © 2005, 2006, Hitachi, Ltd.

Connect the Fibre Channel Interface cables after making sure of the ports to be connected the Location Label (rear side of the subsystem).
Route the Fibre Channel Interface cable to the Clamp).

NOTE : • When bending the Fibre Channel Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• The RKS/RKXS has the limitation in the connection configuration of the Fibre Channel interface cable depending on the existence of the addition of the FC Interface Board and the topology set to the Port.
The connection configuration of the topology set to Port and the Fibre Channel Interface cable. (See "1.2.2 Mini-HUB" (INST 01-0020).)
• The installing direction of the Control Unit differs. Be careful not to make wrong selection of the port to be connected.





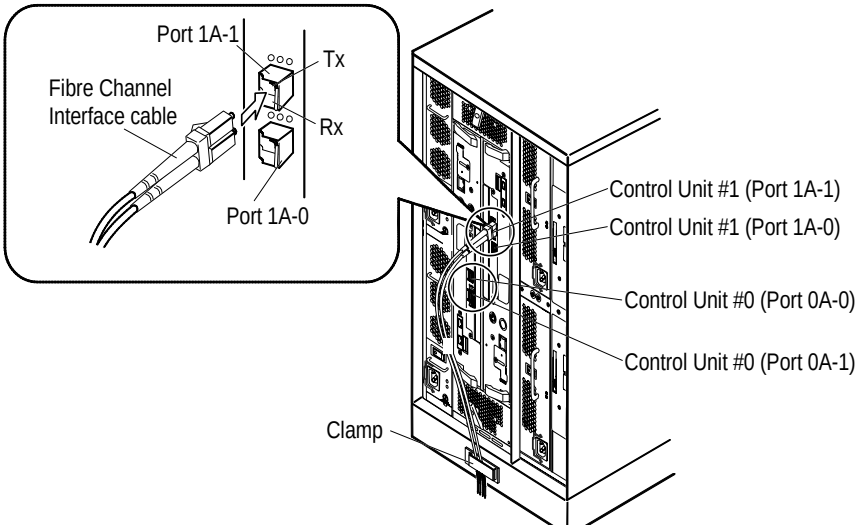


Figure 2.6.1 Port Layout of Fibre Channel (RKM)

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The figure shows the floor (RKS + RKAJ + H2J) model
(case where the FC Interface Board is not added to the Control Unit of the RKS).

Figure 2.6.1.1 Port Layout of Fibre Channel (RKS/RKXS)

*1 : The figure shows the floor (RKS + RKAJ + H2J) model
(case where the FC Interface Board is added to the Control Unit of the RKS).

Figure 2.6.1.2 Port Layout of Fibre Channel when the FC Interface Board is installed (RKS/RKXS)

(2) Connecting the iSCSI Interface cables

Connect the iSCSI Interface cables after making sure of the ports to be connected the label.
Route the iSCSI Interface cable to the Clamp.

NOTE : • When bending the iSCSI Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• The installing direction of the Control Unit differs. Be careful not to make wrong selection of the port to be connected.

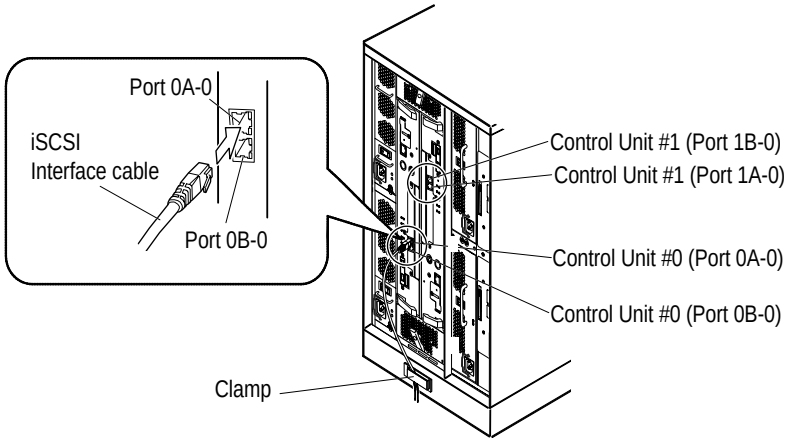

Figure 2.6.1.3 Port Layout of iSCSI (RKM/RKS/RKXS)

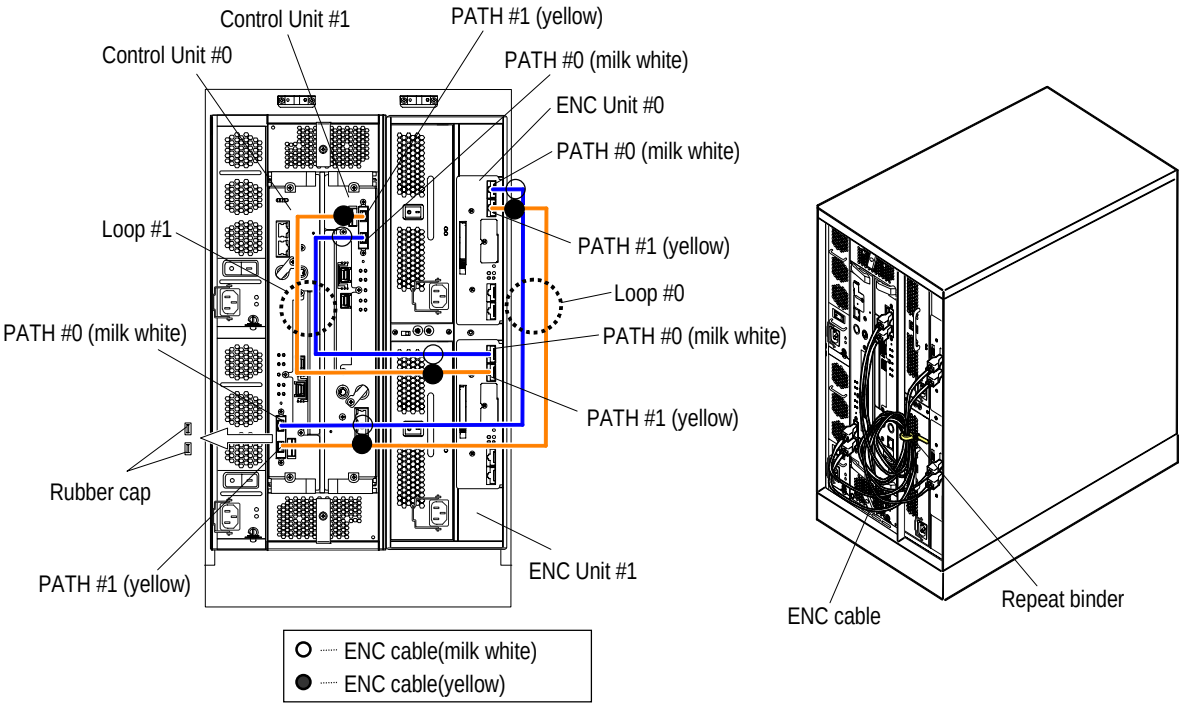
Copyright © 2005, Hitachi, Ltd.

2.6.2 Connecting ENC cables



In the case of the Floor (RKM/RKS+RKAJ+H2J, RKM/RKS+RKAJAT+H2J, RKXS+RKAJAT+H2J) model with both of the RKM/RKAJ, it is required to connect the Control Unit (RKM/RKS) and the ENC Unit (RKAJ) with the ENC cables (‡1). (The ENC cables are supplied with the RKAJ/RKAJAT.)
Take care the method of connecting the cable is different about the Floor (RKM/RKS+RKAJ+H2J) and the Floor (RKM/RKS+RKAJAT+H2J, RKXS+RKAJAT+H2J).

NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses .
• Connect the two (Loop#0 and Loop#1) systems of each of the Control Unit and the ENC Unit with the ENC cables.
Parts of the Loop#0 and Loop #1 systems are discriminated from each other by means of color markings in milk white and yellow respectively.
When connecting the left and right sets of the Control Unit and ENC Unit with the ENC cables, be sure to connect each of the cables to the sets of adjacent connectors of the same kind, that is, the PATH#0 (marked in milk white) and the PATH#1 (marked in yellow) of the ENC Unit and the Control Unit.

(1) Floor (RKM/RKS+RKAJ+H2J) Model
(a) Remove the rubber cap on the Control Unit.
(b) Connect the ENC cable to the Control Unit.
(i) To the PATH#0 (marked in milky white on the RKM side), connect the ENC cable marked in milky white.
(ii) To the PATH#1 (marked in yellow on the RKM side), connect the ENC cable marked in yellow.
(c) Connect the ENC cable to the ENC Unit.
(i) To the PATH#0 (on the ENC Unit side and marked in milk white), connect the ENC cable (marked in milk white) led from the PATH#0 (on the Control Unit) side and marked in milk white).
(ii) To the PATH#1 (on the ENC Unit side and marked in yellow), connect the ENC cable (marked in yellow) led from the PATH#1 (on the Control Unit) side and marked in yellow).
(d) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder, and put it inside the subsystem.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

2.6.3 Connecting power cables

(1) Connecting the power cables of Power Unit

CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : • Connect the power cable to the two systems, Power Unit #0 and Power Unit #1.
• Although the subsystem has a dual power-system, each Power Unit is required to have capacity for the whole subsystem to cope with one power-system failure. Accordingly the facility power source for each Power Unit is also required to have capacity for the whole subsystem.

(a) Make sure that all the Power Unit AC Power Unit switches are turned off.
(b) Connect the connectors (Power Unit side) of the power cables (white, yellow) to the receptacle of the Power Unit.
(c) Connect the power cable to the power outlet.

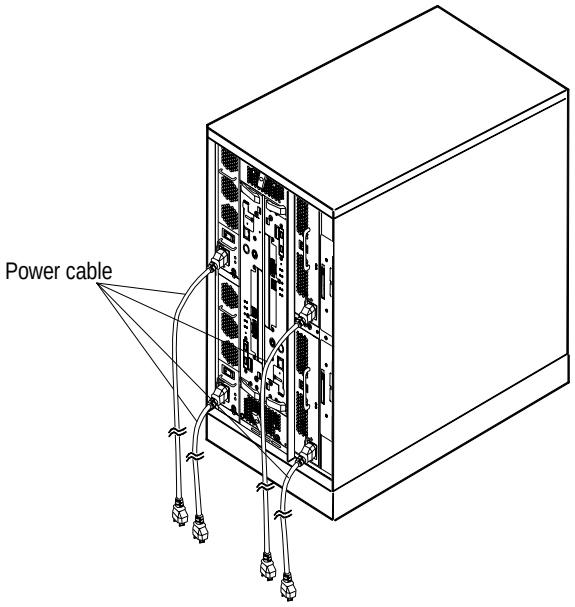

Figure 2.6.4 Power Cable Connection

2.7 Installing Skirt

CAUTION

Do not put your hands at both ends of the skirt when installing the front skirt. The fingers and the like are pinched between the side skirts, and it causes the injury.

(1) Floor (RKM+H1J/RKS+H1J/RKXS+H2J) Model

(a) Install the side skirt (L) by inserting its hooks into rectangular holes on the cart and by sliding it.

(b) Install the side skirt (R) by inserting its hooks into rectangular holes on the cart and by sliding it.

(c) After both side skirts was installed, fit the duracon catch of the front skirt.

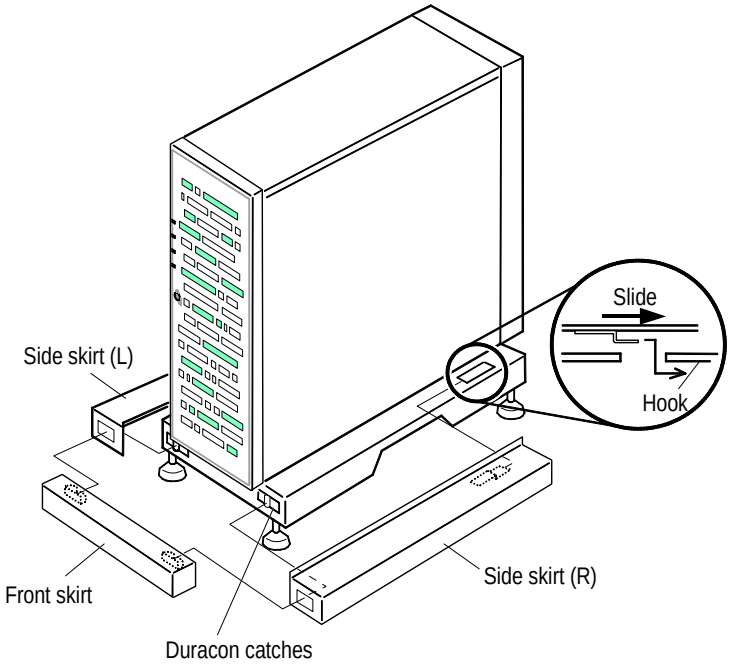

Figure 2.7.1 Installing Skirt

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Floor (RKM/RKS+RKAJ+H2J, RKM/RKS+RKAJAT+H2J, RKXS+RKAJAT+H2J) model

(a) Install the side skirt (L) by inserting its hooks into rectangular holes on the cart and by sliding it.

(b) Install the side skirt (R) by inserting its hooks into rectangular holes on the cart and by sliding it.

(c) After both side skirts was installed, fit the duracon catch of the front skirt.

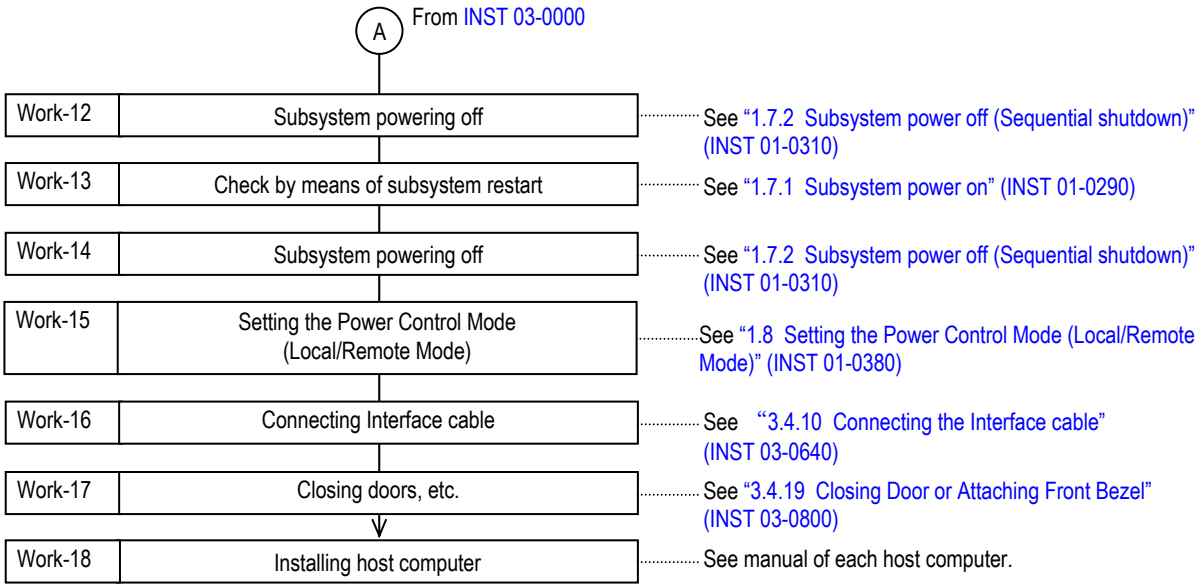
Chapter 3. Installing Rackmount Model

3.1 Procedures for Installing Rackmount Model

(1) Procedures for installation

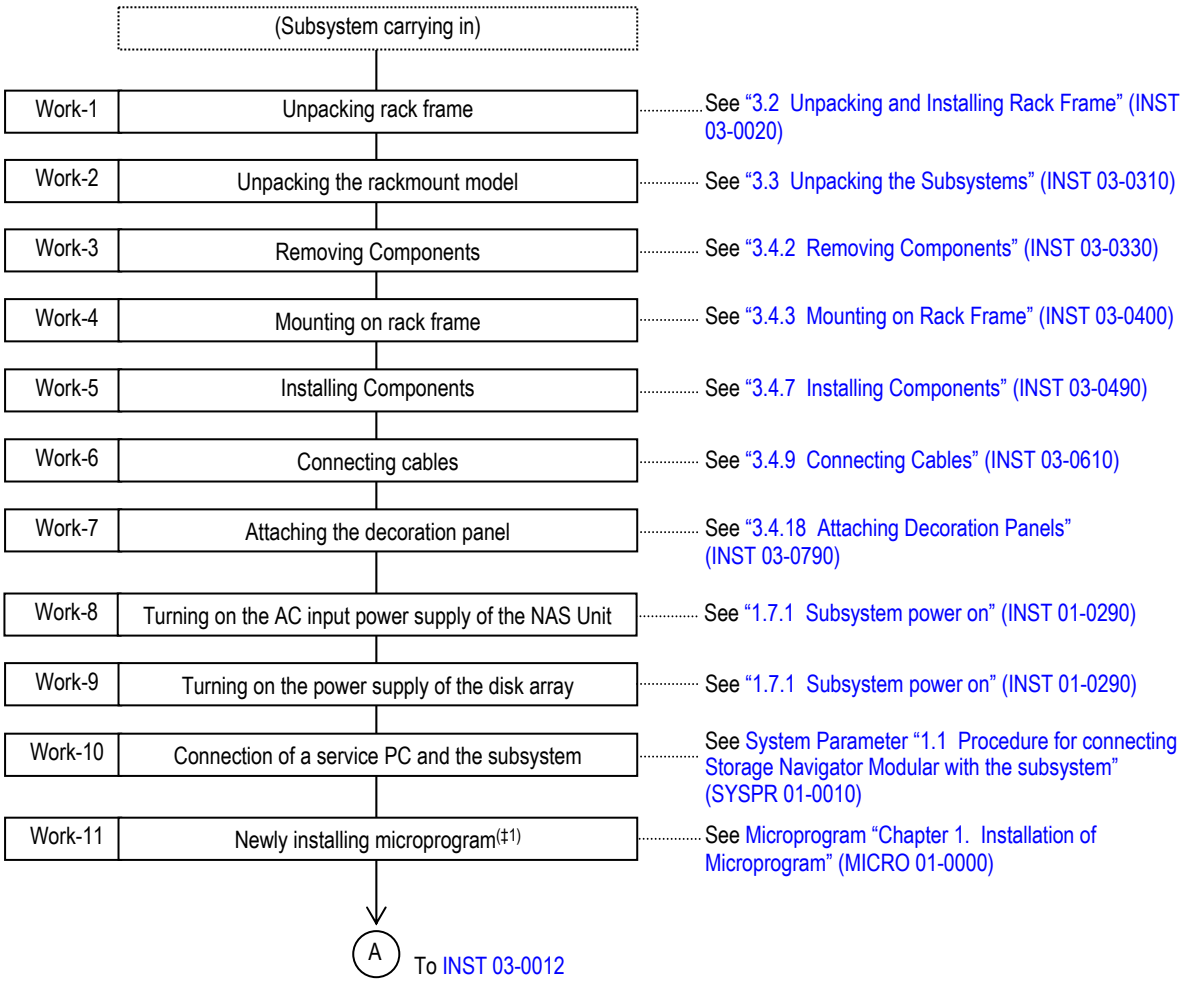


In the case of a new introduction or moving, perform the installation after making sure of the following necessary works.

(a) At the time of the Fibre Channel interface configuration, the system configuration of the iSCSI interface, or the system configuration of the Fibre Channel interface and the iSCSI interface

‡1 : Normally, microprograms are installed when the subsystem is shipped from the factory.

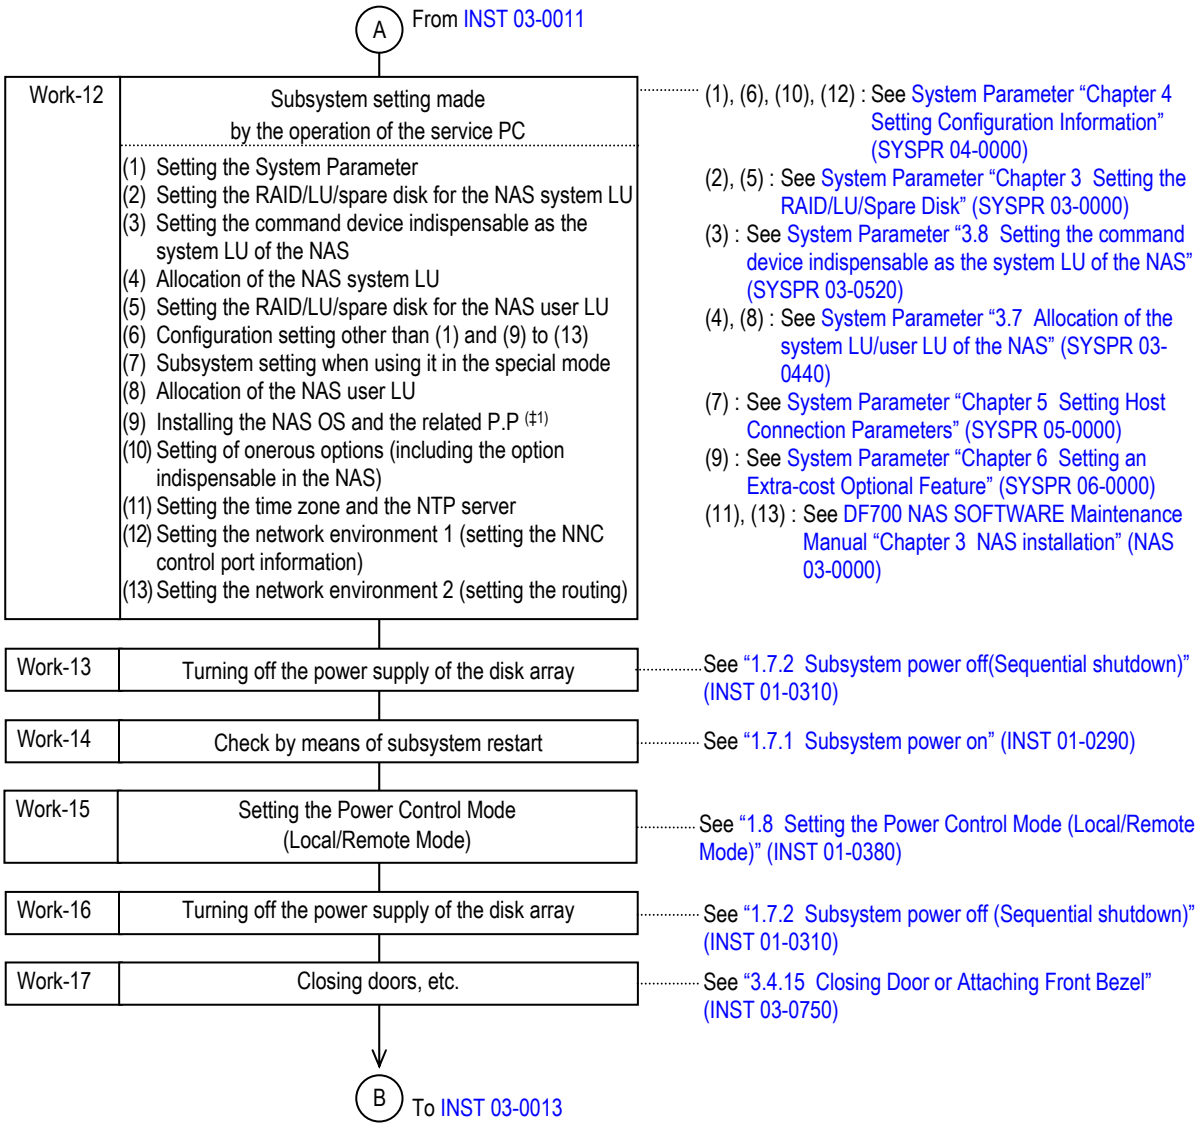
Copyright © 2005, 2006, Hitachi, Ltd.



Copyright © 2005, Hitachi, Ltd.

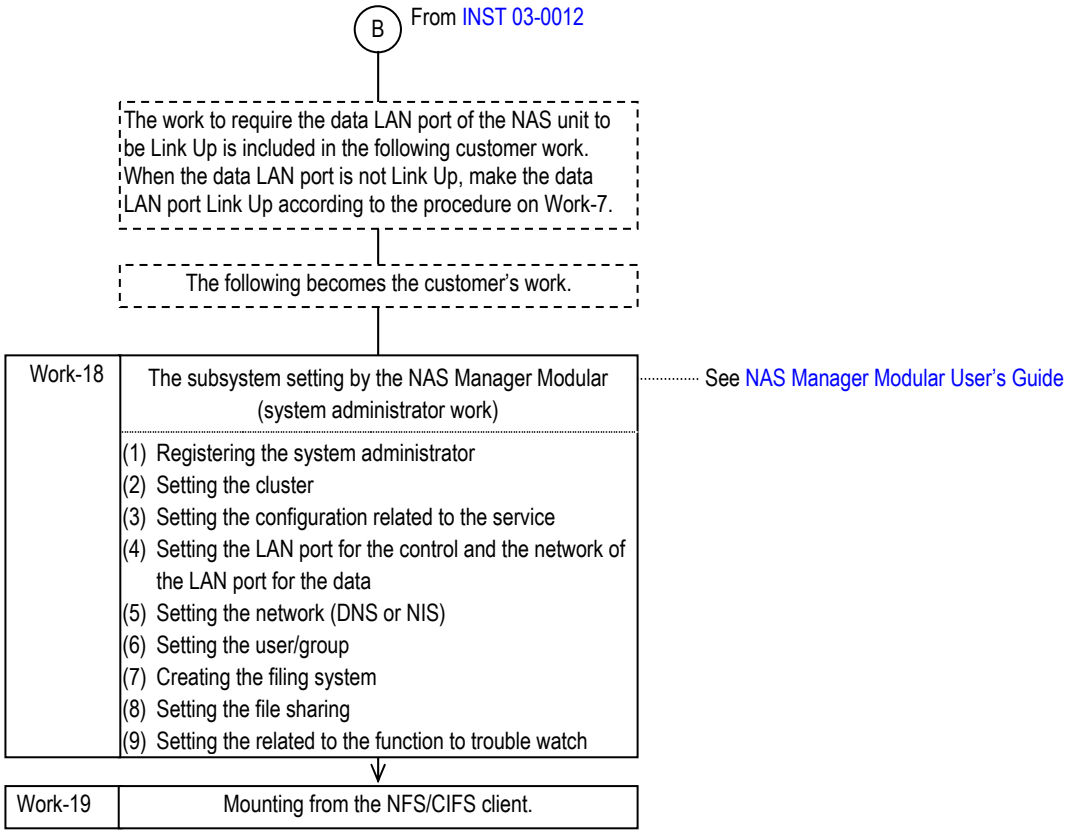
(b) At the time of the system configuration of the NAS model

Perform a prior check necessary to construct the environment indispensable to the NAS model (hereafter, it is called the NAS Modular system). Refer to the DF700 NAS SOFTWARE Maintenance Manual "Chapter 2 NAS Modular System Device Explanation" (NAS 02-0000) for the details. Also, install a necessary tool peculiar to the NAS model in the maintenance PC used for the installation work of the NAS model and the maintenance work. Refer to the DF700 NAS SOFTWARE Maintenance Manual "8.1 Appendix A: Setting up an FTP Server on the Maintenance PC" (NAS 08-0000) for the details.



Perform the construction of the NAS Modular system in the following procedures.

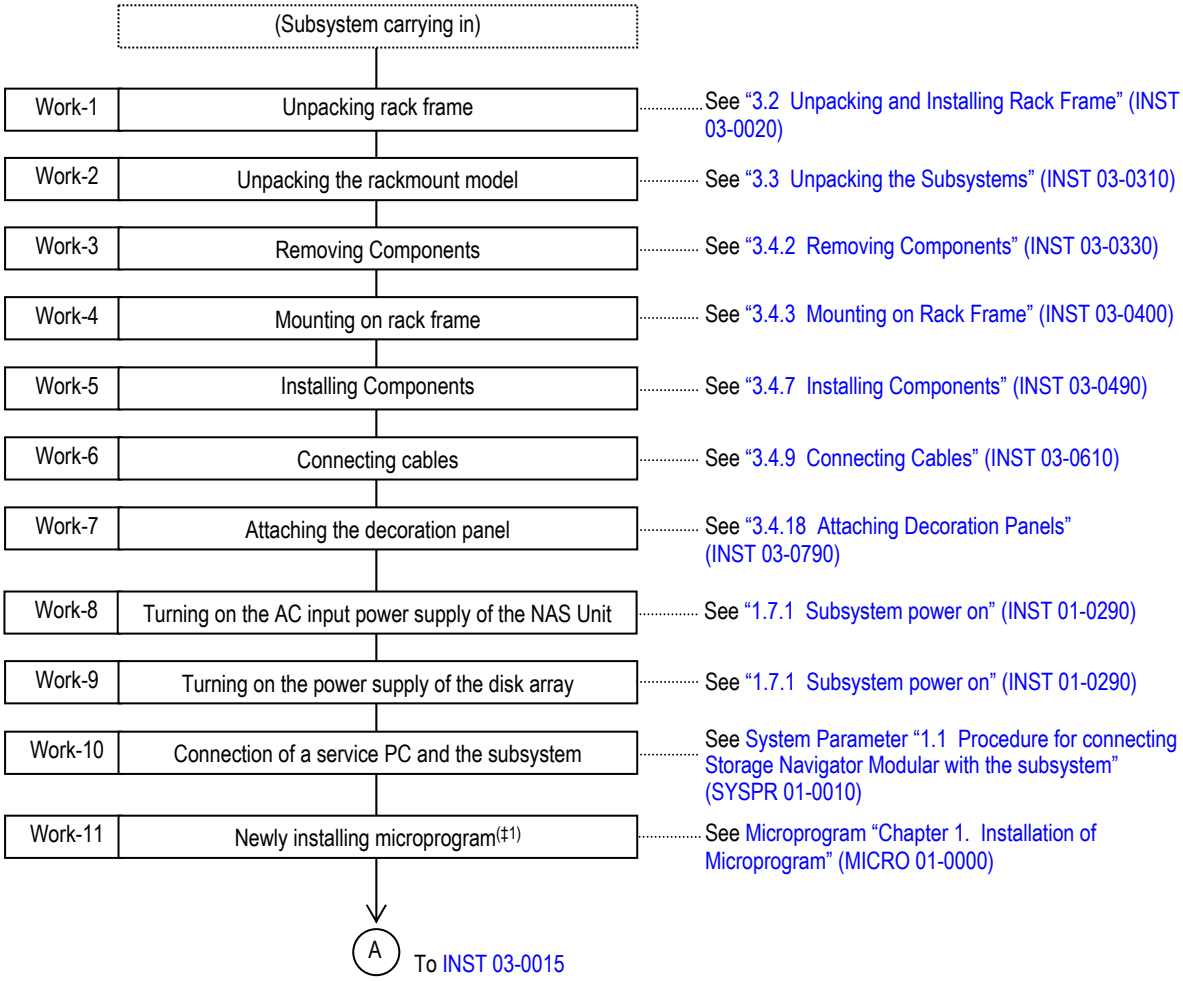
Perform the Work (12) also in the procedures of (1) to (13).



‡1 : The microprogram, the NAS OS and the NAS BIOS are usually installed at the time of shipment of the subsystem.

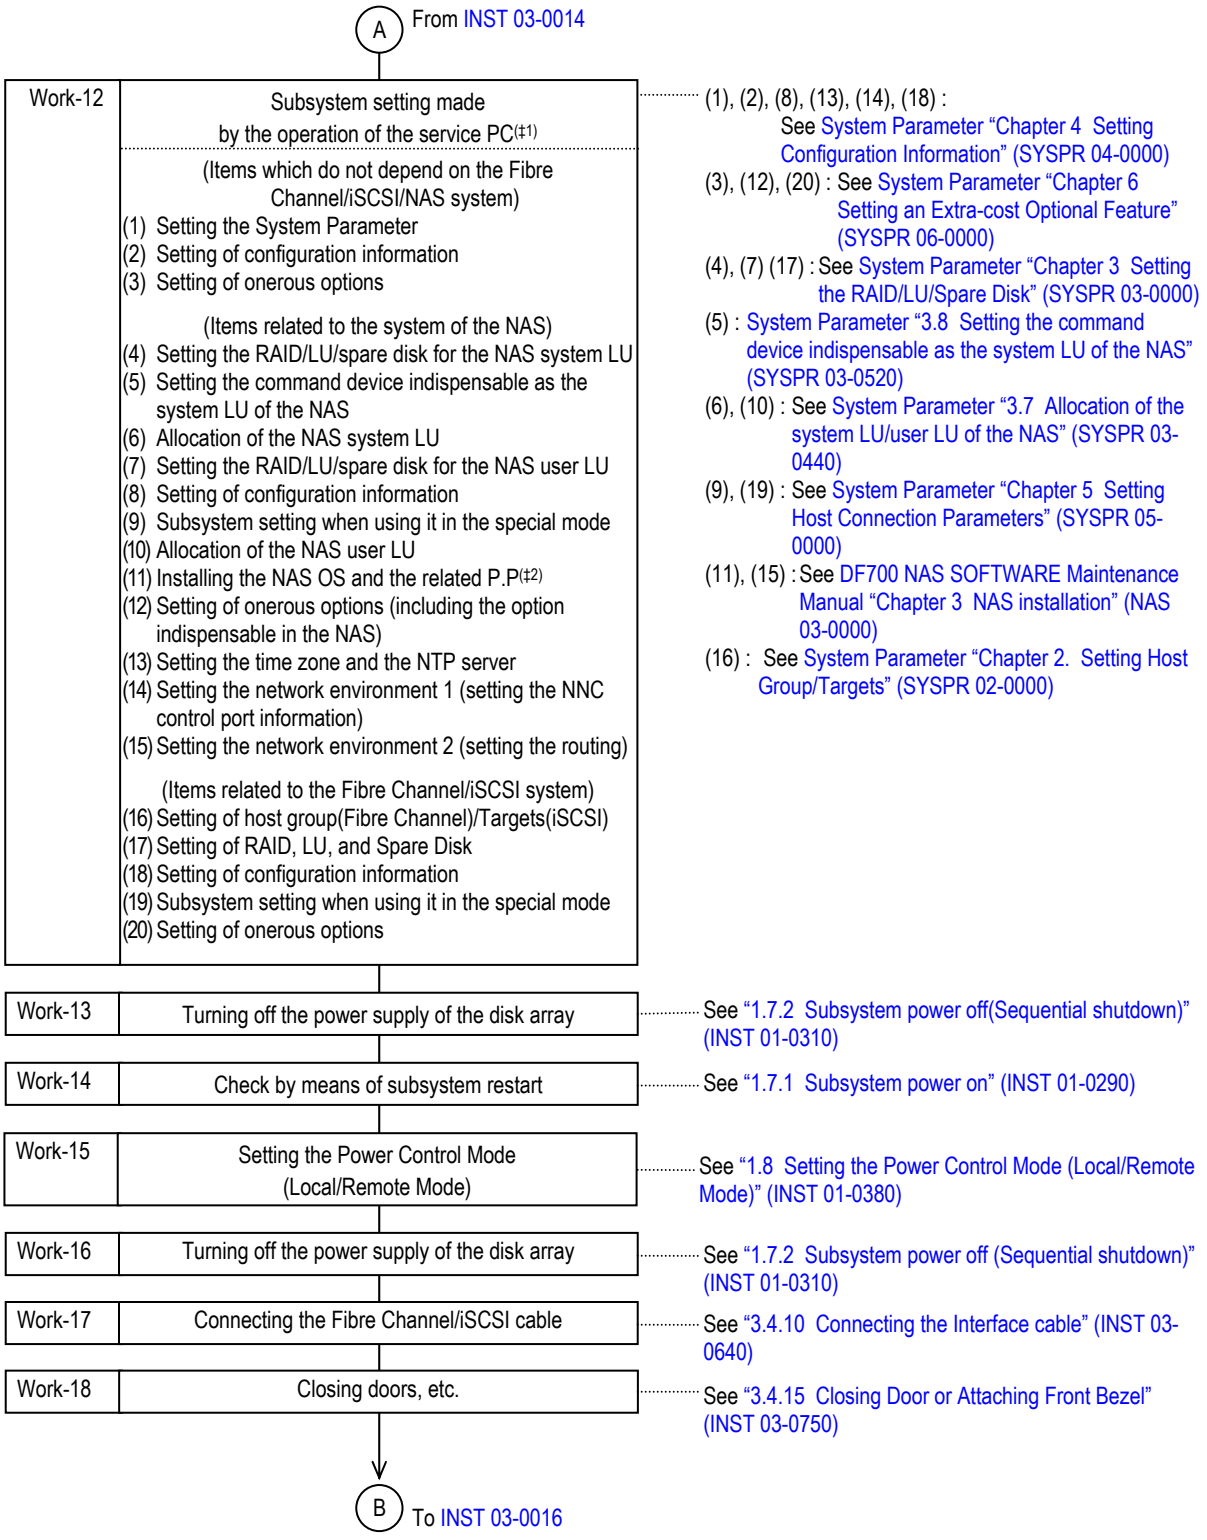
Copyright © 2005, 2006, Hitachi, Ltd.

‡1 : The microprogram, the NAS OS and the NAS BIOS are usually installed at the time of shipment of the subsystem.



Copyright © 2005, 2006, Hitachi, Ltd.

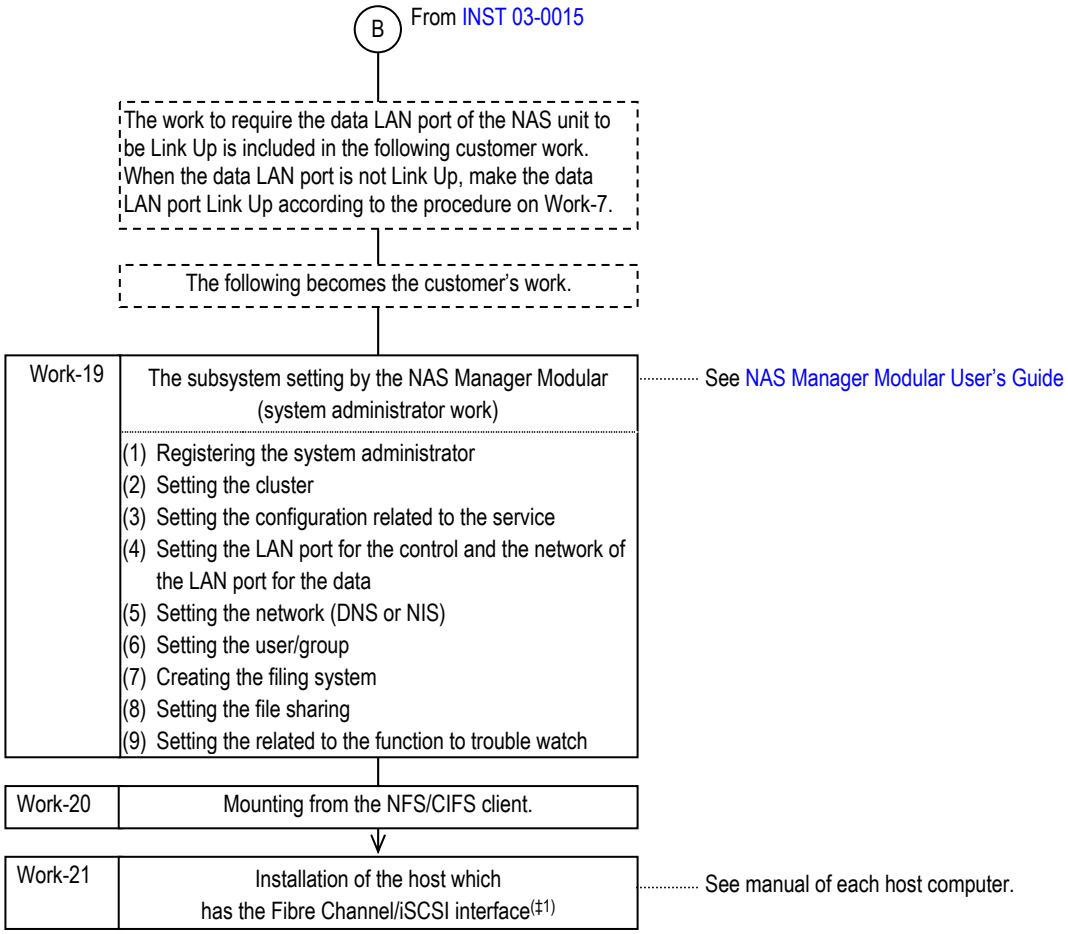
Copyright © 2005, 2006, Hitachi, Ltd.



(c) At the time of the NAS system and the Fibre Channel interface configuration, or the NAS system and the iSCSI interface configuration

Perform a prior check necessary to construct the environment indispensable to the NAS model (hereafter, it is called the NAS Modular system). Refer to the DF700 NAS SOFTWARE Maintenance Manual "Chapter 2 NAS Modular System Device Explanation" (NAS 02-0000) for the details. Also, install a necessary tool peculiar to the NAS model in the maintenance PC used for the installation work of the NAS model and the maintenance work. Refer to the DF700 NAS SOFTWARE Maintenance Manual "8.1 Appendix A: Setting up an FTP Server on the Maintenance PC" (NAS 08-0000) for the details.

‡1 : The microprogram, the NAS OS and the NAS BIOS are usually installed at the time of shipment of the subsystem.



Copyright © 2005, 2006, Hitachi, Ltd.

‡1 : The settings of the items which do not depend on the Fibre Channel/iSCSI/NAS system, the items related to the system of the NAS and the items related to the Fibre Channel/iSCSI system are in no special order. The settings common to each item, such as the configuration setting, can be executed at the same time.

‡2 : The microprogram, the NAS OS and the NAS BIOS are usually installed at the time of shipment of the subsystem.

Copyright © 2006, Hitachi, Ltd.

‡1 : The installation of the host which has the Fibre Channel/iSCSI interface (Work-21) can be performed before the subsystem setting by the NAS Manager Modular (system administrator work) (Work-19).

Copyright © 2006, Hitachi, Ltd.

(2) Tools required

The following tools are required for the installation.

Table 3.1.1 Tools Required

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
	Phillips screwdriver	No.2	Installation of skirts and securing the subsystem.
	Slotted screwdriver	No.1	For Device ID Setting Switch
	Allen wrench	No.3	Securing of cable cramps
	Allen wrench	No.4	Securing of rail and connection of power cable.
	Allen wrench	No.6	Opening/closing of doors; removal of stabilizers
	Spanner	No.22	Adjustment of leveling bolts
Tool of other	Wrist band	–	Band for protecting the subsystem from the static electricity
	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium Ⅱ (233 MHz or more) is recommended), Memory 40 Mbytes or more (64 Mbytes or more is recommended)

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

3.2 Unpacking and Installing Rack Frame

3.2.1 U7 Rack Frame (Unpacking/Installing and Installation areas/maintenance areas)

NOTE : When installing the rack rails in the rack frame that has already been in use, perform the installation works in Step "3.2.1 (11) Installing the rails" (INST 03-0100) and the following steps.

The exterior of the packed rack frame is shown in the "Figure 3.2.1 Packed Status of the U7 Rack Frame" (INST 03-0030).

Table 3.2.1 show optional parts required to install one subsystem.

As many kits as the subsystems to be mounted are required.

Table 3.2.1 Parts Required for Installation of DF-F700-URHT7

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Rail	3272150-1	1	For right hand side	—
2	Rail	3272150-2	1	For left hand side	—
3	Stopper	5528571-1	2	For securing the subsystems	—
4	Cage nut (M5)	5528564-1	12(*1)	For securing the rail, subsystems	—
5	Cage nut (M6)	5528564-3	3(*2)	Not used	—
6	Fastener	5510146-1	14(*1)	For securing the rail, subsystems	—
7	Bind screw (M4×8)	SB408N	8(*1)	For securing the stopper	—
8	Bind screw (M5×10)	SB510N	6(*1)	For securing the subsystems	—
9	Hexagon socket bolt (M5×20)	3261899-520	10(*1)	For securing the rail	—
10	Hexagon socket bolt (M6×12)	BS612N	3(*1)	For securing the subsystems	—
11	LL washer (M4)	5513553-433	6(*1)	For securing the stopper	—
12	LL washer (M5)	5513553-513	10(*1)	For securing the rail	—
13	Washer	5513554-6	3(*2)	Not used	—
14	Lock washer	5513569-6	3(*2)	Not used	—
15	Wire rope	5490846-1	2(*2)	Not used	—
16	Repeat binder (Cable)	5409042-3	3(*2)	Used to fix a slackened part of overlong cable	—
17	Cleat (Cable)	5409055-1	4(*1)	For securing the cable	—
18	Clamp (Fibre)	5511447-1	2	For securing the cable	—
19	Binder (Flat)	5409039-1	6	For securing the cable	—
20	Power cable	3272181-E	2	Power cable (900 mm)	—

*1 : 2 spares are included.

*2 : 1 spare is included.

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Unpacking

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

(a) Remove the external packaging and packing materials.
(b) Take the rack frame out of the polyethylene bag.
(c) Check all items provided with the U7 rack frame against the table below.

Table 3.2.2 Parts Required for Installation of DF-F700-U7(*1)

No.	Product name	Parts No.	Quantity	Comment
1	U7 rack frame	—	1	—
2	SKIRT (S)	3256549-A	1	For right hand side
3	SKIRT (S)	3256549-B	1	For left hand side
4	SKIRT (F)	3256547-A	1	—
5	SKIRT (R)	3256548-A	1	—
6	Bind screw (M4×8)	SB408	10	For securing the holder and skirt
7	Holder (R)	5507132-1	2	For right hand side
8	Holder (L)	5507132-2	2	For left hand side
9	AC power cable	—	4	—

*1 : Exclusive rack frame for mounting an subsystem(s).

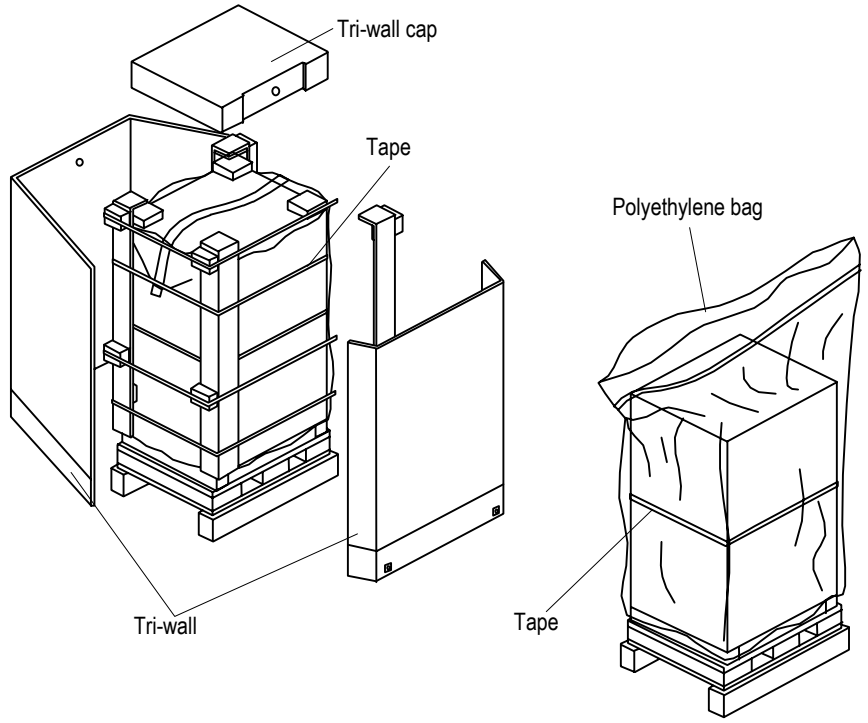

Figure 3.2.1 Packed Status of the U7 Rack Frame

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Inspecting the subsystem visually

Check the exterior of the subsystem visually for distortion or damage owing to the transport.

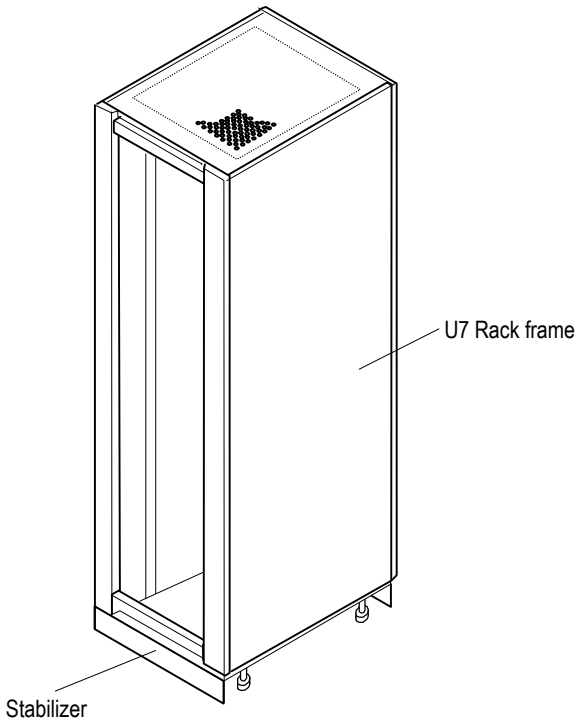

Figure 3.2.2 Exterior Rack Frame

(3) Checking contents of package

Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

Copyright © 2005, Hitachi, Ltd.

(4) Installation and maintenance areas

Figure 3.2.3 shows installation and maintenance areas for the DF-F600-U7 rack frame.

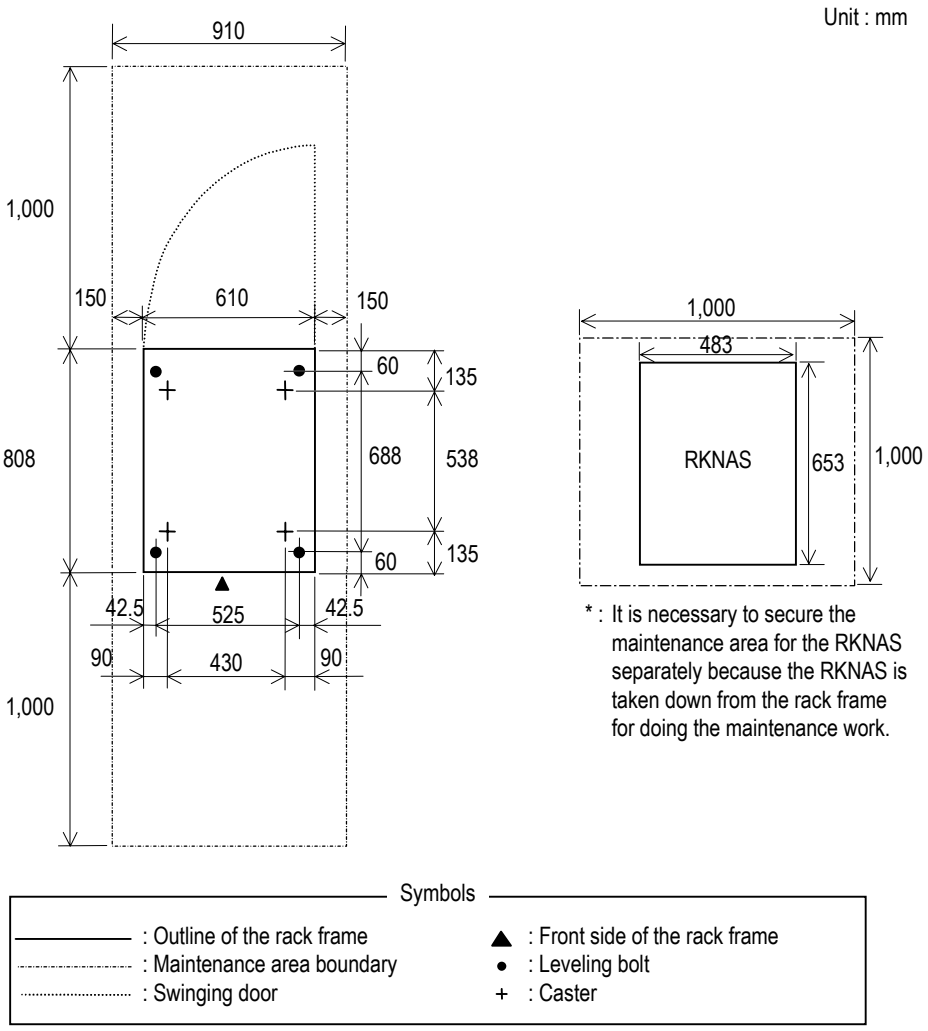

Figure 3.2.3 Installation and Maintenance Areas of Rack Frame

Copyright © 2005, Hitachi, Ltd.

(5) Move the unpacked subsystem to the site where it is to be installed.
When moving the subsystem, attach the stabilizers to prevent it from falling.

(6) Removing stabilizers
(a) Remove the allen bolt (M8×40) with an Allen wrench.
(b) Remove the stabilizers from subsystem.
Keep the removed allen bolt (M8×40) and stabilizers. (They will be necessary when the rack frame is moved again later.)

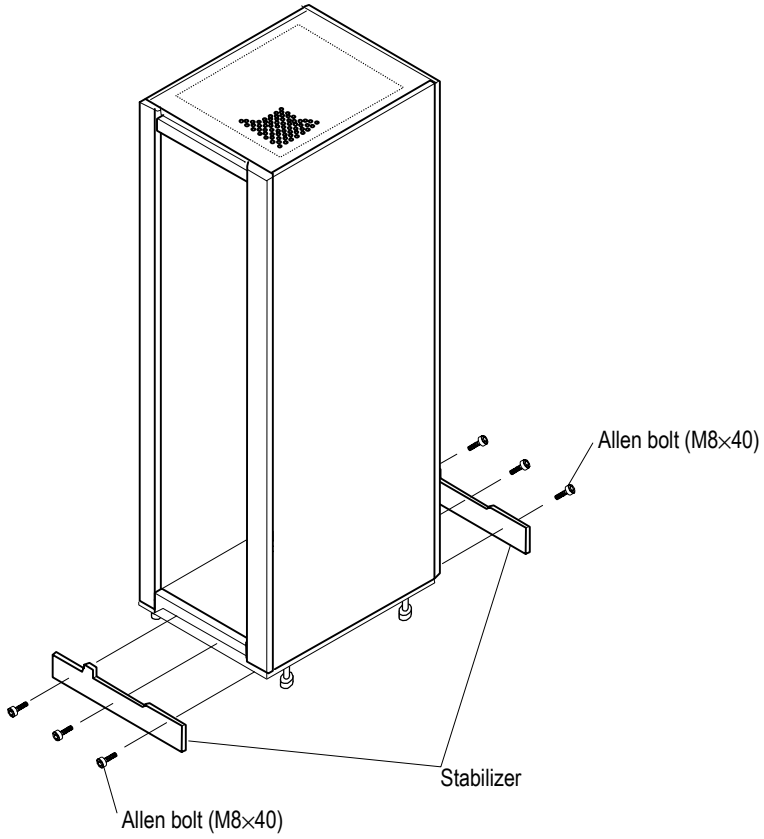

Figure 3.2.4 Removing the Stabilizers

Copyright © 2005, Hitachi, Ltd.

(7) Settling the rack frame

Settle the rack frame in the installation site by adjusting the leveling bolts.

(a) Turn the each leveling bolt in the direction shown by the arrow so that the clearance between the caster and the floor becomes about 2.5 mm.

(b) Adjust the leveling volts so that the tilts of the subsystem to the front or rear and left or right become 0 ± 2 mm.

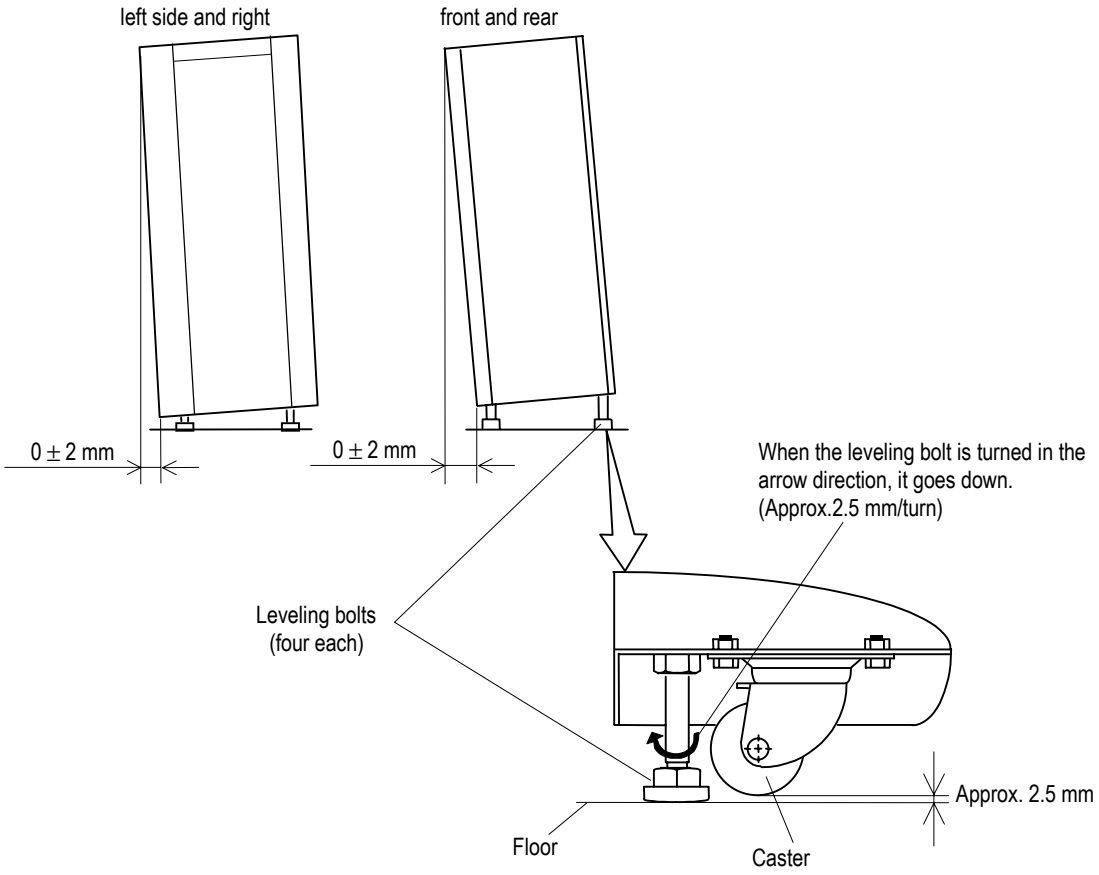

Figure 3.2.5 Adjusting Leveling Bolts

Copyright © 2005, Hitachi, Ltd.

(8) Installing the skirts

Make the bottom of the skirt contact the floor to prevent a trouble caused by an electrostatic discharge.

(a) Fasten the skirt bracket and skirt (F) with the binding screws.

(b) Fasten the holder to the lower part on the side with binding screws.

(c) Install the skirt (S)'s on the left and right sides of the subsystem.

To install the skirt (S), engage it with the holders of the frame by sliding it in the direction from rear to front.

(d) Fasten the skirt (S) with the binding screws.

(e) For wiring on the floor, pull out the plug of PDB before installing the skirt (R).

(f) For wiring on the floor, loosen two screws (M3×8) of the skirt (R), adjust the sliding section and pass the cable.

(g) Install the skirt (R) by fitting its claws into the rectangular holes on the skirt (S).

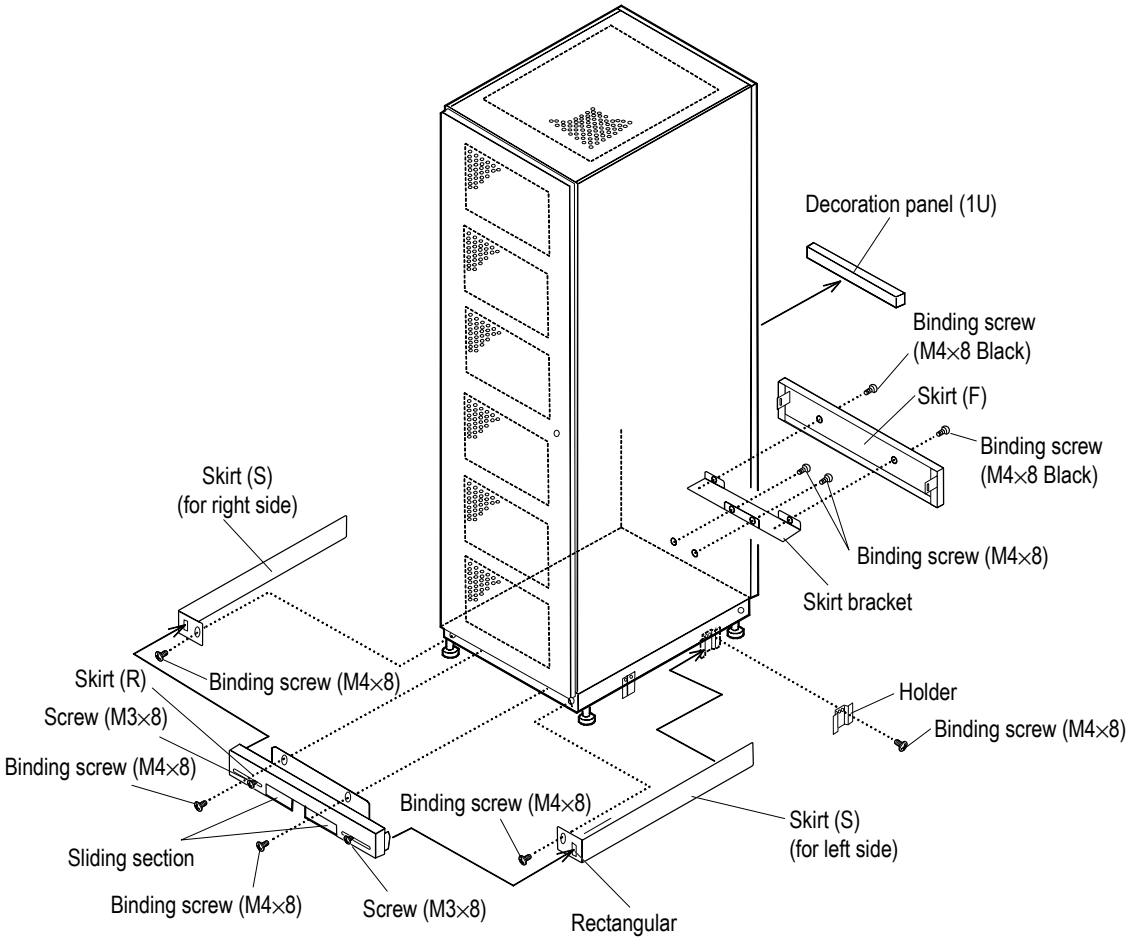

Figure 3.2.6 Installing Skirts and Removing Decoration Panel(s)

(9) Removing the decoration panels (1 U)

When the decorative panels have been attached, it is necessary to remove the one(s) attached to the location(s) where the subsystem(s) is to be mounted.

(a) Pull the decorative panel toward you.

(b) The decorative panel will be come off.

Copyright © 2005, Hitachi, Ltd.

(10) Removing the protection paper

(a) Open the rear door.

(Refer to "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)

(b) Remove the protection paper which covers the Rear door.

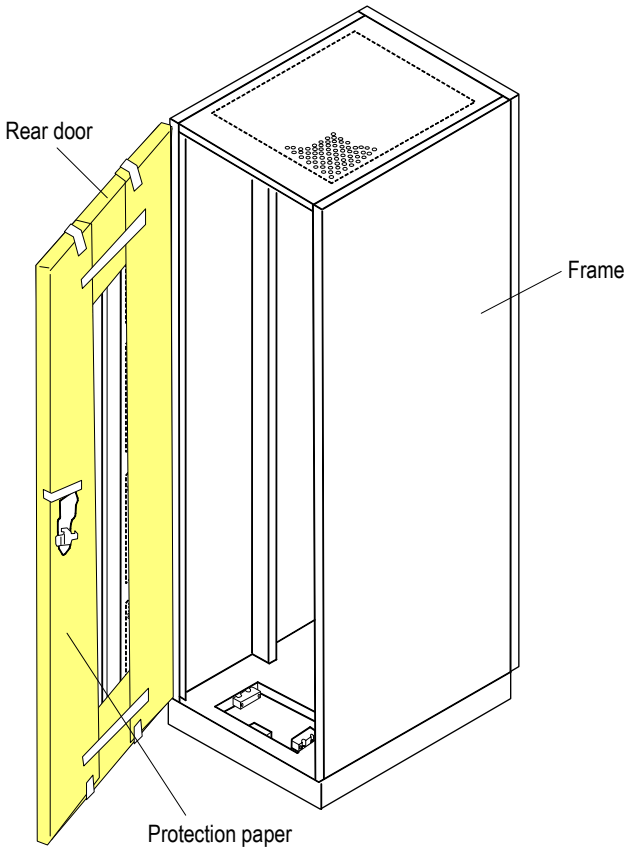

Figure 3.2.6.1 Removing the protection paper

Copyright © 2005, Hitachi, Ltd.

(11) Installing the rails

If the rails have already been installed, this installation is not required.

For the components list, see "Table 3.1.1 Tools Required" (INST 03-0014).

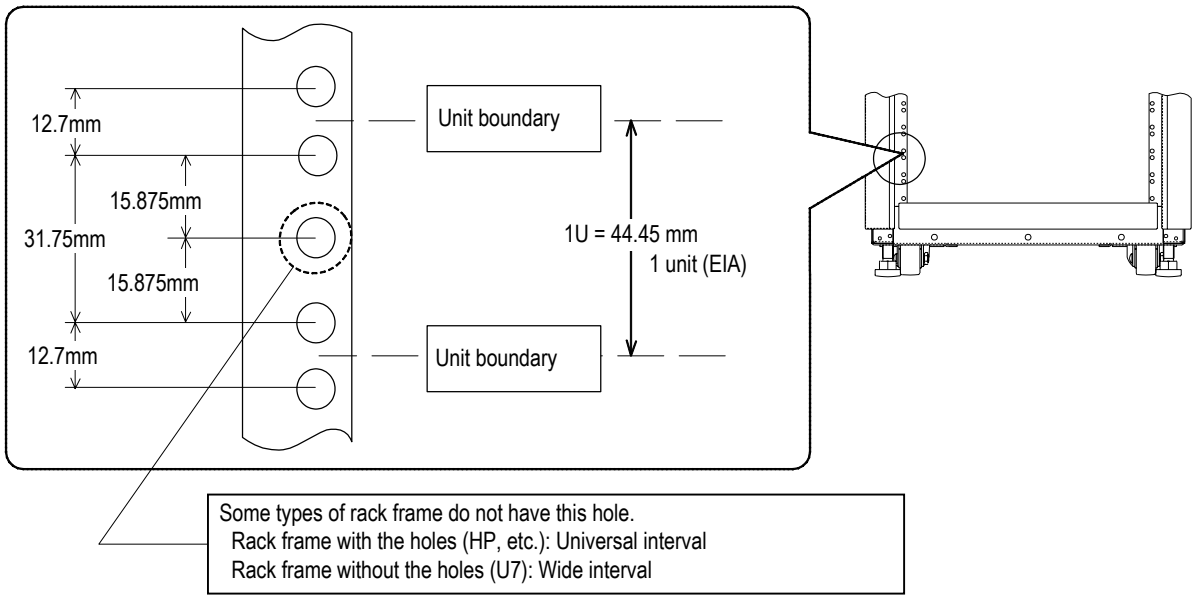
EIA units and intervals of mounting holes of 19-inch rack frame conforming to EIA standard

- A unit (U) space conforming to EIA standard is 19 inches wide and 44.5mm high as shown in the figure below.
- The boundary of the unit falls on the middle of the interval of 12.7mm.
- When the unit space is shifted by 0.5 units, the unit boundary is shifted from the normal position by 22.2mm.

For the U7 rack frame

Wide intervals: Repeat of 44.45mm (31.75mm + 12.7mm)

Maximum number of mountable unit spaces: 38



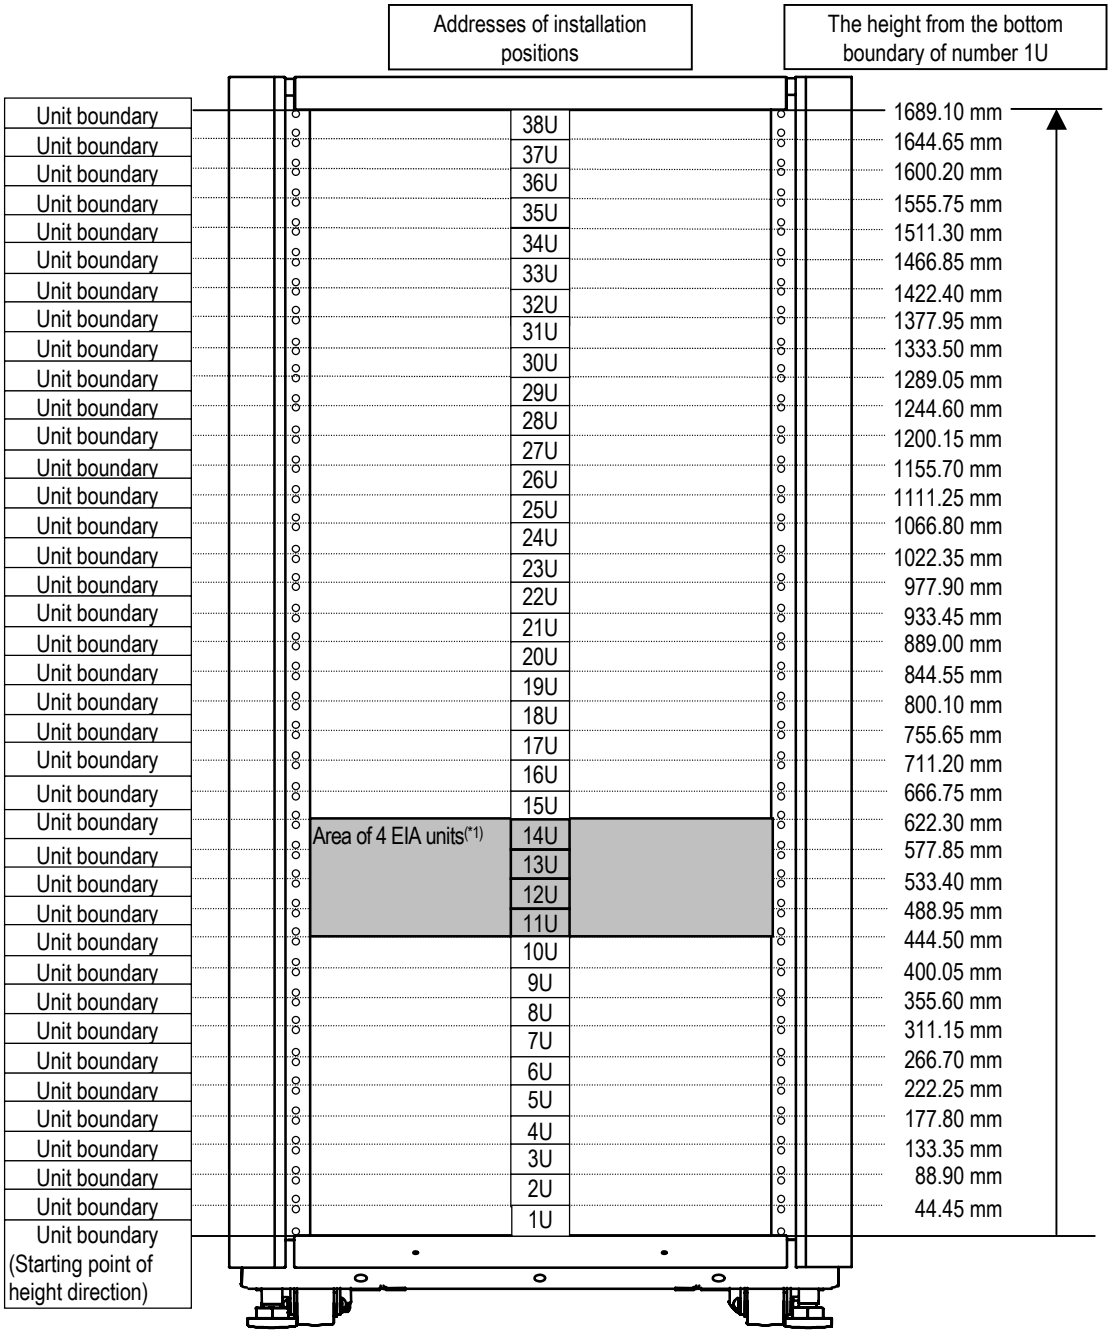


Figure 3.2.7 Attachment Hole Size of Rack

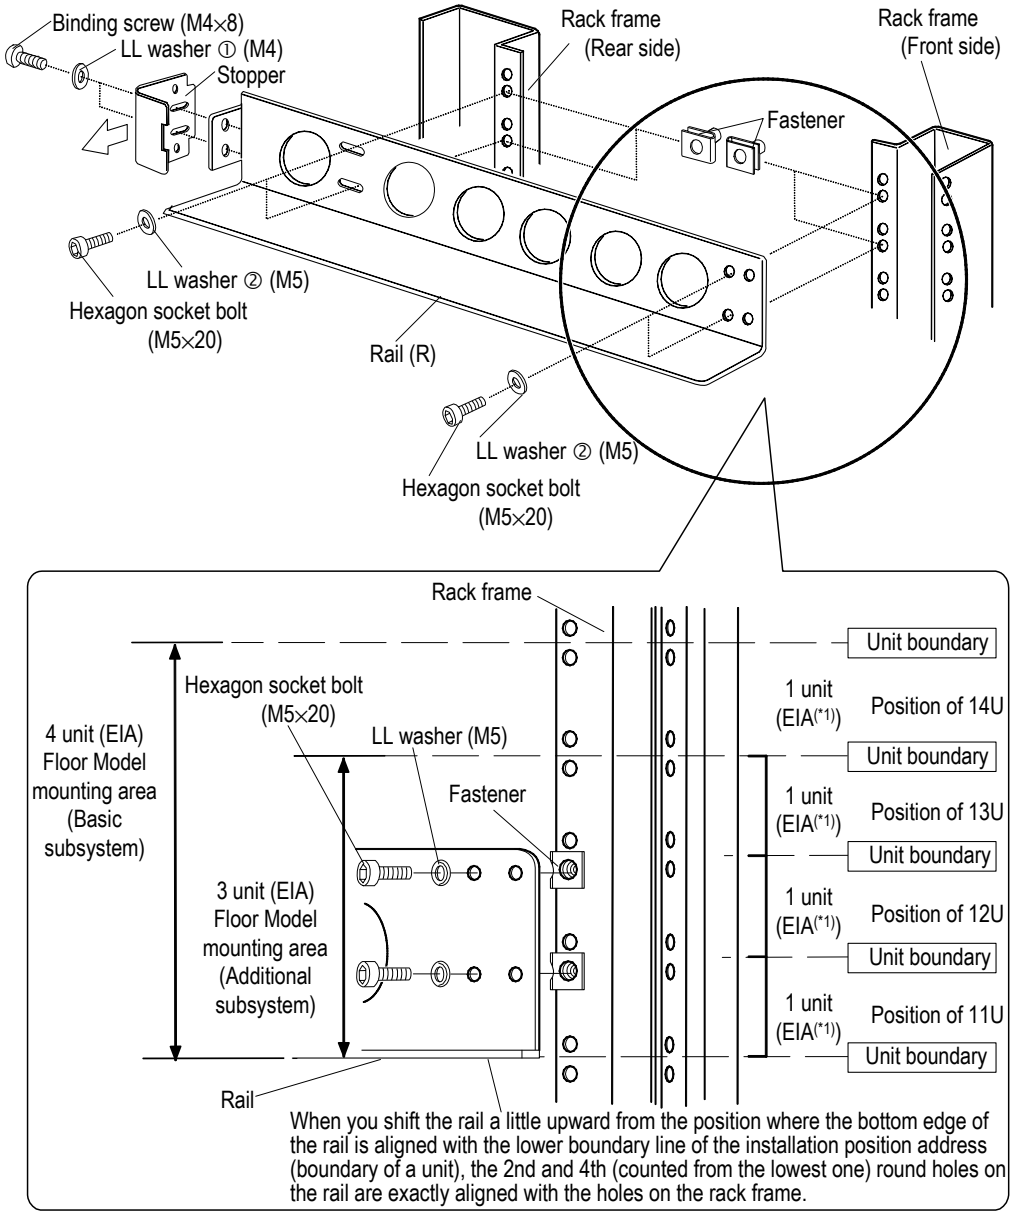
Copyright © 2005, 2006, Hitachi, Ltd.

The addresses are given as 1, 2, 3, and so on counted from the bottom of the rack frame. In the case of the U7 rack frame, you must count the holes to know the address because no number is marked on the rack frame.
The following figure illustrates the whole layout of addresses of installation positions in the U7 rack frame.
There are 38 addresses, that is, the 1U to 38U counted in the vertical direction starting from the lower boundary of the 1U (the lowest unit).



*1 : The grayed are shows a layout of an area for installing the subsystem at the 11U

Figure 3.2.8 Whole Layout of Installation Position Addresses

Copyright © 2005, Hitachi, Ltd.

(a) Slide the stopper in the direction shown by the arrow and temporarily fix it to the Rail (R) using the binding screws and LL washers ① (M4 (at two places.)).
For the installation position address, see Figure 3.2.8.
(b) On the right side of the installation location in the rack frame, align the round holes of the Rail (R) with those of the rack frame and insert the fasteners (at four places in total in front and rear.).
(c) Fasten the Rail (R) to the rack frame using the hexagon socket bolts and LL washers ② (M5 (at two places each on the front and rear sides.)).
(d) Install the Rail (L) to the rack frame in the same way.

*1 : One EIA unit is approximately 44. 45 mm.

Figure 3.2.9 Installation of Rails to the Rack frame and Installation Positions

Copyright © 2005, Hitachi, Ltd.

(12) Installing fasteners on the front side of the rack frame

Install the fasteners on the front side of the rack frame in order to fasten the subsystems to be mounted on the rack frame.

(a) Fit the two fasteners to each of the right and left beams on the front side of the rack frame referring to Figures 3.2.10 and 3.2.11.

Install the mounting fasteners at the 2nd and 5th (counted upward from the unit boundary on the rack frame at the same height as the bottom of the rail) round holes.

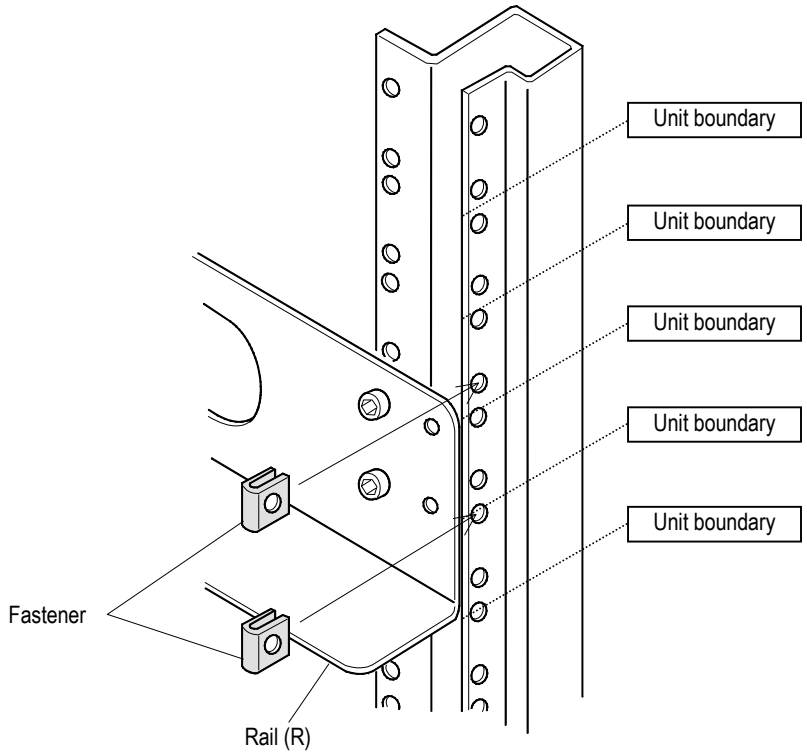


Figure 3.2.10 Installing Fasteners on the Front Side of the Rack Frame

Copyright © 2005, Hitachi, Ltd.

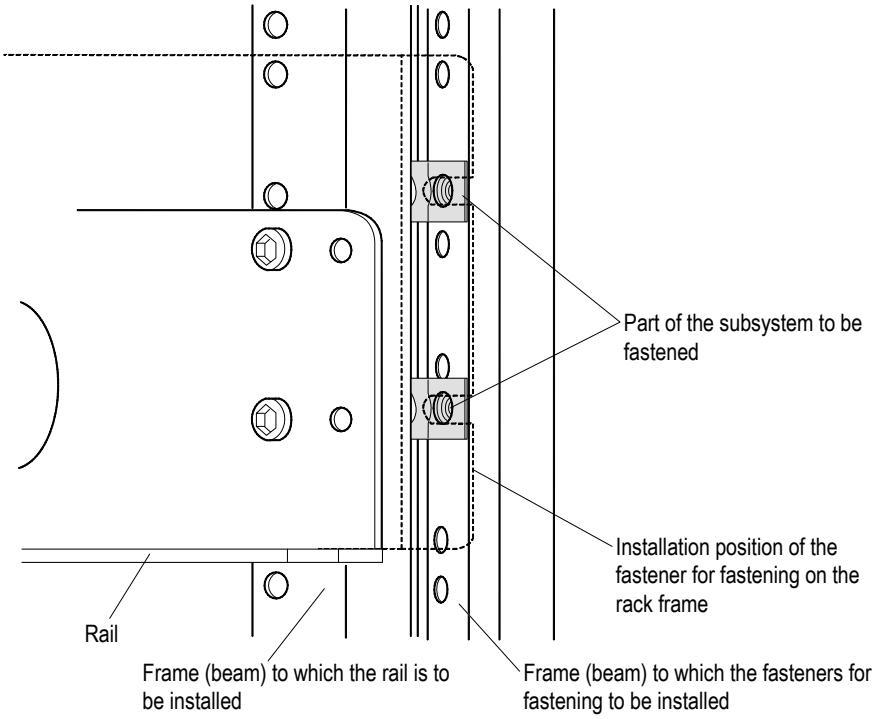

Figure 3.2.11 Installation Positions of Fasteners and Relation with Rails

Copyright © 2005, Hitachi, Ltd.

3.2.2 HP Rack Frame

The DF700 can be mounted on the HP rack frame by installing the rack rails for Hitachi common rack frame (DF-F700-UR7) which are accessory parts.
Installation procedure for the case where the HP rack frame with the rack rails HP rack frame (HP model name: J1501A) are used is shown below.

The exterior of the packed rack frame is shown in the Figure 3.2.22.
Table 3.2.3 show optional parts required to install one subsystem.
As many kits as the subsystems to be mounted are required.

Table 3.2.3 Parts Required for Installation of DF-F700-UR7 (Rev.B or C)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Front rail	3272207-1	1	For left hand side	–
2	Front rail	3272207-2	1	For right hand side	–
3	Rear rail	3272208-1	2	For left/right commonness	–
4	Stopper	5528618-1	2	For securing the subsystems	–
5	Spacer	5528619-1	2	For securing the rail (For U4J)	–
6	Bind screw (M5×10)	SB510N	18	For securing the subsystems, rail (2 spares are included.)	–
7	Bind screw (M4×6)	SB406N	14	For securing the rail (2 spares are included.)	–
8	Bind screw (M3×6)	SB306N	6	For securing the stopper (2 spares are included.)	–
9	19"PART (nickel plated)	5528564-1	10	For securing the cage nut, subsystems, rail (2 spares are included.)	Not used
10	Rack nut	5510146-1	14	For securing the subsystems, rail (6 spares are included.)	–
11	Hexagon Socket Head Bolts	5503443-1	10	For securing the rail (2 spares are included.)	Not used
12	LL washer	5513553-513	10	For securing the rail (2 spares are included.)	Not used
13	Repeat binder (Cable)	5409042-1	3	For securing cables on the subsystem (1 spare is included.)	–

(1) Appearance of HP rack frame
Figure 3.2.12 shows appearance of the HP rack frame.

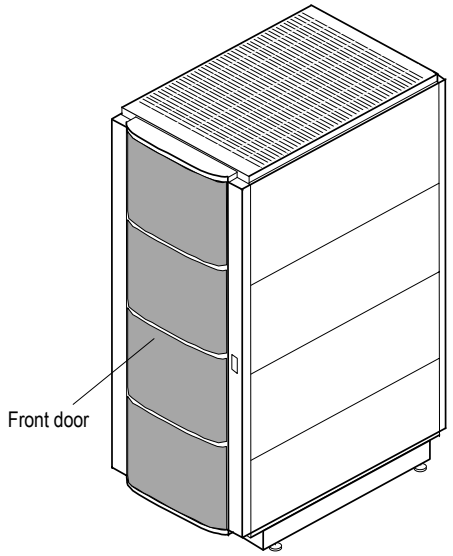

Figure 3.2.12 Appearance of Rack Frame (HP Model Name: J1501A)

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Installing the rails

If the rails have already been installed, this installation is not required.

For the components list, see "Table 3.2.3 Parts Required for Installation of DF-F700-UR7 (Rev.B or C)" (INST 03-0150).

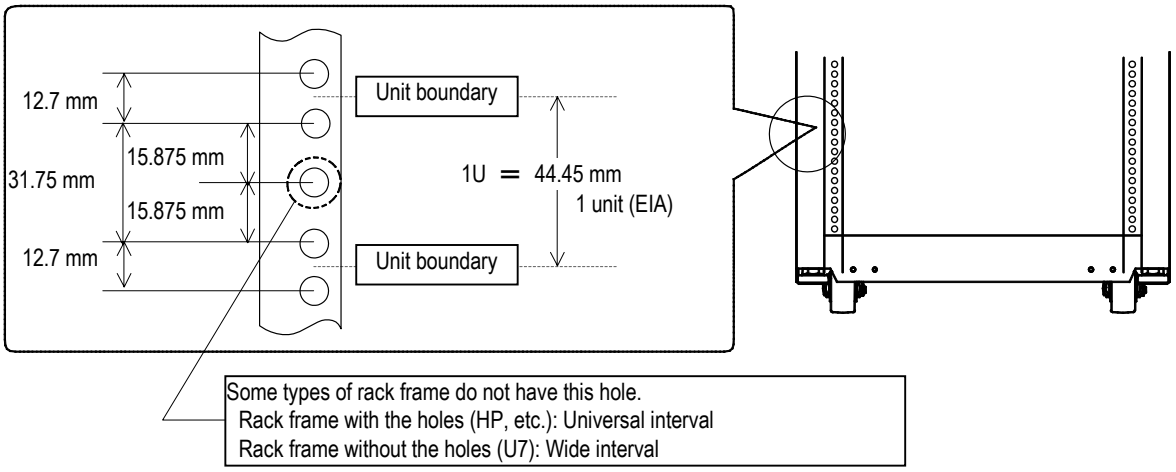
EIA units and intervals of mounting holes of 19-inch rack frame conforming to EIA standard

- A unit (U) space conforming to EIA standard is 19 inches wide and 44.5 mm high as shown in the figure below.
- The boundary of the unit falls on the middle of the interval of 12.7 mm.
- When the unit space is shifted by 0.5 units, the unit boundary is shifted from the normal position by 22.2 mm.

For the HP rack frame

Universal intervals: Repeat of 44.45 mm (15.875 mm + 15.875 mm + 12.7 mm)

Maximum number of mountable unit spaces: 32



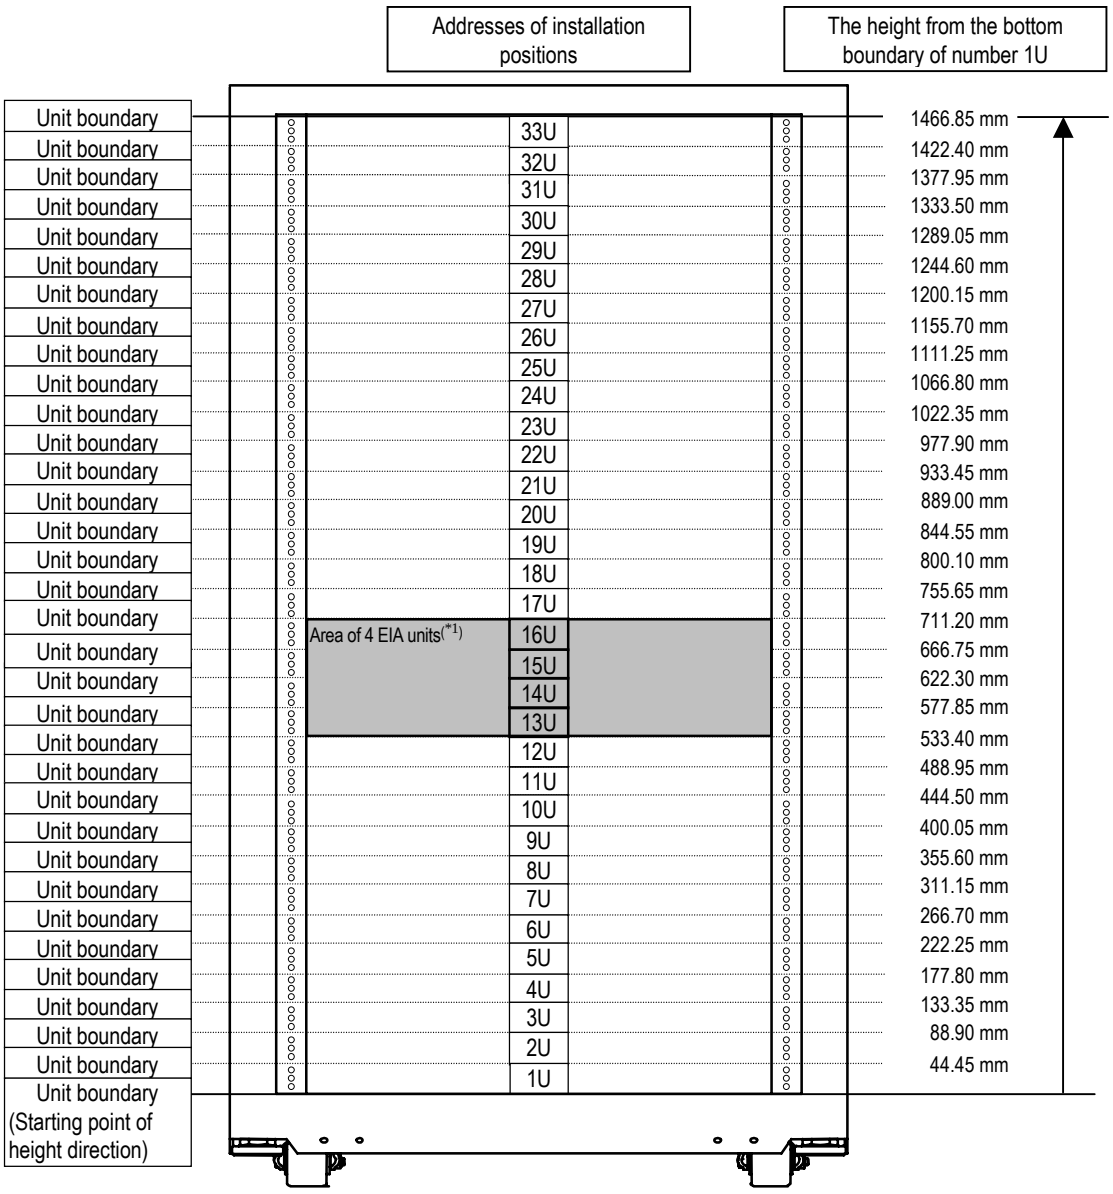


Figure 3.2.13 Attachment Hole Size of Rack

Copyright © 2005, Hitachi, Ltd.

Addresses within the rack frame are called (EIA) unit numbers.
The addresses are given as 1, 2, 3, and so on counted from the bottom of the rack frame.

NOTE : When the HP rack frame has front door, mount the subsystem leaving a space with a height of 1unit (EIA) unit or more from the bottom of the rack frame.

*1 : The grayed are ▭ shows a layout of an area for installing the Basic subsystem at the 11U

Figure 3.2.14 Whole Layout of Installation Position Addresses (HP)

Copyright © 2005, Hitachi, Ltd.

Install the rack rail to the rack frame referring to Figure 3.2.15 - Figure 3.2.17.

(a) Installing the spacer

Install the spacer (there is no vertical distinction) to fix the rail to the front side of the rack frame. (One right and left place for each)

Fasten the 2nd and 8th holes counted upward from the unit boundary of the subsystem installation position and the screw holes at both ends of the space with the binding screws (M5 x 10) from the rear side of the frame.

(b) Remove the rail fixing screws (M4 x 6) of the factory setting.

(c) Fix the places, where the screw holes of the front rail and those of the rear rail are matched, temporarily with the binding screws (M4 x 6 (six places)) (fix at least four places, temporarily).

(d) Install the rack nuts at the 4th and 6th positions counted from the unit boundary of the subsystem installation position of the rear side of the rack frame.

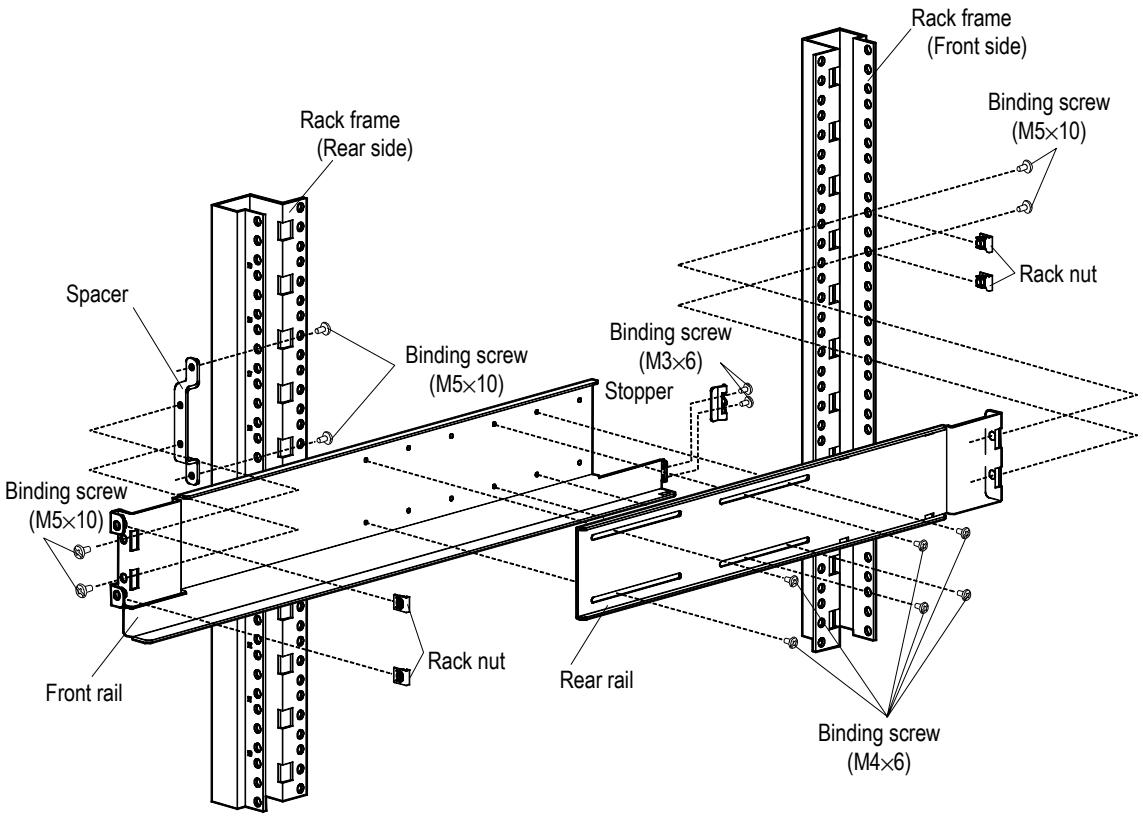
(e) Fasten the holes at two places near the center of the front side of the front rail and the screw holes of the spacer with the binding screws (M5 x 10).

(f) Fasten the rear side of the rear rail and the rack nuts of (d) with the binding screws (M5 x 10).

(g) Fasten the binding screws (M4 x 6) which were temporarily fixed in (c).

(h) Install the rack nuts in the holes at the sheet metal folding part of the front rail (two places).

(i) Perform the above-mentioned installation for the right and left of the rack frame.



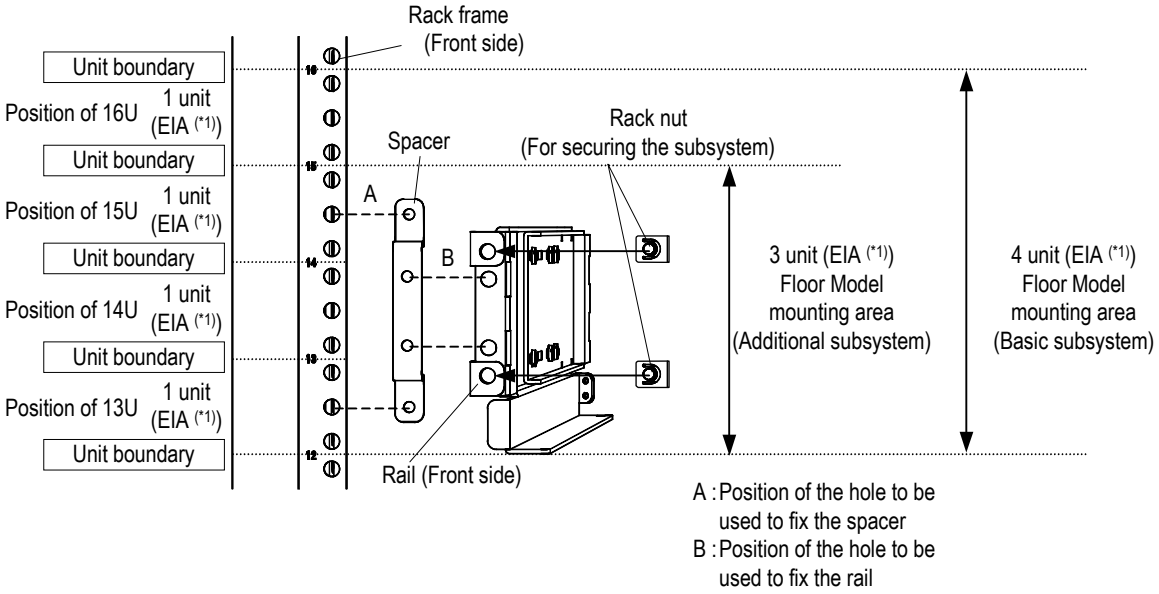


Figure 3.2.15 Installation of Rails to the Rack frame

Copyright © 2005, Hitachi, Ltd.

*1 : One EIA unit is approximately 44. 45 mm.

Figure 3.2.16 Location of installing the rail on the front side of the Rack frame

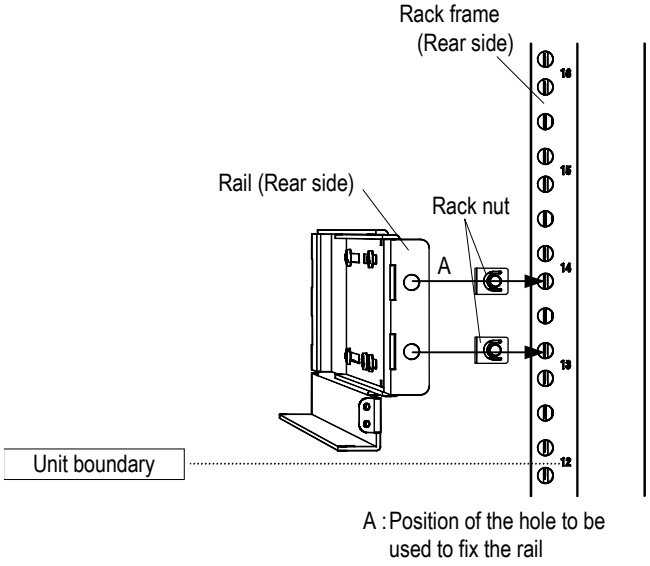

Figure 3.2.17 Location of installing the rail on the rear side of the Rack frame

Copyright © 2005, Hitachi, Ltd.

CAUTION

Press the rail against the rack frame as much as possible to secure the rail to the rack frame. If there is a gap between the rail and the rack frame, the rail may interfere with the equipment.

Copyright © 2005, Hitachi, Ltd.

3.2.3 Sun StorEdge Rack Frame

The RKM/RKAJ/RKAJAT/RKS can be mounted on the Sun 19-inch rack frame by installing the rack rails (DF-F700-UR7) which are accessory parts.
Installation procedure for the case where the Sun 19-inch rack frame with the rack rails (DF-F700-UR7) are used is shown below.

The Components-list of SUN StorEdge Rack-rail is shown in Table 3.2.4.
The packaging of the Rack-frame is shown in Figure 3.2.18.

Table 3.2.4 Components of Rack-rail (DF-F700-UR7) (per one unit)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Front rail	3272207-1	1	For left hand side	–
2	Front rail	3272207-2	1	For right hand side	–
3	Rear rail	3272208-1	2	For left/right commonness	–
4	Stopper	5528618-1	2	For securing the subsystems	–
5	Spacer	5528619-2	2	For securing the rail (For U4J)	Not used
6	Bind screw (M5×10)	SB510N	18	For securing the subsystems (14 spares are included.)	–
7	Bind screw (M4×6)	SB406N	14	For securing the rail (6 spares are included.)	–
8	Bind screw (M3×6)	SB306N	6	For securing the stopper (2 spares are included.)	–
9	19"PART (nickel plated)	5528564-1	10	For securing the cage nut, subsystems, rail (2 spares are included.)	Not used
10	Rack nut	5510146-1	14	For securing the subsystems (10 spares are included.)	–
11	Hexagon Socket Head Bolts	5503443-1	10	For securing the rail (2 spares are included.)	–
12	LL washer	5513553-5113	10	For securing the rail (2 spares are included.)	–
13	Repeat binder (Cable)	5409042-1	3	Used to fix a slackened part of overlong cable (1 spare is included.)	–

(1) Appearance of Sun 19-inch rack frame

Figure 3.2.18 shows appearance of the Sun 19-inch rack frame.

(There are two types of Sun 19-inch rack frames: Sun StorEdge and Sun Fire.)

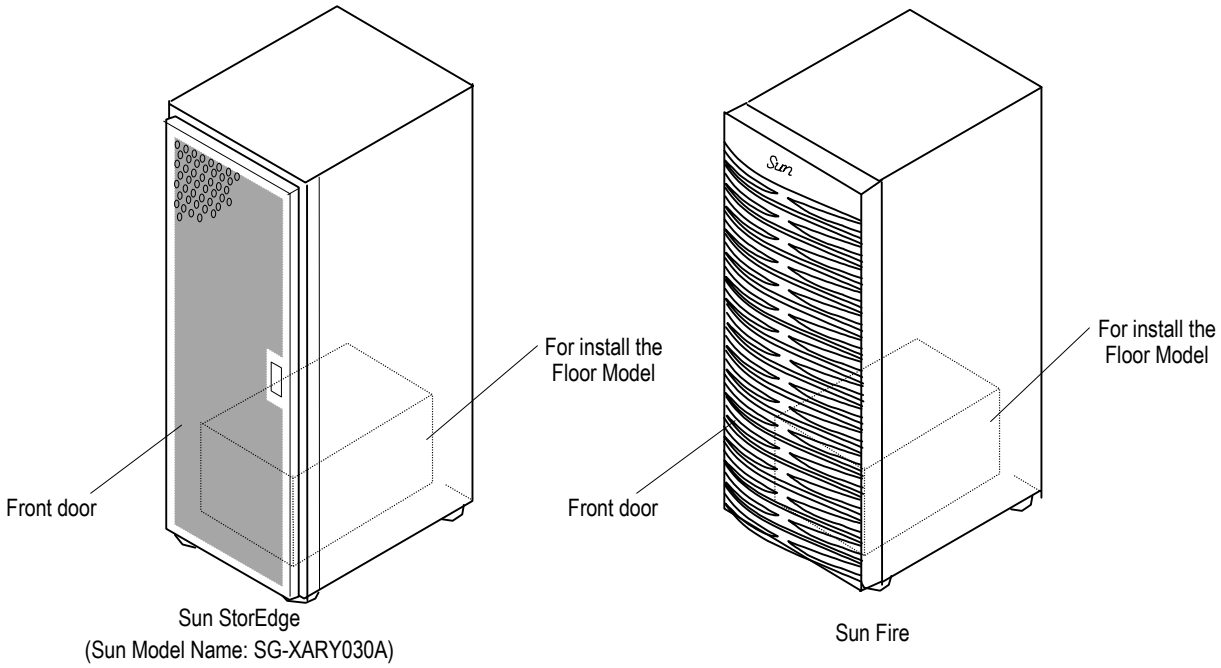

Figure 3.2.18 Appearance of Sun 19-inch Rack Frame

Copyright © 2005, Hitachi, Ltd.

(2) Installing rails

Install the rack rail to the rack frame referring to Figure 3.2.19 - Figure 3.2.21.

(a) Remove the rail fixing screws (M4 x 6) of the factory setting.

(b) Fix the places, where the screw holes of the front rail and those of the rear rail are matched, temporarily with the binding screws (M4 x 6 (four places)).

NOTE : For SUN Fire, fix it temporarily with the binding screws (M4 x 6 (six places)) (fix at least four places, temporarily).

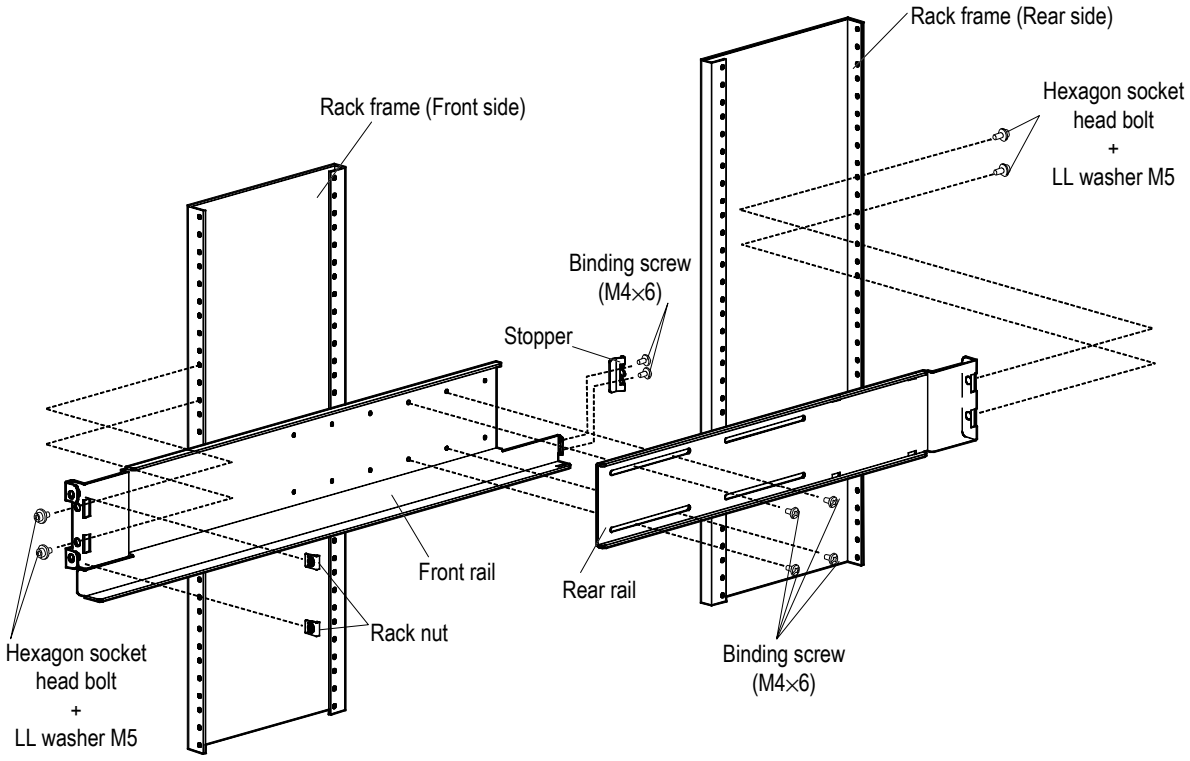
(c) Fasten the holes at two places near the center of the front side of the front rail and the 4th and 6th screw holes counted from the boundary of the subsystem installation position of the front side of the rack frame with the hexagonal socket head bolts and the LL washers M5.

(d) Fasten the holes at two places of the rear side of the rear rail and the 4th and 6th screw holes counted from the boundary unit of the subsystem installation position with the hexagonal socket head bolts and the LL washers M5.

(e) Fasten the binding screws (M4 x 6) which were temporarily fixed in (b).

(f) Install the rack nuts in the holes at the sheet metal folding part of the front rail (two places).

(g) Perform the above-mentioned installation for the right and left of the rack frame.



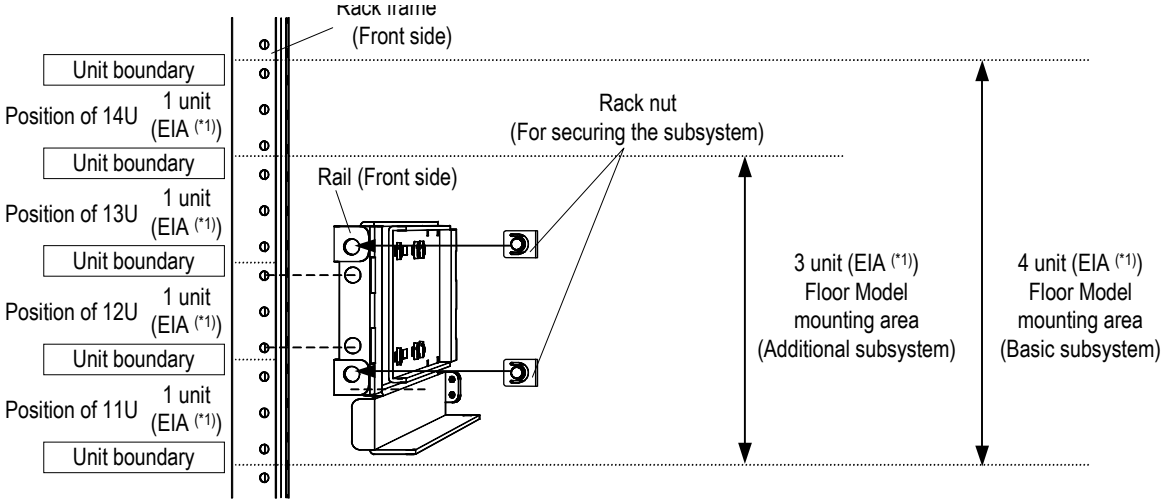


Figure 3.2.19 Installation of Rails to the Rack frame

Copyright © 2005, Hitachi, Ltd.

CAUTION

Press the rail against the rack frame as much as possible to secure the rail to the rack frame. If there is a gap between the rail and the rack frame, the rail may interfere with the equipment.

Copyright © 2005, Hitachi, Ltd.

3.2.4 RS6000 Rack Frame

The subsystems can be mounted on the IBM RS6000 rack frame by installing the rack rails (DF-F700-UR7), which are accessory parts.

(1) When installingDF-F700-UR7

The Components-list of RS6000 Rack-rail is shown in Table 3.2.5.

Table 3.2.5 Components of Rack-rail (DF-F700-UR7) (per one unit)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Front rail	3272207-1	1	For left hand side	—
2	Front rail	3272207-2	1	For right hand side	—
3	Rear rail	3272208-1	2	For left/right commonness	—
4	Stopper	5528618-1	2	For securing the subsystems	—
5	Spacer	5528619-1	2	For securing the rail (For U4J)	Not used
6	Binding screw (M5×10)	SB510N	18	For securing the subsystems, rail (6 spares are included.)	—
7	Binding screw (M4×6)	SB406N	14	For securing the rail (2 spares are included.)	—
8	Binding screw (M3×6)	SB306N	6	For securing the stopper (2 spares are included.)	—
9	19"PART (nickel plated)	5528564-1	10	For securing the cage nut, subsystems, rail (2 spares are included.)	Not used
10	Rack nut	5510146-1	14	For securing the subsystems, rail (2 spares are included.)	—
11	Hexagon Socket Head Bolts	5503443-1	10	For securing the rail (2 spares are included.)	Not used
12	LL washer	5513553-513	10	For securing the rail (2 spares are included.)	Not used
13	Repeat binder (Cable)	5409042-1	3	For securing cable routing (1 spare is included.)	—

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Installing the rails and rack nut

Install the rails and rack nut in order to mount the subsystem(s) on the rack frame.

EIA units and intervals of mounting holes of 19-inch rack frame conforming to EIA standard

- A unit (U) space conforming to EIA standard is 19 inches wide and 44.5 mm high as shown in the figure below.
- The boundary of the unit falls on the middle of the interval of 12.7 mm.
- When the unit space is shifted by 0.5 units, the unit boundary is shifted from the normal position by 22.2 mm.

For the IBM RS6000 rack frame

Universal intervals: Repeat of 44.45 mm (15.875 mm + 15.875 mm + 12.7 mm)

Maximum number of mountable unit spaces: 32

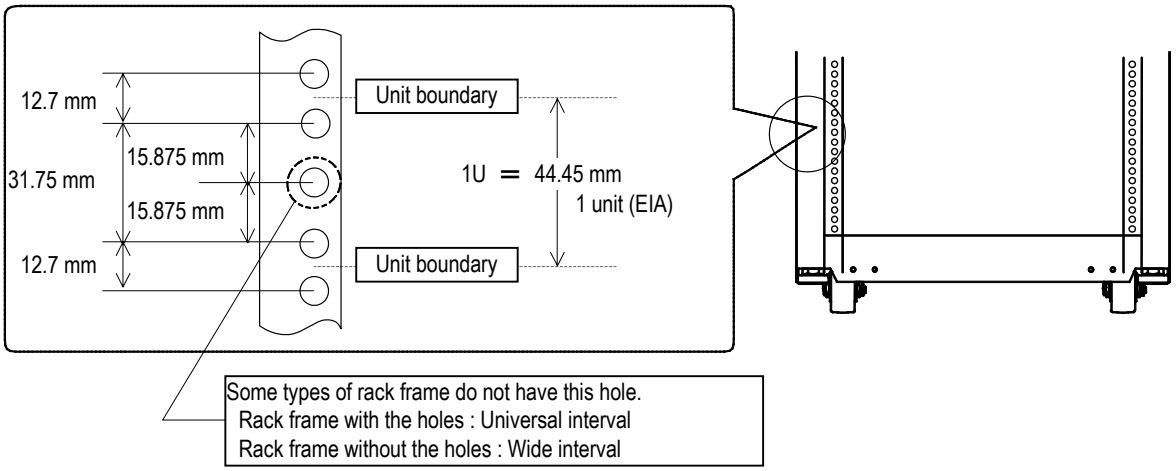

Figure 3.2.22 Attachment Hole Size of Rack

Copyright © 2005, Hitachi, Ltd.

Install the rack rail to the rack frame referring to Figure 3.2.23 - Figure 3.2.25.

(i) Remove the rail fixing screws (M4 x 6) of the factory setting.

(ii) Fix the places, where the screw holes of the front rail and those of the rear rail are matched, temporarily with the binding screws (M4 x 6 (six places))
(fix at least four places, temporarily).

(iii) Install the rack nuts at the 4th and 6th positions counted from the boundary unit of the subsystem installation position for both front and rear sides of the rack frame.

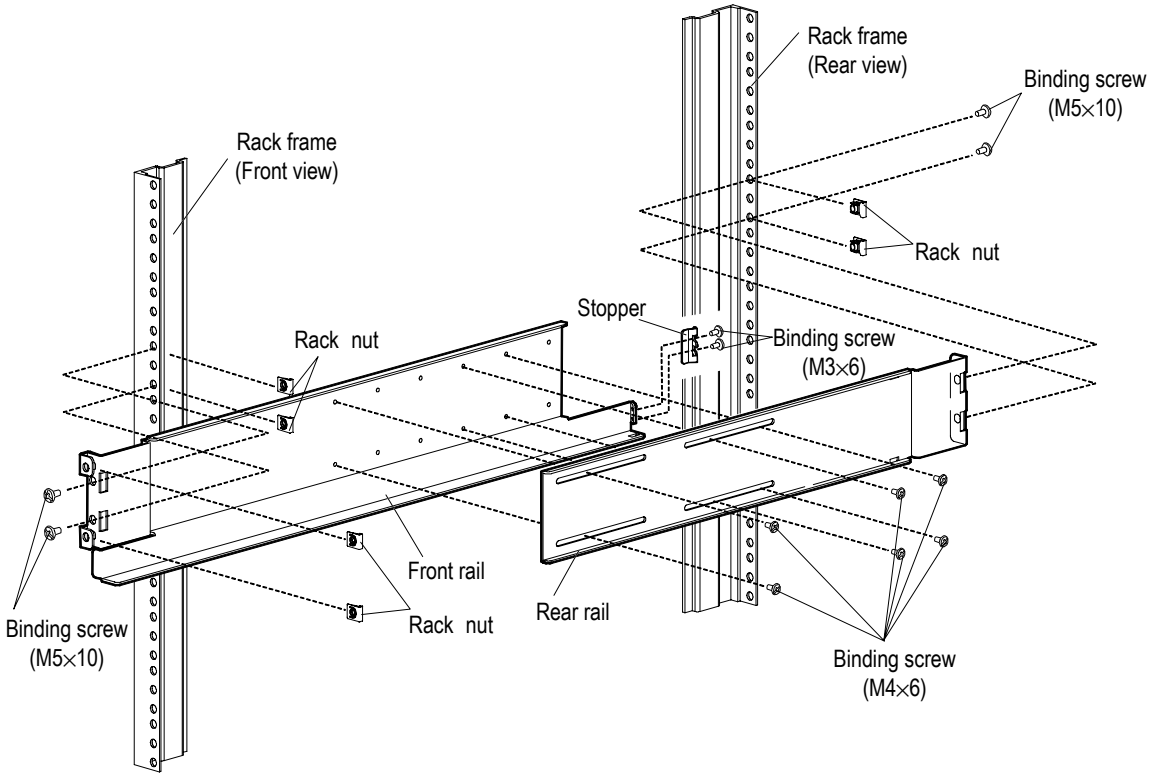
(iv) Fasten the holes at two places near the center of the front side of the front rail and the rack nut installation parts of the front side of the rack frame with the binding screws (M5 x 10) (two places).

(v) Fasten the holes of the rear side of the rear rail and the rack nut installation parts of the rear side of the rack frame with the binding screws (M5 x 10) (two places).

(vi) Fasten the binding screws (M4 x 6) which were temporarily fixed in (ii).

(vii) Install the rack nuts in the holes at the sheet metal folding part of the front rail (two places).

(viii) Perform the above-mentioned installation for the right and left of the rack frame.



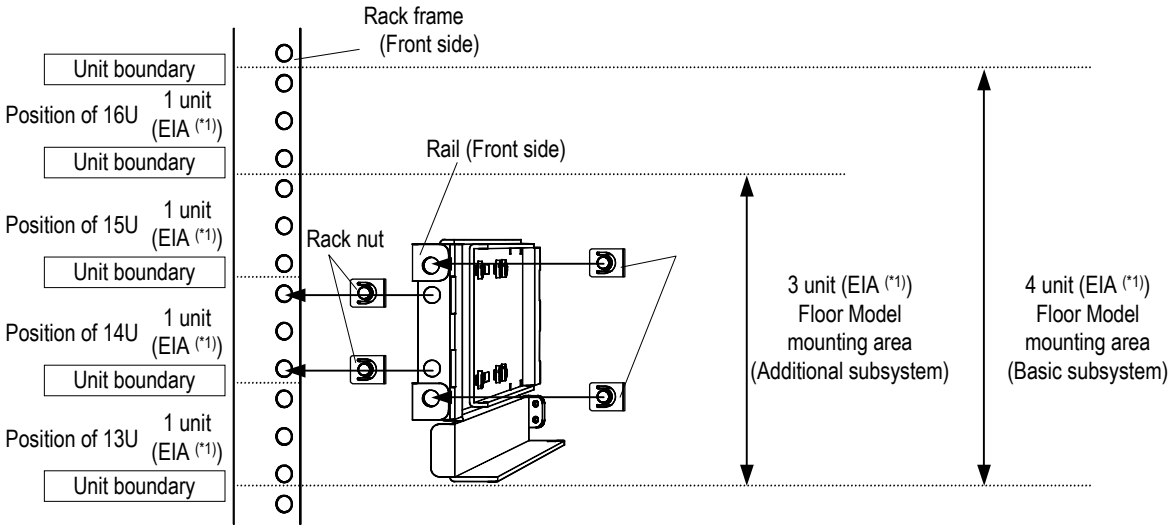


Figure 3.2.23 Installation of Rails to the Rack frame

Copyright © 2005, Hitachi, Ltd.

*1 : One EIA unit is approximately 44. 45 mm.

Figure 3.2.24 Location of installing the rail on the front side of the Rack frame

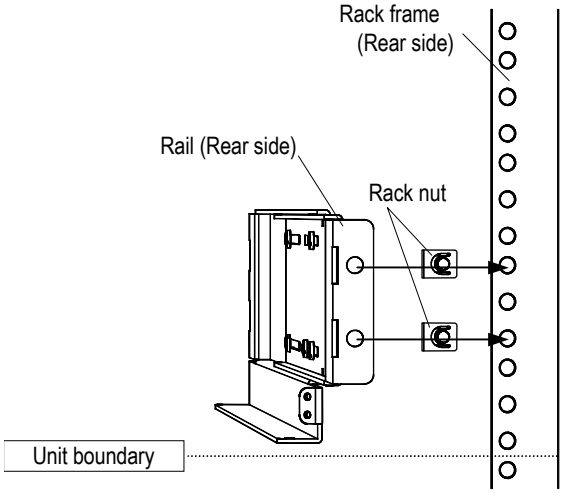

Figure 3.2.25 Location of installing the rail on the rear side of the Rack frame

Copyright © 2005, Hitachi, Ltd.

CAUTION

Press the rail against the rack frame as much as possible to secure the rail to the rack frame. If there is a gap between the rail and the rack frame, the rail may interfere with the equipment.

Copyright © 2005, Hitachi, Ltd.

3.2.5 NSC (Network Storage Controller) Rack Frame

The subsystems can be mounted on the NSC Rack Frame by installing the rack rails (DF-F700-URNS7), which are accessory parts.

(1) When installingDF-F700-URNS7

The Components-list of NSC Rack-rail is shown in Table 3.2.6.

Table 3.2.6 Components of Rack-rail (DF-F700-URNS7) (per one unit)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Rail	3274867-A	1	For right hand side	—
2	Rail	3274495-002	1	For left hand side	—
3	Stopper	5528571-001	2	For securing the subsystems	—
4	Fastener	5510146-001	14(*1)	For securing the rail, subsystems	—
5	Bind screw (M4×8)	SB408N	8(*1)	For securing the stopper	—
6	Bind screw (M5×10)	SB510N	6(*1)	For securing the subsystems	—
7	Hexagon socket bolt (M5×20)	3261899-520	10(*1)	For securing the rail	—
8	LL washer (M4)	5513553-433	6(*1)	For securing the stopper	—
9	LL washer (M5)	5513553-513	10(*1)	For securing the rail	—
10	Repeat binder (Cable)	5409042-003	4(*2)	Used to fix a slackened part of overlong cable	—
11	Cleat (Cable)	5409055-001	4(*1)	For securing the cable	—
12	Clamp (Fibre)	5511447-001	2	For securing the cable	—
13	Binder (Flat)	5409039-001	6	For securing the cable	—
14	Power cable	3272181-E	2	Power cable	—

*1 : 2 spares are included.

*2 : 1 spare is included.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Installing the rails

If the rails have already been installed, this installation is not required.

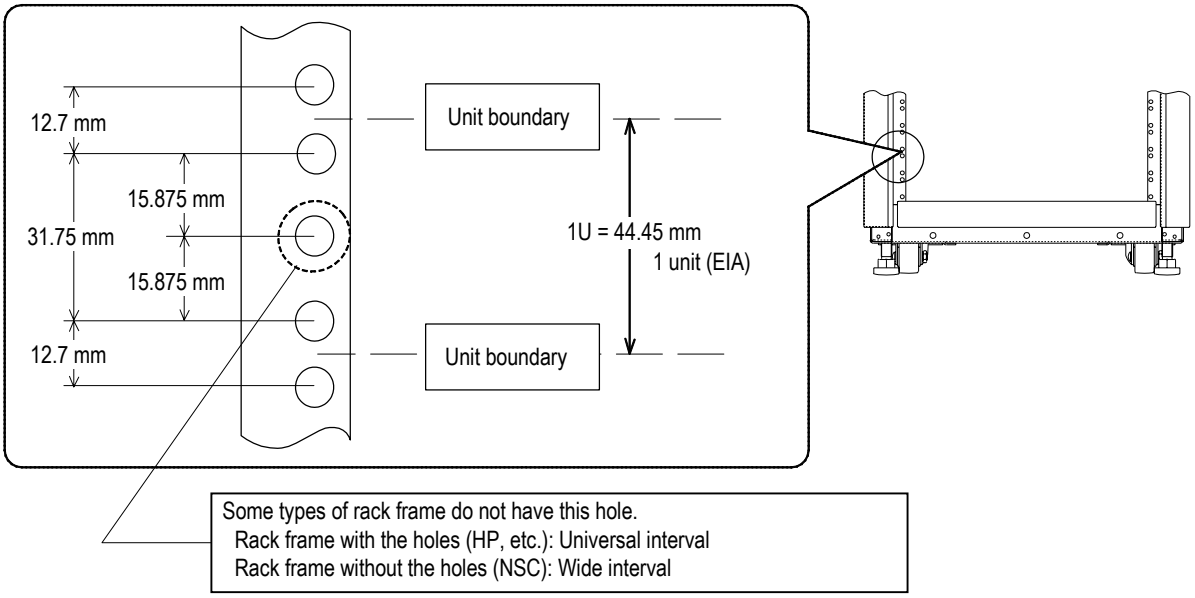
For the components list, see "Table 3.2.6 Components of Rack-rail (DF-F700-URNS7) (per one unit)" (INST 03-0301).

EIA units and intervals of mounting holes of 19-inch rack frame conforming to EIA standard

- A unit (U) space conforming to EIA standard is 19 inches wide and 44.5 mm high as shown in the figure below.
- The boundary of the unit falls on the middle of the interval of 12.7 mm.
- For the NSC Rack Frame

  Wide intervals: Repeat of 44.45 mm (31.75 mm + 12.7 mm)

  Maximum number of mountable unit spaces: 40



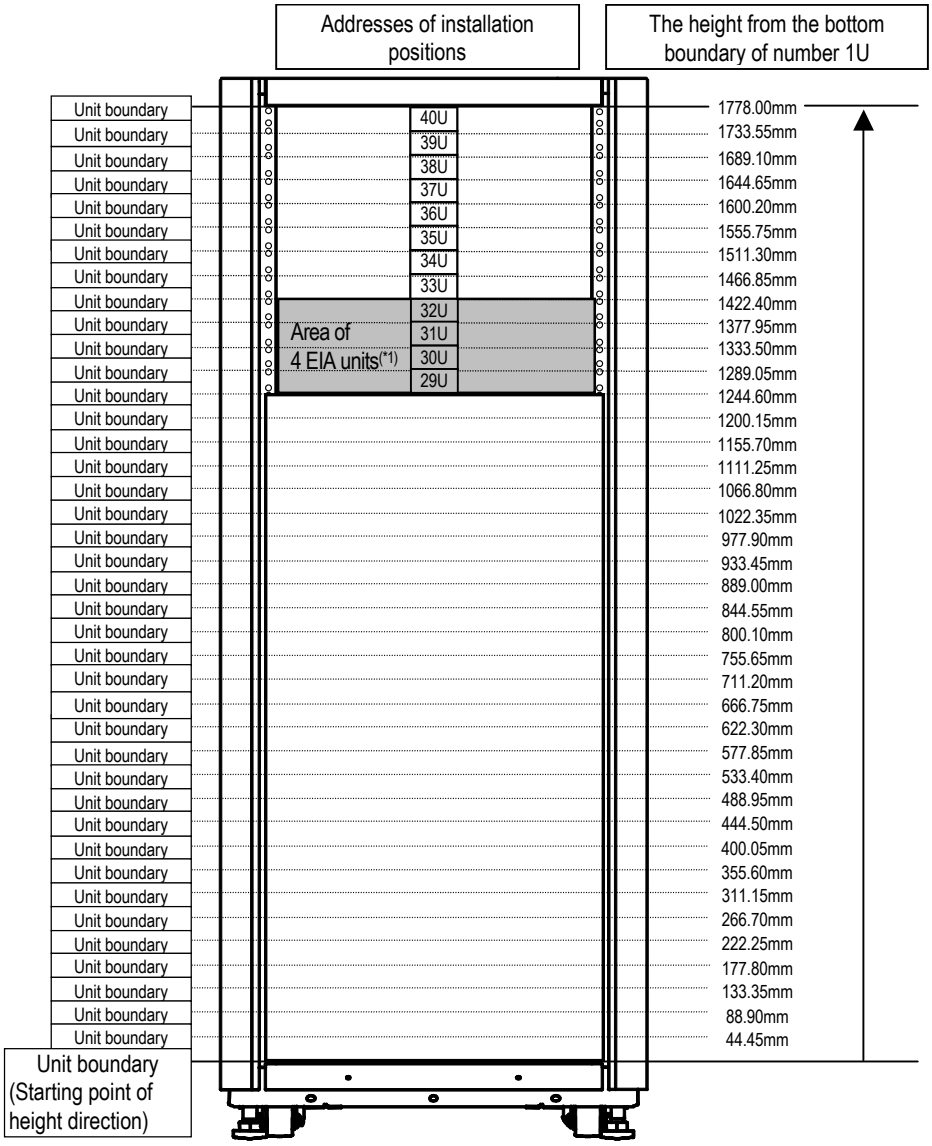


Figure 3.2.26 Attachment Hole Size of Rack

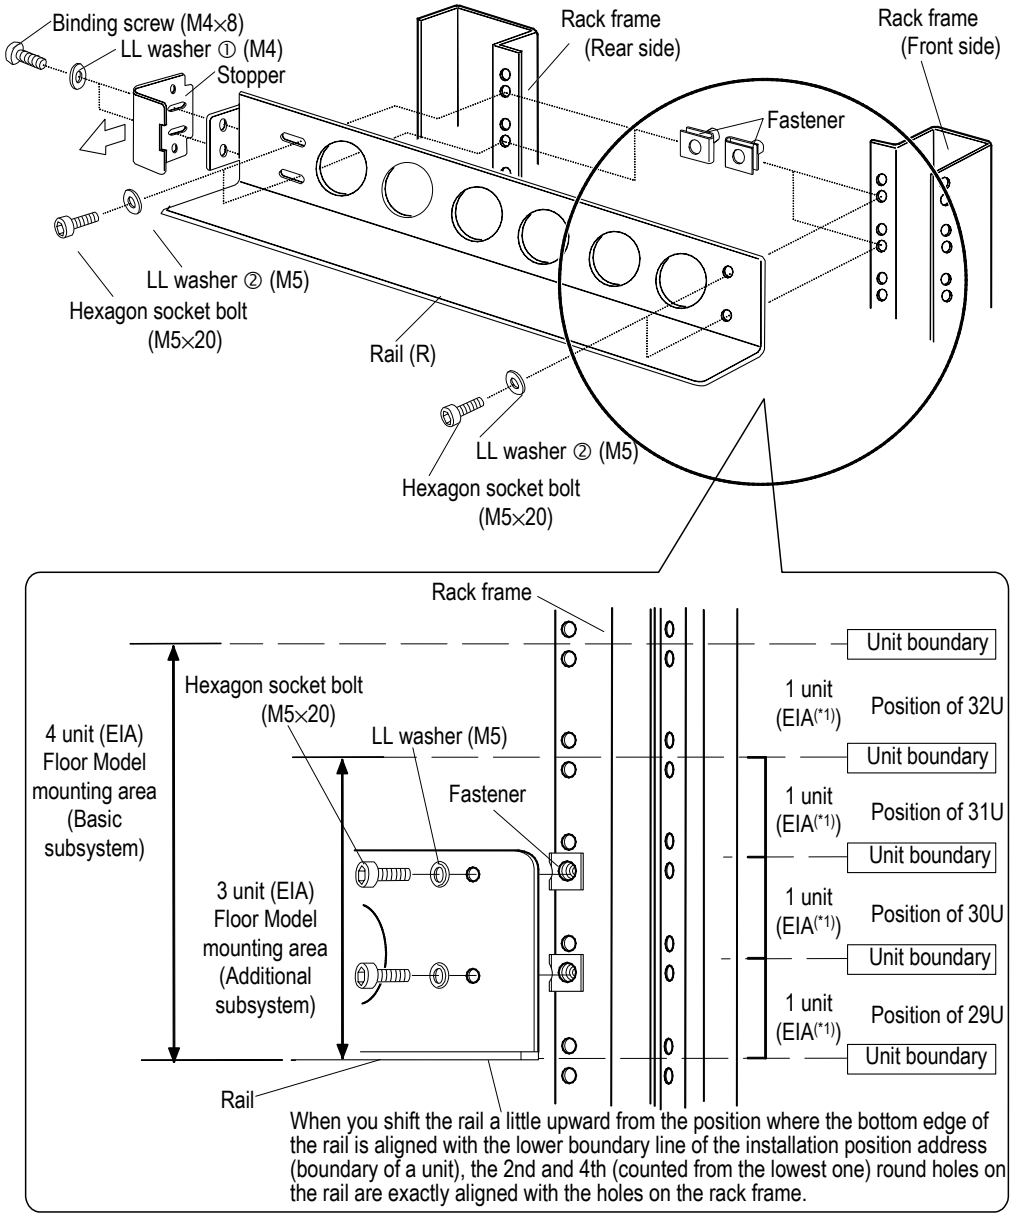
Copyright © 2005, 2006, Hitachi, Ltd.

The addresses are given as 1, 2, 3, and so on counted from the bottom of the rack frame. In the case of the NSC Rack Frame, you must count the holes to know the address because no number is marked on the rack frame.
The following figure illustrates the whole layout of addresses of installation positions in the NSC Rack Frame.
There are 40 addresses, that is, the 1U to 40U counted in the vertical direction starting from the lower boundary of the 1U (the lowest unit).
The subsystem can be installed up to three sets (one basic subsystem and two additional subsystems) between 29U and 40U.

*1 : The grayed are ▭ shows a layout of an area for installing the subsystem at the 29U

Figure 3.2.27 Whole Layout of Installation Position Addresses



Copyright © 2005, Hitachi, Ltd.

(i) Slide the stopper in the direction shown by the arrow and temporarily fix it to the Rail (R) using the binding screws and LL washers ① (M4 (at two places.)).
For the installation position address, see Figure 3.2.27.

(ii) On the right side of the installation location in the rack frame, align the round holes of the Rail (R) with those of the rack frame and insert the fasteners (at four places in total in front and rear.). See Figure 3.2.28.

(iii) Fasten the Rail (R) to the rack frame using the hexagon socket bolts and LL washers ② (M5 (at two places each on the front and rear sides.)).

(iv) Install the Rail (L) to the rack frame in the same way.

*1 : One EIA unit is approximately 44. 45 mm.

Figure 3.2.28 Installation of Rails to the Rack frame and Installation Positions

Copyright © 2005, Hitachi, Ltd.

(b) Installing fasteners on the front side of the rack frame

Install the fasteners on the front side of the rack frame in order to fasten the subsystems to be mounted on the rack frame.

(i) Fit the two fasteners to each of the right and left beams on the front side of the rack frame referring to Figures 3.2.29 and 3.2.30.

Install the mounting fasteners at the 2nd and 5th (counted upward from the unit boundary on the rack frame at the same height as the bottom of the rail) round holes.

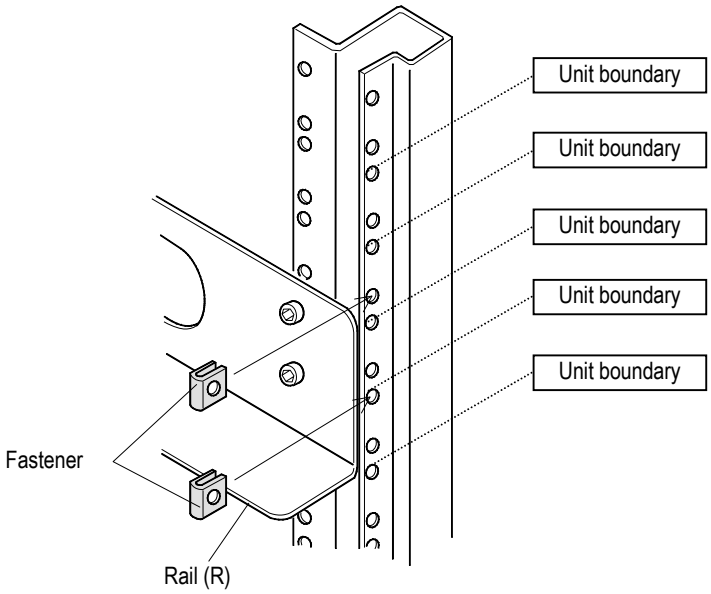


Figure 3.2.29 Installing Fasteners on the Front Side of the Rack frame

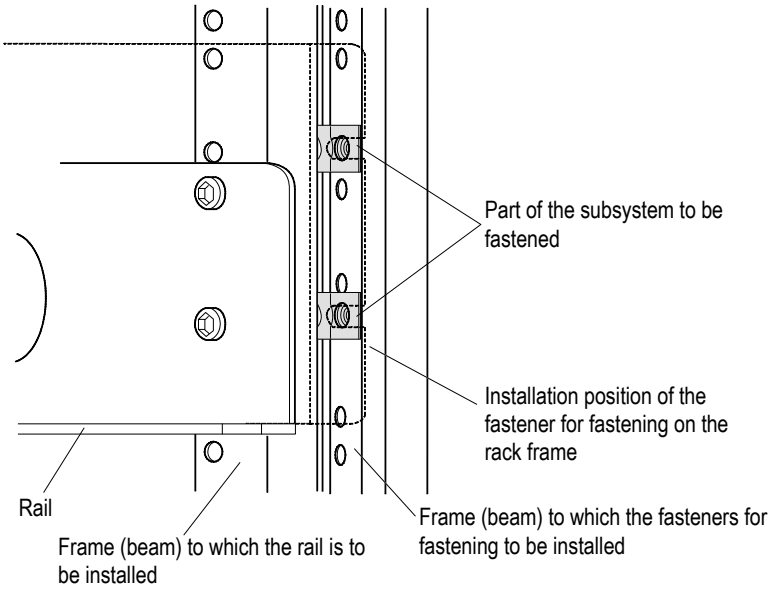

Figure 3.2.30 Installation Positions of Fasteners and Relation with Rails

3.3 Unpacking the Subsystems

⚠ CAUTION

- The unpacking should be done by two or more personnel to prevent turning over of the subsystem or being caught under the subsystem.
- Work carefully because the mass of the single RKM is about 58 kg, RKS/RKXS is about 56 kg, RKH is about 47 kg, RKAJ/RKAJAT is about 40 kg.

(1) Unpacking

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

Figure 3.3.1 shows the subsystem within the outer package and Figures 3.3.2 show the packed subsystem without the outer package.

(a) Remove the outer package and packing materials.
(b) Take the subsystem out of the polyethylene bag.
(c) Remove tapes, etc. applied to the subsystem.
(d) Remove desiccating agent from the lower of the subsystem.
(e) Check the exterior of the subsystem visually for distortion or damage owing to the transport.

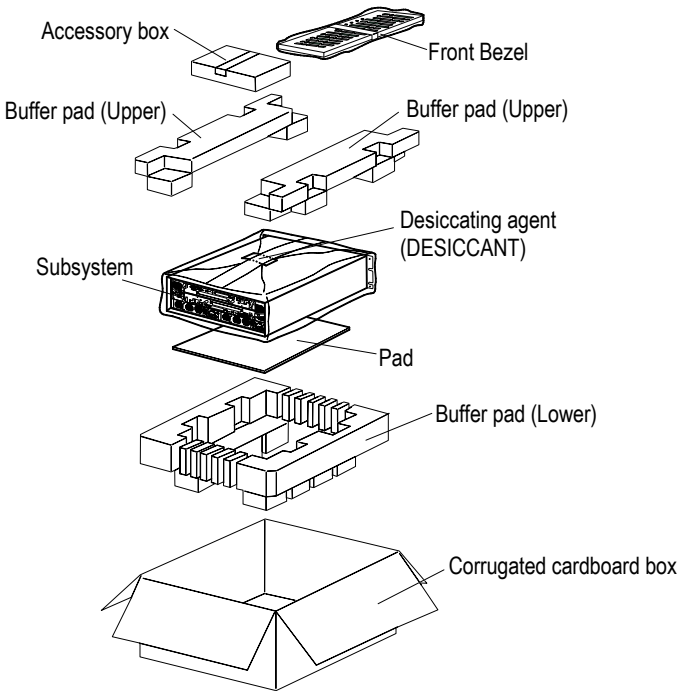

Figure 3.3.1 Packed Subsystem

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Checking contents of package

(a) Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

(b) The key for the front bezel supplied with the subsystem must be kept by service personnel in order to prevent users from maintaining the subsystem.
The key for Front Bezel is used to mount and dismount Front Bezel

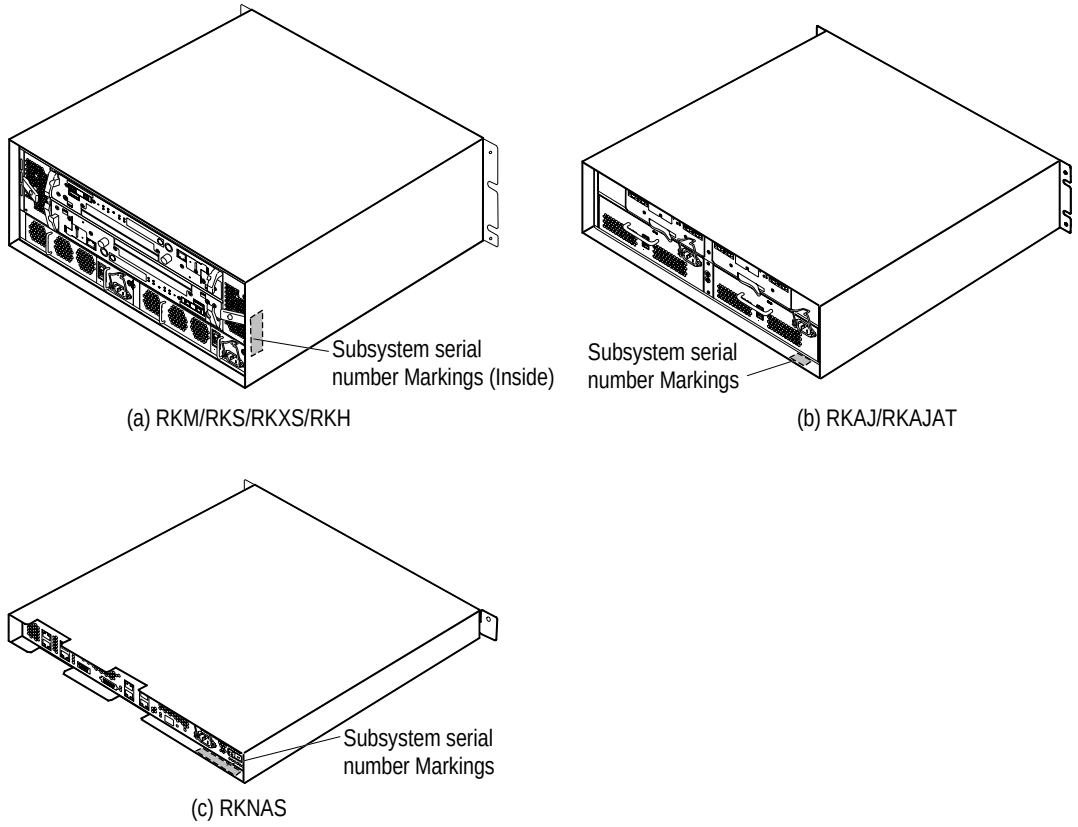

Figure 3.3.2 Locations of Subsystem Serial Number Markings

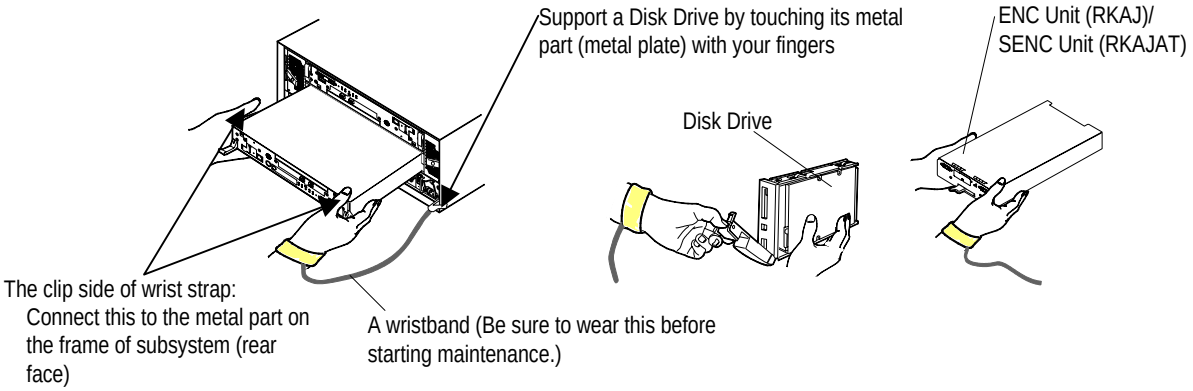
Copyright © 2005, 2006, Hitachi, Ltd.

3.4 Installing the Rackmount Model

3.4.1 Work Procedure before Installing the Rack Mounting

Install it in the Rack Frame with each component mounted when installing it with 1m or less in height or lifter. (Work from "3.4.3 Mounting on Rack Frame" (INST 03-0400).)

In other cases, install it in the Rack Frame after removing each component.
(Work from "3.4.2 Removing Components" (INST 03-0330).)



Since the device ID numbers are set at the factory when the subsystem is newly introduced, make sure of them, and then mount the devices in appropriate order from the lowest one. (For the setting of the device ID number, refer to "3.4.7 (1-2) Setting Device ID number" (INST 03-0520).

3.4.2 Removing Components

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

Be sure to wear the wristband, connect its lead wire to the subsystem enclosure before starting the work, and do not remove them until the work is completed.
When installing a Disk Drive, Control Unit and ENC Unit/SENC Unit, hold it with your hand wearing the wristband having fingers contact metallic portions on the sides of the part.

Copyright © 2005, Hitachi, Ltd.

(1) Removing Disk Drive

(1) Remove the Front Bezel. (“1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem” (INST 01-0100).)

(2) Remove the Disk Drive or a dummy (Disk Drive).
Pull the stopper at the upper part of the Disk Drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive or dummy (Disk Drive) by pulling it out taking care not to apply a shock to it.

(3) Keep the Disk Drive of dummy (Disk Drive) that has been removed temporarily in the component safekeeping container at the location shown on the address label with its handle returned to its original state (locked by the stopper). It is to be installed in the disk array unit after the unit is mounted on the rack frame.

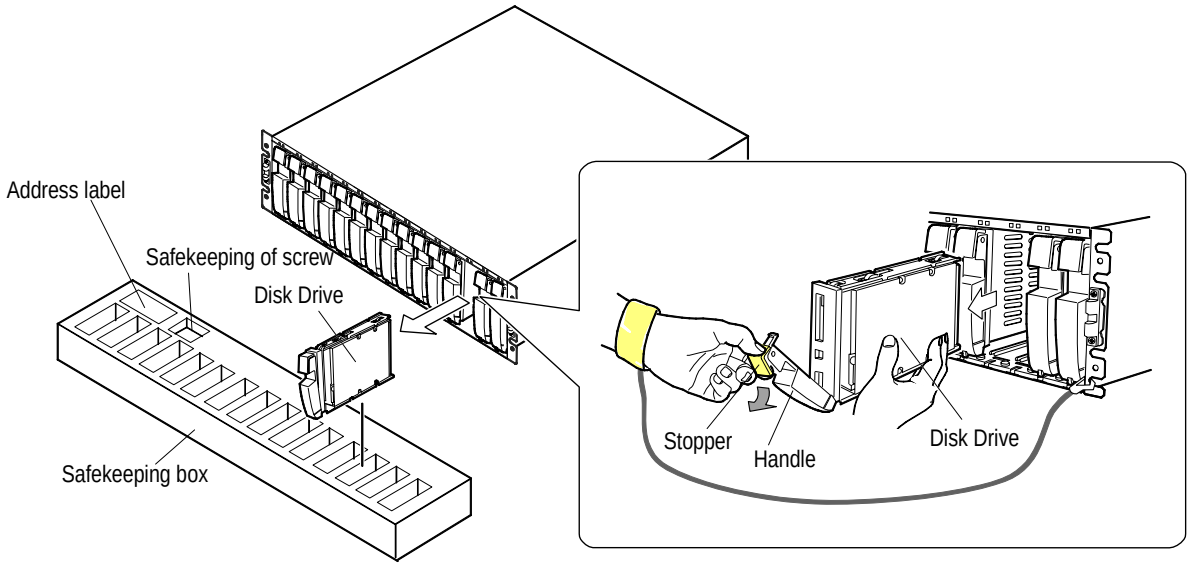


Figure 3.4.1 Removing Disk Drive

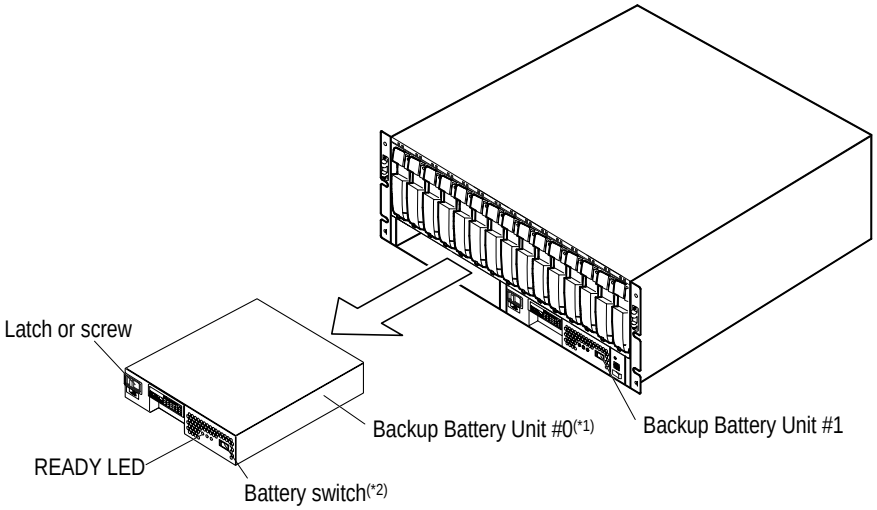
Copyright © 2005, Hitachi, Ltd.



(2) Removing Backup Battery Unit

This Removing work is only applied to RKM/RKS/RKXS/RKH.

(a) Shift the latch on the Battery Units to the Release position and pull the Battery Unit toward you until the latch pin comes out (to release the Unit).
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, loosen the screw that is fixing the latch of the Backup Battery Unit, set the latch to the Release position, and then pull out the Backup Battery Unit forward.

NOTE : Handle the Battery Unit carefully because its depth is shallow (150mm) and weight is heavy (3.0kg).

(b) Take out the Battery Unit holding its main body by your both hands.

*1 : Only one battery is installed in RKS/RKXS left side of the subsystem.

*2 : In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS, there is no battery switch. Also, the latch is fixed with a screw.

*3 : The figure shows RKM.

Figure 3.4.2 Removing Backup Battery Unit (RKM/RKS/RKXS)

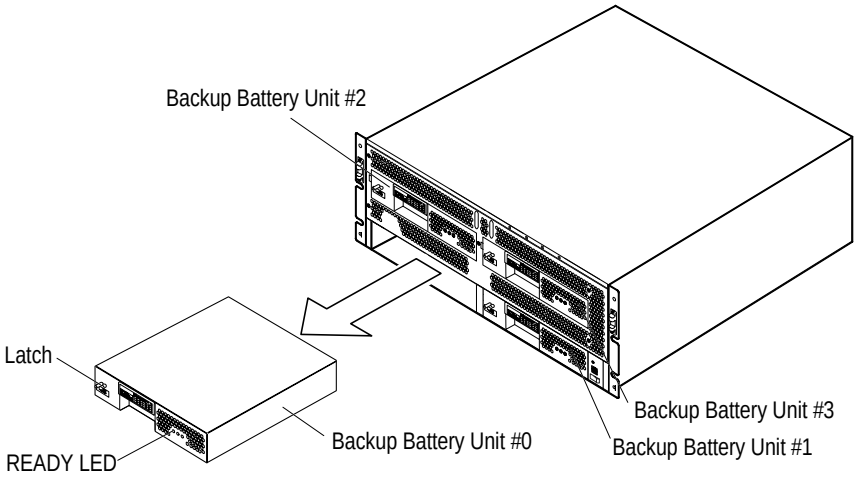


Figure 3.4.2.1 Removing Backup Battery Unit (RKH)

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Removing Fan Assembly

This Removing work is only applied to RKM/RKS/RKXS/RKH.

(a) Loosen the screw which is fixing the lever of the Fan Unit, open the lever, and move it forward.

(b) Remove the Fan Assembly by pulling it out holding its main body with your both hands.

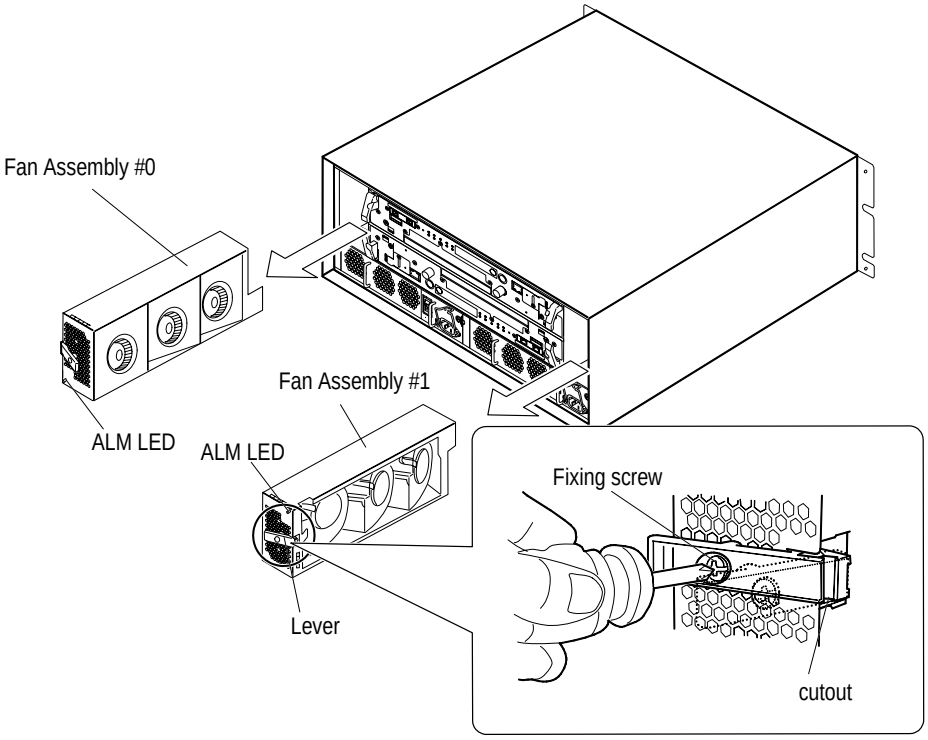

Figure 3.4.3 Removing Fan Assembly

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Removing the Control Unit

(a) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(b) Remove the Control Unit by pulling it out toward you.

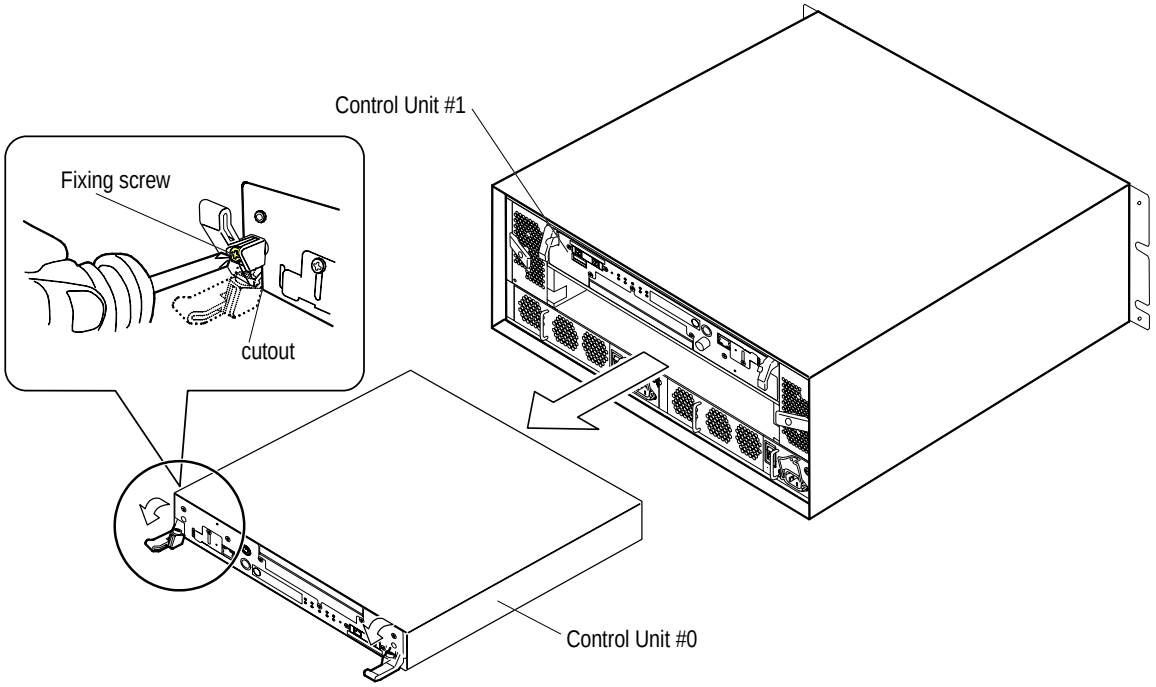

Figure 3.4.4 Removing Control Unit

Copyright © 2005, Hitachi, Ltd.

(5) Removing ENC Unit (for RKAJ) and SENC Unit (for RKAJAT)

(a) Raise the lever on the ENC Unit/SENC Unit in the direction shown by the arrow ① (←) and pull out the ENC Unit/SENC Unit a little way toward you.

(b) Remove the ENC Unit/SENC Unit by pulling it out toward you.

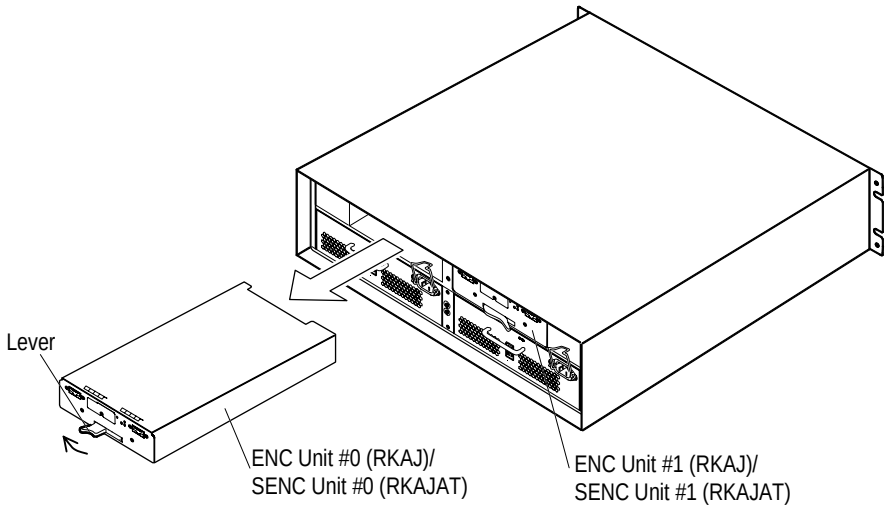

Figure 3.4.5 Removing ENC Unit/SENC Unit

Copyright © 2005, Hitachi, Ltd.

(6) Removing Power Unit

(a) Loosen the screw which is fixing the latch of the Power Unit, shift the latch (fixing screw) to the Release position, and move it forward by holding the handle.

(b) Remove the Power Unit by pulling it out holding its main body with your both hands.

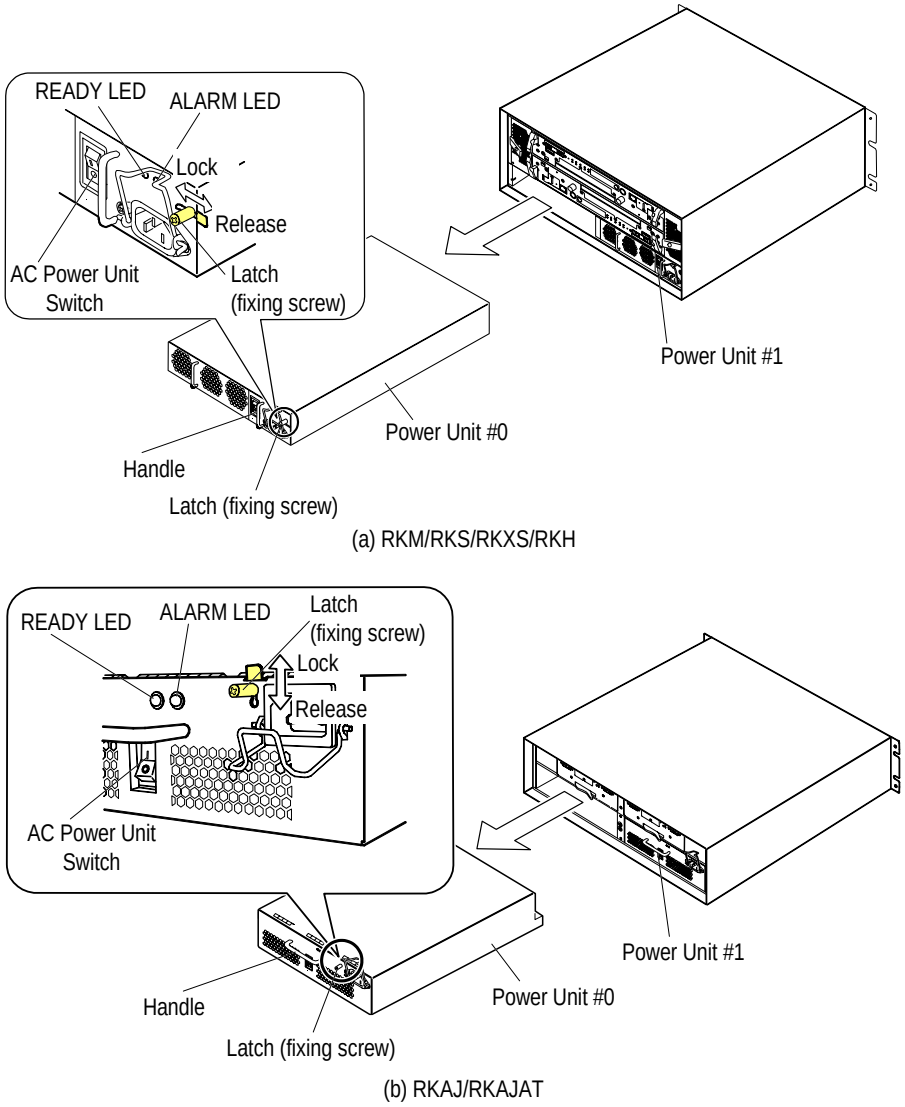

Figure 3.4.6 Removing Power Unit

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.3 Mounting on Rack Frame

Install it in the Rack Frame after sticking the EMI gasket on the Frame.

(1) Sticking EMI gasket

Stick the EMI gasket supplied with the rack rail on the top of the RKM/RKAJ /RKAJAT frame.

(a) Peel off the anti-adhesion sheet from the bottom surface of the EMI gasket.

(b) Stick the EMI gasket by aligning it with the front end of the top of the frame.

(c) Stick the EMI gasket by aligning it with the back end of the top of the frame.

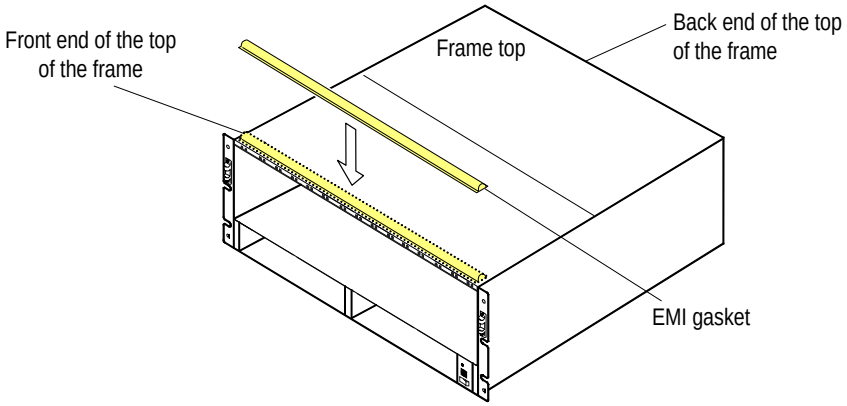

Figure 3.4.7 Position for Sticking EMI Gasket (Basic subsystem)

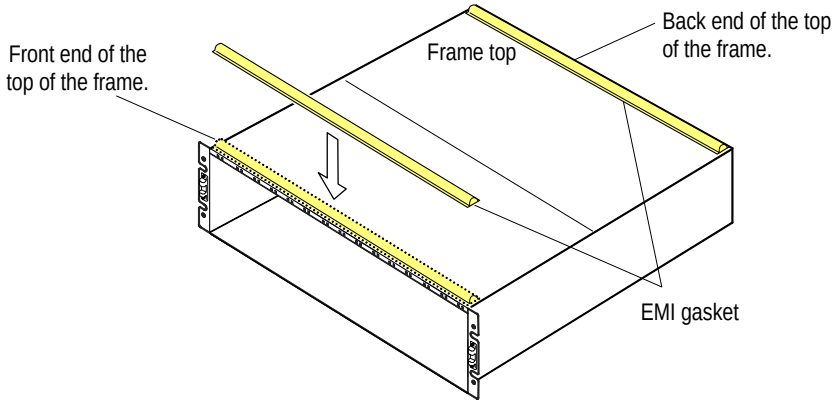

Figure 3.4.8 Position for Sticking EMI Gasket (Additional subsystem)

Copyright © 2005, Hitachi, Ltd.

3.4.4 Mounting lifter on rack frame

Figure 3.4.9 shows external appearance of the special lifter.

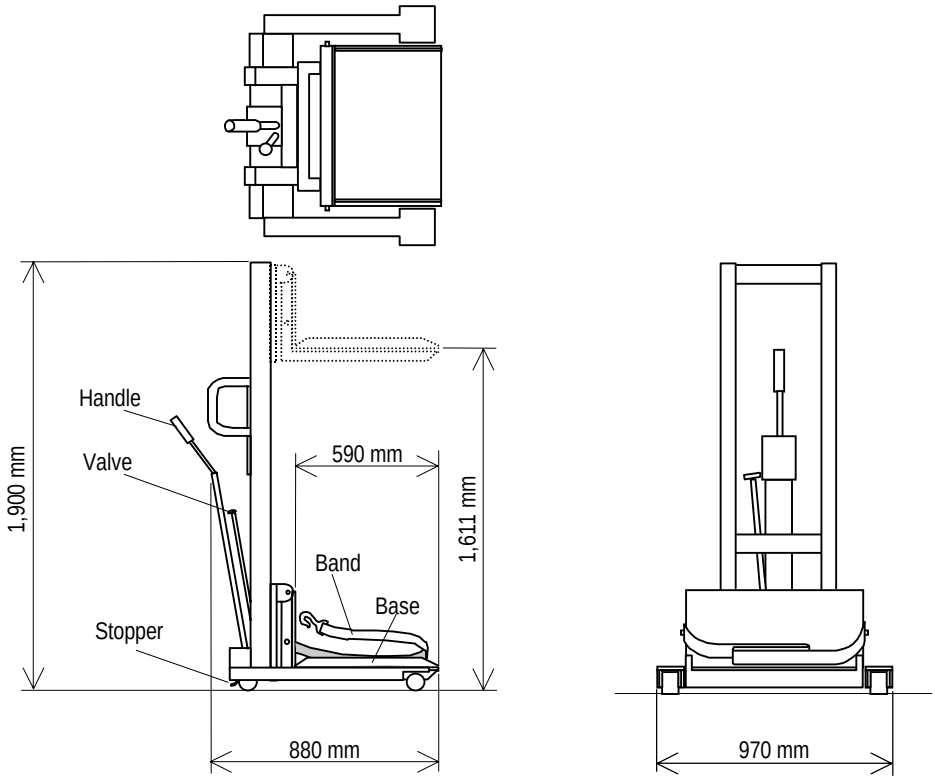

Figure 3.4.9 External lifter

Copyright © 2005, Hitachi, Ltd.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Be sure to perform the operation with two or more workers.
- Work carefully because the mass of the single RKM is about 58 kg, RKS/RKXS is about 56 kg, RKH is about 47 kg, RKAJ/RKAJAT is about 40 kg.

(1) Bring the special lifter close to the subsystem to be mounted and apply the brake to the lifter.

NOTE : When putting the subsystem on the special lifter, be sure to remove the front bezel beforehand.

(2) Put the subsystem on the special lifter.
Put the subsystem with its front bezel removed on the lifter.

(3) Secure the subsystem to the lifter with a band of the lifter.
Bind the subsystem with the band tightly by fitting the length of the belt to the subsystem.

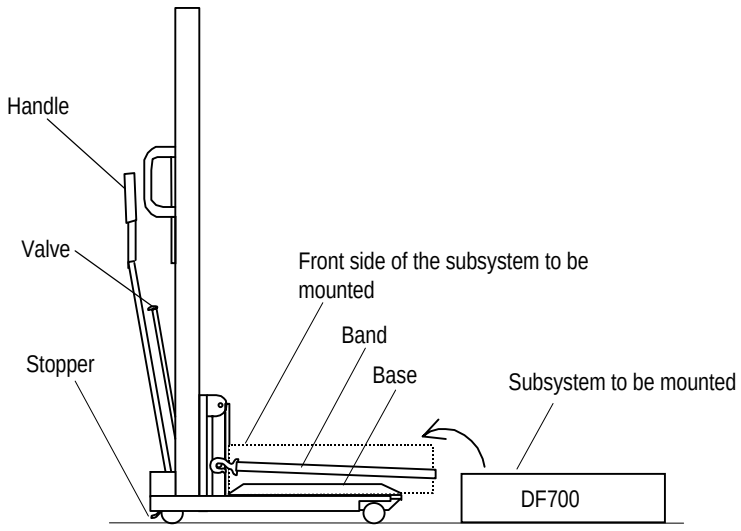

Figure 3.4.10 Setting the Subsystems on Special Lifter

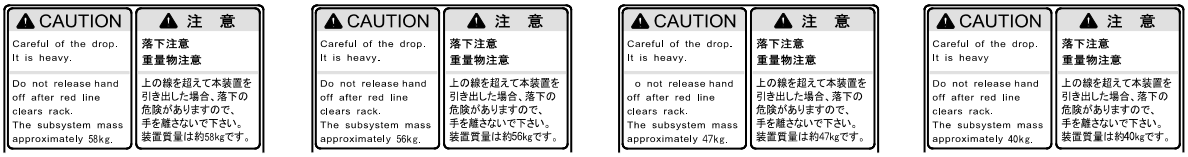
Copyright © 2005, 2006, Hitachi, Ltd.

3.4.5 Mounting subsystem on rack frame

⚠ WARNING

If the Subsystem falls when the elevator of the lifter is at a high position, a personal injury will be caused.
Perform the positioning, fastening, or other handlings very carefully.

⚠ CAUTION



- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Operate the valve slowly when opening it. If it is opened quickly, the elevator of the lifter descends rapidly and may cause personal injury.
- Be sure to perform the operation with two or more workers.
- Work carefully because the mass of the single RKM is about 58 kg, RKS/RKXS is about 56 kg, RKH is about 47 kg, RKAJ/RKAJAT is about 40 kg.
- Be sure to install it in order from the bottom to prevent the falling of the rack when you install the subsystem on the rack.

(1) Take off the brake of the special lifter on which the subsystem has been put, and move the lifter close to the rack frame.
(2) Adjust the position of the subsystem so that it is seated in the center of the rack frame.
(3) Move the pumping handle of the special lifter to the right and left repeatedly to lift the subsystem up to the height suitable for the mounting.
Be careful not to lift the elevating base too high. If you lift it too high, lower it by opening the up/down valve gently.
(4) Remove the band and adjust the position of the subsystem so that the subsystem comes in the center in front of the rack frame. If the subsystem is positioned off-centered, a screw contacts the front bezel preventing the bezel from being opened or closed.
(5) Shift the subsystem onto the rails in the rack frame. When shifting the subsystem, push it in to the end gently.

Copyright © 2005, 2006, Hitachi, Ltd.

CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the subsystem enters the rack frame across the end of it. Otherwise, falling of the subsystem may be caused.

RKM RKS/RKXS RKH RKAJ/RKAJAT

(6) After mounting the subsystem on the rack frame, lower the elevating base to the lowermost position by gently opening the up/down valve of the special lifter and take off the brake of the lifter.

(7) Move the special lifter to the place where the lifter does not disturb the following works.

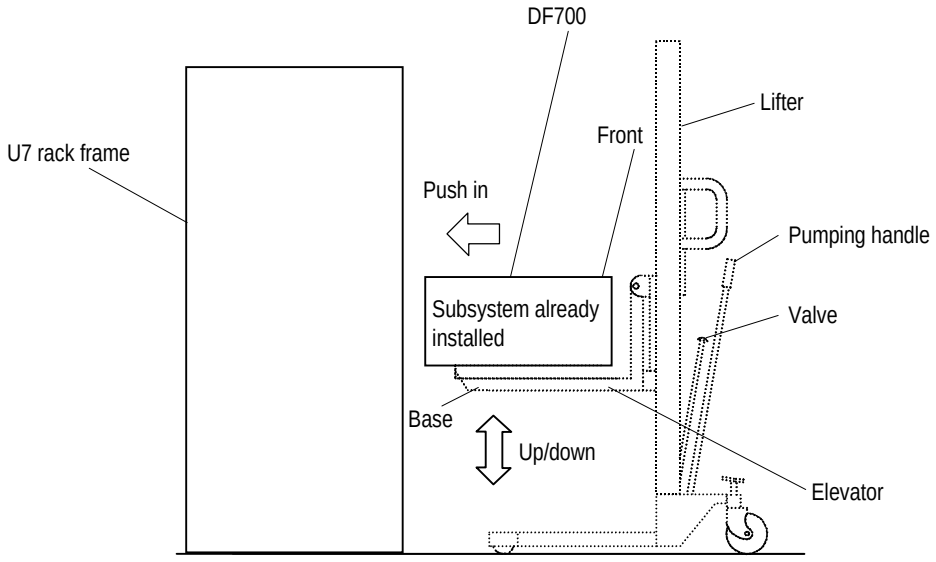


Figure 3.4.11 Mounting Subsystem on Rack Frame

3.4.6 Securing the subsystem

(1) U7 Rack frame

This is common for the three unit and four unit Rackmount models.

(a) Fastening the front side of the subsystem

(i) Fasten the subsystem to the rack frame with the four M5×10 binding screws.

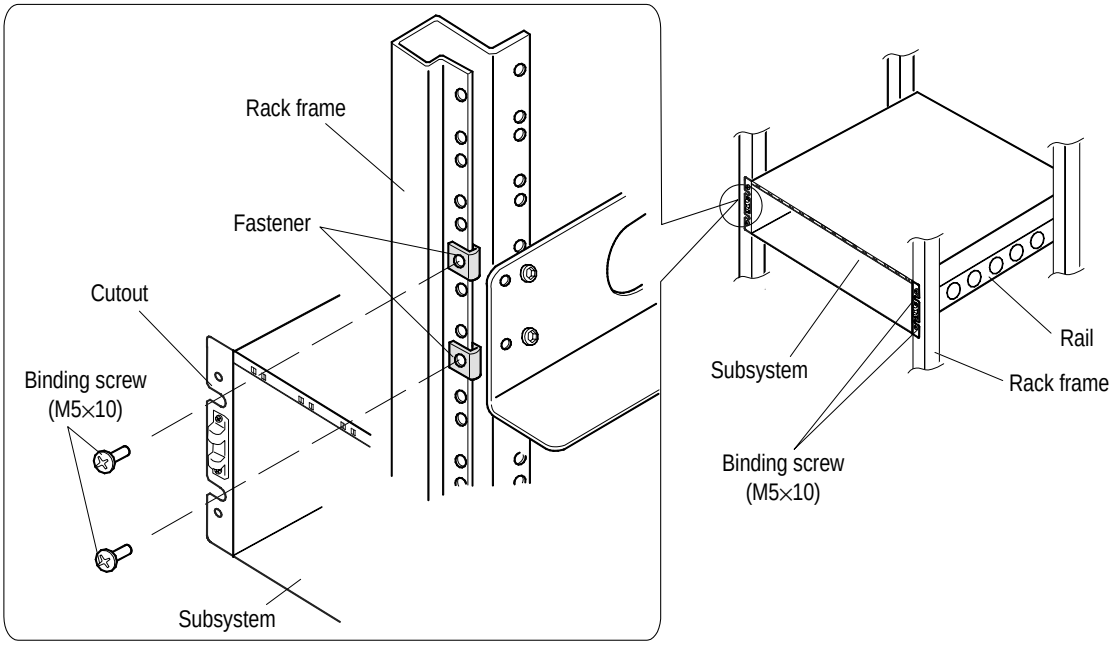

Figure 3.4.12 Fastening Front Side of the Subsystem

(b) Fastening rear side of the subsystem

This is common for the three unit and four unit Rackmount models.

(i) Shift each of the two stoppers in the direction shown by the arrow and make it contact the frame.

(ii) Tighten the binding screws.

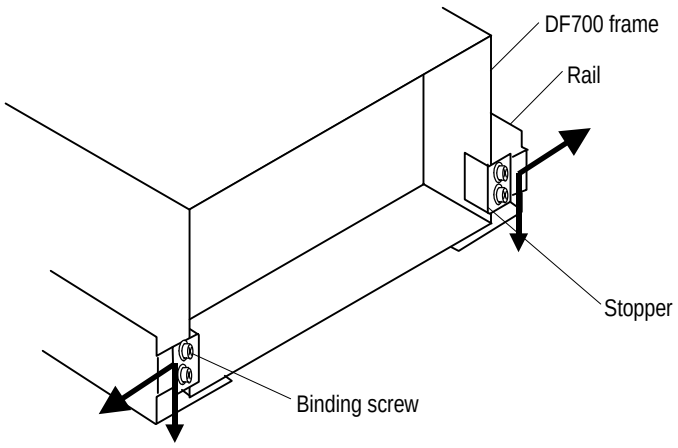

Figure 3.4.13 Securing Rear Side of the Subsystem

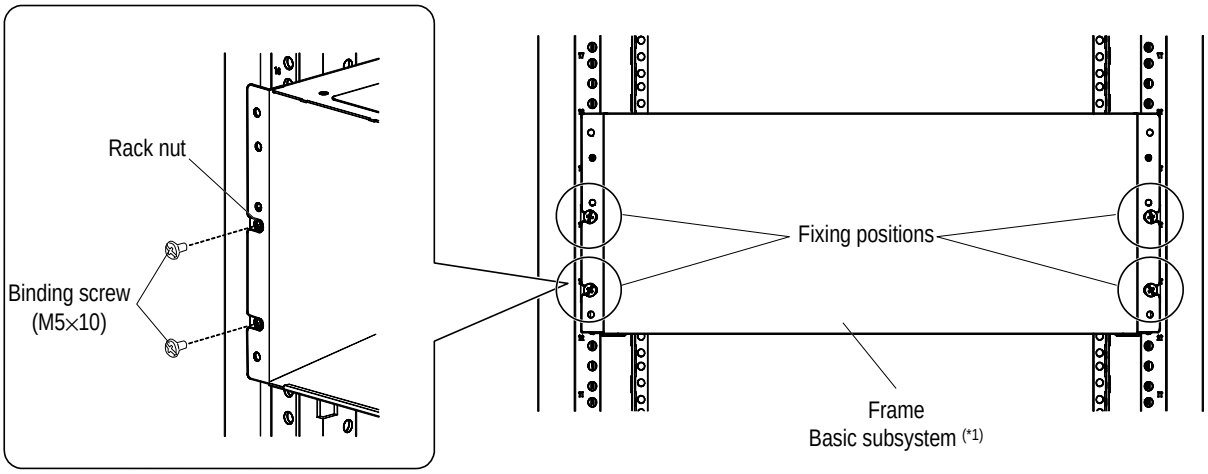

Copyright © 2005, Hitachi, Ltd.

(2) HP Rack frame

(a) Fastening the front side of the subsystem

This is common for the three unit and four unit Rackmount models.

(i) Fasten the cutouts of the subsystem to the rack frame with the binding screws (M5 x 10) (four places).

*1 : Fasten Additional subsystem (3U) as well.

Figure 3.4.14 Fastening Front Side of the Subsystem

(b) Fastening rear side of the subsystem

(i) Slide each of the two stoppers in the direction shown by the arrow until it contacts with the frame.

(ii) Tighten the binding screws (M3 x 6) to fix it.

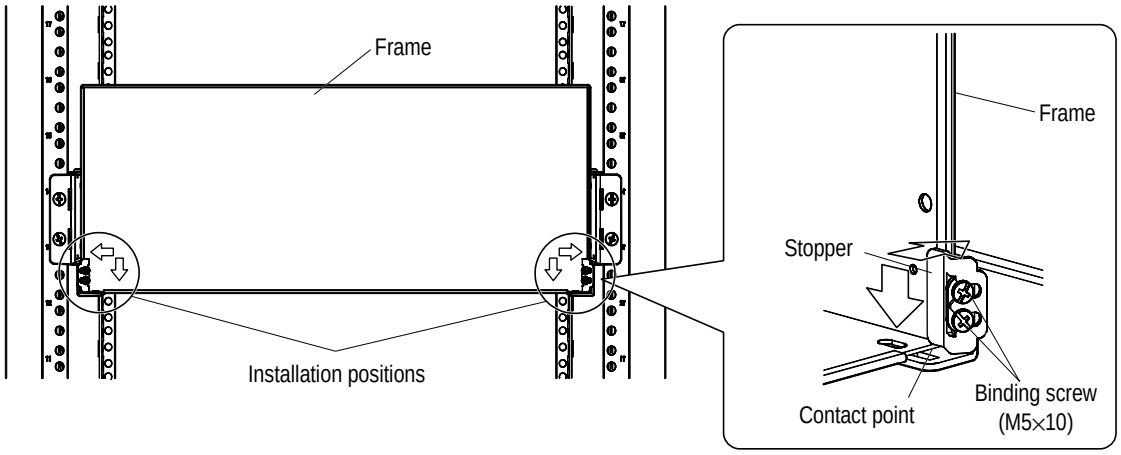

Figure 3.4.15 Securing Rear Side of the Subsystem

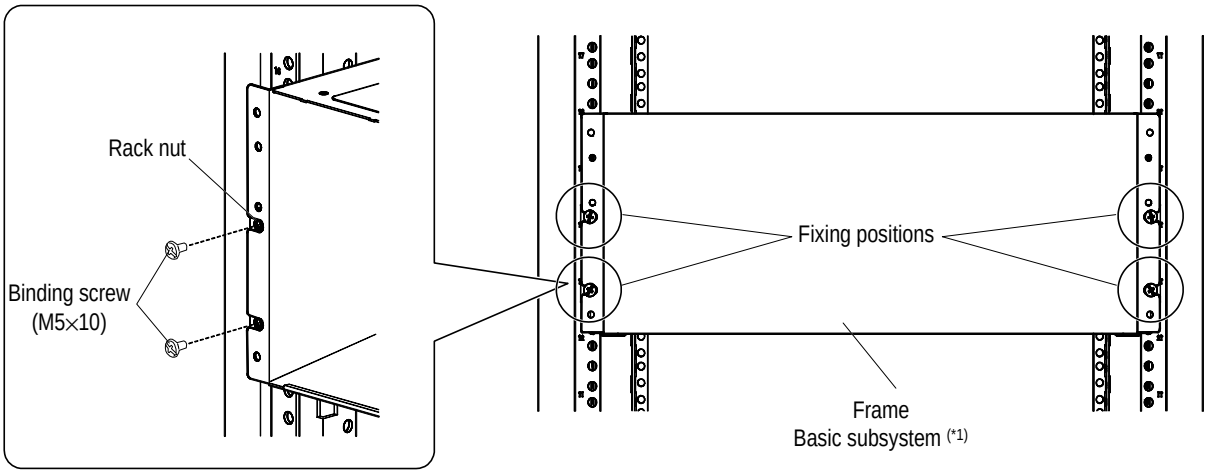

Copyright © 2005, Hitachi, Ltd.

(3) Sun StorEdge Rack frame

(a) Fastening the front side of the subsystem

This is common for the three unit and four unit Rackmount models.

(i) Fasten the cutouts of the subsystem to the rack frame with the binding screws (M5 x 10) (four places).

*1 : Fasten Additional subsystem (3U) as well.

Figure 3.4.16 Fastening Front Side of the Subsystem

(b) Fastening rear side of the subsystem

(i) Slide each of the two stoppers in the direction shown by the arrow until it contacts with the frame.

(ii) Tighten the binding screws (M3 x 6) to fix it.

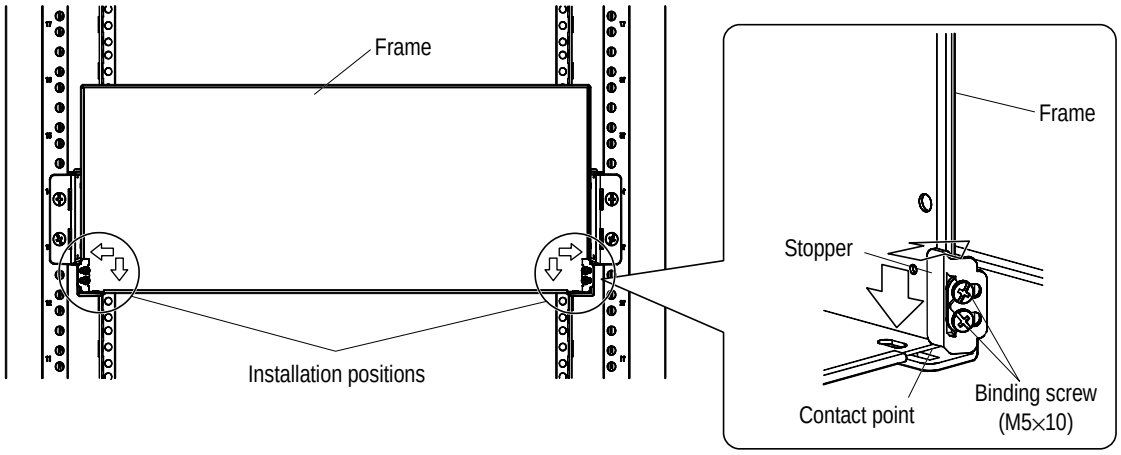

Figure 3.4.17 Securing Rear Side of the Subsystem

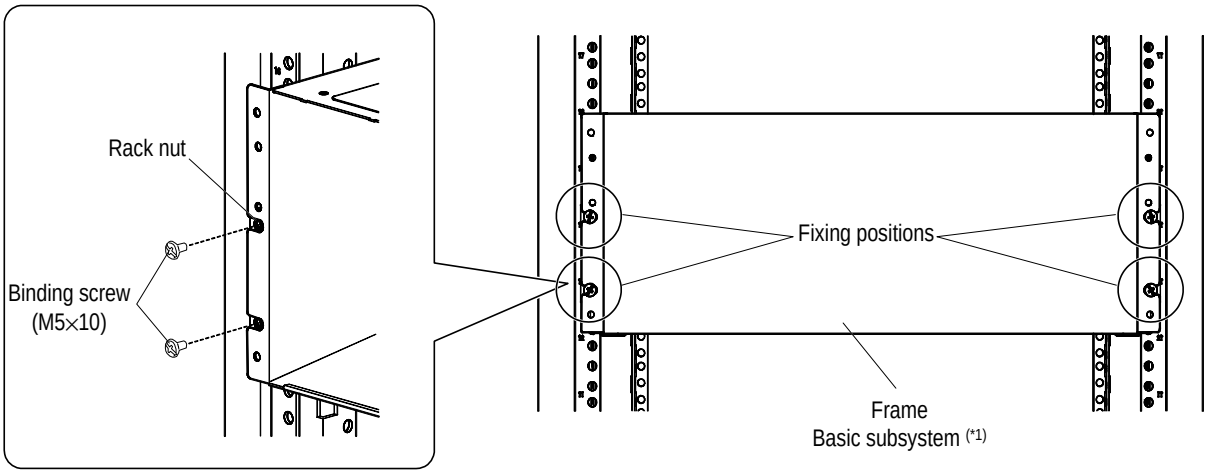

Copyright © 2005, Hitachi, Ltd.

(4) IBM RS6000 Rack frame

(a) Fastening the front side of the subsystem

This is common for the three unit and four unit Rackmount models.

(i) Fasten the cutouts of the subsystem to the rack frame with the binding screws (M5 x 10) (four places).

*1 : Fasten Additional subsystem (3U) as well.

Figure 3.4.18 Fastening Front Side of the Subsystem

(b) Fastening rear side of the subsystem

(i) Slide each of the two stoppers in the direction shown by the arrow until it contacts with the frame.

(ii) Tighten the binding screws (M3 x 6) to fix it.

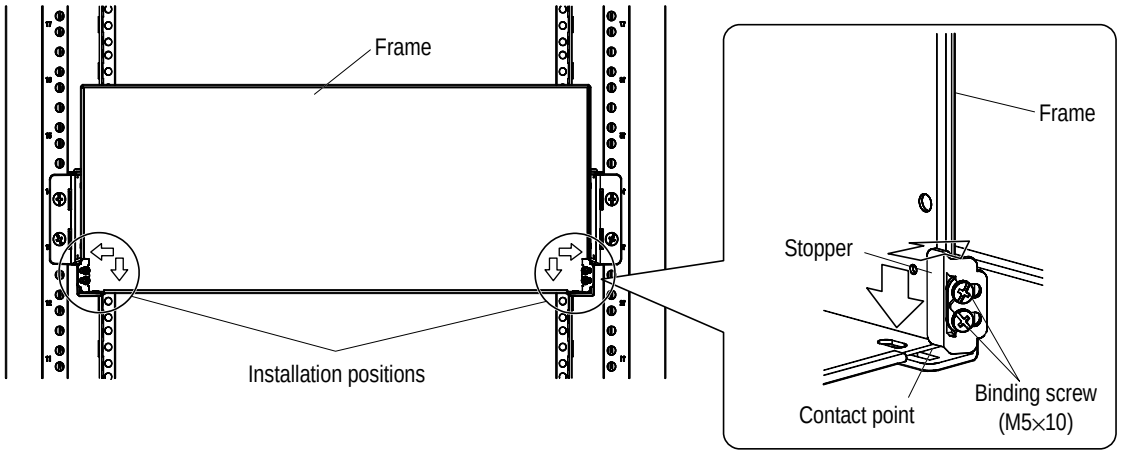

Figure 3.4.19 Securing Rear Side of the Subsystem

Copyright © 2005, Hitachi, Ltd.

(5) NSC Rack frame

This is common for the three unit and four unit Rackmount models.

(a) Fastening the front side of the subsystem

(i) Fasten the subsystem to the rack frame with the four M5×10 binding screws.

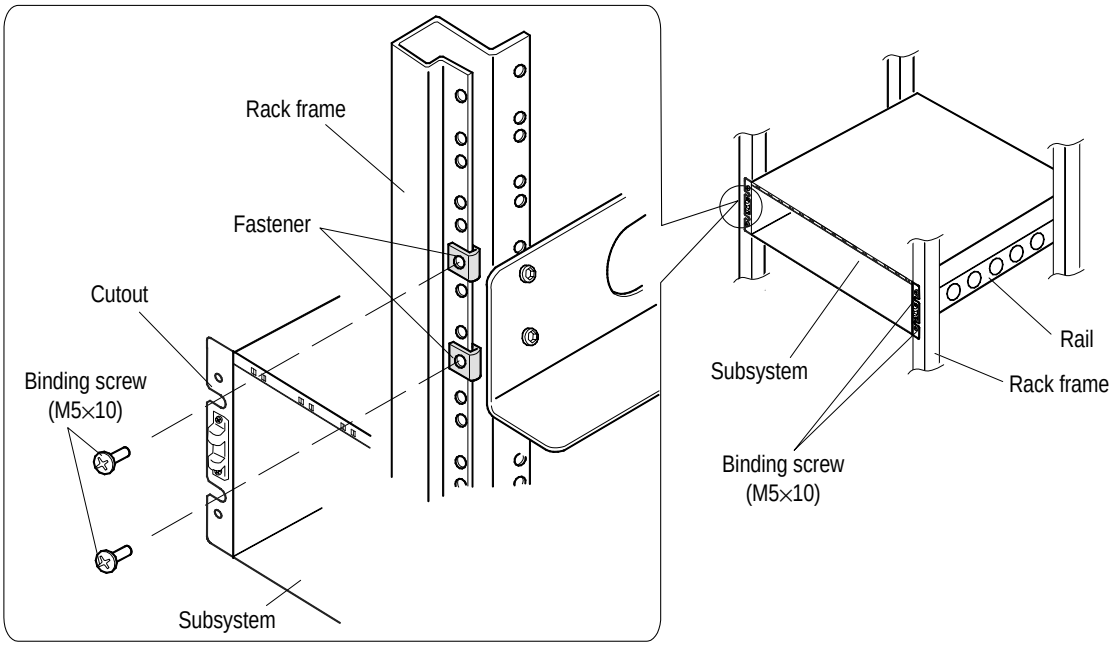

Figure 3.4.20 Fastening Front Side of the Subsystem

(b) Fastening rear side of the subsystem

This is common for the three unit and four unit Rackmount models.

(i) Shift each of the two stoppers in the direction shown by the arrow and make it contact the frame.

(ii) Tighten the binding screws.

3.4.7 Installing Components

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

Be sure to wear the wristband, connect its lead wire to the subsystem enclosure before starting the work, and do not remove them until the work is completed.
When installing a Disk Drive, Control Unit and ENC Unit/SENC Unit, hold it with your hand wearing the wristband having fingers contact metallic portions on the sides of the part.

Copyright © 2005, Hitachi, Ltd.

When the components are not installed, install them. If they have already been installed, go to the next step since this work is not needed.

Table 3.4.1 Parts Required for Installation of RKM/RKS

No.	Component name	Model	Quantity	Remark
1	DISK Drive	DF-F700-AGF72	2 to 15(*1)	The Disk Drive with a model name selected from those shown on the left is installed.
		DF-F700-AGH72		
		DF-F700-AGF146		
		DF-F700-AGH146		
		DF-F700-AGF300

(1) Installing the Disk Drive

(1-1) Procedure for attachment

(a) Pull the parts out of the Disk Drives safekeeping of component.
Be sure to install the removed Disk Drive to the original bay.

(b) Insert the Disk Drive into the position (address) where it was by holding it with the handle.

(i) Fit the Disk Drive in the guide rail of the RKAJAT and slide it in the direction shown by the arrow.

(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.

(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) Pull the handle lightly to make sure that the Disk Drive cannot be pulled out.

(d) Attach the dummy (Disk Drive) to the each Disk Drive slot in which no Disk Drive is installed.
There are two types of the dummies (Disk Drives), and the installation methods are different respectively.

- The dummy (Disk Drive) of which the external appearance is similar to the Disk Drive
  There is no label attached on the handle part.
  Install it in the same way as the Disk Drive.
- The dummy (Disk Drive) of which the external appearance is all black
  This is the dummy (Disk Drive) of the resin all-in-one molded piece (black) with no stopper and handle part.
  Insert it into the slot slowly so that the latch (round dent) part of the dummy (Disk Drive) comes to the lower side.

(1-2) Setting Device ID number

The subsystem ID of the RKM/RKS/RKXS or the RKAJ to be connected to the RKH is set to # 0. Set the Device ID numbers of the RKAJ/RKAJAT in serial order starting from the RKAJ/RKAJAT connected next to the RKH/RKM/RKS/RKXS.

In the case of a configuration of one RKM/RKS+ RKAJs + RKAJATs, set the device IDs of the RKAJ, the RKAJATs connected to the Path 0, and the RKAJATs connected to the Path 1 as #0x, #2x, and #3x respectively. Set the "x" as an ascending serial number in each of the Path 0 and Path 1 without discrimination between the RKAJ and RKAJAT.
Set #2x for RKAJAT of RKXS + RKAJAT. Set x in ascending order.

In the case of a configuration of one RKH + RKAJs, set the device IDs of the RKAJs, the RKAJATs connected to the PATH #0, and the RKAJATs connected to the PATH #1 as #0x, #2x, and #3x respectively. Set the "x" as an ascending serial number in each of the PATH #0 and PATH #1 without discrimination between the RKAJ and RKAJAT.
Set the device IDs of the RKAJs, the RKAJATs connected to the PATH #2, and the RKAJATs connected to the PATH #3 as #1x, #4x, and #5x respectively. Set the "x" as an ascending serial number in each of the PATH #2 and PATH # 3 without discrimination between the RKAJ and RKAJAT.

For details of the device ID setting, refer to "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).

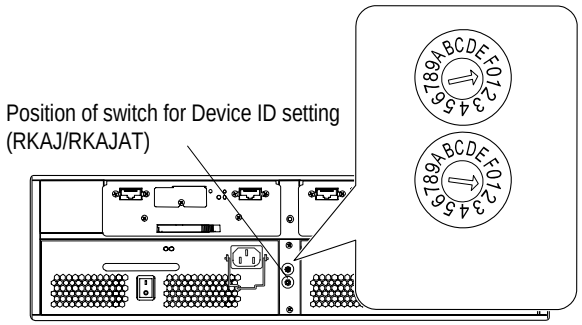

Figure 3.4.23 Position of Switch for Device ID Setting

Copyright © 2005, 2006, Hitachi, Ltd.

(1-3) Setting the subsystem identification switch

Set only the RKAJ.

When the basic subsystem to be connected is the RKM/RKH, set it in the M side, and when it is the RKS, set it in the S side.

Check the RKM and RKS by the subsystem model names. (Refer to "2.2 (3) Checking contents of package" (INST 02-0040).)

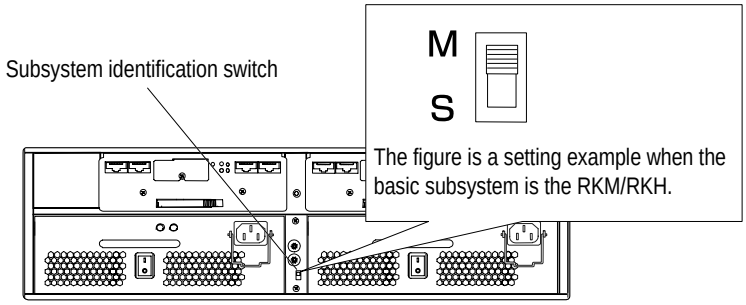

Figure 3.4.24 Position of Switch for the Subsystem Identification

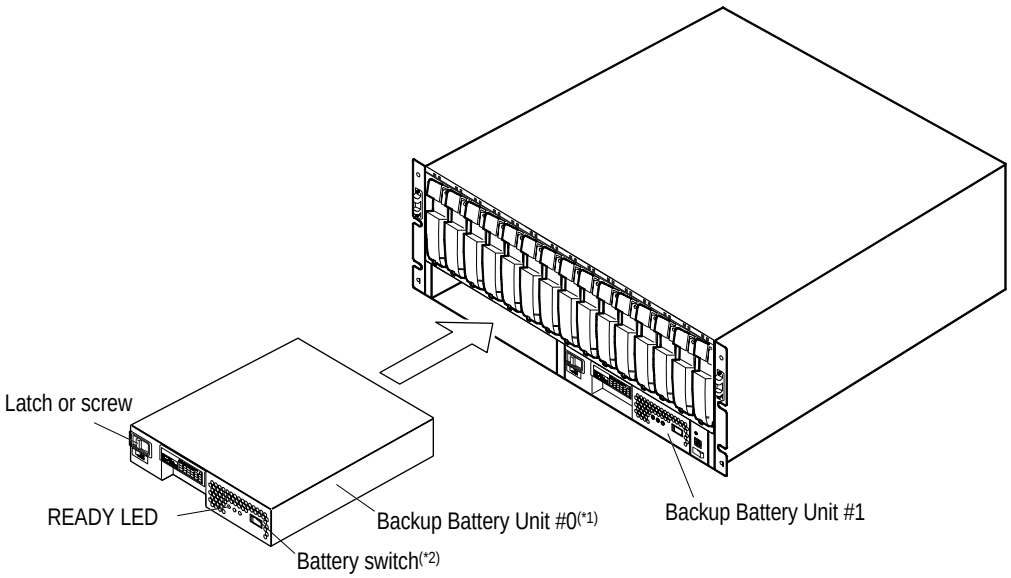
(2) Installing Backup Battery Unit

This installation work is only applied to RKM/RKS/RKXS/RKH.



(a) Remove the Front Bezel. ("1.5 How to Open/Close Door or Attach/Remove Front Bezel/Rear Cover of the Subsystem" (INST 01-0100))

(b) Make sure that the battery switch on the Backup Battery Unit is turned off.

NOTE : In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, this work is unnecessary because there is no battery switch.

(c) Insert the Backup Battery Unit in the specified location in the subsystem to the position where it is completely fixed until the latch moves to Lock side.
In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS/RKH, shift the latch (fixing screw) of the Backup Battery Unit to the Release position, and insert the subsystem.
Shift the latch (fixing screw) of the Backup Battery Unit to the Lock position, tighten the latch (fixing screw).

NOTE : There is only one Backup Battery Unit to be installed in the RKS/RKXS and it is installed in the left side when seen from the front of the subsystem.

*1 : Only one battery is installed in RKS/RKXS left side of the subsystem.

*2 : In case of the Backup Battery Unit of REV. C to be installed in the RKM/RKS and the Backup Battery Unit to be installed in the RKXS, there is no battery switch. Also, the latch is fixed with a screw.

*3 : The figure shows RKM.

Figure 3.4.25 Installing Backup Battery Unit (RKM/RKS/RKXS)

(3) Installing Fan Assembly

This installing work is only applied to RKM/RKS/RKXS/RKH.

The two same Fan Assembly are installed facing each other in the state in which each of them faces left and right. When installing them, make each of them face reverse direction correctly.

(a) Insert the Fan Assembly in the specified position in the subsystem, raise it by fitting the hook of the lever to the cutout of the subsystem, and tighten it with the fixing screw.

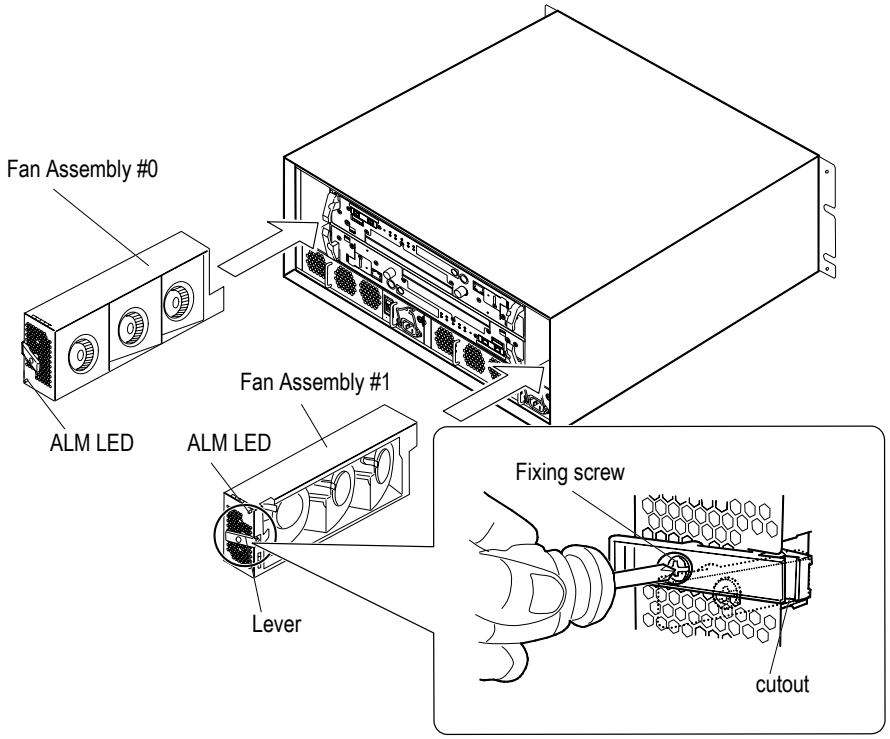

Figure 3.4.26 Installing Fan Assembly

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Installing the Control Unit, Cache Unit and Interface Board

When the Cache Unit and the Interface Board are already installed, the installing work for Cache Unit and the Interface Board is not required.

(a) In the case of RKS/RKXS

(a-1) When the interface board is not installed in the Control Unit of the RKS/RKXS

(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.

• Be careful not to insert Cache Units at the reversed direction.

(iii) Make sure that the Cache Unit is firmly installed.

(iv) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(v) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.

In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2005, Hitachi, Ltd.

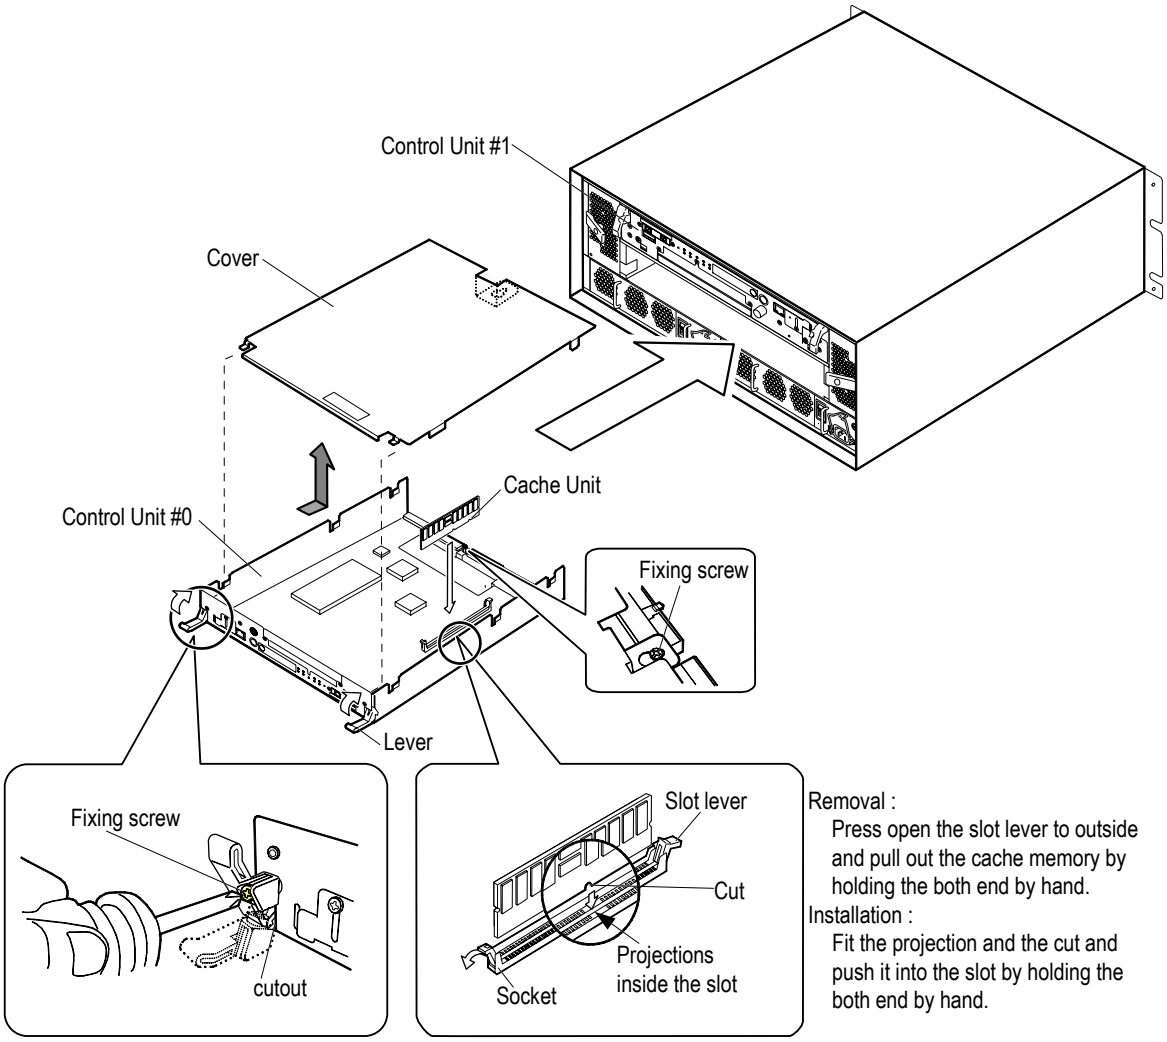

Figure 3.4.27 Installing Control Unit and Cache Unit

Copyright © 2005, Hitachi, Ltd.

(a-2) When the Interface Board is installed in the Control Unit of the RKS/RKXS

(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Remove two host connectors for 2 G bps from the Control Unit.

- Pull it out after raising the lever for Type 1.
- Pull it out after pushing down the lever toward for Type 2.

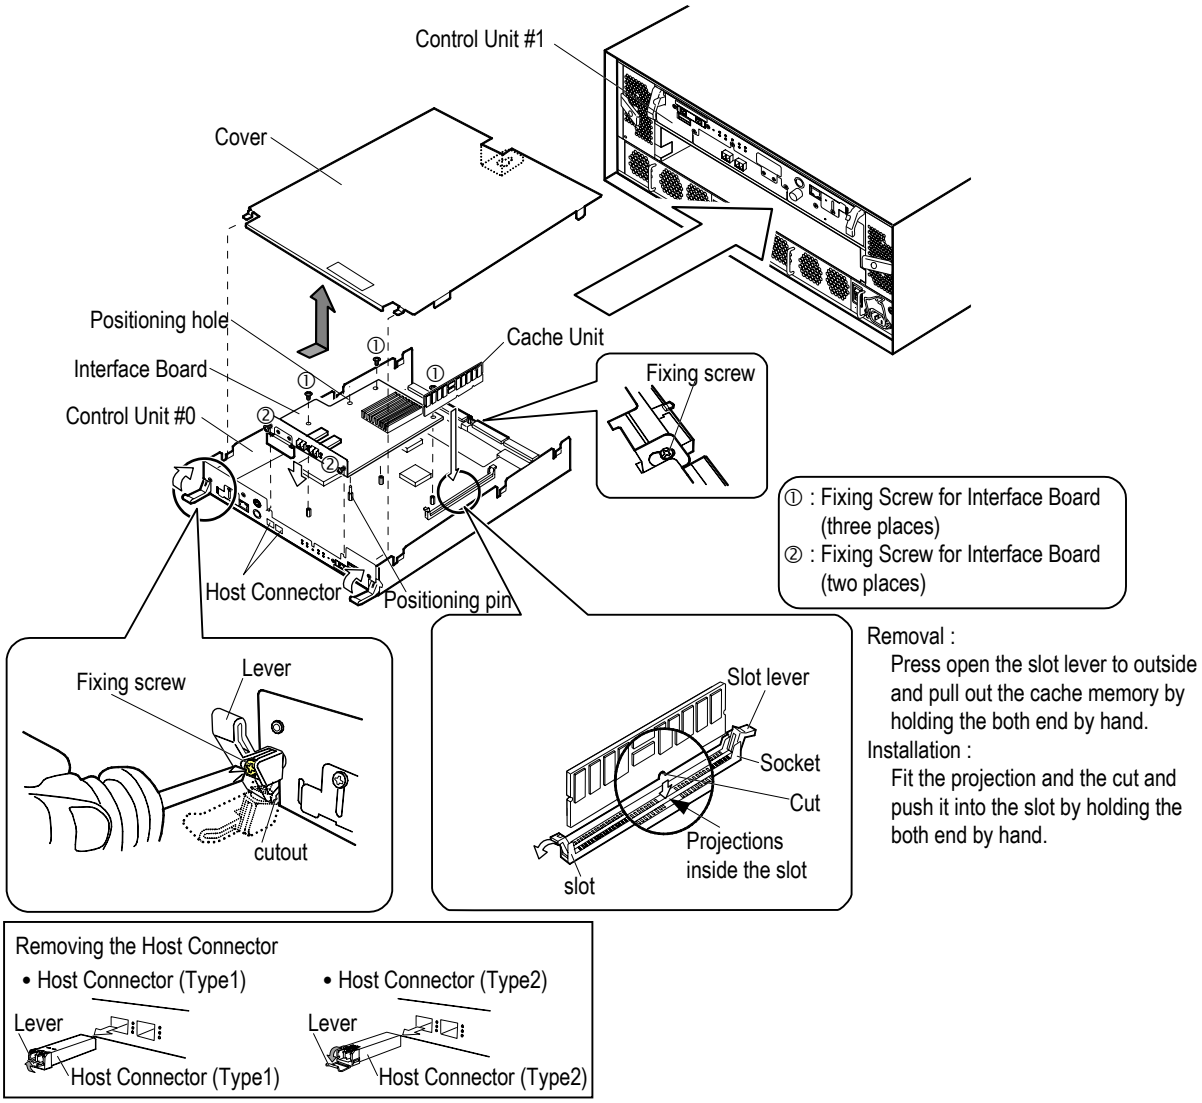
After this, hand over the removed two host connectors for 2 G bps to the customer, and ask him/her to keep them carefully.

(iii) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). Insert the connectors surely.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

(iv) Make sure that the Interface Board is firmly installed.
When the NAS Interface Board was installed, loosen the screws of the connector cover for the maintenance of the Control Unit, attach the Panel, and fix it by tightening the screws.

(v) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE :
- For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
- Be careful not to insert the Cache Units in the reverse orientation.
- Insert the Cache Units in the cache slots in regular order starting from the slot #0.
- Insert the dust cover in the Cache slot in which the Cache memory is not installed.



(vi) Make sure that the Cache Unit is firmly installed.

(vii) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(viii) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2005, Hitachi, Ltd.

*1 : The figure shows the case where the FC Interface Board is added to the Control Unit of the RKS.

Figure 3.4.27.1 Installing Control Unit, Cache Unit and Interface Board

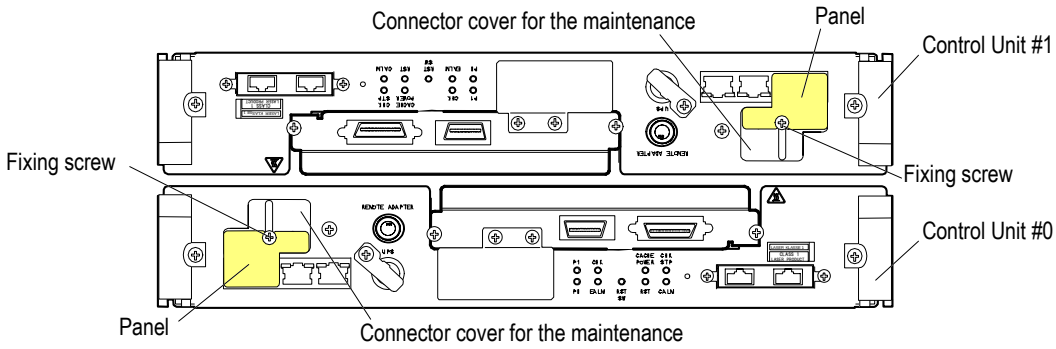


Figure 3.4.27.2 Installation position of Panel when NAS Interface Board is installed

Copyright © 2005, Hitachi, Ltd.

(b) In the case of RKM

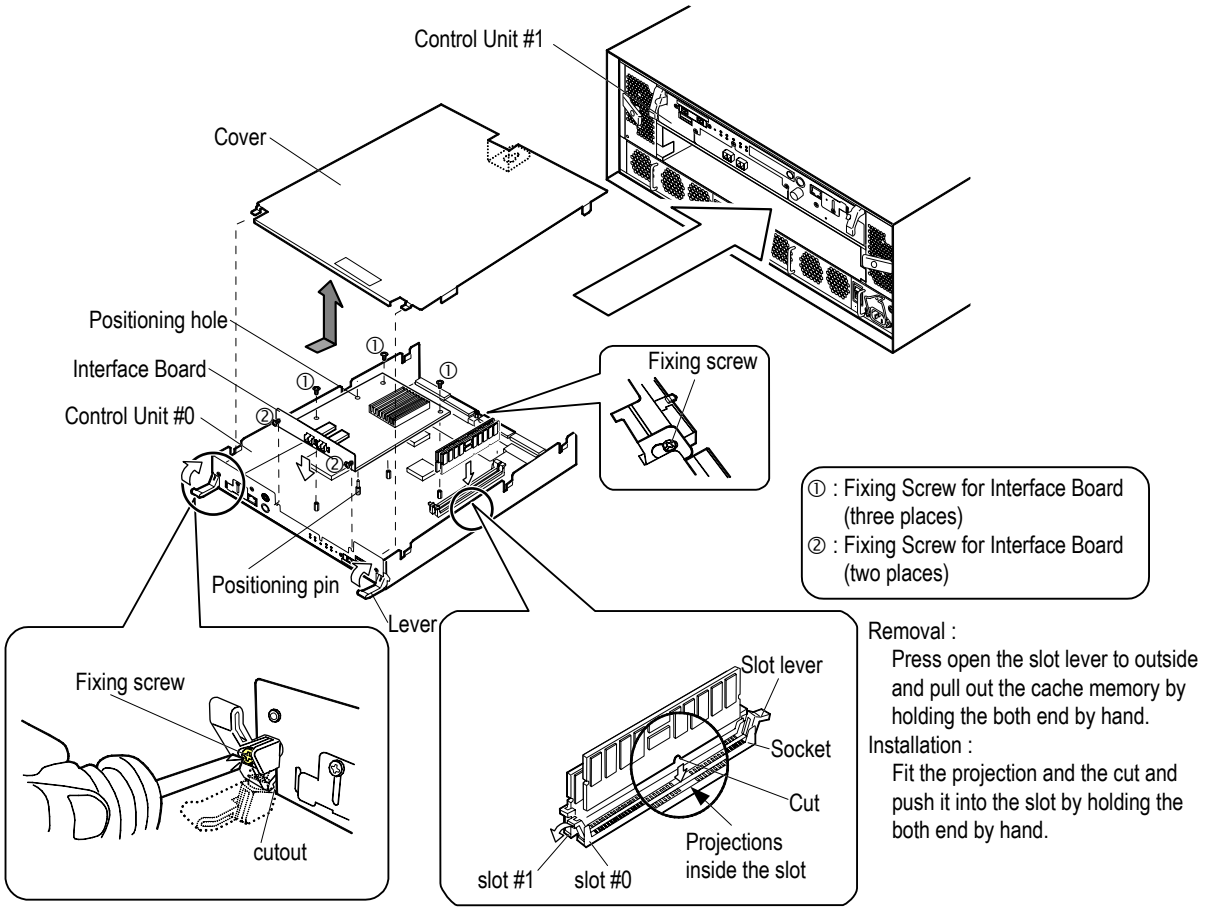
(i) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(ii) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). Insert the connectors surely.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

(iii) Make sure that the Interface Board is firmly installed.
When the NAS Interface Board was installed, loosen the screws of the connector cover for the maintenance of the Control Unit, attach the Panel, and fix it by tightening the screws.

(iv) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Be careful not to insert the Cache Units in the reverse orientation.
• Insert the Cache Units in the cache slots in regular order starting from the slot #0.
• Insert the dust cover in the Cache slot in which the Cache memory is not installed.



(v) Make sure that the Cache Unit is firmly installed.

(vi) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(vii) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2005, Hitachi, Ltd.

*1 : The figure shows the case where the FC Interface Board is installed in the Control Unit of the RKM.

Figure 3.4.28 Installing Control Unit, Cache Unit and Interface Board

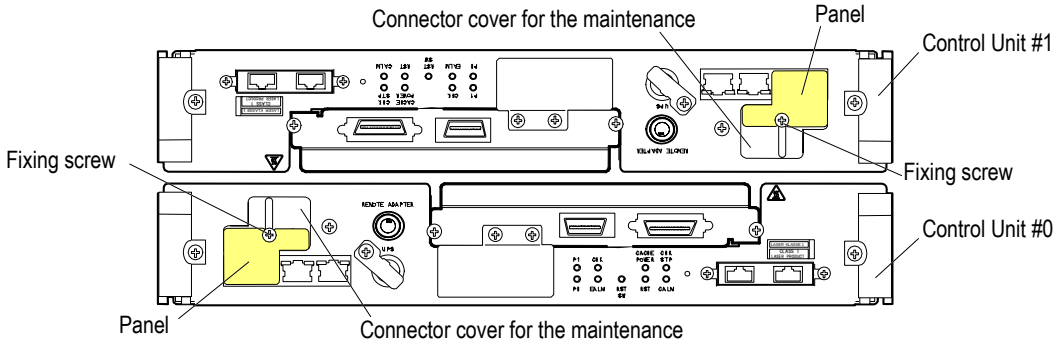


Figure 3.4.28.1 Installation position of Panel when NAS Interface Board is installed

(c) In the case of RKH/RKHE

NOTE : Use the Control Unit whose model name is the DF-F700-F1JH for the RKH.
Use the Control Unit whose model name is the DF-F700-F2JH for the RKHE.
The Control Unit of the RKH and the Control Unit of the RKHE cannot be mixed.

(i) Loosen two fixing screws for the cover at the back of the cover, remove the cover in the direction shown by the arrow (⟶).

(ii) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). Insert the connectors surely.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

NOTE : • Be careful that the position to install the Interface Board is determined. (Refer to Table 3.4.6).
• Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1.

(iii) Make sure that the Interface Board is firmly installed.
When the NAS Interface Board was installed, loosen the screws of the connector cover for the maintenance of the Control Unit, open it.

(iv) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • Be careful not to insert the Cache Units in the reverse orientation.
• If the Cache memories are not installed in the slot #0 and the slot #1, the blockade of the Control Unit occurs.
Be sure to install the Cache memories in the slot #0 and the slot #1.
• Install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Install the Cache Units by the set of two in the slot #0 and #1 and the slot #2 and #3.
• Install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively.
• Insert the dust cover in the Cache slot in which the Cache memory is not installed.

(v) Make sure that the Cache Unit is firmly installed.

(vi) Attach the cover in the opposite direction of which it was removed, and tighten the fixing screw for the cover at the back of the cover.

(vii) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Table 3.4.6 Installation position of the Interface Board

Installation case	Installation position	
	Interface Board #0	Interface Board #1
1	FC Interface Board	–
2	–	NAS Interface Board
3	iSCSI Interface Board	–
4	FC Interface Board	FC Interface Board
5	FC Interface Board	NAS Interface Board

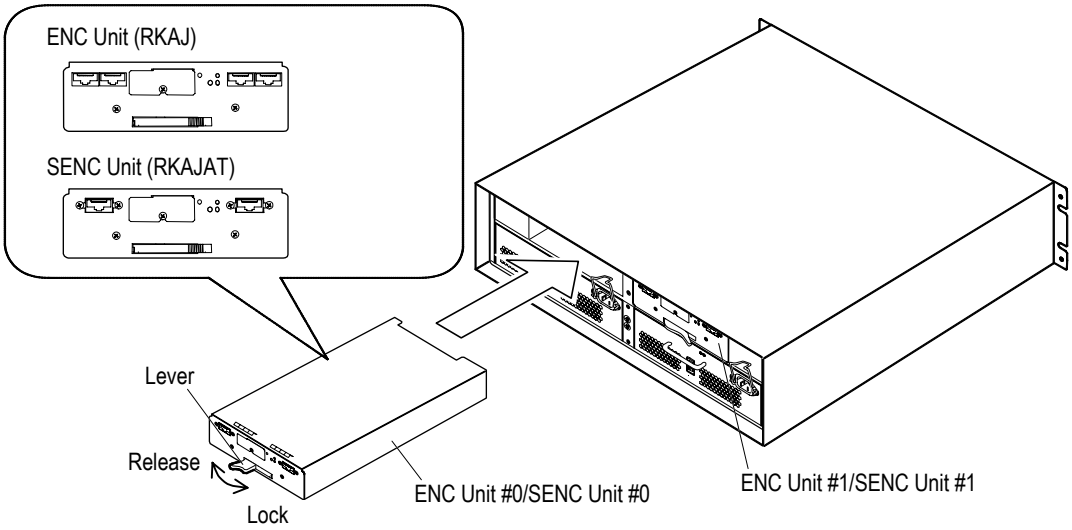
(5) Installing ENC Unit (for RKAJ) and SENC Unit (for RKAJAT)

Install the ENC unit in the RKA and the SENC unit in the RKAJAT.

(a) Insert the ENC Unit/SENC Unit into the specified location in the subsystem with its lever being raised, then return the lever in the direction shown by the arrow (⟶).
Take notice that the forms differ between the ENC Unit and SENC Unit.



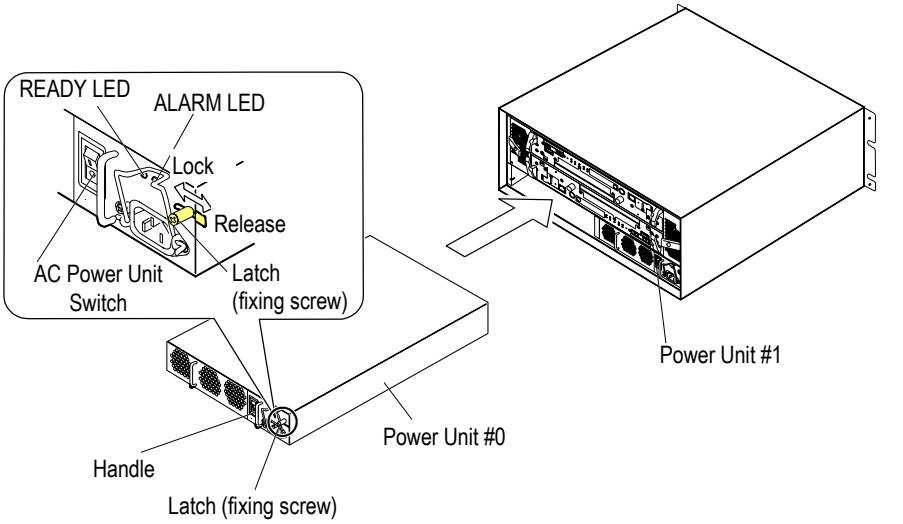


Figure 3.4.29 Installing ENC Unit/SENC Unit

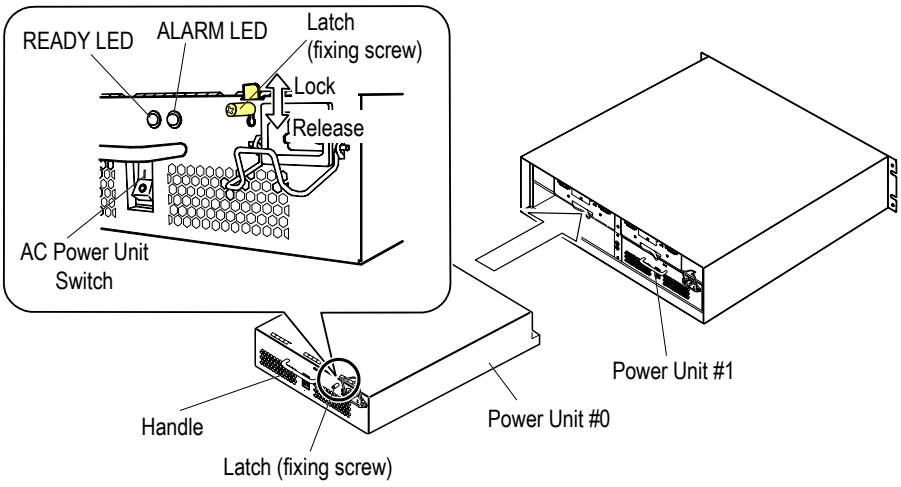
Copyright © 2005, Hitachi, Ltd.



(6) Installing Power Unit

(a) Make sure that the AC Power Unit Switch is turned off.

(b) Shift the latch (fixing screw) of the Power Unit to the Release position, insert it slowly into the sheet metal slit part at the top of the power Unit, and then push it to the end.

(a) RKM/RKS/RKXS/RKH

(b) RKAJ/RKAJAT

3.4.8 Installing the RKNAS

(1) Installing in the U7 rack Frame

When installing the RKNAS in the U7 rack frame, use the rack rail (DF-F700-URHTN7). The Components-list of U7 rack rail is shown in Table 3.4.8.

Table 3.4.8 Components of Rack-rail (DF-F700-URHTN7) (per one unit)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Rail	3274740-A	1	For right hand side	–
2	Rail	3274740-B	1	For left hand side	–
3	Stopper	5531106-1	2	For securing the subsystems	–
4	Rack nut	5510146-1	12	For securing the subsystems and the rails (2 spares are included.)	–
5	Bind screw with washer (M3×10)	3261960-310	6	For securing the Stopper (2 spares are included.)	–
6	Bind screw (M5×10)	SB510N	4	For securing the subsystems (2 spares are included.)	–
7	Bind screw (M5×16)	SB516N	10	For securing the rails (2 spares are included.)	–

(a) Installing the rail

(i) On the left side of the installation location in the rack frame, align the round holes of the Rail (L) with those of the rack frame and insert the Rack nut (at four places in total in front and rear.). (Refer to Figure 3.4.30.1)

(ii) Fasten the Rail (L) to the rack frame using the binding screw (M5×16) (at two places each on the front and rear sides.).

(iii) Install the Rail (R) to the rack frame in the same way.

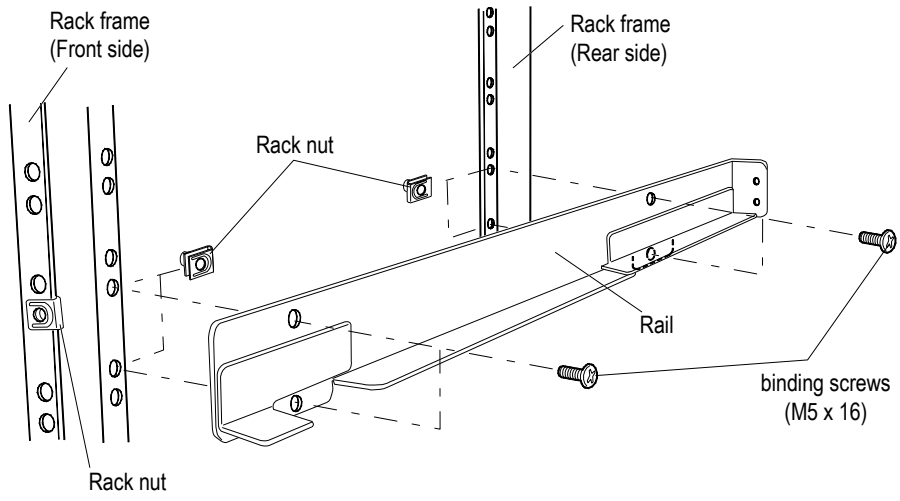

Figure 3.4.30.1 Installing the Rail for the RKNAS Installation (U7 rack frame)

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Installing the RKNAS

(i) Install the RKNAS in the rail.

(ii) Fix the front part of the RKNAS to the rack with two binding screws (M5 x 10) (one place each at right and left).

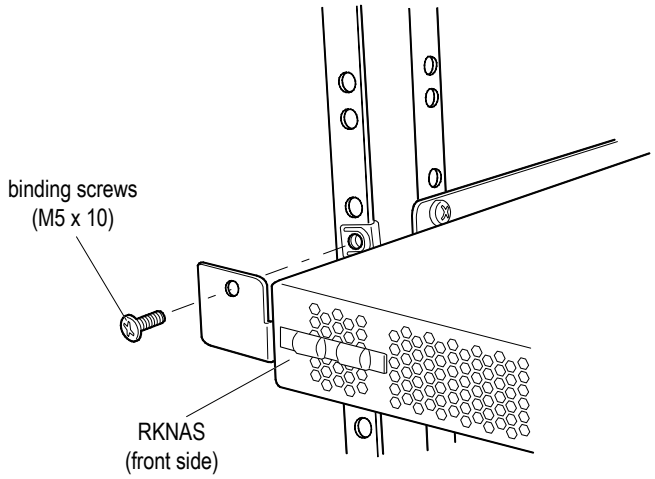

Figure 3.4.30.2 Fixing the Front Part of the RKNAS

(iii) Fix the rear part of the RKNAS with two Stoppers and four binding screws with washer (M3 x 10) (one place each at right and left for the Stoppers, and two places each at right and left for the binding screws with washer (M3 x 10)).

NOTE : Shift each of the two Stoppers in the direction shown by the arrow and make it contact the frame.

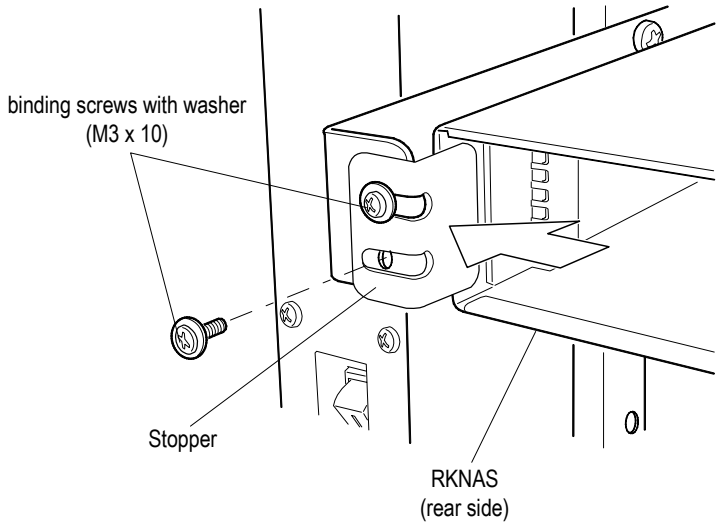

Figure 3.4.30.3 Fixing the Rear Part of the RKNAS

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Installing in the 19-inch rack Frame

When installing the RKNAS in the 19-inch rack frame, use the rack rail (DF-F700- URN7). The Components-list of 19-inch rack rail is shown in Table 3.4.9.

Table 3.4.9 Components of Rack-rail (DF-F700-URN7) (per one unit)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	Front Rail	2850146-A	1	For right hand side	–
2	Front Rail	2850146-B	1	For left hand side	–
3	Rear Rail	3274832-1	1	For right hand side	–
4	Rear Rail	3274832-2	1	For left hand side	–
5	Stopper	5531200-1	2	For securing the subsystems	–
6	Spacer	5531202-1	2	For securing the subsystems	–
7	Bind screw (M5×10)	SB510N	10	For securing the rails (2 spares are included.)	–
8	Bind screw (M4×8)	SB408N	10	For securing the rails (2 spares are included.)	–
9	Bind screw (M3×6)	SB306N	6	For securing the stopper (2 spares are included.)	–
10	Screw	SC306N	6	For securing the Spacer (2 spares are included.)	–
11	Rack nut	5510146-1	10	For securing the rails (2 spares are included.)	–
12	Bind screw (M5×8)	3274845-508	4	For securing the subsystems (2 spares are included.)	–

(a) Installing the rail

(i) Install the Rack nuts in the installation position of the front rail (two places).

(ii) Fix the front side of the front rail with the Binding screws (M5x10) (two places).

(iii) Install the Spacer in the front of the front rail, and fix it with the Screws (M3x6) (two places).

(iv) Install the Rack nuts in the installation position of the rear rail (two places).

(v) Fix the rear side of the rear rail with the Binding screws (M5x10) (two places).

(vi)) Fix the front rail and the rear rail with the Binding screws (M4x8) (four places).

(vii) Perform the above-mentioned installation to the right and left of the rack frame.

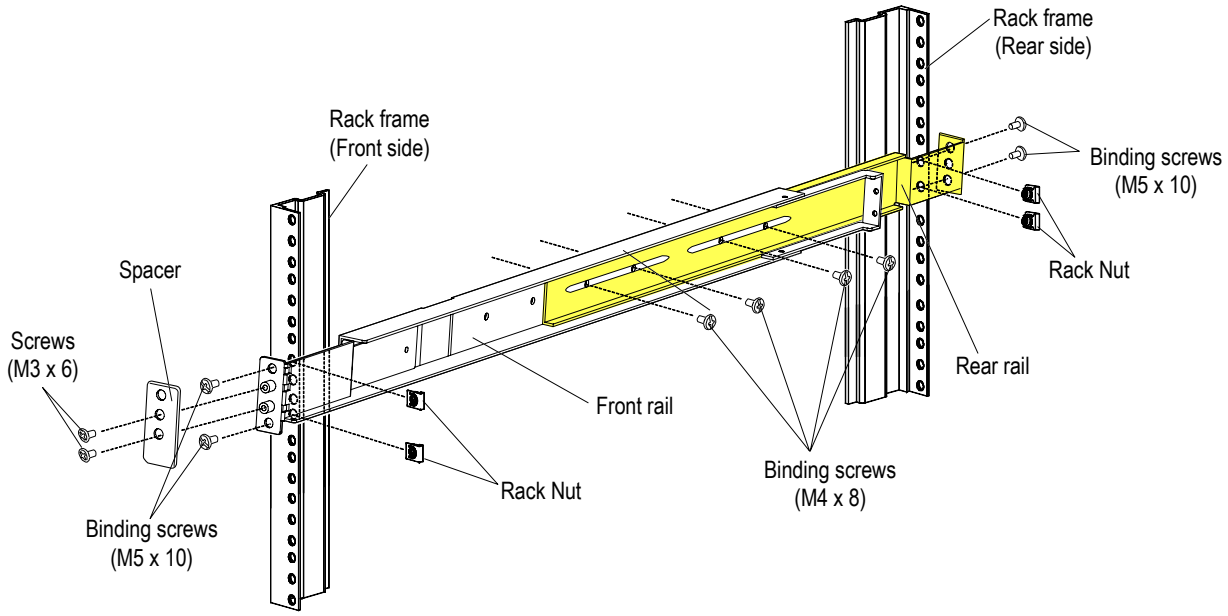

Figure 3.4.30.4 Installing the Rail for the RKNAS Installation (19-inch rack frame)

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Installing the RKNAS

(i) Install the RKNAS in the rail.

(ii) Fix the front part of the RKNAS to the rack with two Binding screws (M5 x 8) (one place each at right and left).

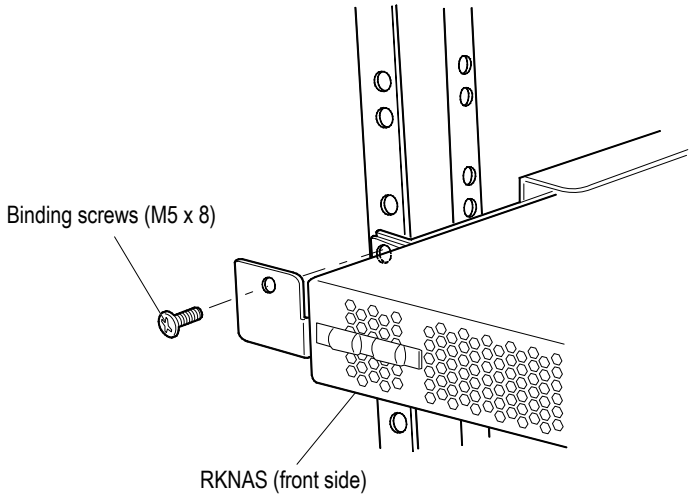

Figure 3.4.30.5 Fixing the Front Part of the RKNAS

(iii) Fix the rear part of the RKNAS with two Stoppers and four Binding screws (M3 x 6) (one place each at right and left for the Stoppers, and two places each at right and left for the Binding screws (M3 x 6)).

NOTE : Shift each of the two Stoppers in the direction shown by the arrow and make it contact the frame.

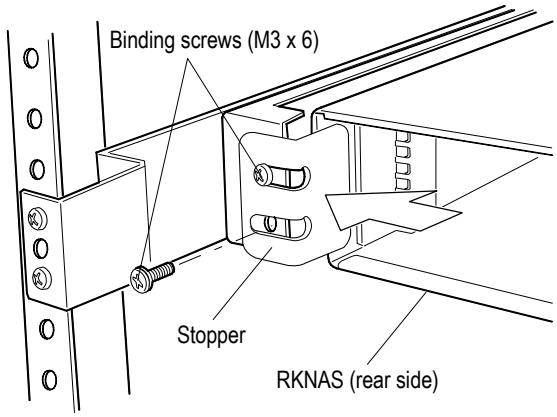

Figure 3.4.30.6 Fixing the Rear Part of the RKNAS

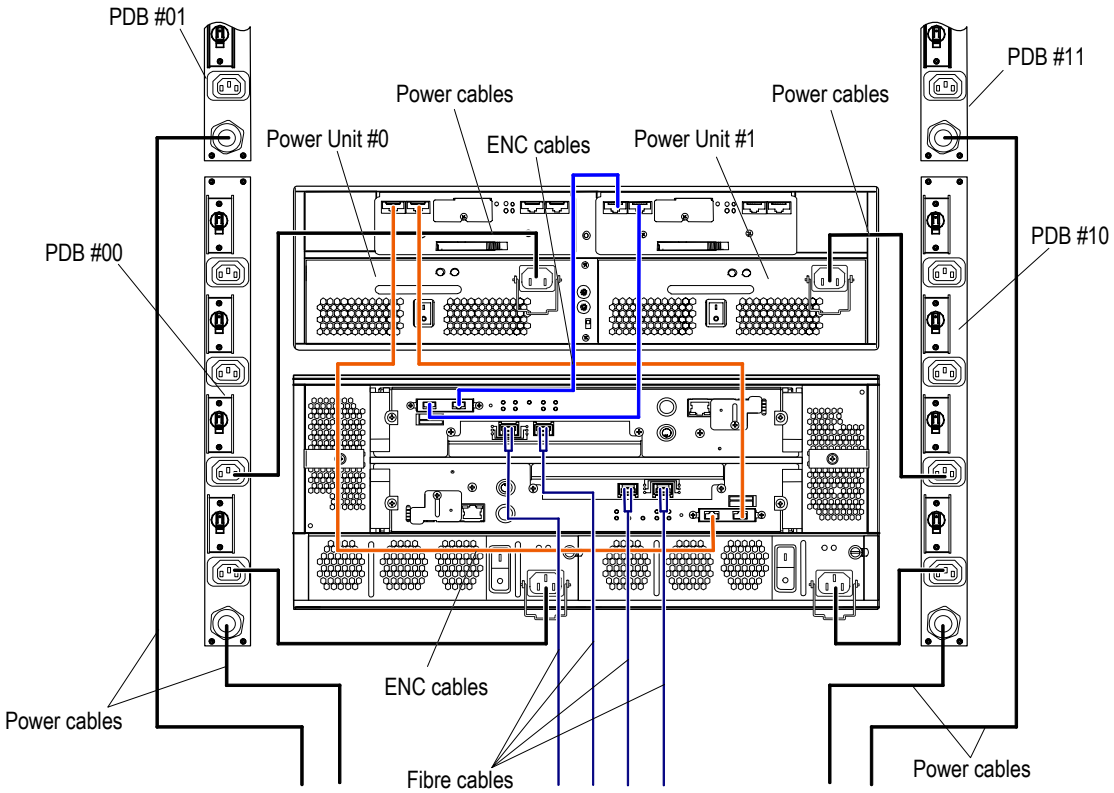
3.4.9 Connecting Cables

CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "1.1 (3) Note on cable routing" (INST 01-0010).

NOTE : Power supply system of the subsystem is duplicated.
It is recommended to connect each system to outlet of one of the two power sources independent of each other.



The cable routing for the subsystem which is mounted on the rack frame is shown in Figure 3.4.31, Figure 3.4.32, Figure 3.4.32.1 and Figure 3.4.32.2. Types of the cables to be used are shown in Table 3.4.10.

Table 3.4.10 Types Cables to be Connected

No.	Cable name	Remarks
1	Fibre Channel Interface cable	See "3.4.10 Connecting the Interface cable" (INST 03-0640)
2	iSCSI Interface cable	See "3.4.10 Connecting the Interface cable" (INST 03-0640)
3	ENC cable	See "3.4.11 Connecting the ENC cables" (INST 03-0670)
4	Power cable(*1) (100 V)	See "3.4.12 Connecting the power cables" (INST 03-0710)
5	Power cable (200 V) (Rack frame PDB)	See "3.4.13 Connecting the power cables (Rack frame PDB)" (INST 03-0730)
	Power cable (Added PDB)	See Addition/Subtraction/Relocation "1.5.2 (5) Installing the power Cable (Added PDB append parts) and cable holder." (ADD 01-0480)

*1 : When replacing power cable of the RKM/RKAJ/RKAJAT/RKS, which has already been connected, with the optional power cable, refer to Addition/Subtraction/Relocation "3.3.1 Disconnecting the power cables" (ADD 03-0090).

3.4.10 Connecting the Interface cable

(1) Connecting the Fibre Channel Interface cable

Two types of cable are provided as the Fibre Channel Interface cables(‡1) to be used so that they fit to connector shapes of the RKM/RKS/RKXS/RKH and host computer (or HBA (Host Bus Adapter), SW) to be connected.

Table 3.4.11 shows correspondences between the connector shapes and cable types. Choose the applicable cables from the table correctly.

Table 3.4.11 Types Fibre Channel Interface Cables to be Connected

FC Interface Board side (for RKM/RKS/RKXS/RKH side)			Host computer side (HBA (Host Bus Adapter), SW)	Types Cables to be Connected	
Parts name of connected cable plug	Model	Connector form	Connector form	Cable connector shape	Model
Control Unit	DF-F700-F1JM (RKM) DF-F700-F1JS (RKS) DF-F700-F1JXS (RKXS) DF-F700-F1JH (RKH) DF-F700-F2JH (RKHE)	LC	SC	LC-SC cable	DF-F700-KB×M(*1)
			LC	LC-LC cable	DF-F700-KC×M(*1)
Interface Board	DF-F700-DJ4G2 (RKM) DF-F700-DJ4G2W (RKS/RKXS) DF-F700-DJ4G2H (RKH)	LC	SC	LC-SC cable	DF-F700-KB×M(*1)
			LC	LC-LC cable	DF-F700-KC×M(*1)

*1 : "x" denotes a valuable (1 to 5) that shows a cable length.

(a) Connect the Fibre Channel Interface cables after making sure of the ports to be connected the LOCATION (REAR) label. (Refer to Figure 3.4.33, Figure 3.4.33.1.)

NOTE : • When bending the Fibre Channel Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

• The RKS/RKXS has the limitation in the connection configuration of the Fibre Channel interface cable depending on the existence of the addition of the FC Interface Board and the topology set to the Port.
The connection configuration of the topology set to Port and the Fibre Channel Interface cable. (See "1.2.2 Mini-HUB" (INST 01-0020).)

(b) Pull all the Fibre Channel Interface cables into the rack frame passing them through an opening for cables on the bottom plate of the rack frame.

‡1 : When the multiple ports are used, make sure of the port corresponding to the host computer to be connected.

Copyright © 2005, 2006, Hitachi, Ltd.

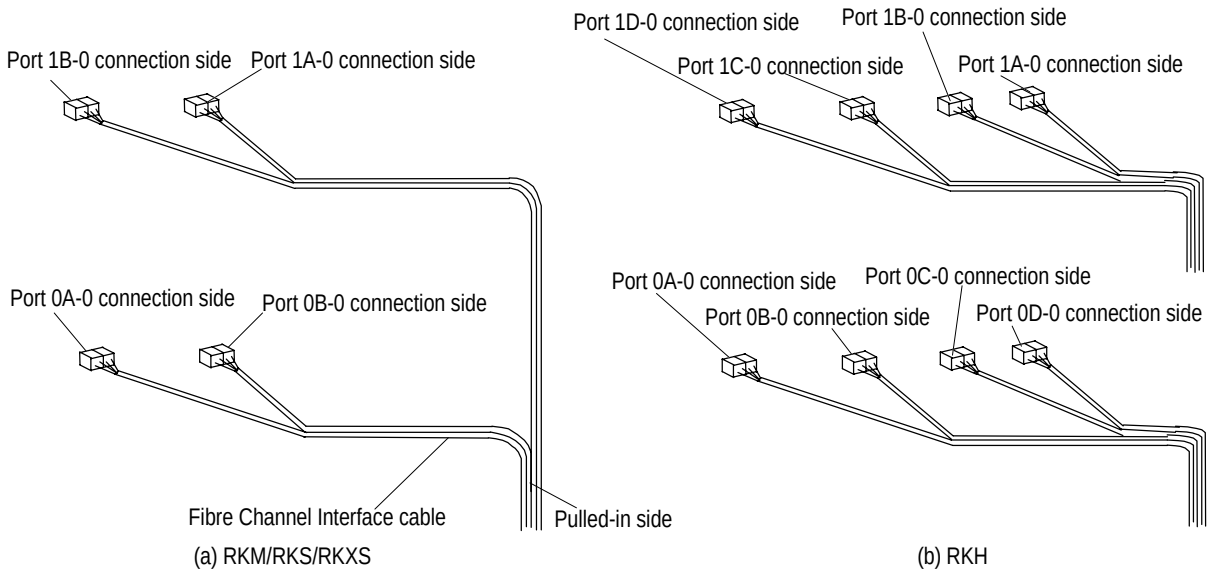

Figure 3.4.33 Binding Fibre Channel Interface Cables (RKM, RKS/RKXS (FC Interface Board is added), RKH)

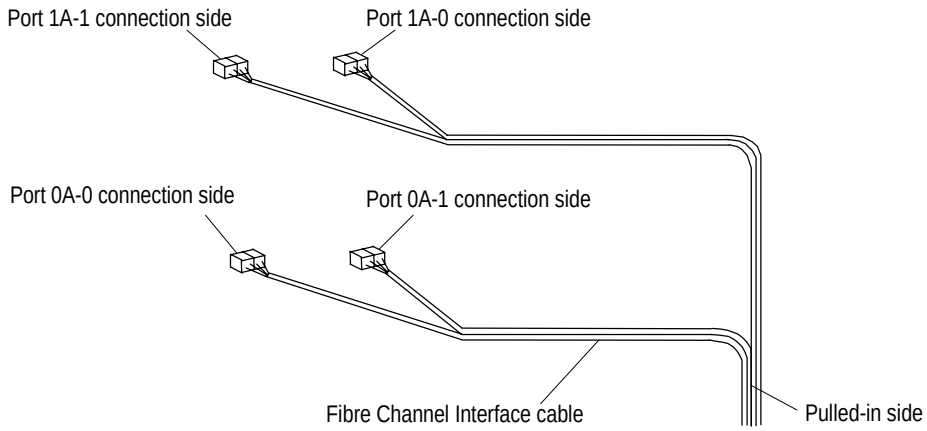

Figure 3.4.33.1 Binding Fibre Channel Interface Cables (RKS/RKXS (FC Interface Board is not added))

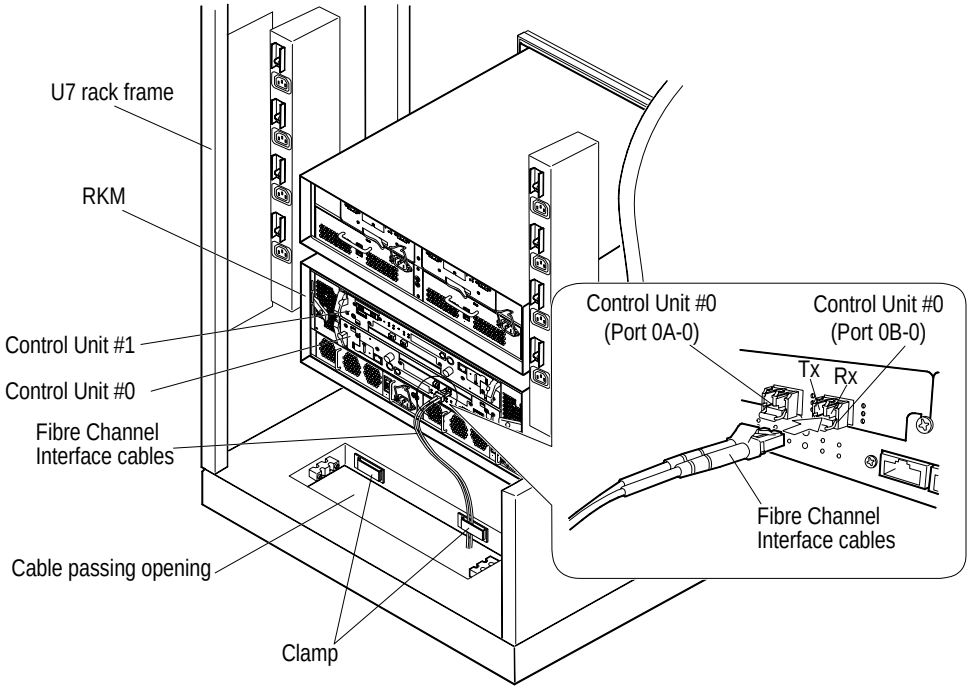
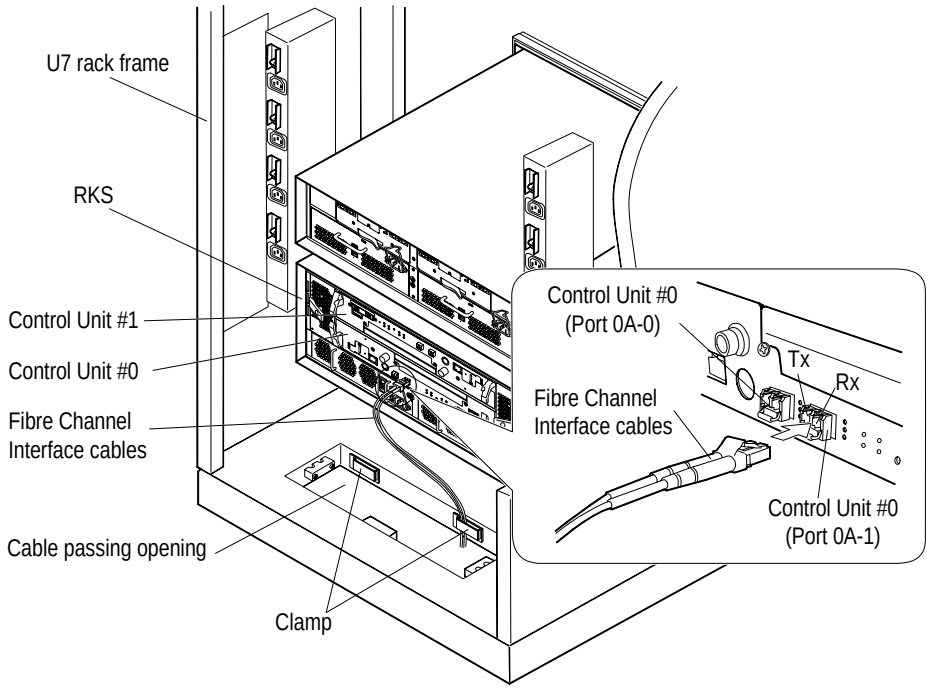


(c) Connect the Fibre Channel Interface cable to the connector of the each port.

NOTE : Insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(d) In the case of the U7 rack frame, affix the clamps attached to the DF-F700-URHT7 (rail kit for the U7) on it, and perform the routing of the Fibre Channel interface cables.
In the case of the NSC rack frame, affix the clamp attached to the DF-F700-URNS7 (rail kit for the NSC) on it, perform the routing of the Fibre Channel interface cables, and fix them with the repeat binders.



(e) Fasten the Fibre Channel Interface cables to the rack frame at the cable passing opening on the he bottom plate giving them excessive lengths so that they will not be pulled.

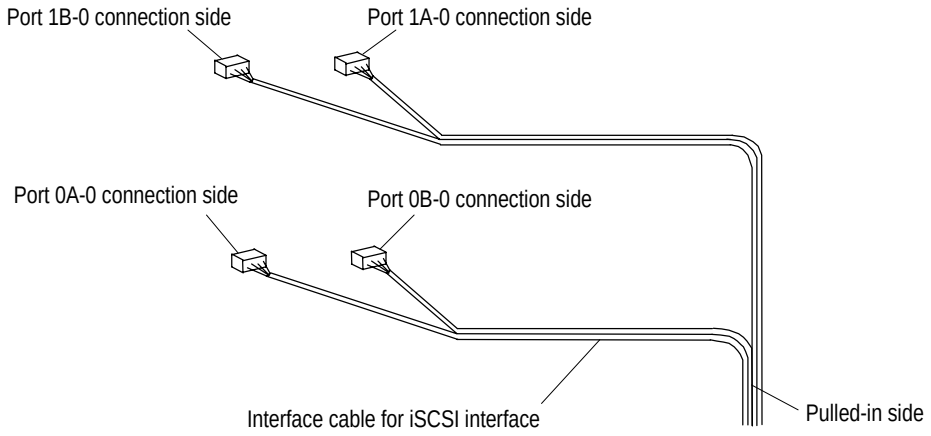
(2) Connecting the iSCSI Interface cable

(a) Connect the iSCSI Interface cables after making sure of the ports to be connected the LOCATION (REAR) label. (Refer to Figure 3.4.34.4.)

NOTE : When bending the iSCSI Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(b) Pull all the Interface cables into the rack frame passing them through an opening for cables on the bottom plate of the rack frame.



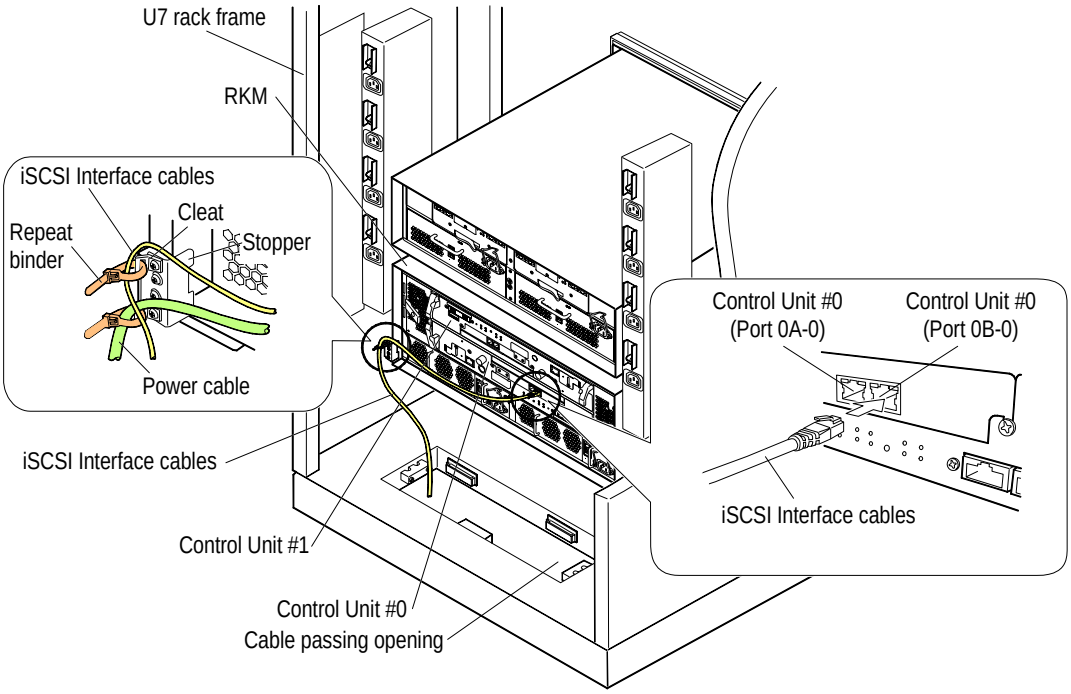


Figure 3.4.34.8 Binding Interface Cables (RKH/RKM/RKS/RKXS (iSCSI Interface Board is installed))

(c) Connect the Interface cable to the connector of the each port.

(d) In case of the U7 rack frame, perform the routing of the iSCSI interface cables, attach the cleat to the stopper, and fix the iSCSI interface cables through the repeat binder.
In the case of the NSC rack frame, perform the routing of the iSCSI interface cables, and fix them with the repeat binders.

(e) Fasten the iSCSI interface cables giving them excessive lengths so that they will not be pulled.

3.4.11 Connecting the ENC cables

According to the cable figure to be output from ACE Tool, connect the ENC cable.
For the operation method of ACE Tool, refer to Installation "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).
When connecting the RKM/RKS and RKAJ, execute the procedure (1).
(Refer to "(1) When connecting the RKM and RKAJ" (INST 03-0670).)
When connecting the RKM/RKS and RKAJAT, execute the procedure (2).
(Refer to "(2) When connecting the RKM and RKAJAT" (INST 03-0690).)
When connecting the RKXS and RKAJAT, execute the procedure (3).
(Refer to "(3) When connecting the RKXS and RKAJAT" (INST 03-0701).)
When connecting the RKH and RKAJ, execute the procedure (4).
(Refer to "(4) When connecting the RKH and RKAJ" (INST 03-0703).)
When connecting the RKH+RKAJ and RKAJAT, execute the procedure (5).
(Refer to "(5) When connecting the RKH+RKAJ and RKAJAT" (INST 03-0705).)

(1) When connecting the RKM/RKS and RKAJ

In the case of the RKAJ with both of the Control Unit of RKM/RKAJ, it is required to connect the Control Unit (RKM/RKS) and the ENC Unit with the ENC cables (‡1). (The ENC cables are supplied with the RKAJ.)

NOTE : • In single controller configuration, connect the ENC cable only to the Loop #0 (ENC Unit #0) side. Do not connect it to the Loop #1 (ENC unit #1) side. When two or more RKAJ are connected, however, both cables in ENC Unit #0 and ENC Unit #1 should be connected for the RKAJ.

• When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

Execute the following referring to "Figure 3.4.35 Connecting ENC Cables" (INST 03-0680).

(a) Remove the rubber cap on the Control Unit.
(b) Connect the ENC cable to the Control Unit.
(c) Connect the ENC cable to the ENC Unit of the RKAJ.

NOTE : Connect the Control Unit#0 of the RKM/RKS with the ENC Unit#0 of the RKAJ and the Control Unit#1 of the RKM/RKS with the ENC Unit 1 of the RKAJ. Connect two Path#0 connectors (with milk white indication) using the ENC cable and also connect two Path#1 connectors (with yellow indication) using another ENC cable (see Figure 3.6.4).

(i) To the PATH#0 (marked in milky white on the RKM/RKS side), connect the ENC cable marked in milky white.
(ii) To the PATH#1 (marked in yellow on the RKM/RKS side), connect the ENC cable marked in yellow.

(d) When the two or more RKAJs are mounted, connect each of the sets of the adjacent connectors of the same kind, that is, the PATH#0 and PATH#1 of the RKAJs using the ENC cables. (see Figure 3.4.32)
For the ENC cable connection in which the maximum configuration of RKM and RKAJs is installed, refer to "Figure 1.6.1 Example of RKM+RKAJ ENC cable connection (The figure shows an example in which the maximum configuration is installed in the U7 rack frame.)" (INST 01-0160).

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Remove the rubber cap of the ENC Units in the locations where the ENC cables are to be connected.

(ii) Connect each of the connectors PATH#0 (marked in milk white) and PATH#1 (marked in yellow) of the ENC Unit, from which the rubber cap was removed, with the ENC cables marked in the same color respectively.

(iii) Connect each of the connectors PATH#0 (marked in milk white) and PATH#1 (marked in yellow) of the adjacent RKAJ with the ENC cables marked in the same color.

(e) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

NOTE : Do not fix the ENC cable and the power cable together.

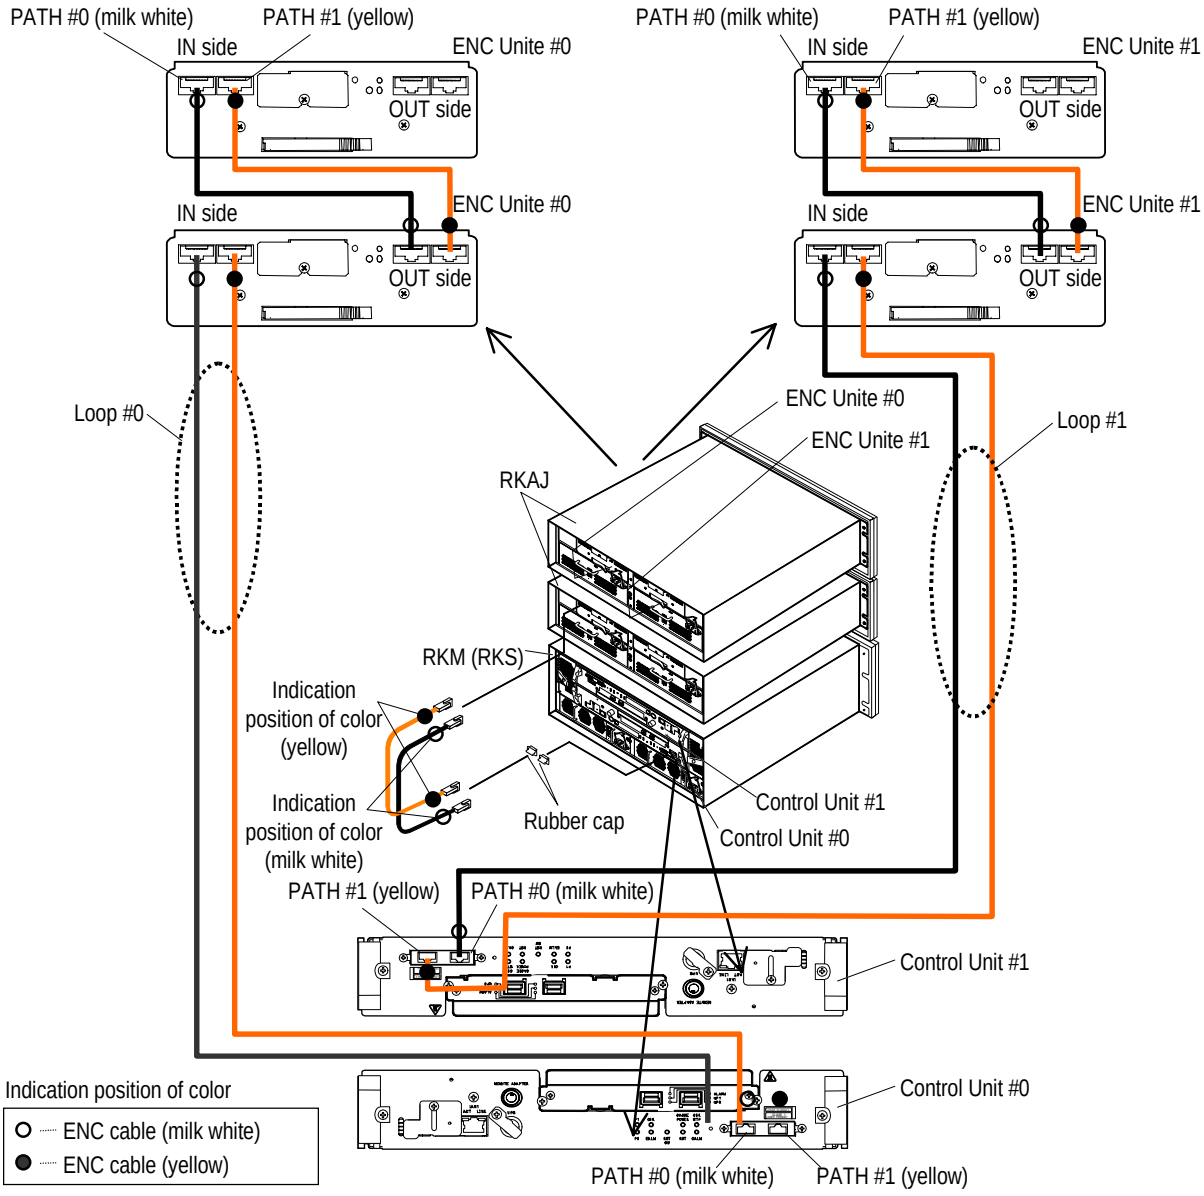

Figure 3.4.35 Connecting ENC Cables (RKM/RKS+RKAJ)

Copyright © 2005, 2006, Hitachi, Ltd.

(2) When connecting the RKM/RKS and RKAJAT

In the case of the RKAJAT with both of the Control Unit of RKM/RKS, it is required to connect the Control Unit (RKM) and the SENC Unit with the ENC cables (‡1). (The ENC cables are supplied with the RKAJAT.)

NOTE : • In single controller configuration, connect the ENC cable only to the Loop #0 (SENC Unit #0) side. Do not connect it to the Loop #1 (SENC unit #1) side. When two or more RKAJAT are connected, however, both cables in SENC Unit #0 and SENC Unit #1 should be connected for the RKAJAT.
• When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• The IN and OUT connectors of the SENC unit of the RKAJAT have indications by means of blue and green labels respectively.

Execute the following referring to "Figure 3.4.36 Connecting ENC Cables (RKM+RKAJAT)" (INST 03-0700).

(a) Attach milk white or yellow Mini-Binders to the ENC cable.
(b) Remove the rubber cap on the Control Unit.
(c) Connect the ENC cable to the Control Unit.
(d) Connect the ENC cable to the SENC Unit of the RKAJAT.

NOTE : Connect the Control Unit#0 of the RKM/RKS with the ENC Unit#0/SENC Unit#0 of the RKAJ/RKAJAT and the Control Unit#1 of the RKM/RKS with the ENC Unit #1/SENC Unit #1 of the RKAJAT (see Figure 3.4.35).

(i) Connect the cable marked in milky white from PATH#0 (marked in milky white) of RKM/RKS to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID#1).
(ii) Connect the cable marked in yellow from PATH#1 (marked in yellow) of RKM/RKS to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID#2).

(e) When the two or more RKAJATs are mounted, connect the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit of the RKAJATs using the ENC cables. (see Figure 3.4.36) For the ENC cable connection in which the maximum configuration of RKM and RKAJATs is installed, refer to "Figure 1.6.2 Example of RKM+RKAJ+RKAJAT ENC cable connection (The figure shows an example in which the maximum configuration is installed in the U7 rack frame.)" (INST 01-0170).

(i) Remove the rubber cap of the SENC Units in the locations where the ENC cables are to be connected.
(ii) Connect each of the connectors the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit, from which the rubber cap was removed, with the ENC cables.

(f) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

NOTE : Do not fix the ENC cable and the power cable together.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

Copyright © 2005, 2006, Hitachi, Ltd.

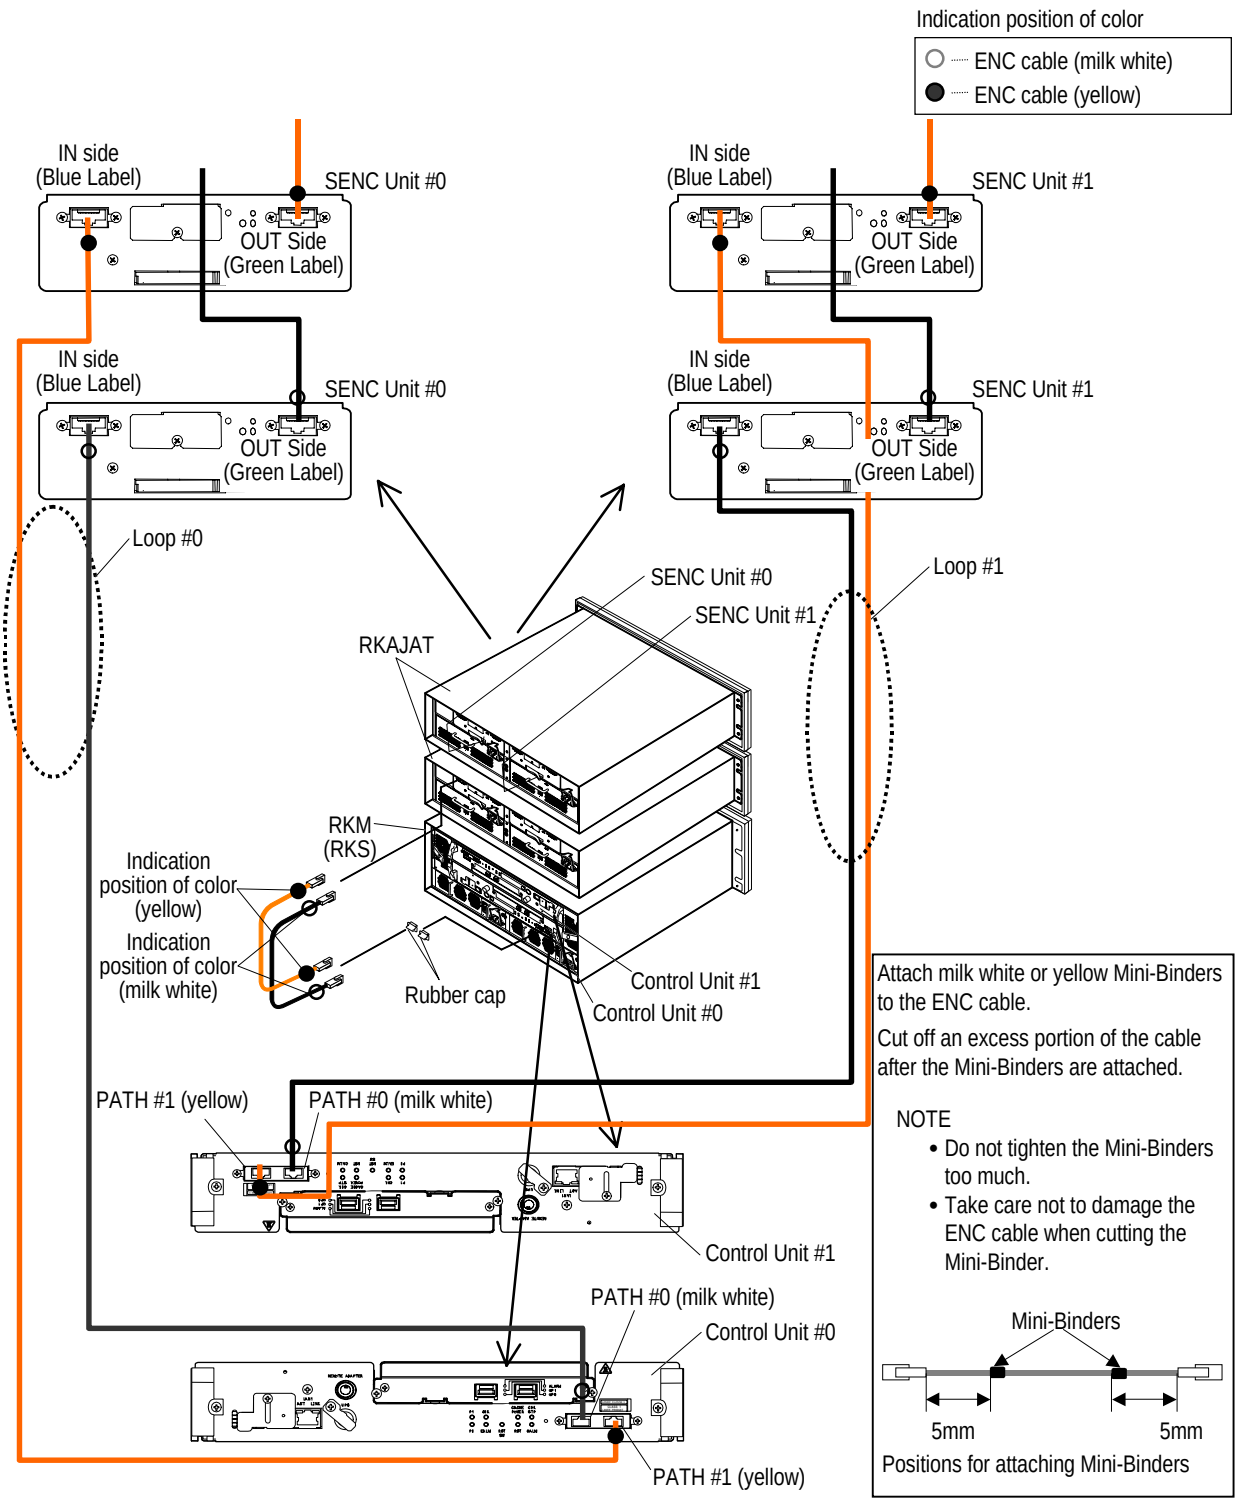

Figure 3.4.36 Connecting ENC Cables (RKM/RKS+RKAJAT)

(3) When connecting the RKXS and RKAJAT

In the case of the RKAJAT with both of the Control Unit of RKXS, it is required to connect the Control Unit (RKXS) and the SENC Unit with the ENC cables (‡1). (The ENC cables are supplied with the RKAJAT.)

NOTE : • In single controller configuration, connect the ENC cable only to the Loop #0 (SENC Unit #0) side. Do not connect it to the Loop #1 (SENC unit #1) side. When two or more RKAJAT are connected, however, both cables in SENC Unit #0 and SENC Unit #1 should be connected for the RKAJAT.
• When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• The IN and OUT connectors of the SENC unit of the RKAJAT have indications by means of blue and green labels respectively.

Execute the following referring to "Figure 3.4.36.1 Connecting ENC Cables (RKXS+RKAJAT)" (INST 03-0702).

(a) Attach milk white or yellow Mini-Binders to the ENC cable.
(b) Remove the rubber cap on the Control Unit.
(c) Connect the ENC cable to the Control Unit.
(d) Connect the ENC cable to the ENC Unit/SENC Unit of the RKAJ/RKAJAT.

NOTE : Connect the Control Unit#0 of the RKXS with the ENC Unit#0/SENC Unit#0 of the RKAJ/RKAJAT and the Control Unit#1 of the RKXS with the ENC Unit #1/SENC Unit #1 of the RKAJAT (see Figure 3.4.36.1).

(i) Connect the cable marked in milky white from PATH#0 (marked in milky white) of RKXS to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID#1).
(ii) Connect the cable marked in yellow from PATH#1 (marked in yellow) of RKXS to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID#2).

(e) When the two or more RKAJATs are mounted, connect the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit of the RKAJATs using the ENC cables. (see Figure 3.4.36.1) For the ENC cable connection in which the maximum configuration of RKXS and RKAJATs is installed, refer to "Figure 1.6.3 Example of RKXS+RKAJAT ENC cable connection (The figure shows an example in which the maximum configuration is installed in the U7 rack frame.)" (INST 01-0171).
(i) Remove the rubber cap of the SENC Units in the locations where the ENC cables are to be connected.
(ii) Connect each of the connectors the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit, from which the rubber cap was removed, with the ENC cables.

(f) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

NOTE : Do not fix the ENC cable and the power cable together.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

Copyright © 2005, 2006, Hitachi, Ltd.

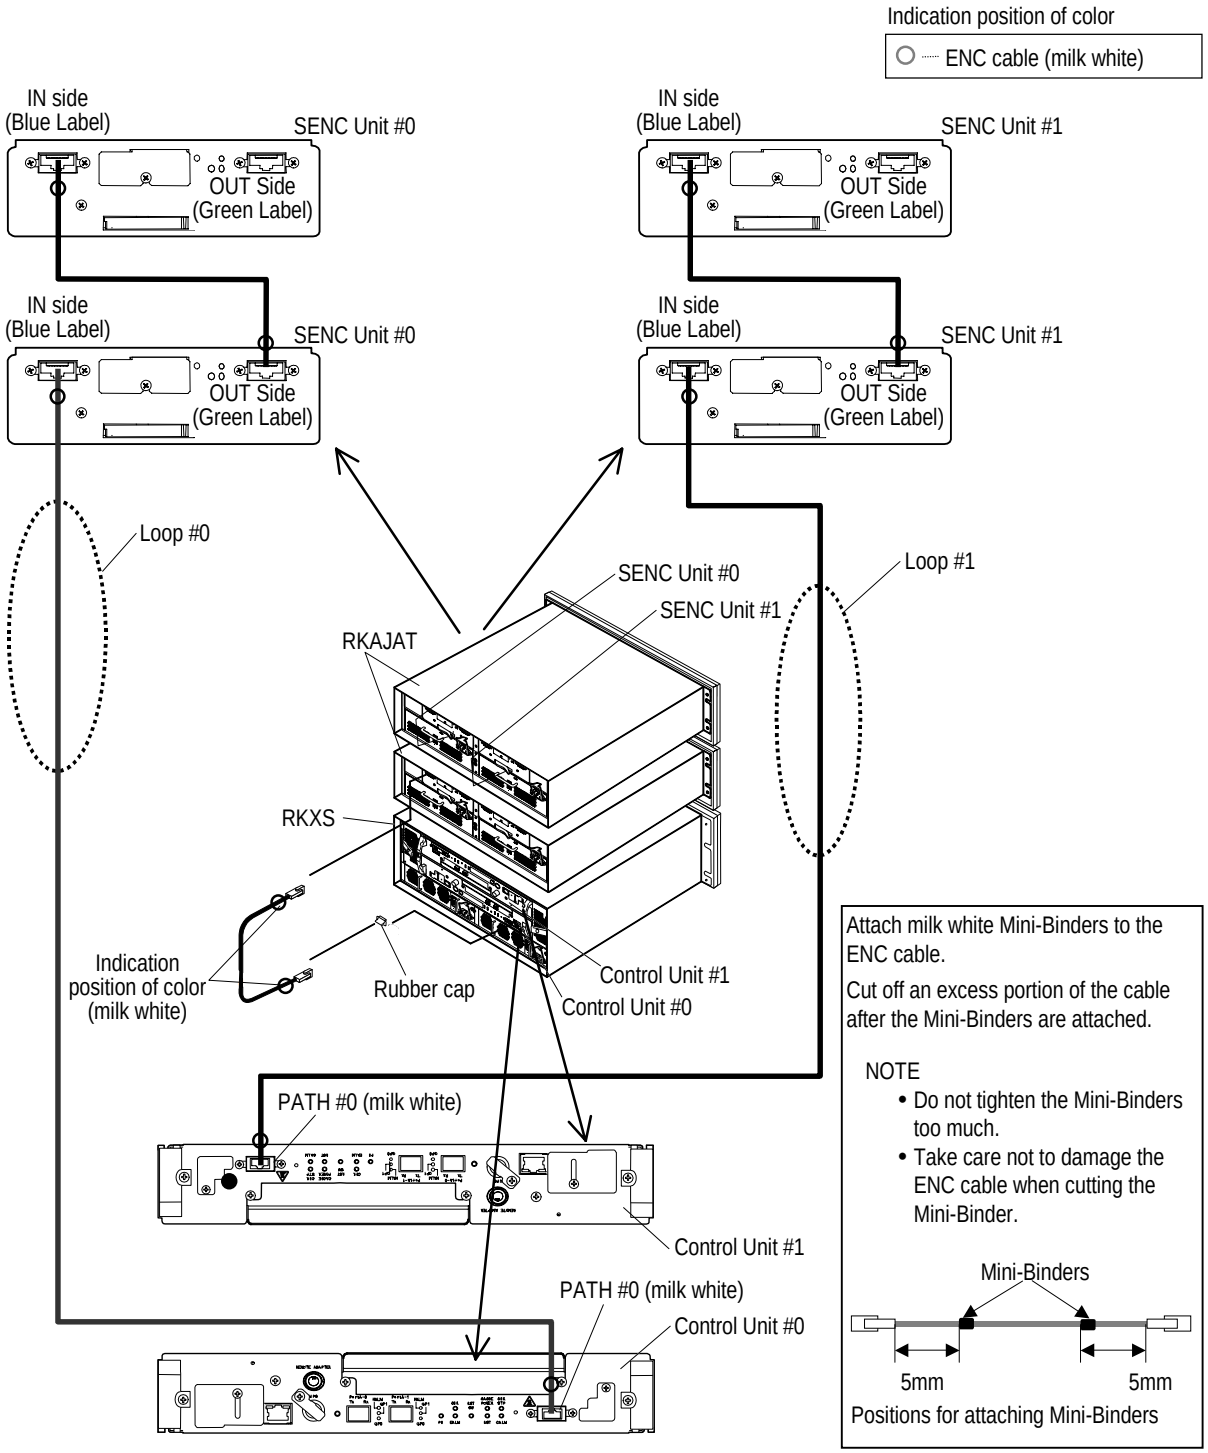

Figure 3.4.36.1 Connecting ENC Cables (RKXS+RKAJAT)

Copyright © 2005, 2006, Hitachi, Ltd.

(4) When connecting the RKH and RKAJ

In the case of the RKAJ with both of the Control Unit of RKH, it is required to connect the Control Unit (RKH) and the ENC Unit with the ENC cables (‡1).

NOTE : When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses .

Execute the following referring to Figure 3.4.36.2.

(a) Remove the rubber cap on the Control Unit.

(b) Connect the ENC cable to the RKH.

(c) Connect the ENC cable to the ENC Unit of the RKAJ.

NOTE : Connect the Control Unit#0 of the RKH with the ENC Unit#0 of the RKAJ and the Control Unit#1 of the RKH with the ENC Unit#1 of the RKAJ. Connect two Path#0, #2 connectors (with milk white indication) using the ENC cable and also connect two Path#1, #3 connectors (with yellow indication) using another ENC cable (see Figure 3.4.36.2).

(i) To the PATH#0, #2 (marked in milky white on the RKH side), connect the ENC cable marked in milky white.

(ii) To the PATH#1, #3 (marked in yellow on the RKH side), connect the ENC cable marked in yellow.

(d) When the two or more RKAJs are mounted, connect each of the sets of the adjacent connectors of the same kind, that is, the PATH#0, PATH#1, PATH#2 and PATH#3 of the RKAJs using the ENC cables. (see Figure 3.4.36.2)

For the ENC cable connection in which the maximum configuration of RKH and RKAJs is installed, refer to Figure 1.6.1 (INST 01-0160).

(i) Remove the rubber cap of the ENC Units in the locations where the ENC cables are to be connected by loosening the thumb screws.

(ii) Connect each of the connectors PATH#0, #2 (marked in milk white) and PATH#1, #3 (marked in yellow) of the ENC Unit, from which the rubber cap was removed, with the ENC cables marked in the same color respectively.

(iii) Connect each of the connectors PATH#0, #2 (marked in milk white) and PATH#1, #3 (marked in yellow) of the adjacent RKAJ with the ENC cables marked in the same color.

(e) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

Copyright © 2006, Hitachi, Ltd.

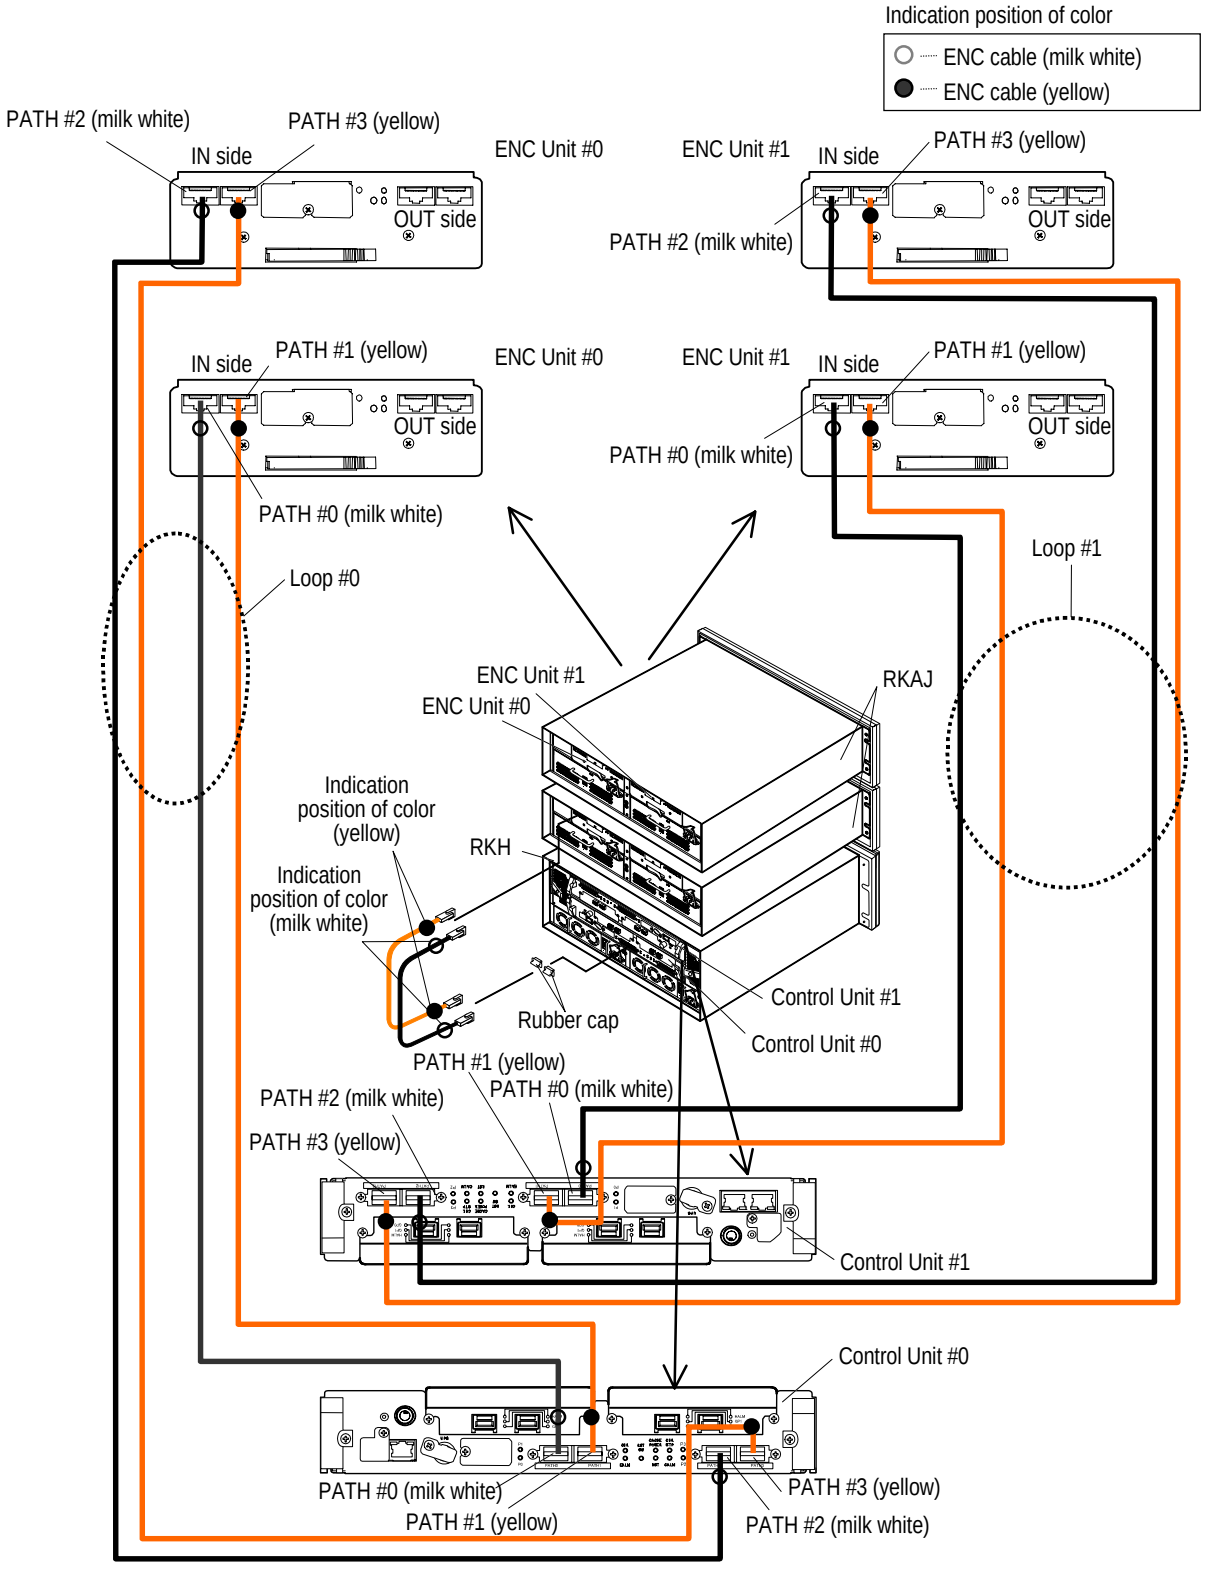

Figure 3.4.36.2 Connecting ENC Cables (RKH+RKAJ)

Copyright © 2006, Hitachi, Ltd.

(5) When connecting the RKH+RKAJ and RKAJAT

In the case of the RKAJAT with both of the Control Unit of RKH, it is required to connect the Control Unit (RKH) and the ENC Unit/ SENC Unit with the ENC cables [‡1].

NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses ..
• The IN and OUT connectors of the SENC Unit of the RKAJAT have indications by means of blue and green labels respectively.

Execute the following.

When connecting the RKH+ RKAJ and RKAJAT, refer to Figure 3.4.36.3.

(a) Attach milk white or yellow Mini-Binders to the ENC cable.
(b) Remove the rubber cap on the Control Unit.
(c) Connect the ENC cable to the RKH.
(d) Connect the ENC cable to the ENC Unit of the RKAJ.

NOTE : Connect the Control Unit#0 of the RKH with the ENC Unit#0 of the RKAJ and the Control Unit#1 of the RKH with the ENC Unit#1 of the RKAJ.
Connect two PATH#0 connectors (with milk white indication) using the ENC cable and also connect two PATH#1 connectors (with yellow indication) using another ENC cable.

(i) To the PATH#0 (marked in milky white on the RKAJ side), connect the ENC cable marked in milky white.
(ii) To the PATH#1 (marked in yellow on the RKAJ side), connect the ENC cable marked in yellow.

(e) When the two or more RKAJATs are mounted, connect the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit of the RKAJATs using the ENC cables.
For the ENC cable connection in which the maximum configuration of RKH+RKAJs and RKAJATs is installed, refer to Figure 1.6.2 (INST 01-0170).
(i) Remove the rubber cap of the ENC Units/SENC Units in the locations where the ENC cables are to be connected by loosening the thumb screws.
(ii) Connect each of the connectors the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit, from which the rubber cap was removed, with the ENC cables.
(f) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

3.4.12 Connecting the power cables

Connecting the power cables of Power Unit

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

(1) U7 rack frame

(a) Make sure that the breaker of the each PDB has been turned off.

(b) Make sure that the AC Power Unit Switch of the each Power Unit has been turned off.

(c) Insert the power cable plug into the receptacle on the each Power Unit.

(d) Pass Repeat Binders through the cleats attached to the right and left stoppers and fasten the power cable with the Binders.

(e) Insert the each power cable plug into the corresponding receptacle of the PDB. (Use the PDB receptacles in the order from the J10 to J13.)

NOTE : • Be sure to plug the power cable for the Power Unit#0 in the receptacle of the PDB#00 or PDB#01.
Be sure to plug the power cable for the Power Unit#1 in the receptacle of the PDB#10 or PDB#11.
If they are plugged in the receptacles of the PDBs on the same side, the function of the duplicated power supply does not work.

• Do not plug any cable other than the power cable of the mounted subsystem in the outlet of the PDB.

• Limit the total current output from the outlets J10 to J13 so that it does not exceed 20 amperes (‡1).

(f) Hang the cable clamp of PDB on the plug of the power cable.

(g) Route the power cables.

(h) Push in the plug of the power cable which has been inserted into the PDB again.
It may be loosened owing to a routing.

‡1 : When installing the two or more RKMs, connect them so that the load on a PDB does not exceed 20 A after checking the load through a calculation.
RKH one unit : 2.6 A
RKM one unit : 4.2 A
RKS one unit : 4.0 A
RKXS one unit : 3.0 A
RKAJ one unit : 2.6 A
RKAJAT one unit : 2.4 A

Copyright © 2005, 2006, Hitachi, Ltd.

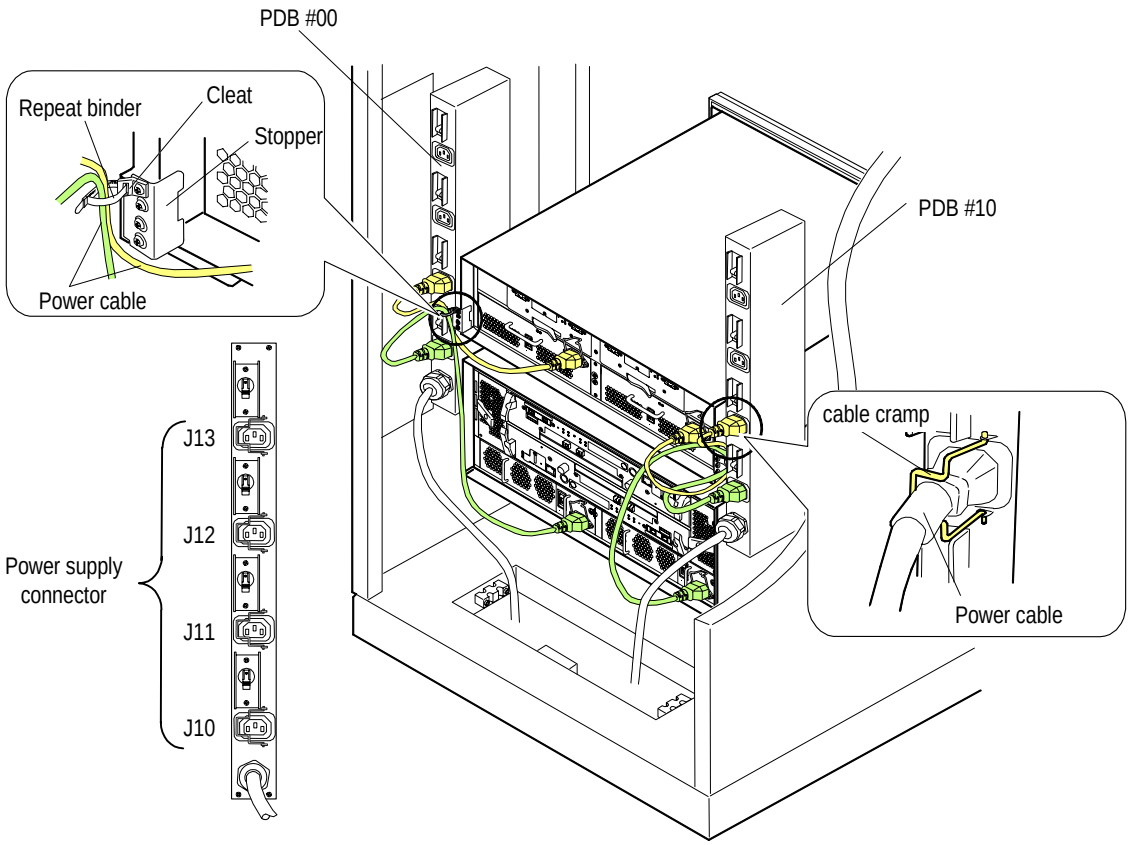

Figure 3.4.37 Routing Power Cables to the Mounted Subsystem in the U7 rack frame

Copyright © 2005, 2006, Hitachi, Ltd.

(2) NSC rack frame

(a) Make sure that the AC Power Unit Switch of the each Power Unit has been turned off.

(b) Insert the power cable plug into the receptacle on the each Power Unit.

(c) Pass Repeat Binders through the cleats attached to the right and left stoppers and fasten the power cable with the Binders.

(d) Insert the each power cable plug into the corresponding receptacle of the PDB. (Use the PDB receptacles in the order from the J102 to J104.)

NOTE : • Be sure to plug the power cable for the Power Unit#0 in the receptacle of the PDB#10.
Be sure to plug the power cable for the Power Unit#1 in the receptacle of the PDB#11.
If they are plugged in the receptacles of the PDBs on the same side, the function of the duplicated power supply does not work.

• Do not plug any cable other than the power cable of the mounted subsystem in the outlet of the PDB.

(e) Hang the cable clamp of PDB on the plug of the power cable.

(f) Route the power cables.

(g) Push in the plug of the power cable which has been inserted into the PDB again.
It may be loosened owing to a routing.

3.4.13 Connecting the power cables (Rack frame PDB)

⚠ CAUTION

- Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.
- The cable of PDB is a fixed type. Do not loosen the installation part. If it is loosened, the connected part is damaged, and it causes an electric shock or fire.

NOTE : Make sure that conductors shall be provided with 30 A over current protection in accordance with Article 240 of the National Electrical Code, ANSI/NFPA 70, and the Canadian Electrical Code, Part 1, CSA C22.1, Section 14.

(1) Open the rear door. (See Subsection, "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)
(2) Make sure that the power supply switches of the PDBs are turned off.
(3) Put out the power cables of PDBs through the Cable passing opening at the bottom of the Rack.
(4) Remove the cable holders from the rack frame by removing the hexagon socket head bolts.
(5) Fasten the power cables to the rack frame by attaching the cable holders with the Allen bolts.
(6) Make sure that the connecter is securely fixed after the assembly work.

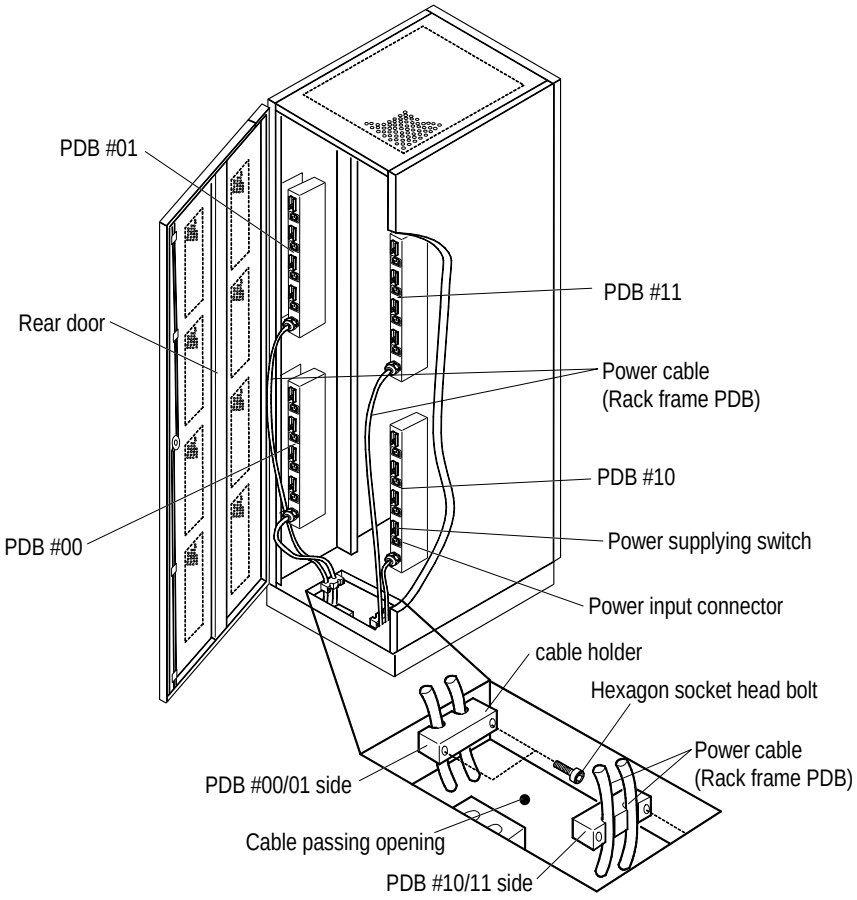

Figure 3.4.38 Connecting Power Cables (Rack frame PDB)

3.4.14 Connecting the cables for the RKNAS

CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "1.1 (3) Note on cable routing" (INST 01-0010).

The cable routing for the subsystem which is mounted on the rack frame is shown in Figure 3.4.31, Figure 3.4.32. Types of the cables to be used are shown in Table 3.4.12.

Table 3.4.12 Types Cables to be Connected

No.	Cable name	Remarks
1	NAS Interface cable (PCI-Express cable, CTRL cable)	See "3.4.15 Connecting the NAS interface cable" (INST 03-0750)
2	LAN cable for NAS	See "3.4.16 Connecting the LAN cable for the NAS" (INST 03-0760)
3	Power cable (100 V) for NAS	See "3.4.17 Connecting the power cable for the NAS" (INST 03-0770)
4	LAN cable for the data	Connect to LAN for the User
5	LAN cable for the control	Connect to NAS Manager control PC
6	FC cable for the backup	Connect to the backup device

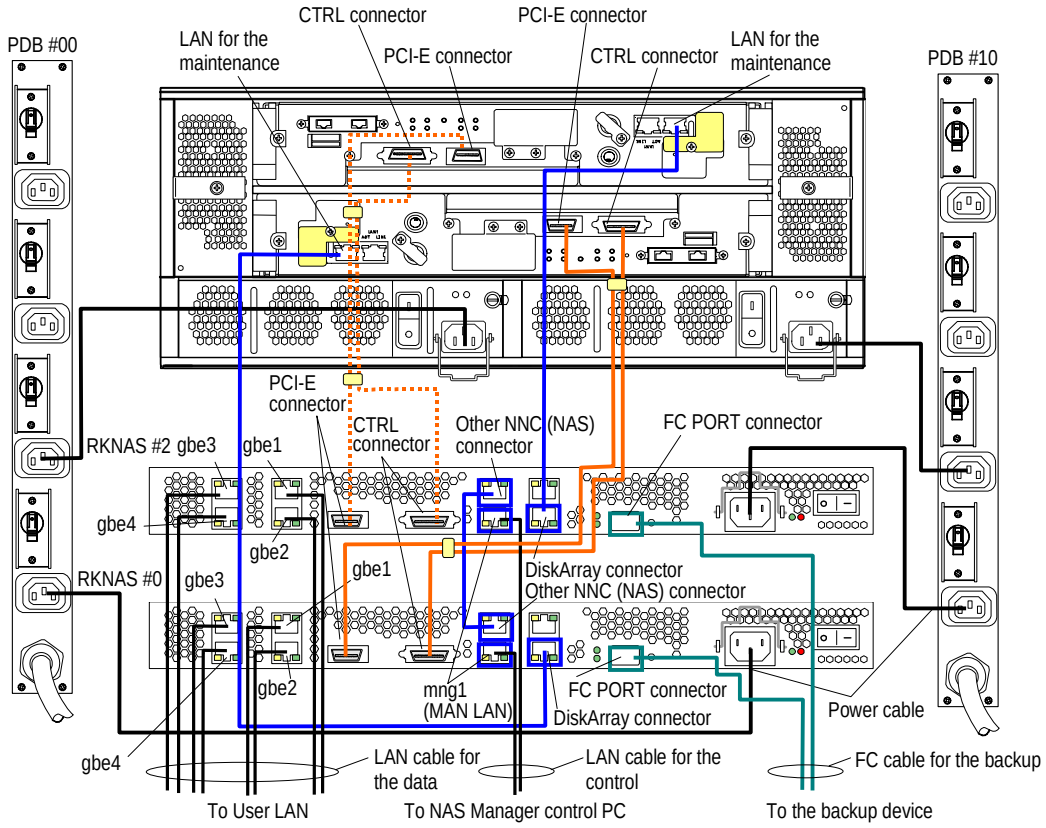

Figure 3.4.39 Connecting Cables for NAS

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.15 Connecting the NAS interface cable

When connecting the RKNAS, it is necessary to connect the NAS Interface Board of the RKM/RKS/RKXS/RKH and the RKNAS with the PCI-Express cable and the CTRL cable.

Perform the following, referring to the Figure 3.4.40.

(1) Connect the PCI-Express cable to the PCI-E connector on the NAS Interface Board of the RKM/RKS/RKXS/RKH. Connect the CTRL cable to the CTRL connector as well.

(2) Connect the PCI-Express cable and the CTRL cable to the RKNAS.
Bundle the connected PCI-Express cable and the CTRL cable with a repeat binder (at the position approximately 150mm from the tip of the cable).

(3) Bundle the extra length of the connected PCI-Express cable and the CTRL cable lightly in a circular pattern with the repeat binder.

NOTE : Do not fix the PCI-Express cable and the CTRL Cable together with the power cable.

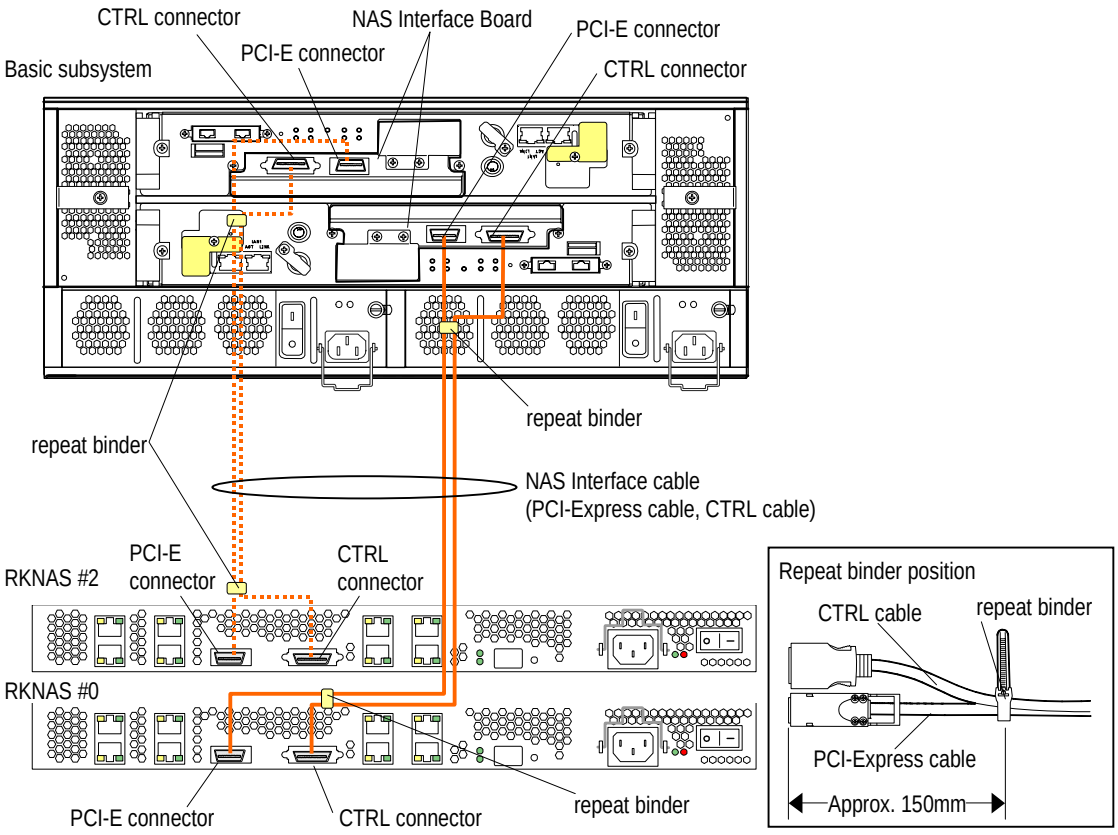

Figure 3.4.40 Connecting NAS Interface Cables (RKM/RKS/RKXS)

3.4.16 Connecting the LAN cable for the NAS

When connecting the RKNAS, it is necessary to connect the Control Unit of the RKM/RKS/RKXS/RKH and the LAN cable of RKNAS.
Also, connect between the RKNASs with the LAN cable.
Perform the following, referring to the Figure 3.4.41.

(1) Attach the labels on both ends of the LAN cable. (The labels are supplied with the RKNAS.)
Attach the yellow labels on the LAN cable between the Control Unit and the RKNAS.
Attach the red labels on the LAN cable between the RKNAS #0 and the RKNAS #2.
When the Basic Chassis is the RKH, attach the red label on the LAN cable between the RKNAS #1 and the RKNAS #3.
(2) Connect the LAN cable on which the yellow labels are attached to the LAN connector for the maintenance on the Control Unit of the RKM/RKS/RKXS/RKH.
(3) Connect the LAN cable on which the yellow labels are attached to the DiskArray connector of the RKNAS.
(4) Connect between the Other NNC connector of the RKNAS #0 and the Other NNC connector of the RKNAS #2 with the LAN cable on which the red labels are attached.
(5) Connect the control LAN cable to the mng1 connector of the RKNAS.
(6) Connect the data LAN cable to the gbe1 - gbe4 connector of the RKNAS.
If the covers are attached to the gbe1 - bge4 connectors, connect the cables after removing them.

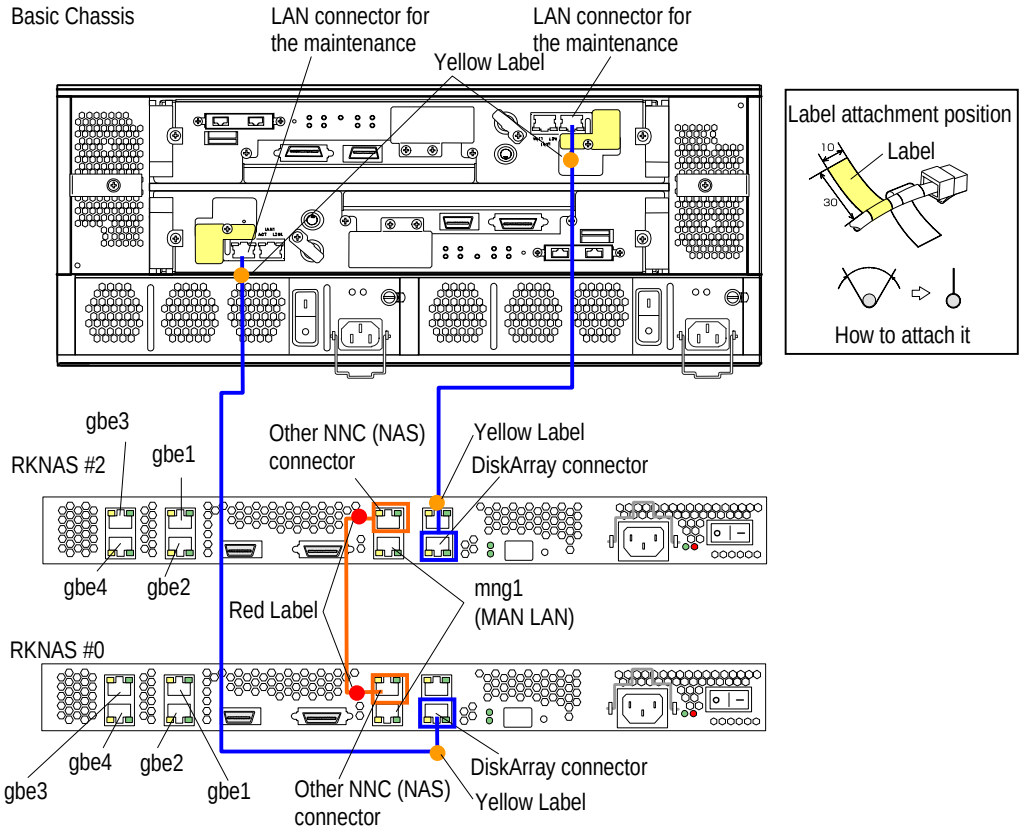

Figure 3.4.41 Connecting LAN Cables for NAS (RKM/RKS/RKXS)

3.4.17 Connecting the power cable for the NAS

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

(1) Check that all the breakers of the PDB are turned off.
(2) Check that all the AC Input Power Switches of the RKNAS power supply unit are turned off.
(3) Insert the socket of the power cable in the RKNAS power supply unit.
(4) Insert the plug of the power cable in the PDB (use it from J10 to J13 in order).

NOTE : • Be sure to insert the power cable for the RKNAS #0 in the PDB #00/01.
In the case of the RKH, be sure to insert the power cable for the RKNAS #1 in the PDB #00/01.
Be sure to insert the power cable for the RKNAS #2 in the PDB #10/11.
In the case of the RKH, be sure to insert the power cable for the RKNAS #3 in the PDB #10/11.
It cannot be duplicated if inserting it in the same PDB side.
• Do not insert anything other than the installed power cable in the outlet of the PDB.
• Do not let the total current output from J10 to J13 exceed 20A (‡1).

(5) Hang the cable clamp of the PDB on the plug of the power cable.
(6) Route the power cable.
(7) Push the plug of the power cable inserted into the PDB again. It may be loosen by routing.

‡1 : When installing the two or more RKMs, connect them so that the load on a PDB does not exceed 20 A after checking the load through a calculation.
RKH one unit : 2.6 A
RKM one unit : 4.2 A
RKS one unit : 4.0 A
RKXS one unit : 3.0 A
RKAJ one unit : 2.6 A
RKAJAT one unit : 2.4 A
RKNAS one unit : 2.0 A

Copyright © 2005, 2006, Hitachi, Ltd.

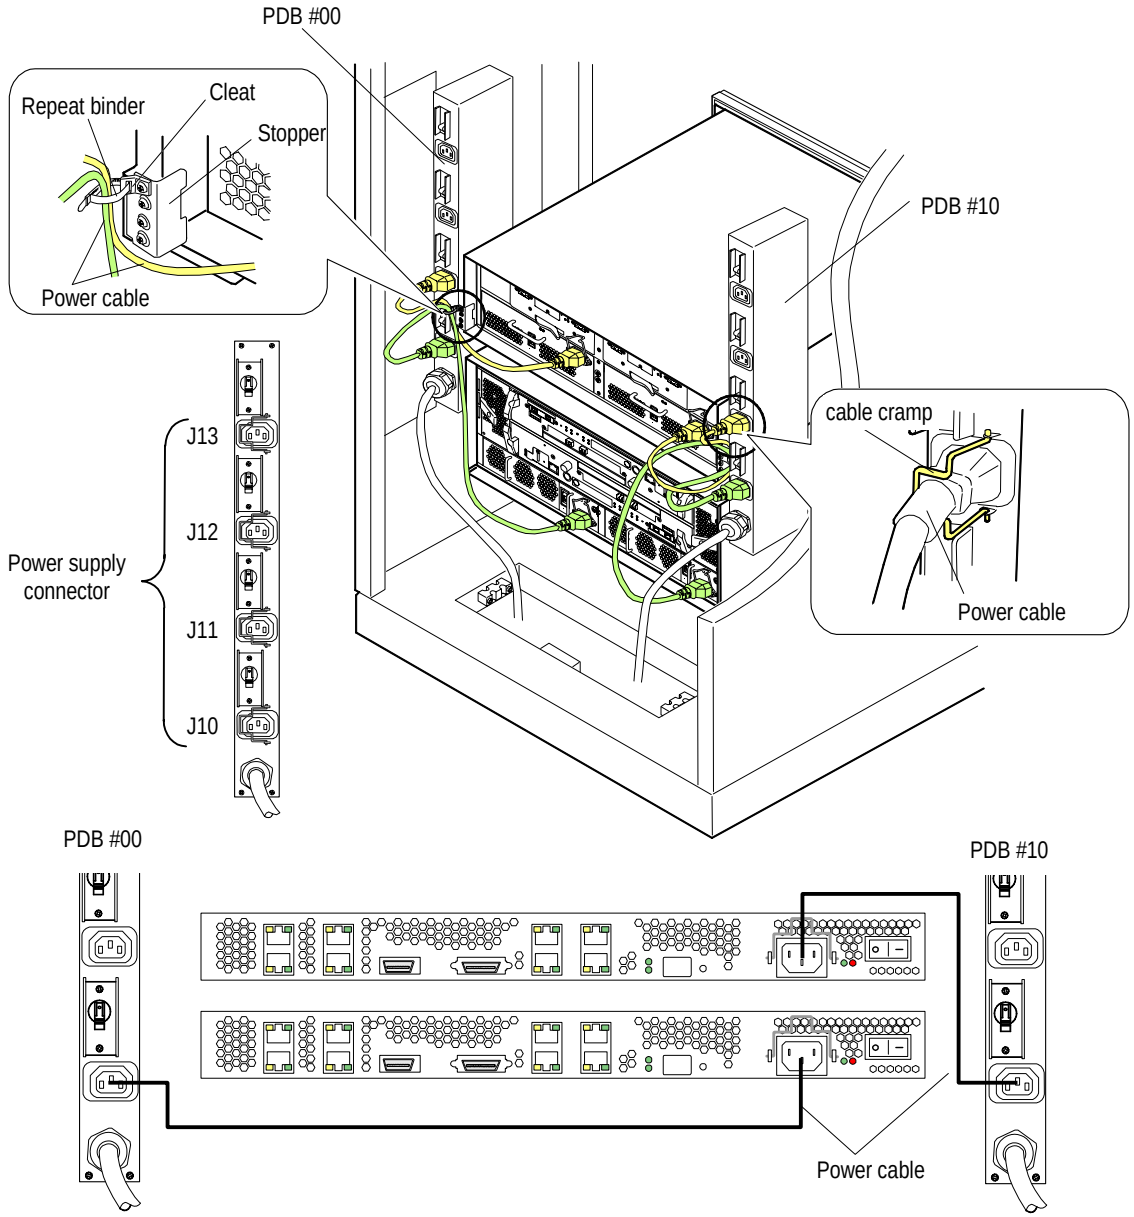

Figure 3.4.42 Connecting Power Cables for NAS

Copyright © 2005, Hitachi, Ltd.

3.4.18 Attaching Decoration Panels

When a vacant space is left on the front side of the rack frame, install the decoration panels there.

(1) Fit the decoration panels to the front side of the rack frame one by one starting from the top.
(2) The decoration panel can be installed when the two extrusions of it are aligned with the holes, which are prepared on the rack frame with intervals of one EIA unit, and then pressed into the holes.

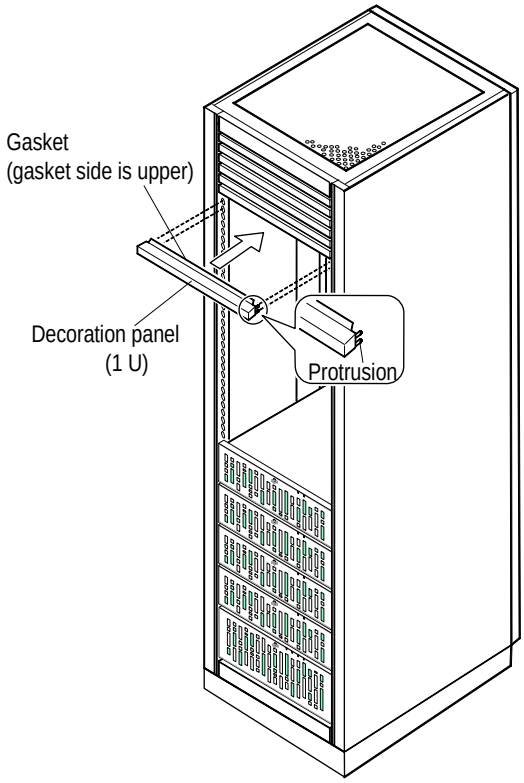

Figure 3.4.43 Attaching Decoration Panel

Copyright © 2005, Hitachi, Ltd.

3.4.19 Closing Door or Attaching Front Bezel

(1) Close the rear door. (Refer to "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)

(2) Attach the Front Bezel. (Refer to "1.5.3 How to attach/remove Front Bezel of the Rackmount Model" (INST 01-0130).)

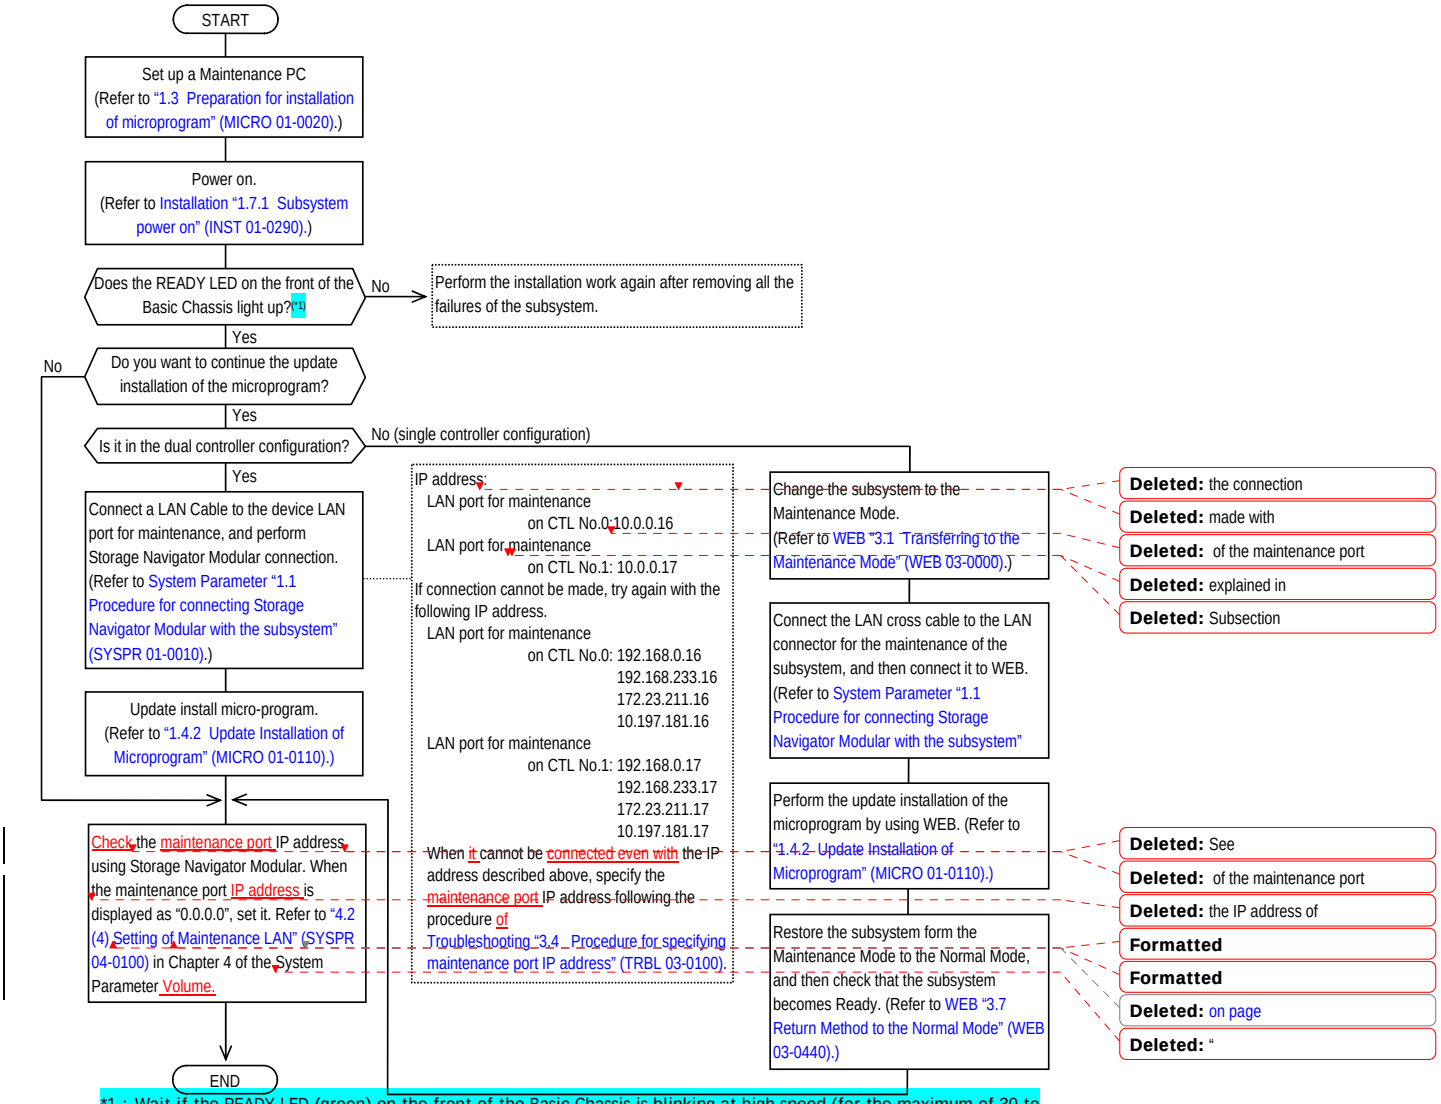
Chapter 1. Installation of Microprogram

This work is for new installation or update installation of the microprogram in the subsystem.

NOTE : • If new installation is performed, user data is lost. When user data already exists, be sure to perform update installation.
- Do not perform the update installation of the microprogram while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).
- Do not perform the new or update installation of the microprogram, update of the NAS BIOS firmware, or the installation of the NAS OS while the array subsystem is being started.
- When the subsystem is in the single controller configuration, the update installation of the microprogram which uses the Storage Navigator Modular cannot be performed. In this case, change the subsystem to the Maintenance Mode, and perform the update installation of the microprogram by using WEB in the Maintenance Mode.

1.1 Materials necessary for installation

- Maintenance PC(‡1)
- LAN cross cable
- CD-ROM for microprogram installation



‡1 : The service PC must have a CD-ROM drive for the microprogram installation. If the Maintenance PC has no CD-ROM drive, it must be set up beforehand via a network.
(See "1.3 (4) Procedure for setting up the Maintenance PC" (MICRO 01-0050).

Copyright © 2005, 2006, Hitachi, Ltd.

1.2 Outline of procedure for installation (update installation)

(1) Install the microprogram using the WEB or Storage Navigator Modular connection from the Maintenance PC.

(2) In the Maintenance PC, JRE (‡1) 1.3.1 03 must be installed. (See "1.3 (4) Procedure for setting up the Maintenance PC" (MICRO 01-0050).)

*1 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

‡1 : Java runtime environment.

Copyright © 2005, 2006, Hitachi, Ltd.

1.3 Preparation for installation of microprogram

(1) Outline

Set up the Maintenance PC before starting the update installation. Outline of the setting up is shown below

- Installation of the JRE 1.3.1 03
- Setting of the security policy file
- Copying of the microprogram from the CD-ROM for the microprogram installation to the service PC

(2) Prerequisites for setting up of a Maintenance PC

Prerequisites concerning the user ID of Windows are as follows.

- The user ID of Windows at the time when the microprogram is installed in the Maintenance PC must be identical with that at the time when a maintenance work is done.
- The user ID mentioned above must be defined not with full size Japanese characters but with half size alphabetic characters and/or numerals.

A prerequisite of a drive for booting the OS of the Maintenance PC

- The drive for booting the OS must be the c drive.

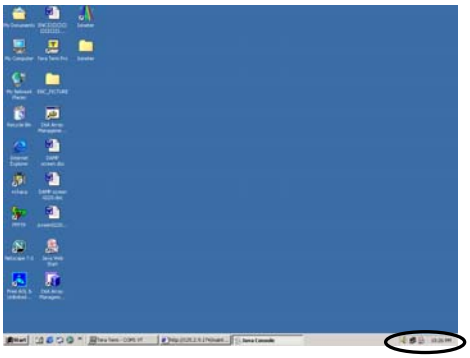
(3) Java error codes displayed at the time of update installation and actions for coping with them.

When the PC does not satisfy the prerequisite shown in Item (2) Prerequisites for setting up of a Maintenance PC. Details of the Java errors and actions for coping with them are shown below.

If the message code of the Java error that occurred does not exist in Table 1.3.1, refer to Message "7.1 Web error messages (Uploading Function)" (MSG 07-0000).

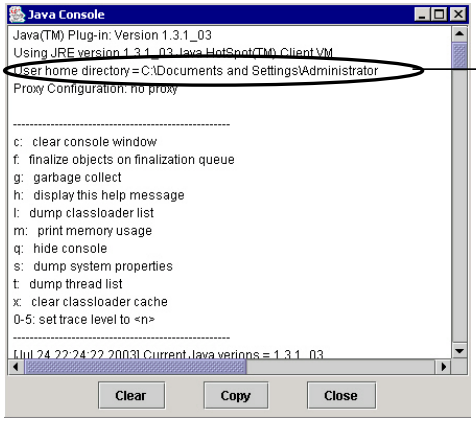
Copyright © 2005, 2006, Hitachi, Ltd.

Table 1.3.1 Java error codes



Message code	Message text	Time when the error occurs/ Cause estimated	Action for coping with the error
1216	Access to the property information was rejected. Confirm the setup of the security policy.	Time when the error occurs • The error occurs immediately after the [Select] key is pressed when the microprogram is selected. Cause estimated • A drive for booting the OS is not the c drive. • The user name of Windows at the time when the microprogram was installed in the Maintenance PC is not identical with that at the time when the microprogram is updated, or two-byte characters (full size characters or Japanese characters) are used to define the user name	① Check if the drive for booting the OS is the c drive. (Refer to the note (a) of (3) in Subsection 1.3.) In the case of the dual boot, boot Windows using the c drive and perform the installation again. ② Check if the user name of Windows at the time when the microprogram is installed in the Maintenance PC is identical with that at the time when the microprogram is updated and if two-byte characters (such as full size characters and Japanese characters) are not used. If an illegal specification has been made, perform the logon over again using an appropriate user name and perform the installation again after connecting the browser.
1219	An error occurred during the communication with the subsystem. Confirm the subsystem status and the LAN environment.	Time when the error occurs • The error occurs when the resource for the LAN cannot be ensured. Cause estimated • The error occurs because the resource (memory) of the Maintenance PC is insufficient.	① Reboot the subsystem and the Maintenance PC and quit unnecessary application programs. Make sure that the subsystem is in the Ready status, place the subsystem in the Maintenance mode, and perform the installation again. ② If the error recurs in spite of the operations above, replace the Maintenance PC and perform the installation over again from the beginning. Use a Maintenance PC whose memory capacity is as large as possible.

Copyright © 2005, Hitachi, Ltd.

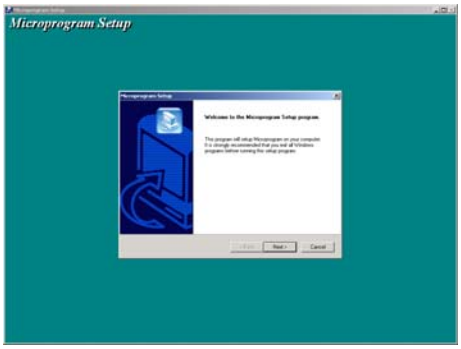


(a) Method for checking the drive for booting the OS

A method for checking the boot drive when the Java message (message code: 1216) is issued is shown below.

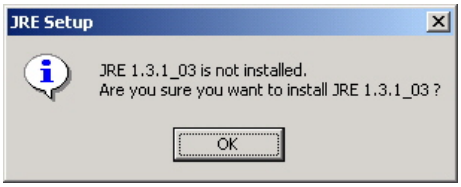
(i) Double click the [: Java icon]on the task tray at the bottom right in the Maintenance PC window.

(ii) Since the JavaConsole window opens, make sure that the [User Home Directory] is the c drive (=C: ¥*****…).



Copyright © 2005, Hitachi, Ltd.

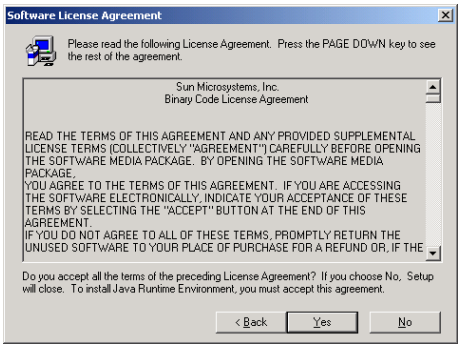
(4) Procedure for setting up the Maintenance PC



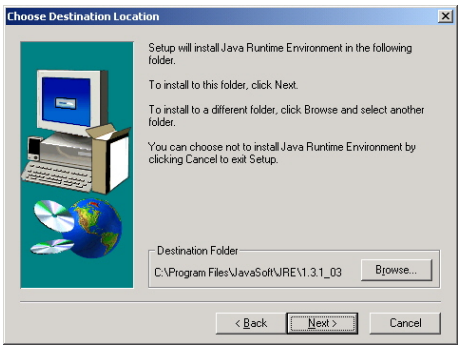
(a) When the version other than JRE 1.3.1 03 is installed in the service PC, the microprogram replacement may not be performed normally.
When the version other than JRE 1.3.1 03 is installed, be sure to uninstall the JRE, and then go to Procedure (b).
Open [Setting] – [Control Panel] from the start menu of Windows, and delete the JRE by "Addition and Deletion of Applications" to uninstall the JRE.

(b) Double click the "Program¥micro upload¥micro setup¥Setup. exe" of the CD-ROM for microprogram installation.

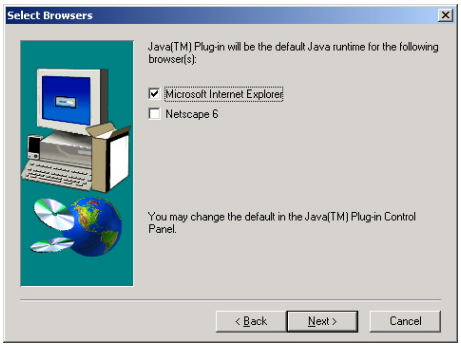
(c) The initial window of the setting up appears.
When the [Next] button is pressed, the JRE 1.3.1 03 installer is activated in the case where the JRE 1.3.1 03 is not installed yet.
In the case where the JRE 1.3.1 03 has been installed, windows shown in Steps (d) to (h) are not displayed.



(d) A dialog box for asking confirmation of starting the JRE 1.3.1 03 installer. Click the [OK] button.

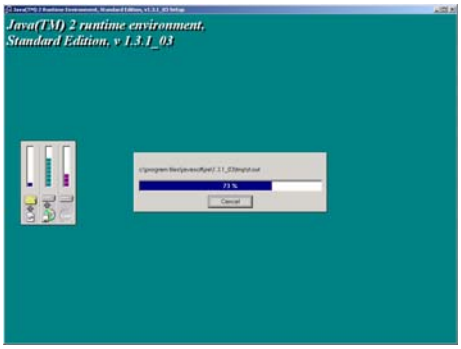


Copyright © 2005, 2006, Hitachi, Ltd.



(e) A window of product licensing contract is displayed. Click the [Yes] button.

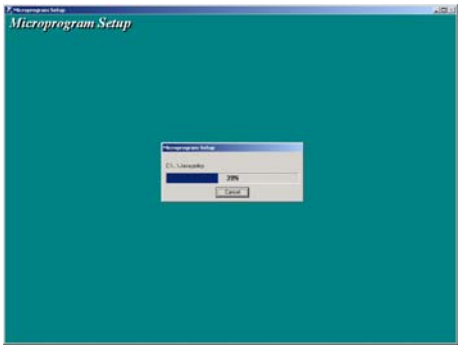
(f) A window for selecting a directory in which the JRE 1.3.1 03 is to be installed. Select the directory for the installation and click the [Next] button.



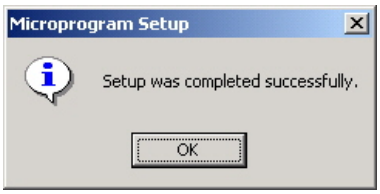
(g) A window for specifying the Java default browser is displayed. Select the browser being used and click the [Next] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Installation of the JRE 1.3.1 03 is started.



(i) After the installation of the JRE 1.3.1 03 is completed, set the security policy file.
When the security policy file (.java.policy) exists in the home directory of the current user, a window for asking confirmation of starting the setting is displayed.
Click the [Yes] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(j) The microprogram is copied on the Maintenance PC.
Create a directory to which the microprogram is to be copied directly under the "C:¥diskarray-microprogram¥microprogram" for each microprogram revision and copy the microprogram file with the subdirectories (DF700M, DF700S, ENC, ---) into the directory.

(k) The setting up is completed. Press the [OK] button.

(5) Notes
(a) Note that the settings of the security policy file is changed when the Maintenance PC is set up.
(b) If the microprogram is transferred to a directory other than "C:¥diskarray-microprogram¥microprogram" which is a directory copied by the installer, the installation cannot be done. Therefore, care should be taken.
(c) Do not change a name of the unified version directory(‡1) or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

‡1 : For the unified version directory, refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090).

Copyright © 2005, 2006, Hitachi, Ltd.

1.3.1 Hierarchy of Microprogram Storage Directories

The hierarchical structure of Microprogram storage directories is shown in Table 1.3.2.
The structure of directories of the CD-ROM for installing the Microprogram is the same as that shown in Table 1.3.2.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:¥diskarray-microprogram¥microprogram."
When installing the Microprogram, specify the unified version directory.

Table 1.3.2 Directory Hierarchy

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	microprogram file	-	-

NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The Microprogram becomes unable to be installed if the directory name is changed.

NOTE : When using the NAS model, the microprogram, the BIOS firmware, and the NAS OS may be newly released at the same time. In this case, perform the installation work in the following order unless otherwise instructed.
① Installation of the microprogram
② Installation of the BIOS firmware
③ Installation of the NAS OS

Copyright © 2005, Hitachi, Ltd.

1.4 Procedure for installation

1.4.1 The point to be checked before installation

Make sure of the following before starting installation

- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem.
- When newly installing, the subsystem does not become READY after turning on the main switch of the subsystem because the microprogram is not installed. ("RB8400 Download failed" is displayed on the "Information Message".)
- When the microprogram is already installed in the disk array subsystem, check that the READY LED (green) on the front of the Basic Chassis lights up. When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, do not perform the update work for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.
- When the microprogram is already installed in the disk array subsystem, check that the WARNING LED (orange) on the front of the Basic Chassis goes out, and the READY LED (green) lights up. When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed.
- Check with Information Message on WEB ("I141xy (or I141HH) System copy completed" is displayed for the Disk Drive indicated by "I140xy <or I140HH> System copy start") that the system copy is not being operated. If the system copy is being executed, install it after completing the system copy.
- If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance the update installations in the status that TrueCopy remote replication/ TrueCopy Extended Distance is enabled, the following phenomena occur.
  - Both of the TrueCopy remote replication path or the TrueCopy Extended Distance path are blocked.
    When the paths are blocked, the failure monitoring program (ASSIST), notice of the E-MAIL ASSIS function, and the TRAP of SNMP Agent Support Function occur. Give the check and the notice to the Failure Monitoring Department in advance.
  - When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

  If the array subsystem is the update installed unavoidably, the update installation it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

Copyright © 2005, 2006, Hitachi, Ltd.

- If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
  When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

  NOTE : When Power Saving of the priced option is used, if you perform the update installation of the microprogram in the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the microprogram replacement is completed.
  Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then install the microprogram in the subsystem.
  If the spin-down fails, execute the spin-down again.

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

1.4.2 Update Installation of Microprogram

Please execute "(1) Procedure for download" (MICRO 01-0110) and "(2) Replacing the microprogram" (MICRO 01-0170) to the update installation.

NOTE : • Do not perform the update installation of the microprogram while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

- When registering the disk array subsystem at the time of connecting the disk array subsystem, specify only the Control Unit #0 in [Connection Destination] (refer to System Parameter "1.1 (3) (c) Registering the disk array subsystem" (SYSPR 01-0060)).
- When executing the update installation online at the time of the NAS Unit connection, check the fail-over of the NAS Unit before performing (3-2), and stop the NAS OS of the NAS Unit. After that, check the fail-back after the microprogram replacement. (Refer to DF700 SOFTWARE Maintenance Manual "4.2.1 NAS Hardware Replacement Flow" (NAS 04-0020).)(‡1)
- When the CIFS file system is created and used, the update installation during the system operation cannot be performed.
- When the LU, whose status of the forced parity correction is any of "Correcting", "Waiting", "Waiting Disk Drive Recovery", "Uncorrected", "Uncorrected 1" and "Uncorrected 2", is in the subsystem, change the status of the LU to "Restored" or "Skip" by executing or skipping the forced parity correction (recommendation).

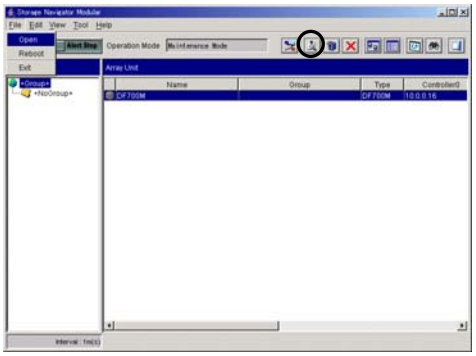
(1) Procedure for download

Download the microprogram from the CD-R into the subsystem. In the download, the microprogram is stored in the subsystem; the microprogram of the subsystem is not replaced.

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the Web. (See Subsection Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000).

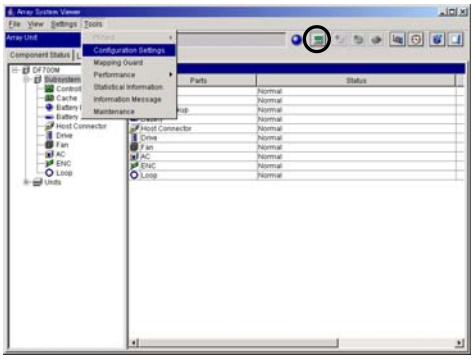
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection System Parameter "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050).))

Copyright © 2005, 2006, Hitachi, Ltd.



‡1 : Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

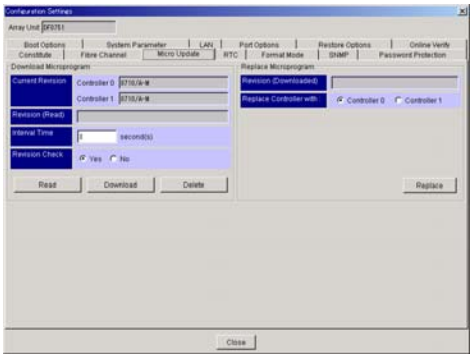
Copyright © 2005, 2006, Hitachi, Ltd.



(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

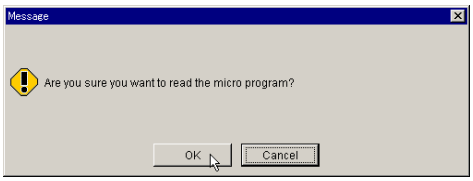
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(d) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

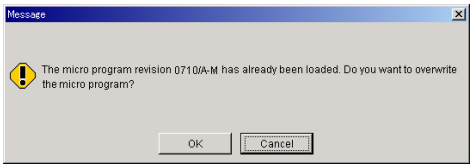
Copyright © 2005, 2006, Hitachi, Ltd.



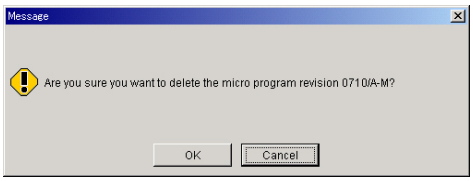
(e) Click the [Micro Update] tab.

(f) Read in the microprogram to the Maintenance PC in which Storage Navigator Modular is installed. Click the [Read] button.
When a microprogram revision is displayed in the [Revision(Read)] box, the microprogram has already been read in. When only the Unified version directory(‡1) storing the microprogram is specified, the whole microprogram is read in automatically.

(g) Since a message asking for confirmation whether or not to read in the microprogram, click the [OK] button.



NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the download of the microprogram again from the beginning.



‡1 : For the unified version directory, refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090).

Copyright © 2005, 2006, Hitachi, Ltd.

In the case where the microprogram has already been read in, the message asking for the confirmation is displayed. When you click the [OK] button, the microprogram is overwritten. When you abort the reading in, click the [Cancel] button.

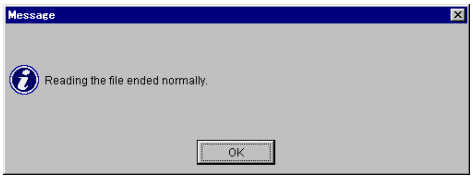
When you eliminate the microprogram that has already been read in to the computer, click the [Delete] button. Since the message asking for confirmation is displayed, click the [OK] button.

(h) Since a window for specifying the directory in which the microprogram to be read in is stored is displayed, specify the Unified version directory(‡1) . When you click the [OK] button, reading in of the microprogram is started.
Examples of the path entry are shown below.

When using Windows®:

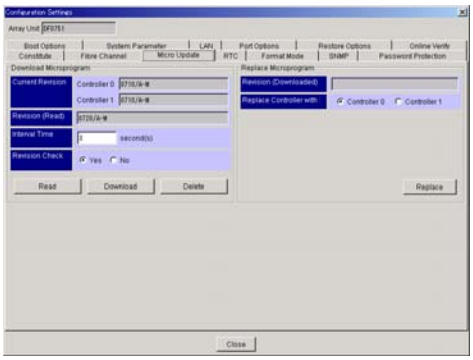
c:/diskarray-microprogram/microprogram/micro/0710A

When using Solaris™, IRIX®, HP-UX®, or Red Hat Linux®:



diskarray-microprogram/microprogram/micro/0710A

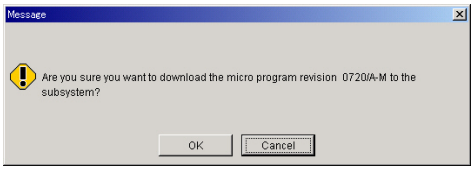
Unified version directory in the hard disk in which the micro program is copied.



‡1 : For the unified version directory, refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090).

Copyright © 2005, 2006, Hitachi, Ltd.

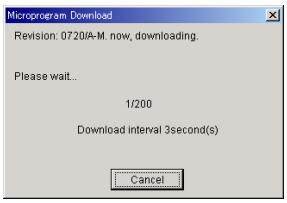
(i) Since a message is displayed when the reading in of the microprogram is completed, click the [OK] button.



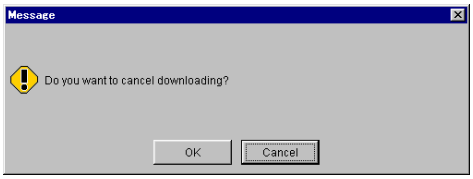
The revision of the microprogram that has been read in is displayed in the [Revision(Read)] box.

(j) Click the [Download] tab.

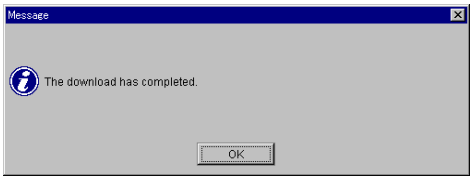
(k) The confirmation window is display. Click the [OK] button.



The confirmation window is display. Click the [Yes] button.



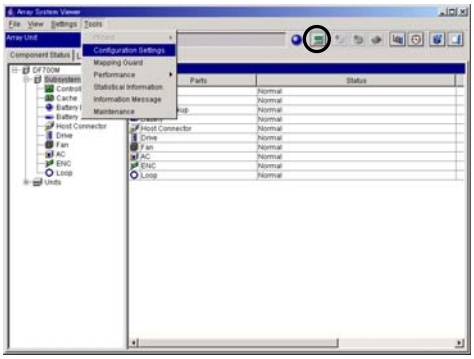
Copyright © 2005, 2006, Hitachi, Ltd.



The download of the microprogram starts by clicking the [Yes] button, and the dialog is displayed.

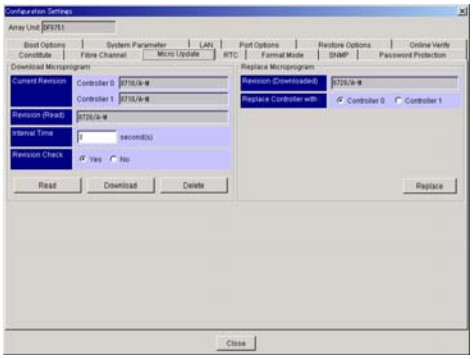
When you abort the downloading, click the [Cancel] button.
A message asking for confirmation is displayed. When you click the [OK] button, the downloading is aborted.
When you click the [Cancel] button, the downloading is continued.

(l) Since a message is displayed when the downloading is completed normally, click the [OK] button.



NOTE : After the microprogram is downloaded, be sure to restart the disk array subsystem or replace the microprogram. If the Control Unit board is replaced in the online mode before restarting the disk array subsystem or replacing the microprogram, the replaced Control Unit may be detached. When the subsystem is burdened with a heavy I/O load by a host at the time of the downloading, the downloading may be terminated abnormally. Perform the downloading again.

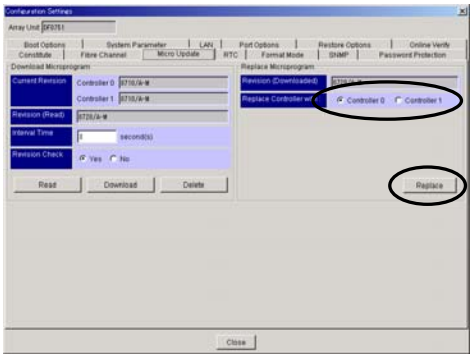
Copyright © 2005, 2006, Hitachi, Ltd.



(2) Replacing the microprogram

Replace the microprogram that was downloaded to the disk array subsystem with the microprogram installed in the Control Unit. When making replacement, be sure to replace the microprograms of the both Control Units 0 and 1. When the microprogram of one of the Control Units is replaced and the unit window of Storage Navigator Modular is closed, the unit window may be opened no more. If the unit window becomes unable to be opened, replace the microprogram after changing the registration to that in which only the Control Unit whose microprogram has not be replaced is registered.

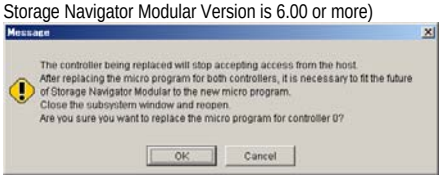
(a) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.



(b) Click the [Micro Update] tab.

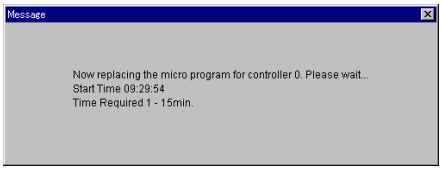
Copyright © 2005, 2006, Hitachi, Ltd.

(c) Select the Control Unit whose microprogram is to be replaced and click the [Replace] button.



(d) The confirmation window is display. Check if the selected Control Unit is correctly displayed and click the [OK] button.

NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the replace of the microprogram again from the beginning.



Storage Navigator Modular Version is less than 6.00)

Storage Navigator Modular Version is 6.00 or more)

↓

NOTE : Then "W0100x CTL alarm (CTL-x)" message is displayed in information message of Web and Array Unit becomes Warning Status.

↓

Click the [OK] button according to the dialog message.

Copyright © 2006, Hitachi, Ltd.

(e) When the replacement of the microprogram terminates normally, a completion message is displayed. Click the [OK] button.

NOTE : When making the access from the host accepted by the instruction from Storage Navigator Modular, the following message may be displayed if it is not operated for 20 minutes or more in the case where Account Authentication is valid, and it may not be completed normally. Perform the dummy replacement (‡1) of the Control Unit whose microprogram was replaced to make the access from the host accepted.
If the access from the host is made accepted when the replacement of the microprogram is completed, the dummy replacement (‡1) is unnecessary.

(f) In the case of the dual controller configuration, also replace the microprogram of the other Control Unit according to the procedure (c) to (e).
However, in the case of the NAS model, perform the failback of the I/O to the side replace first, and then perform the failover of the I/O to the side to be replaced next according to the DF700 Software Maintenance Manual “4.2.1 NAS Hardware Replacement Flow” (NAS 04-0020). After that, replace the microprogram according the procedure (c) to (e)(‡2).

(g) Click the [Close] button.

(h) Select [View] – [Refresh] in the unit window.

(i) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

(j) Click the [Micro Update] tab and check that the revision of the microprogram replaced to [Current Revision] is displayed.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.
‡2 : Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

Copyright © 2006, Hitachi, Ltd.

(k) When the revision check of the both Control Units is completed, the microprogram replacement of the array subsystem ends.
However, in the case of the NAS model, perform the failback of the I/O according to the DF700 Software Maintenance Manual "4.2.1 NAS Hardware Replacement Flow" (NAS 04-0020).

NOTE : • When the replacement of the microproram is made for only one of the dual Control Unit, the disk array subsystem is put in the status in which a warning is issued. The warning is called off when the other one of the dual Control Unit is replaced. When you replace the microprogram, be sure to make the replacement for the both Control Units continuously.
• When the microprogram was replaced online after performing the processing to change the system configuration (LU formation, format, LU owner right change, etc.), the "I140xy (or I140HH) System copy started" message may be displayed two or more times in Information Message on WEB, but it is not a problem.

(3) Checking the maintenance port IP address
Check that the maintenance port IP address has been set correctly using Storage Navigator Modular.
When the maintenance port IP address is displayed as "0.0.0.0", set it.
Refer to System Parameter "4.2 (4) Setting of Maintenance LAN" (SYSPR 04-0100).

Deleted: Make sure
Deleted: of the maintenance port
Deleted: of the maintenance port

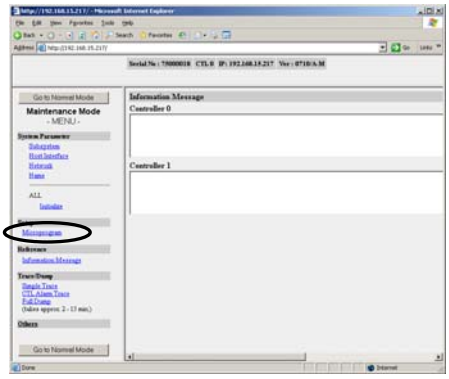
(4) Checking the READY LED (green) on the front of the Basic Chassis
Check that the READY LED (green) on the front of the Basic Chassis lights up. When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, the READY LED (green) on the front of the Basic Chassis lights up after blinking at high speed for the maximum of 30 to 50 minutes (40 to 60 minutes in case of the RKH) because the automatic download of the ENC/SENC firmware is being operated.

(5) Checking the completion of the automatic download of the ENC/SENC firmware
Check that "IZYR00 Automatic ENC microprogram download completed successfully" and "IZYS00 Automatic ENC microprogram download start" are displayed in Information Message on WEB.
When "IZYQ00 Automatic ENC microprogram download failed" is displayed in Information Message on WEB, perform the maintenance according to the recovery method of the message code. However, if [Unit Window] – [Tool] – [Maintenance] – [ENC Micro Update] – [Automatic Download] is set to [Disable] in Storage Navigator Modular, Procedure (5) is not necessary.

Copyright © 2006, Hitachi, Ltd.

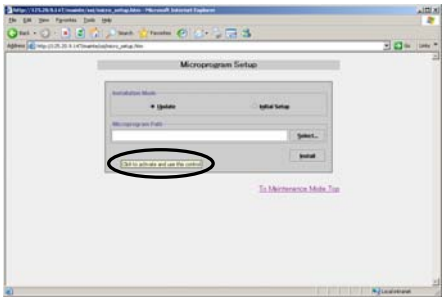
This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.



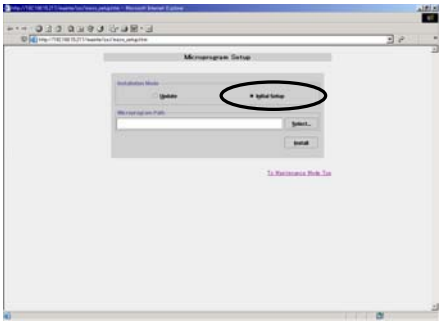
1.4.3 Procedure for new installation

NOTE : If new installation is performed, user data is lost. When user data already exists, be sure to perform update installation.



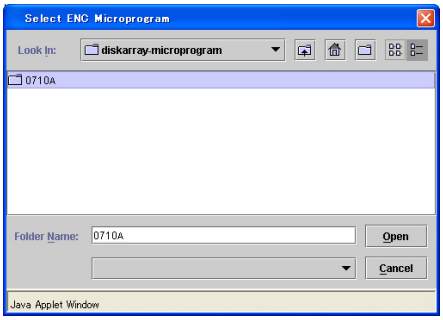
(1) Set the operation mode in the Maintenance Mode. (See "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000).)

(2) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the Web. (See Subsection "3.1 Procedure to WEB connection" (TRBL 03-0000).)

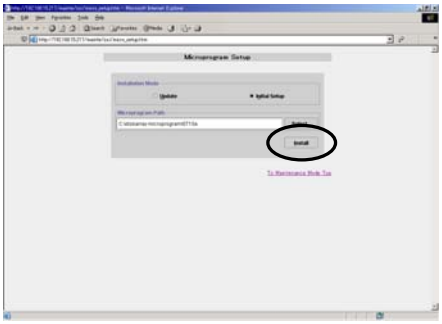


(3) Click "Maintenance", "Setup", and "Microprogram" in this order in the Web window.
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(4) When the Microprogram Setup window is displayed, check the "Initial Setup" radio button of the "Installation Mode". When the following message is displayed, it is necessary to click ActiveX Control with a mouse and to change it into the active status.

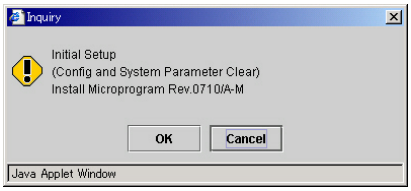


Copyright © 2005, 2006, Hitachi, Ltd.



Copyright © 2005, 2006, Hitachi, Ltd.

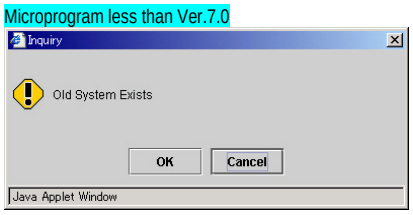
(5) Set the microprogram path.
Specify the Unified version directory(‡1) in which the microprogram that has been copied to the Maintenance PC is stored.
When the “Select” button is clicked, the “Select Microprogram” window is displayed. Select the Unified version directory in which the microprogram is stored and click the “Open” button.



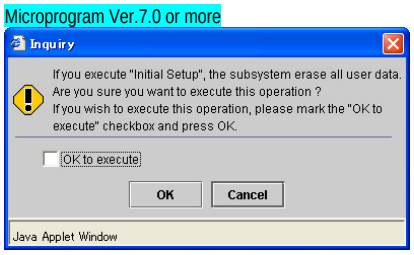
NOTE : If the window is not displayed, the JRE 1.3.1 03 may have not been installed or the installation of it may have failed.
Perform the installation of the JRE1.3.1 03 (See “1.3 Preparation for installation of microprogram” (MICRO 01-0020).) again.

(6) Click the [Install] button to install the microprogram.

(7) A dialog box for confirming whether to execute the installation is displayed. Press the [OK] button when you want to install or [Cancel] when you want to abort.



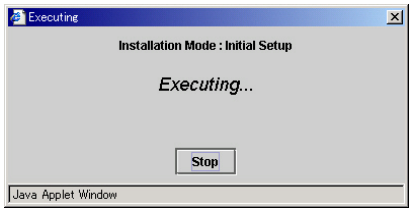
‡1 : For the unified version directory, refer to “1.3.1 Hierarchy of Microprogram Storage Directories” (MICRO 01-0090).



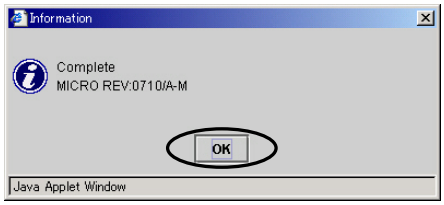
Copyright © 2005, 2006, Hitachi, Ltd.

(8) The following dialog box is displayed when the microprogram has already been installed in the subsystem in the case where the initial setting up is specified.

Microprogram less than Ver.7.0



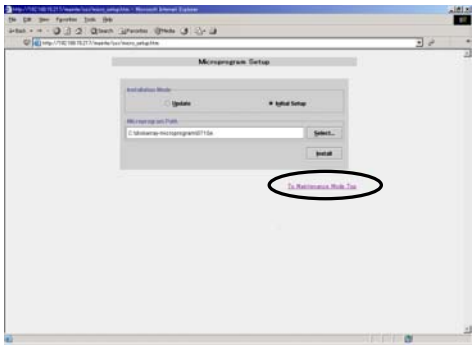
Microprogram Ver.7.0 or more



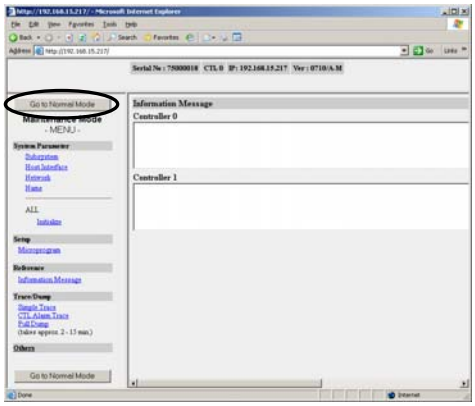
(9) When you want to continue the installation, press the [OK] button. When you want to abort the installation, press the [Cancel] button.

(10) When the installation is started, the following dialog box showing that the installation is in progress is displayed. The installation type and a name of a file being processed is displayed in the dialog box. When you abort the installation, press the [Stop] button.

NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the window in the procedure (11) was displayed, execute the new installation procedure again from the beginning.

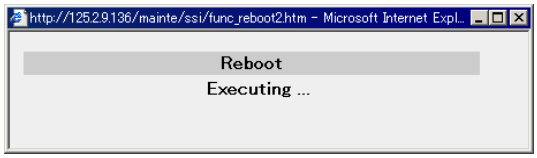


(11) When the installation is completed, the completion window is displayed. Click the [OK] button.

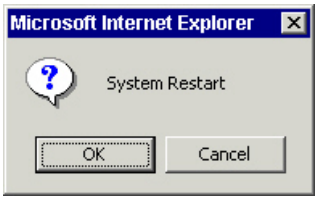


Copyright © 2005, 2006, Hitachi, Ltd.

(12) Go to the “Maintenance Mode” window by clicking “To Maintenance Mode Top” in the Microprogram Setup” window.



(13) Change the mode from Maintenance to Normal by clicking the [Go to Normal Mode] button.



(14) When the [Go to Normal Mode] button is clicked, the following window is displayed.

NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the display of the following window disappears, click [View] – [Refresh] of the menu bar or the [Refresh] button of the tool bar, and then update the page of WEB. After that, click the [Go To Normal Mode] button when the main window is displayed.

Copyright © 2006, Hitachi, Ltd.

(15) Click the [OK] button.

(16) The subsystem becomes READY in about four minutes (about five minutes in case of the RKH).
Check that the READY LED (green) on the front of the Basic Chassis lights up usually after four minutes in case that the Basic Chassis is the RKM/RKS/RKXS, and after five minutes in case of the RKH.
At this time, if the subsystem is a dual controller configuration and the READY LED (green) on the front of the Basic Chassis is blinking at high speed, the READY LED (green) on the front of the Basic Chassis lights up after blinking at high speed for the maximum of 30 to 50 minutes (40 to 60 minutes in case of the RKH) because the automatic download of the ENC/SENC firmware is being operated. Also, when the subsystem is a single controller configuration and the READY LED (green) on the front of the Basic Chassis does not light up but the WARNING LED (orange) is blinking at high speed, the READY LED (green) on the front of the Basic Chassis lights up after the WARNING LED (orange) on the front of the Basic Chassis blinks at high speed for the maximum of 30 to 85 minutes because the update of the flash program or the automatic download of the ENC/SENC firmware is being operated.
If the READY LED (green) on the front side of the Basic Chassis does not come on, the installation may have failed. Perform the installation over again.
If the READY LED (green) on the front of the Basic Chassis still does not light up, collect the Full Dump (refer to Troubleshooting "7.5 Collecting Full Dump" (TRBL 07-0130)), turn off the main switch, turn off all the AC Input Power Switches, and then replace the Control Unit (refer to Replacement "2.5.5 (2) Procedure for the replacement with the power turned off" (REP 02-0500)).

NOTE : Do not perform the update installation of the microprogram while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

(17) Check that "I10000 Subsystem is ready" is displayed referring to Information Message on WEB.

(18) When the Basic Chassis is the RKH/RKHE, check that "I5390x The CTL type different from the other CTL was detected" is not displayed before "I10000 Subsystem is ready" referring to Information Message on WEB.

Copyright © 2006, Hitachi, Ltd.

(19) Check that "IZYR00 Automatic ENC microprogram download completed successfully" and "IZYS00 Automatic ENC microprogram download start" are displayed in Information Message on WEB. When "IZYQ00 Automatic ENC microprogram download failed" is displayed in Information Message on WEB, perform the maintenance according to the recovery method of the message.

1.4.4 Procedure for the version downgrade

Perform (2) Download of the microprogram and (3) Replacement of the microprogram for the version downgrade of the microprogram.

NOTE : Do not perform the update installation of the microprogram while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

(1) Restrictions of the version downgrade of the microprogram
For the restrictions of the version downgrade of the microprogram, refer to "1.7 Restrictions of the version downgrade of the microprogram" (MICRO 01-0290).

(2) Download of the microprogram
(a) Make the Storage Navigator Modular to read the microprogram of which the version is to be downgraded, according to the procedure for update installation ("1.4.2 Update Installation of Microprogram (1) Procedure for download (a) to (i)" (MICRO 01-0110 to MICRO 01-0150).
(b) Check [No] of [Revision Check].

(c) Download the microprogram of which the version is to be downgraded in the subsystem from the Storage Navigator Modular, according to the procedure for update installation ("1.4.2 Update Installation of Microprogram (1) Procedure for download (j) to (l)" (MICRO 01-0150 to MICRO 01-0160).

(3) Replacement of the microprogram
Replace the microprogram which is downloaded in the array subsystem to the microprogram of the Control Unit, according to the procedure for update installation ("1.4.2 Update Installation of Microprogram (2) Replacing the microprogram" (MICRO 01-0170).

Copyright © 2005, 2006, Hitachi, Ltd.

1.5 Checking the start and the termination of the ENC/SENC firmware automatic download

The ENC/SENC firmware is a function that is managed as a part of the microprogram and checks the version of all ENC/SENC firmware in the subsystem when the subsystem starts or the SENC is replaced, and downloads it automatically if necessary.

(1) Opportunity to start the automatic download

The ENC/SENC firmware starts the download automatically in the following opportunities. In the single controller configuration, the automatic download of the ENC/SENC firmware operates only at the time of the starting opportunity.

<Start-up Opportunity>

- When the main switch of the subsystem is turned on, and the subsystem enters the READY status
- When rebooting on remote
- When rebooting automatically
- When rebooting the Control Unit in the maintenance mode

<Maintenance Opportunity>

- When the Control Unit is inserted online
- When the ENC Unit/SENC Unit are inserted online
- When the chassis frame is added online
- When the microprogram is changed online
- When the ENC microprogram automatic download function is enabled
- When the following warnings are released before starting the automatic download
  Loop Warning/ENC Warning/Control Unit Warning/SNMP Warning/Disk drive Warning/PIN Warning/Power Unit Warning/UPS Warning/Battery backup Unit Warning/Battery backup circuit Warning/Fan Unit Warning
- When the following warnings, which caused the abnormal termination of the automatic download, are released
  Loop Warning/ENC Unit Warning/Control Unit Warning/Disk drive Warning/ENC replacement which occurred in the SES error

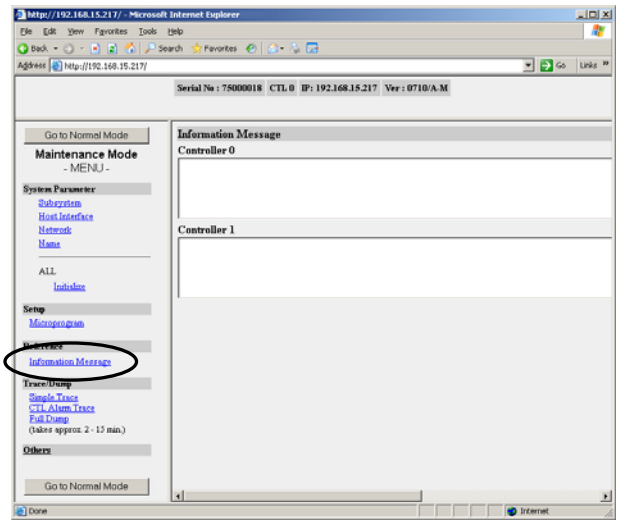
(2) Restriction items during the automatic download

Do not perform the following work during the ENC/SENC firmware automatic download.

- Planned shutdown
- Update installation of the microprogram from Storage Navigator Modular
- Setting change of Boot Options by Storage Navigator Modular
- Setting change of LAN by Storage Navigator Modular
- Text file input of Boot Options of the configuration copy information by Storage Navigator Modular
- Unlocking of the priced options by Storage Navigator Modular
- Setting change of SNMP by Storage Navigator Modular
- Setting change of Cache Residency Manager by Storage Navigator Modular
- Validation of Power Saving with Storage Navigator Modular
- Parts replacement

Copyright © 2005, 2006, Hitachi, Ltd.

- Adding optional components
- Subtracting optional components
- Relocation / Removal work
- Changing to the maintenance mode of the array subsystem by pressing RST SW of the Control Unit



Execute the above-mentioned work after the ENC/SENC firmware automatic download is completed.

(3) Checking the start messages and the termination messages of the automatic download.
When the download starts, it takes up to 30 to 85 minutes to terminate it.

NOTE : The download does not start when the subsystem is in the warning status. Connect to the WEB and perform the recovery procedure for each WEB message (Troubleshooting "Chapter 4. Trouble Analysis by WEB Connection" (TRBL 04-0000)).
If the warning status is recovered and the subsystem is maintained in the normal status for one minute, the download starts.

(a) Connect the LAN cross cable to the LAN connector for maintenance of the subsystem and connect to WEB (Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000).)

(b) Click [Information Message] in the main window menu frame in the normal mode.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Check that there are the start message and the normal termination message displayed in "Information Message".

Table 1.5.1 Message Check

Message	Content
IZYS00 Automatic ENC microprogram download start	Indicates that the automatic download started.
IZYR00 Automatic ENC microprogram download completed successfully	Indicate that the automatic download terminated normally.
IZYQ00 Automatic ENC microprogram download failed	Indicate that the automatic download terminated abnormally.

<Message Check Example>

- When it is normal (ENC Unit #0 and #1 are objects)

  Automatic ENC microprogram download start
  ENC#0 microprogram download start
  ENC#0 microprogram download complete
  ENC#1 microprogram download start
  ENC#1 microprogram download complete
  Automatic ENC microprogram download completed successfully

- When it is normal (when there is no object ENC Unit)

  Automatic ENC microprogram download start
  Automatic ENC microprogram download completed successfully

- When it is abnormal

  Automatic ENC microprogram download start
  ENC#0 microprogram download start
  ENC#0 microprogram download complete
  ENC#1 microprogram download start
  ENC alarm (Unit-01, ENC-1)
  Loop alarm (Path-0, Loop-1)
  :
  ENC microprogram download error detected (Unit-01)
  :
  ENC#1 microprogram download complete
  Automatic SENC microprogram download failed

(4) Recovery method when terminating abnormally after starting the automatic download.

(a) Perform the maintenance for the warnings which were output from the automatic download start to the abnormal termination.

(b) Check the start message and the termination message of the automatic download again.

Copyright © 2005, 2006, Hitachi, Ltd.

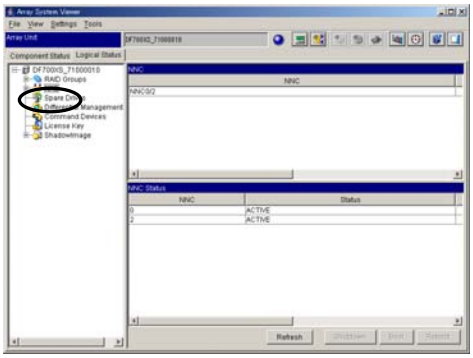
1.6 Procedure for the NAS BIOS firmware update

Use the Storage Navigator Modular, and perform the update of the BIOS for each NAS Unit.
Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

(1) Procedure for the firmware update

(a) Before performing the NAS BIOS firmware update, request the user for the fail-over of the NAS Unit (NNC) that the firmware update is performed.

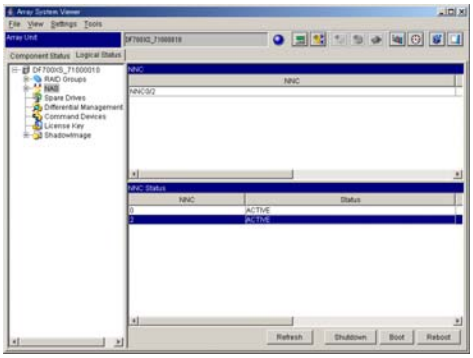
(b) Connect the LAN to the LAN connector for the maintenance of the NAS Unit. (Refer to Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000).)



(c) Start the Storage Navigator Modular and change the operation mode to the "maintenance mode". (Refer to System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).)

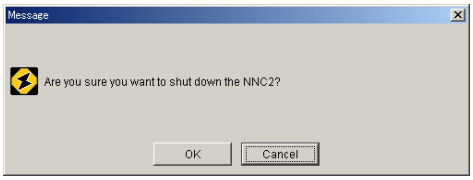
(d) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



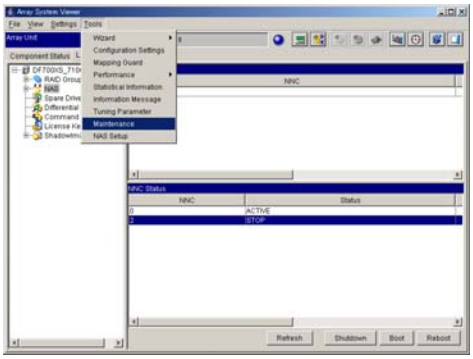
(e) Click the [Logical Status] tab, and click the [NAS].
When the status of the NAS Unit is "NEW", "ACTIVE", "INACTIVE" or "WARN", go to Step (f).
When the status of the NAS Unit is "STOP", go to Step (i).
When the status of the NAS Unit is "DOWN" and the following message is displayed, go to Step (f) after removing the failure factors according to the recovery method of the information message on WEB.
When anything other than the following messages is displayed, perform the update from the beginning again after removing the failure factors according to the recovery method of the information message on WEB.
- IB230X NNC BIOS firmware installation failed [check sum error]
- IB240X NNC BIOS firmware installation failed [download error]
- IAPN00 NNC BIOS firmware installation timeout

Copyright © 2005, 2006, Hitachi, Ltd.

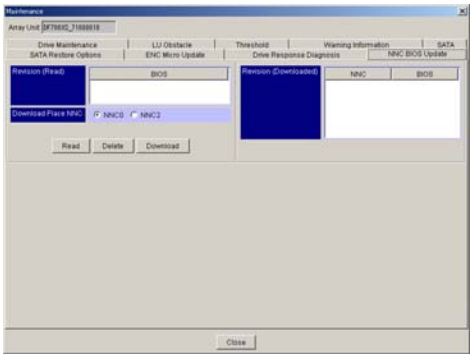


Copyright © 2005, 2006, Hitachi, Ltd.

(f) Select the NAS Unit that the firmware update is performed.

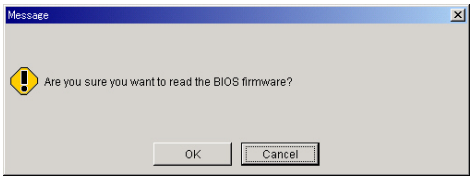


(g) When the [Shutdown] button is clicked, a confirmation message is displayed. Click the [OK] button.

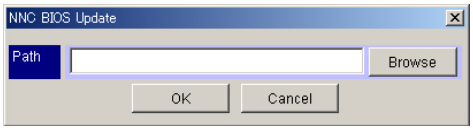


(h) Check that the status of the stopped NAS Unit is “STOP”, “DOWN” or “NEW”.

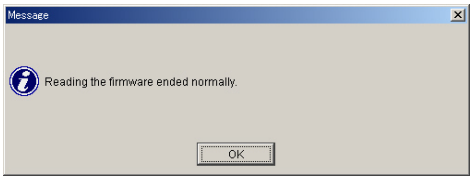
(i) Select [Tools] – [Maintenance] in the unit window.



Copyright © 2005, 2006, Hitachi, Ltd.

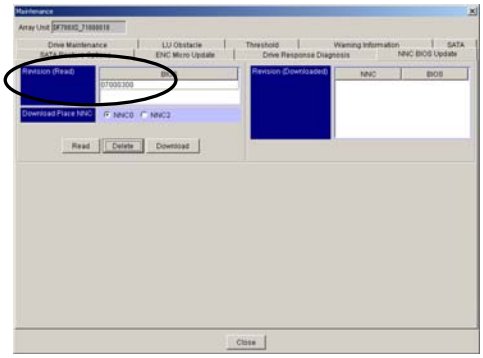


(j) Click the [NNC BIOS Update] tab.

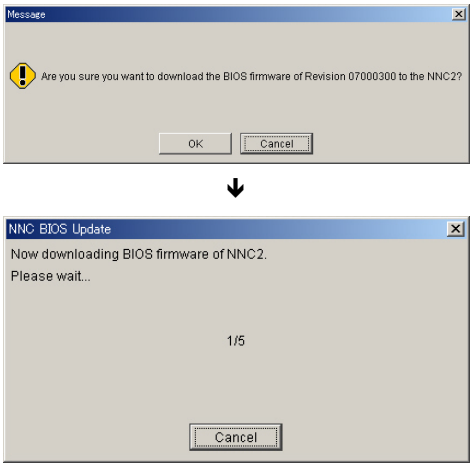


(k) When the [Read] button is clicked, a confirmation message is displayed. Click the [OK] button.

(l) Specify "C:¥diskarray-microprogram¥microprogram¥07xxx" (xxx indicates 26x or more) for the path, and click the [OK] button.

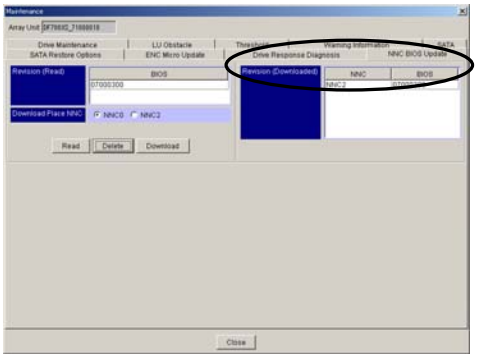


(m) The window of the reading completion is displayed. Click the [OK] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(n) Check the revision by “Revision (Read)”.



(o) Select the download destination from “Download Place NNC” and click the [Download] button.

(p) The confirmation message is displayed. Click the [OK] button.

(q) Check the revision by “Revision (Downloaded)”.

Copyright © 2005, 2006, Hitachi, Ltd.

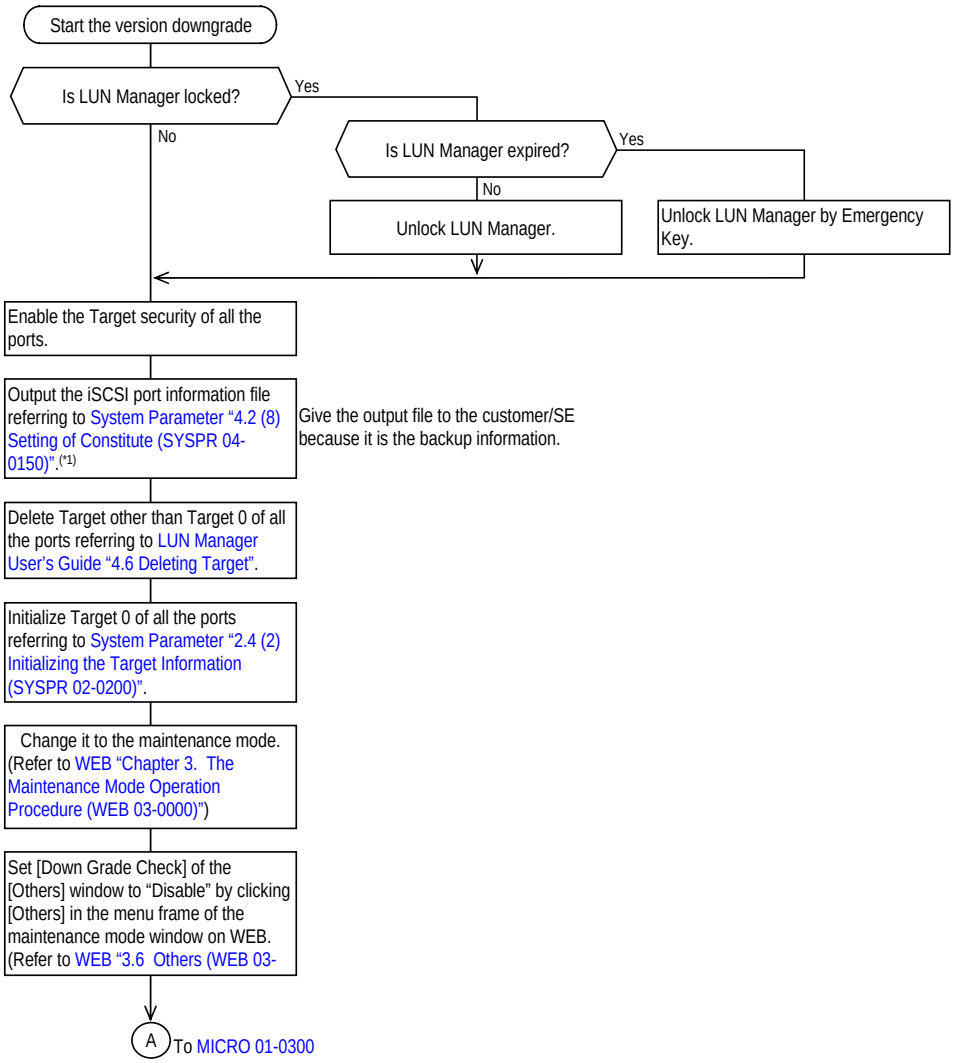
(r) Click the [Close] button.
(s) Request the user for the fail-back of the NAS Unit.
(t) Request the fail-over of another NAS Unit.
(u) Perform the work from (5) to (19) to the NAS Unit that was the fail-over.
(v) Request the user for the fail-back.

Copyright © 2006, Hitachi, Ltd.

(2) Recovery method at the time of the firmware update failure

When the NAS BIOS firmware update failed, perform the update again in the following procedure.

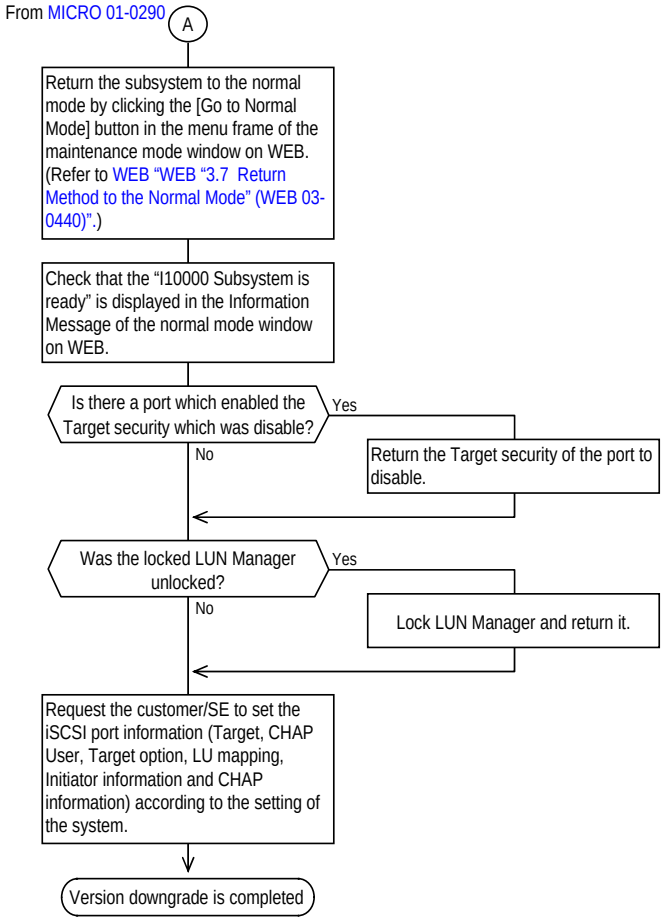
(a) Remove the failure factors according to the recovery method of the information message on WEB.



(b) Perform the NAS BIOS firmware update again.

NOTE : If the NAS Unit receives the start instruction from the Storage Navigator Modular or the NAS Unit is turned on from the planned shutdown status of the subsystem, the NAS Unit may start with the old BIOS, may not start, or may try to start with the new BIOS even though the firmware update failed.
In any cases, perform the NAS BIOS firmware update again after removing the failure factors of the NAS BIOS firmware update.

Copyright © 2006, Hitachi, Ltd.



1.7 Procedure of the version downgrade of the microprogram

The procedure of the version downgrade of the microprogram in the status that the extension function of the number of the iSCSI connection hosts (The number of host connections is 129 or more and 255 or less, the number of iSCSI targets is 129 or more and 255 or less, the number of CHAP User definitions is 257 or more and 512 or less, and the number of mappings of the iSCSi initiator of the LUN Manager is 129 or more and 256 or less.) is used is shown below.

*1 : Report to the customer/SE that the file output is not performed about secret of CHAP User or CHAP information by the viewpoint on security.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2006, Hitachi, Ltd.

1.8 Restrictions of the version downgrade of the microprogram

The version of the microprogram cannot be downgraded if corresponding to the conditions in Table 1.7.1, so that follow the actions to be taken.

Table 1.8.1 Restrictions of the version downgrade of the microprogram

Unified version (*1) ("x" is optional.)		Restrictions of the microprogram to be downloaded		Actions to be taken
Microprogram of the Control Unit	Microprogram to be downloaded			
0720/A – 0720/C or less	071x/x	1	The RAID level defines the RAID Group of RAID6.	Install the microprogram of which the unified version is 0720/A or more. Or, install the microprogram after the RAID level deletes the RAID Group of RAID6.
		2	The RKA is connected.	Install the microprogram of which the unified version is 0720/A or more. Or, install the microprogram after reducing the connected RKA.
		3	The microprogram less than the unified version 071x/x cannot be installed in the RKXS.	Install the microprogram of which the unified version is 0720/A or more.
0720/C – 0726/A or less	0720/A – 0720/C or less	4	The Cache memory of DF-F700-C2GJ is installed in the Control Unit.	Install the microprogram of which the unified version is 0720/C or more. Or, install the microprogram after replacing the Cache Unit of the DF-F700-C2GJ, which is installed in the Control Unit, to the Cache Unit of the DF-F700-C1GJ.
	071x/x	–	Restrictions in 1 to 4.	Refer to the actions to be taken for each of 1 to 4.
0726/A – 0726/E or less	0720/C – 0726/A or less	5	The FC Interface Board is added to the Control Unit board of the RKS/RKXS.	Install the microprogram whose unified version is 0726/A or more. Or, install the microprogram after reducing the FC Interface Board.
		6	The NAS Interface Board is installed on the Control Unit board of the RKM/RKS/RKXS.	Install the microprogram whose unified version is 0726/A or more. Or, install the microprogram after reducing the NAS Interface Board.
		7	At the time of RKNAS connection, the microprogram less than the unified version 0726/A cannot be installed.	Install the microprogram whose unified version is 0726/A or more.
		8	The IP address of the maintenance port after the version downgrade is set except for CTL0: 10.0.0.16 or 192.168.0.16 CTL1: 10.0.0.17 or 192.168.0.17	The IP address of the maintenance port after the version downgrade becomes CTL0: 10.0.0.16 or 192.168.0.16 CTL1: 10.0.0.17 or 192.168.0.17
	0720/A – 0720/C or less	–	Restrictions in 4 to 8.	Refer to the actions to be taken for each of 4 to 8.
	071x/x	–	Restrictions in 1 to 8.	Refer to the actions to be taken for each of 1 to 8.

*1: Refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090) for the unified version.

Copyright © 2006, Hitachi, Ltd.

Unified version (*1) ("x" is optional.)		Restrictions of the microprogram to be downloaded		Actions to be taken
Microprogram of the Control Unit	Microprogram to be downloaded			
0726/E – 0730/A or less	0726/A – 0726/E or less	9	The LAN port number of the Control Unit is set other than 2000.	The LAN port number of the Control Unit becomes 2000 after the version downgrade. Also, it is required to change the service file of the computer in which the Storage Navigator Modular is installed.
	0720/C – 0726/A or less	–	Restrictions in 5 to 9.	Refer to the actions to be taken for each of 5 to 9.
	0720/A – 0720/C or less	–	Restrictions in 4 to 9.	Refer to the actions to be taken for each of 4 to 9.
	071x/x	–	Restrictions in 1 to 9.	Refer to the actions to be taken for each of 1 to 9.
0730/x	0726/E – 0730/A or less	10	The iSCSI interface board is installed on the Control Unit board of the RKM/RKS/RKXS.	Install the microprogram whose unified version is 0730/A or more. Or, install the microprogram after reducing the iSCSI interface board.
	0726/A – 0726/E or less	–	Restrictions in 9 to 10.	Refer to the actions to be taken for each of 9 to 10.
	0720/C – 0726/A or less	–	Restrictions in 5 to 10.	Refer to the actions to be taken for each of 5 to 10.
	0720/A – 0720/C or less	–	Restrictions in 4 to 10.	Refer to the actions to be taken for each of 4 to 10.
	071x/x	–	Restrictions in 1 to 10.	Refer to the actions to be taken for each of 1 to 10.
0731/x	0730/A – 0731/A or less	11	The microprogram less than the unified version 0731/A cannot be installed in the RKH.	Install the microprogram whose unified version is 0731/A or more.
	0726/E – 0730/A or less	–	Restrictions in 10 to 11.	Refer to the actions to be taken for each of 10 to 11.
	0726/A – 0726/E or less	–	Restrictions in 9 to 11.	Refer to the actions to be taken for each of 9 to 11.
	0720/C – 0726/A or less	–	Restrictions in 5 to 11.	Refer to the actions to be taken for each of 5 to 11.
	0720/A – 0720/C or less	–	Restrictions in 4 to 11.	Refer to the actions to be taken for each of 4 to 11.
	071x/x	–	Restrictions in 1 to 11.	Refer to the actions to be taken for each of 1 to 11.
0732/x	0731/A – 0732/A or less	12	The NAS Interface Board is installed on the Control Unit board of the RKH.	Install the microprogram whose unified version is 0732/A or more. Or, install the microprogram after subtracting the NAS Interface Board.
	0730/A – 0731/A or less	–	Restrictions in 11 to 12.	Refer to the actions to be taken for each of 11 to 12.
	0726/E – 0730/A or less	–	Restrictions in 10 to 12.	Refer to the actions to be taken for each of 10 to 12.
	0726/A – 0726/E or less	–	Restrictions in 9 to 12.	Refer to the actions to be taken for each of 9 to 12.
	0720/C – 0726/A or less	–	Restrictions in 5 to 12.	Refer to the actions to be taken for each of 5 to 12.
	0720/A – 0720/C or less	–	Restrictions in 4 to 12.	Refer to the actions to be taken for each of 4 to 12.
	071x/x	–	Restrictions in 1 to 12.	Refer to the actions to be taken for each of 1 to 12.

*1: Refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090) for the unified version.

Copyright © 2006, Hitachi, Ltd.

Unified version (*1) ("x" is optional.)		Restrictions of the microprogram to be downloaded		Actions to be taken
Microprogram of the Control Unit	Microprogram to be downloaded			
0733/x – 0735/A or less	0732/A – 0733/A or less	13	The Cache Partition Manager is unlocked, and the segment size of the partition is set to 64 k bytes, 256 k bytes or 512 k bytes.	Install the microprogram whose unified version is 0735/A or more. Or, install the microprogram after setting the segment size of all the partitions to 16 k bytes or less.
		14	The Cache Partition Manager is unlocked, and the stripe size of the LU is set to 256 k bytes or 512 k bytes.	Install the microprogram whose unified version is 0735/A or more. Or, install the microprogram after setting the stripe size of all the LUs to 64 k bytes.
	0731/A – 0732/A or less	–	Restrictions in 12 to 14.	Refer to the actions to be taken for each of 12 to 14.
	0730/A – 0731/A or less	–	Restrictions in 11 to 14.	Refer to the actions to be taken for each of 11 to 14.
	0726/E – 0730/A or less	–	Restrictions in 10 to 14.	Refer to the actions to be taken for each of 10 to 14.
	0726/A – 0726/E or less	–	Restrictions in 9 to 14.	Refer to the actions to be taken for each of 9 to 14.
	0720/C – 0726/A or less	–	Restrictions in 5 to 14.	Refer to the actions to be taken for each of 5 to 14.
	0720/A – 0726/C or less	–	Restrictions in 4 to 14.	Refer to the actions to be taken for each of 4 to 14.
	071x/x	–	Restrictions in 1 to 14.	Refer to the actions to be taken for each of 1 to 14.
0735/x – 0750/A or less	0733/A – 0735/A or less	15	TrueCopy Extended Distance is unlocked.	Install the microprogram whose unified version is 0735/A or more. Or, install the microprogram after locking TrueCopy Extended Distance.
	0732/A – 0733/A or less	–	Restrictions in 13 to 15.	Refer to the actions to be taken for each of 13 to 15.
	0731/A – 0732/A or less	–	Restrictions in 12 to 15.	Refer to the actions to be taken for each of 12 to 15.
	0730/A – 0731/A or less	–	Restrictions in 11 to 15.	Refer to the actions to be taken for each of 11 to 15.
	0726/E – 0730/A or less	–	Restrictions in 10 to 15.	Refer to the actions to be taken for each of 10 to 15.
	0726/A – 0726/E or less	–	Restrictions in 9 to 15.	Refer to the actions to be taken for each of 9 to 15.
	0720/A – 0726/A or less	–	Restrictions in 5 to 15.	Refer to the actions to be taken for each of 5 to 15.
	071x/x	–	Restrictions in 1 to 15.	Refer to the actions to be taken for each of 1 to 15.

*1: Refer to "1.3.1 Hierarchy of Microprogram Storage Directories" (MICRO 01-0090) for the unified version.

Copyright © 2006, Hitachi, Ltd.

Unified version (*1) ("x" is optional.)		Restrictions of the microprogram to be downloaded		Actions to be taken
Microprogram of the Control Unit	Microprogram to be downloaded			
0750/A – 0760/A or less	0735/A – 0750/A or less	16	Negotiation of user management port is set except "Auto" (When version downgrade of the microprogram is done via user management port)	First, set the negotiation of user management port to "Auto" and negotiation of device connected to user management port to Auto negotiation. Then, install the microprogram
	0733/A – 0735/A or less	–	Restrictions in 15 to 16.	Refer to the actions to be taken for each of 15 to 16.
	0732/A – 0733/A or less	–	Restrictions in 13 to 16.	Refer to the actions to be taken for each of 13 to 16.
	0731/A – 0732/A or less	–	Restrictions in 12 to 16.	Refer to the actions to be taken for each of 12 to 16.
	0730/A – 0731/A or less	–	Restrictions in 11 to 16.	Refer to the actions to be taken for each of 11 to 16.

Chapter 2. Procedure for Recovery from a Failure

2.1 Procedure for recovery from a failure during installation

Identify a factor of the failure based on the statuses of the LEDs and follow the recovery procedure concerned.

<Failure which causes system down>

- LED status

WARNING LED	ALARM LED	Recovery procedure
Blinking	On	Connect the WEB and recover from the failure following the recovery procedure against each WEB message. For the details, refer to Troubleshooting "Chapter 4. Trouble Analysis by WEB Connection" (TRBL 04-0000).

- Details of WEB error logs (Refer to Message "Chapter 5. Flash Detected Messages" (MSG 05-0000) for the detail of content or recovery methods.)

Message code	Message text	Recovery procedure
RB0000	Upload system error	The configuration of the directory from which the microprogram is installed on the client PC is incorrect.
RB0100	File remove error	The file in the RAM disk on the device cannot be deleted.
RB0A00	Upload file SUM check error	An error was detected in the file by SUM check.
RB3100	File open error	The file in the RAM disk on the device cannot be opened.
RB3200	File read error	The file in the RAM disk on the device cannot be read.
RB3500	Bad block ID	The block ID is illegal.
RB7000	Program size too large	The program size is too large for the storage capacity.
RB8100	Install failed	The writing to all the system drives failed.
RB8300	Empty system retry full install	The updating installation cannot be done because the microprogram is not installed.
RBA000	Down grade check NG	Although the version downgrade of the microprogram was attempted, the update installation terminated abnormally because Down Grade Check was not Disable.
RBC000	No drive available	The access to all the system drives is disabled.
RBC10x	Drive block size error (Unit-0, HDU-x)	The value of the block size of the capacity data reported from the Disk Drive was other than the specified value.
RBC20x	Unknown drive (Unit-0, HDU-x)	The value of the logical block address of the capacity data reported from the Disk Drive was equal to or less than the size of the system area.
RBC2HH	Unknown drive (Unit-0, HDU-x)	The value of the logical block address of the capacity data reported from the Disk Drive was equal to or less than the size of the system area.

Copyright © 2005, 2006, Hitachi, Ltd.

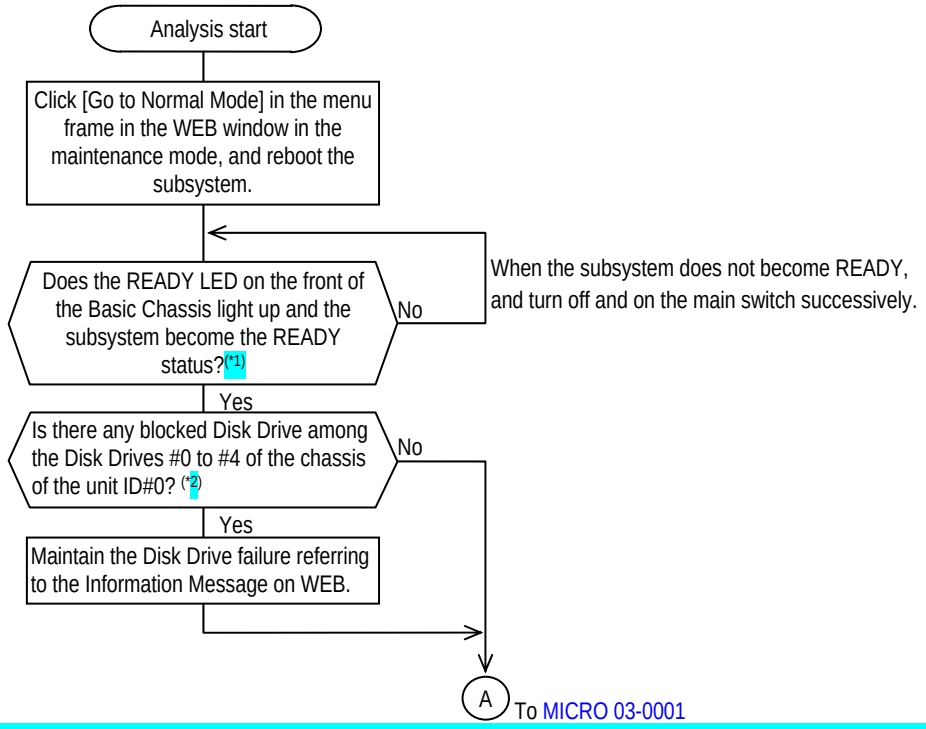
<Install partially complete (The installation of some of the Disk Drives failed.)>

- LED status

WARNING LED	ALARM LED	Recovery procedure
Off(*1)	Off	Connect the WEB and recover from the failure following the recovery procedure against each WEB message. For the details, refer to Troubleshooting "Chapter 4. Trouble Analysis by WEB Connection" (TRBL 04-0000). It may be a Disk Drive failure. For the details, refer to "Chapter 3. Procedure for Isolating Cause of Disk Drive Failure when "Install partially complete" Message Is Output" (MICRO 03-0000).

*1 : When a beep of the buzzer is stopped by a pressing of the TRACE SW/BUZZER OFF SW, the process is continued automatically and the blinking of the WARNING LED is stopped.
The subsystem is placed in the READY status.

- Details of WEB error logs



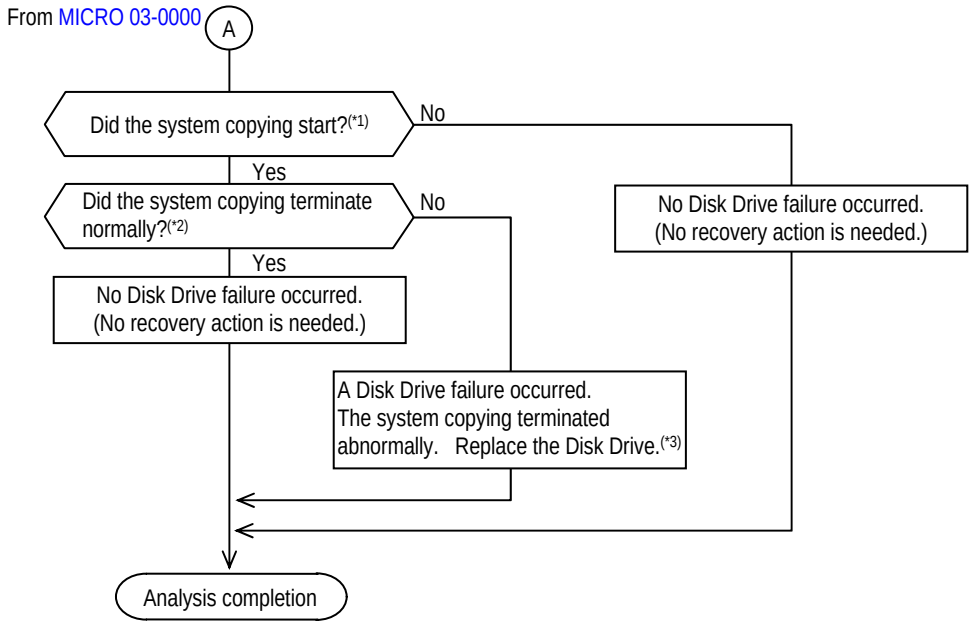
Message code	Message text	Recovery procedure
RB8200	Install partially complete	The installation of some of the Disk Drives failed.

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 3. Procedure for Isolating Cause of Disk Drive Failure when "Install partially complete" Message Is Output

The "Install partially complete" message is displayed in the WEB window when the subsystem detected either of the following statuses. Also, the "Install partially complete" status can be checked in the LED status. When this message code is displayed on WEB, there may be a Disk Drive failure. Therefore, analyze it in the following procedure, and take a necessary action.

- When the microprogram was installed in the maintenance mode, at least one Disk Drive was not installed among the Disk Drives #0 to #4 of the chassis of the unit ID#0.
- When the microprogram was installed in the maintenance mode, at least one failed in the write of the microprogram among the Disk Drives #0 to #4 of the chassis of the unit ID#0.



*1 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

*2 : The ALM LED (red) on the Disk Drive lights up, and any of the following messages is displayed in the Information Message on WEB.

- HDU alarm message ····· "W060AT SATA HDU alarm", "W060xy HDU alarm" or "W060HH HDU alarm", "W0GG00 HDU alarm [RKA]", "W0GH00 HDU alarm [RKAJ]"
- Spare HDU alarm message ··· "W061AT SATA Spare HDU alarm", "W061xy Spare HDU alarm" or "W061HH Spare HDU alarm", "W0GJ00 Spare HDU alarm [RKA]", "W0GK00 Spare HDU alarm [RKAJ]"

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

3.1 Procedure for Checking whether system copy operation occurred

You can verify whether the system copy operation has occurred by viewing the "Information Message" window in the WEB window.

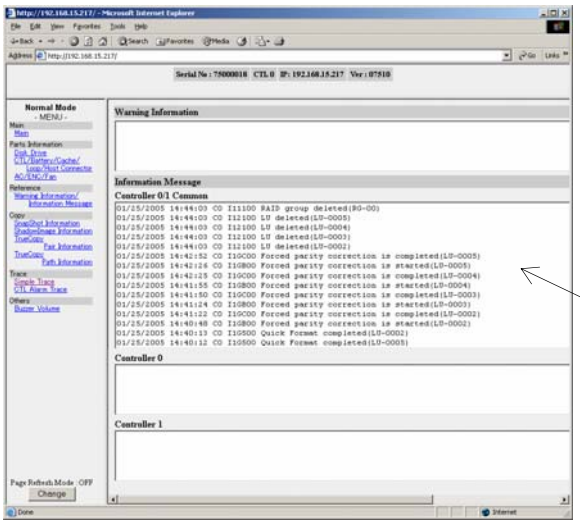
• When the occurred of system copy

MM/DD/YYYY HH:MM:SS Cx I140xy (or I140HH) System copy started (Unit-x, HDU-y)

Date Time Detect Controller #

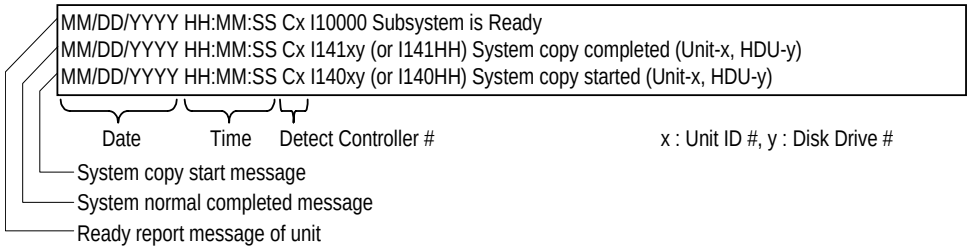
x : Unit ID #
y : Disk Drive #

For the RKH, "I140HH System copy started (Unit-x, HDU-y)" is displayed.



• When the not occurred of system copy

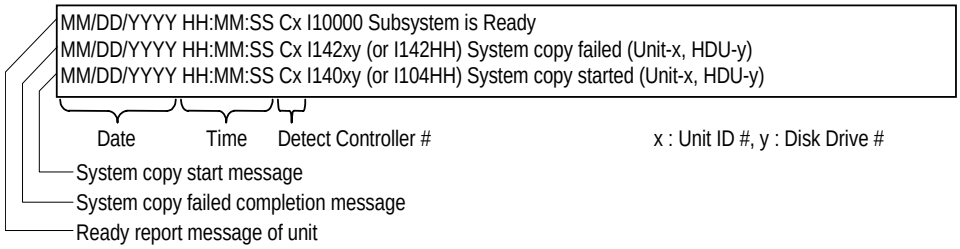
The message above is not displayed but a message "I10000 Subsystem is Ready" is displayed.



Copyright © 2005, 2006, Hitachi, Ltd.

3.2 Procedure for checking the status of system copy complete

You can verify whether the system copy operation has occurred by viewing the "Information Message" window in the WEB window.



• When the normal completed of system copy

For the RKH, "I140HH System copy started (Unit-x, HDU-y)", "I141HH System copy completed (Unit-x, HDU-y)" is displayed.

• When the not occurred of system copy

For the RKH, "I140HH System copy started (Unit-x, HDU-y)", "I142HH System copy failed (Unit-x, HDU-y)" is displayed.

Chapter 1. Setting (Storage Navigator Modular)

This chapter explains method of setting the subsystem parameters using Storage Navigator Modular.
The Storage Navigator Modular can execute the setting function or the reference function by connecting it to the array subsystem when the array subsystem is in the Ready status.

The procedures for setting device parameters are described below.

Precautions when restarting.
If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

Copyright © 2005, 2006, Hitachi, Ltd.

If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

1.1 Procedure for connecting Storage Navigator Modular with the subsystem

The procedure for connecting Storage Navigator Modular with the subsystem is shown below.

NOTE : When the microprogram installed in the subsystem to be connected is 0726/E or more, the LAN Port Number may be changed. If there is no problem on the LAN connection or the IP address setting and the array cannot be registered in the following procedure, it is necessary to change the LAN Port Number of the PC referring to the LAN Port Number set in the array subsystem (refer to "4.2 (17-1) (a)" (SYSPR 04-0340)).

(1) Checking the LAN environment setting

(a) Make sure that the Storage Navigator Modular has been installed. (Make sure that the activation file startsnm.bat exists.)

(b) Check the LAN environment setting for the PC

- Make sure that the following settings have been made, or change the settings to the following.
  For the maintenance PC, set the IP address shown in No. 1 in Table 1.1.1 below.
  When it cannot be connected, specify the connectable value and perform the WEB connection by setting the values of No.2 to No.5 in order.
  If not connected yet, refer to Troubleshooting "3.4 Procedure for specifying maintenance port IP address" (TRBL 03-0100).

Table 1.1.1 Operational Environment

No.	Subsystem (LAN port for maintenance)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 0.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL 0: 192.168.233.16 CTL 1: 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL 0: 172.23.211.16 CTL 1:172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL 0: 10.197.181.16 CTL 1:10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0

Copyright © 2005, 2006, Hitachi, Ltd.

- Manual change of the network parameter of the Maintenance port
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.
  Therefore, the LAN port for the maintenance when performing the WEB connection is set as any value of No.1 to No.5 in Table 1.1.1 on the work other than the installation of the subsystem at the time of the shipment.

  NOTE : However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
  If this is the case, set network address other than maintenance port in the LAN device which is connected via the Gateway in the extension of the User management port, or set maintenance port other than the network address of LAN device which is connected via the Gateway. (Refer to "4.2 (4) Setting Maintenance of LAN"(SYSPR 04-0100).)

(c) Make sure that negotiation of Maintenance PC is set to auto negotiation.
To check negotiation of Maintenance PC, refer to Troubleshooting "3.1 (6) Procedure for setting negotiation" (TRBL 03-0041).

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Connecting the LAN cross cable

Connect the Control Unit #0 LAN Maintenance port of the subsystem and the LAN card of a PC. For the NAS Unit connection configuration, remove the cover of the LAN connector for the maintenance of the NAS Unit, and connect it with the LAN connector for the maintenance and the LAN cross cables of the PC.

NOTE : At the time of the NAS connection, connect it to the LAN connector for the maintenance of the NAS Unit. In such case, check that the AC Input Power of the NAS Unit is turned on. If it is turned off, turn on the AC Input Power of the NAS Unit. (Refer to Installation "1.7 Power On/Off Procedure" (INST 01-0290))

(a) For the RKM/RKS/RKXS

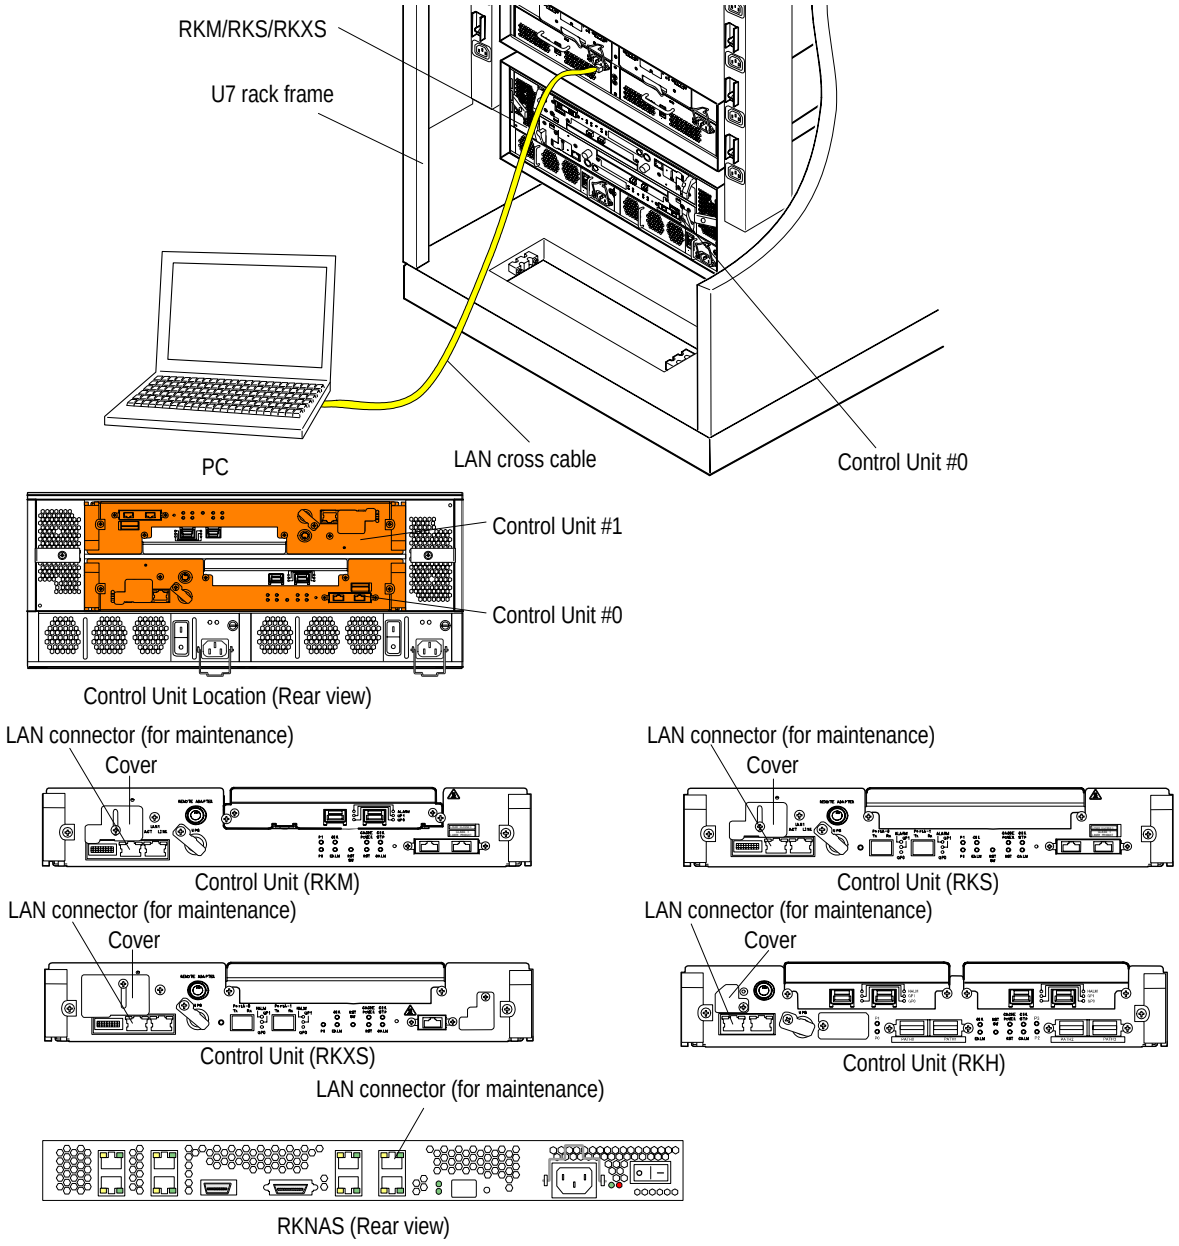

Figure 1.1.1 Connecting the LAN cable (for the RKM/RKS/RKXS)

(3) Registering the newly introduced DF in the Storage Navigator Modular

(a) Activating the Storage Navigator Modular

(i) Execute the batch file or shell script for activating the Storage Navigator Modular.
In the case of Windows, activate the batch file, startsnm.bat.

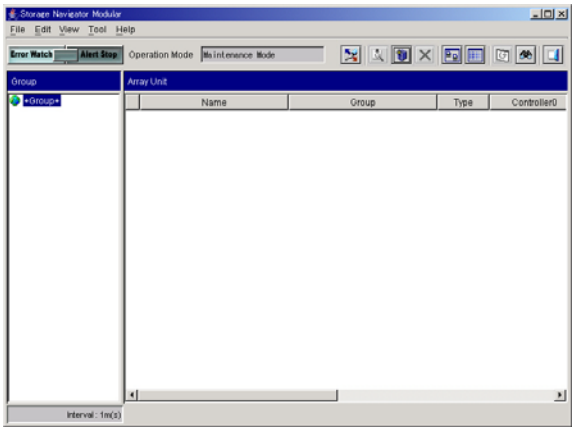
(ii) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed(‡1).

In the case of Windows, the prompt window is also displayed.
The prompt window has nothing to do with operation of Storage Navigator Modular. But don't close the prompt screen. It is unusually finished.
The icon can be minimized automatically when "Program Quitting" is selected from the properties of the batch file.
You can execute the display of the Storage Navigator Modular Operation Mode and state of the failure monitoring and the following functions in the main window.
For the operation of each function, refer to the page explaining each function.

- Registration of the disk array subsystem (registration, deletion, change, and properties display)
- Execution of the failure monitoring and setting of the failure monitoring option
- Change of the Operation Mode
- Display of the version

‡1 : The mode change cannot be done at the time of the initial activation of the Storage Navigator Modular. A registration of a password validates the mode change.

Copyright © 2005, Hitachi, Ltd.



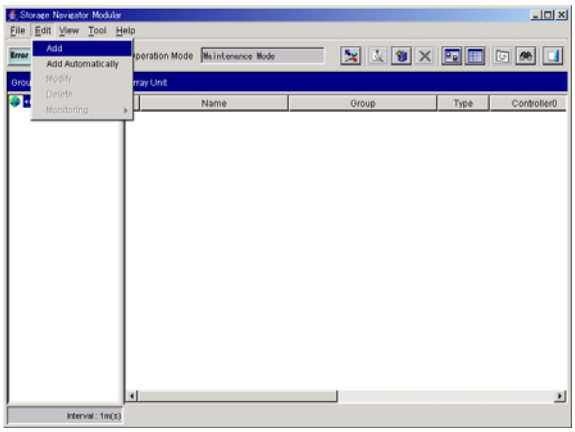
(b) Changing the Maintenance Mode

Storage Navigator Modular has three Active Modes, that is, the Normal Mode, Management Mode, and Maintenance Mode. In the Normal Mode, the program displays the configuration and statuses of the disk array. In the Management or Maintenance Mode, it can set the configuration of the disk array in addition to the function in the Normal Mode.

(i) Changing the Normal Mode to the Maintenance Mode

Change the Operation Mode from the Normal Mode to the Maintenance Mode.
When the log-in has been made in the Normal Mode, [Normal Mode] is displayed as a detailed information of the [Operation Mode] in the upper part of the main window.

① In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.
Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

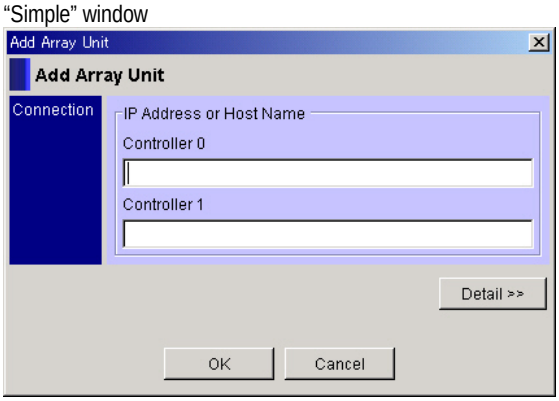


Copyright © 2005, Hitachi, Ltd.

(c) Registering the disk array subsystem

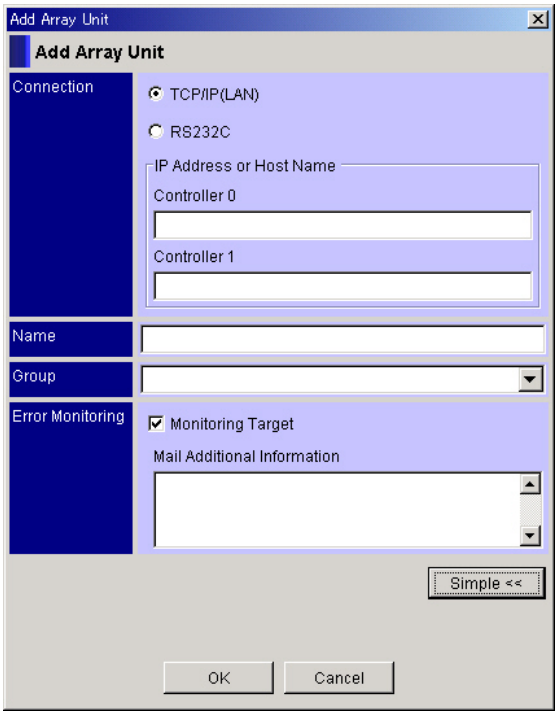
Register the disk array subsystem to be operated in order to operate it from the Storage Navigator Modular. A registration of a non-existent disk array subsystem cannot be done.

(i) Select [Add] in the main window or click [: Add].



Copyright © 2005, Hitachi, Ltd.

(ii) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.



NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. [Array Unit Type] is used to select a type of the subsystem to be connected. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.

• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

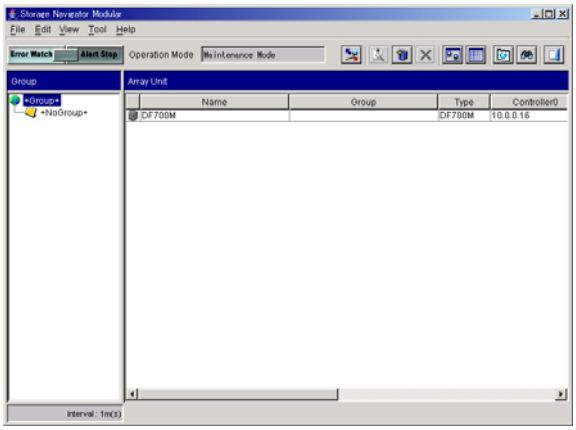
"Simple" window

"Detail" window

[Connection] : Select TCP/IP (LAN) connection to be used for the disk array subsystem. RS232C is not supported in DF700.
When connecting the LAN, select the [TCP/IP (LAN)], and then specify the [IP Address], [Host Name], and [IP Address] or [Host Name] of controller 0 and 1.

[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).
The maximum number of the groups allowed to be registered is 200.
The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.



Copyright © 2005, 2006, Hitachi, Ltd.

[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

(iii) When a message informing of a completion of the registration is displayed, click the [OK] button.

(iv) The updated main window is displayed.

When an entry has been made in [Group Name], the group name is displayed in the tree diagram on the right side of the window. A clicking on the group name displays an icon(s) of the disk array subsystem(s) registered in the group.
There are two types of icon of the disk array subsystem as shown below: an icon for the dual system and that for the single system.

• Icon for the dual system :

• Icon for the single system :

The icons of the disk array subsystem are displayed in the order of the registration of the disk array subsystems.

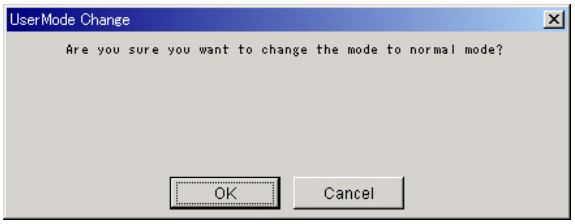
(d) Changing the Maintenance Mode to the Normal Mode



Change the Operation Mode from the Maintenance Mode to the Normal Mode.

When the log-in has been made in the Maintenance Mode, [Maintenance mode] is displayed as a detailed information of the [Operation Mode] in the upper part of the main window.

(i) Select [Tool] – [Operation Mode] – [Change] in the main window or click [ : Change Operation Mode].

(ii) The message asking for the confirmation is displayed. Click [OK] button.

(iii) [Normal Mode] is displayed for the [Operation Mode] in the upper part of the main window. When the unit window is displayed, the Storage Navigator Modular operates in the [Normal Mode].

Copyright © 2005, Hitachi, Ltd.

1.2 Setting the LAN Port Number

When it cannot be accessed the array subsystem from the Storage Navigator Modular due to the duplication of the LAN Port Number, the access will be possible by changing the LAN Port Number which the Storage Navigator Modular uses.

- "Inspect skinny" option that is the VoIP function option of firewall of Cisco is effective, and the Storage Navigator Modular cannot access to the Subsystem through the firewall. In this case, it is necessary to change in LAN port number.

(1) Prerequisites

The LAN Port Number can be changed by the Storage Navigator Modular only when the prerequisites described below are all satisfied.

- Microprogram Version 0726/E or more
- Storage Navigator Modular Version 2.61 or more
  The CLI is not supported in this version.
- The Storage Navigator Modular is available connecting to the LAN port of both control units.

NOTE : It is possible to change the LAN port number for every control unit from the user port management port. Refer to "4.2 (17-1) Recovery method" (SYSPR 04-0340).

(2) Restrictions

The LAN Port Number cannot be changed in the following conditions.

- While the LAN port to be changed is used in the other application or the failure monitor. In this case, change the LAN Port Number after stopping the program that is activated.

(3) Points of concern

When using this function, consider the following points.

- Use the number not used in the connected network in the range of 1024 to 49151 for the LAN Port Number that can be changed.
- When the HiCommand are used, the setting needs to be changed.
- When the initialization of the array subsystem and initial setup of the microprogram are performed, the set LAN Port Number returns to the initial value (2000).
- When returning the microprogram to the revision 0726/E less than after the LAN port number was changed other than 2000, execute it after returning the LAN port number to 2000.
- When returning the Storage Navigator Modular version to the Version 2.61 or less after changing the LAN Port Number to the number other than 2000, return the LAN Port Number to 2000, and then return the Storage Navigator Modular version to the Version2.61 or less.
- When changing the LAN Port Number, set the same LAN Port Number for both Control Units, and change the port number of all the array subsystems at the site concerned to the same number.
- When the LAN Port Number set to the array subsystem and the LAN Port Number described in the services file in the PC to be connected do not correspond, the PC cannot be connected to the LAN port of array subsystem. When the PC cannot be connected to the LAN port of array subsystem after changing the LAN Port Number, check the LAN Port Number of the array subsystem and the LAN Port Number described in the services file in the PC.

Copyright © 2005, 2006, Hitachi, Ltd.

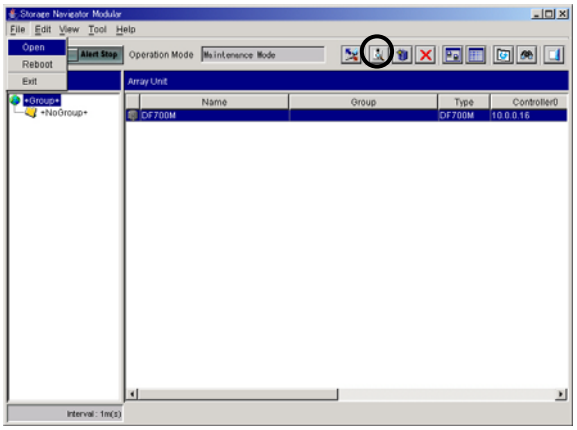
(4) Procedure of changing LAN Port Number

Refer to "4.2 (17) Setting of LAN Port Number" (SYSPR 04-0300).

Copyright © 2005, Hitachi, Ltd.

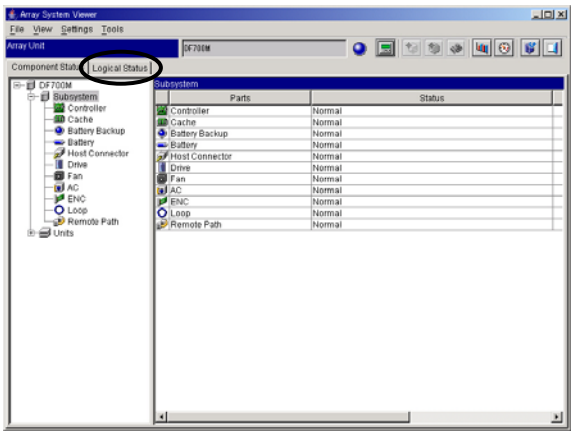
Chapter 2. Setting Host Group/Targets

- Make a setting for making the subsystem recognized by a server.
- The setting of the host group/targets must be made for each port.



2.1 Before setting host group/Targets

(1) Turn on the power supply.



(2) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050), "Registering the newly introduced DF in the Storage Navigator Modular" in Subsection 1.1.

(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

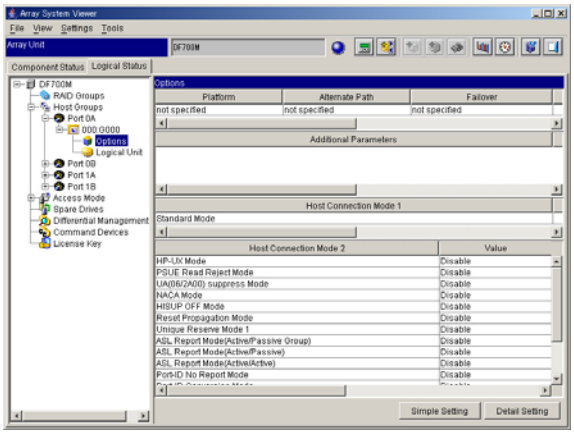
(4) On the unit window, click the [Logical Status] tab.

Copyright © 2005, Hitachi, Ltd.

2.2 Setting of option

- When the Fibre Channel interface is added in the RKM/RKS/RKXS/RKH or the RKS/RKXS, or in case of the NAS system.
  : Go to "2.2 (1) For Fibre model/NAS model" (SYSPR 02-0010)
- When the iSCSI interface is added in the RKM/RKS/RKXS/RKH.
  : Go to "2.2 (2) For iSCSI model" (SYSPR 02-0090)

(1) For Fibre model/NAS model(‡1)



There are two methods for setting the options, that is, the simple setting and detail setting. When making the simple setting, select elements of an environment of the host computer to be connected. When the selection is made, the host group options (host connection mode 1 and 2) necessary for the host computer to be connected are set automatically.
When making the detail setting, directly set the necessary host group options (host connection mode 1 and 2) in the same way as conventional one.

(a) Simple setting

Set the host group options (host connection mode 1 and 2) necessary for the host computer to be connected by selecting elements of the environment of the host, that is, platform, alternative path, fail-over, and additional parameter. Since some host environments require detail setting as well as the simple setting, refer to the table of host connection parameters.

(i) Click the [Logical Status] tab in the unit window.

(ii) Display the [000:G000] by clicking the port through a controller for which you want to set the host connection mode. Then display the options and logical unit by double clicking on the [000:G000] and select the options.

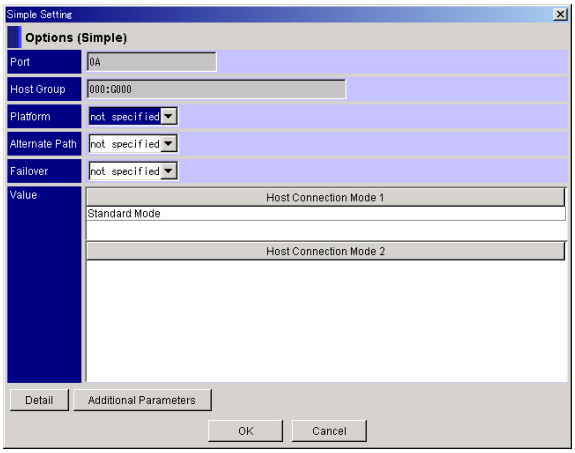
NOTE : In the case of the RKH, the port number 0C, 0D, 1C or 1D of the Fibre Channel is displayed according to the installation status of the Interface Board(‡2).

(iii) Click the [Simple Setting] button that is displayed at the lower right part of the window.

‡1 : The setting is supported in the Storage Navigator Modular Ver.2.60 or more.
‡2 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(iv) "Options (Simple)"Property window is opened.
Select [Platform], [Alternative Path], and [Fail-Over] according to an environment of the host to be connected.



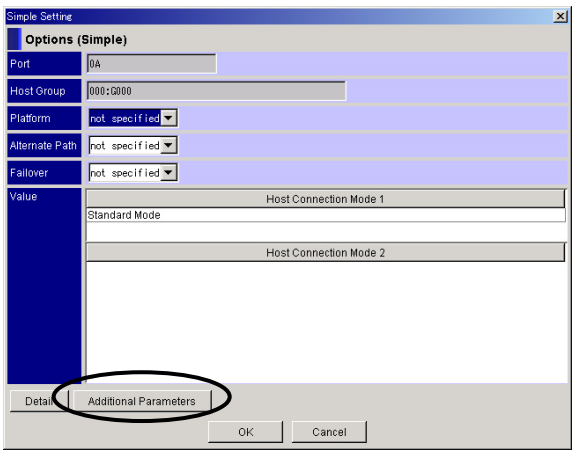


Table 2.2.1 Simple Setting Item List

No.	Menu item	Contents		Factory setting
		Parameter	How to set	
1	Platform	Not specified	Select one of the items	Not selected
		HP-UX		
		Solaris		
		AIX		
		WindowsNT		
		Windows2000		
		Windows2003		
		Linux		
		Tru64		
2	Alternative path	Not specified	Select one of the items	Not selected
		PV Link		
		HDLM		
		VxVM		
3	Fail-over	Not specified	Select one of the items	Not selected
		MC/ServiceGuard		
		Sun Cluster		
		VCS		
		HACMP		
		MSCS		
		Tru Cluster		

Copyright © 2005, Hitachi, Ltd.

(v) Click the [Additional Parameters] button.

(vi) The "Additional Parameters" window is opened. Select the [Item] as occasion demands and click the [OK] button.

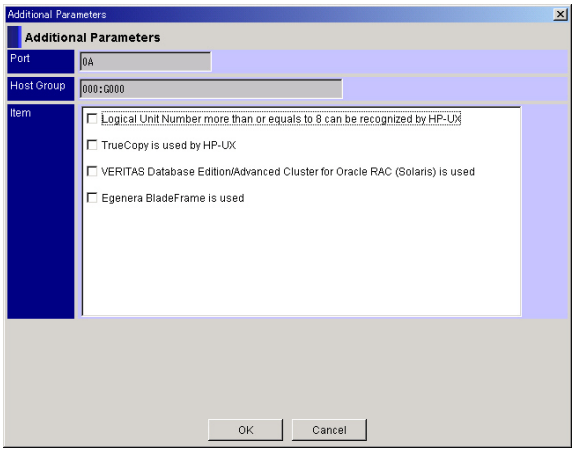

Table 2.2.2 Simple Setting Item List

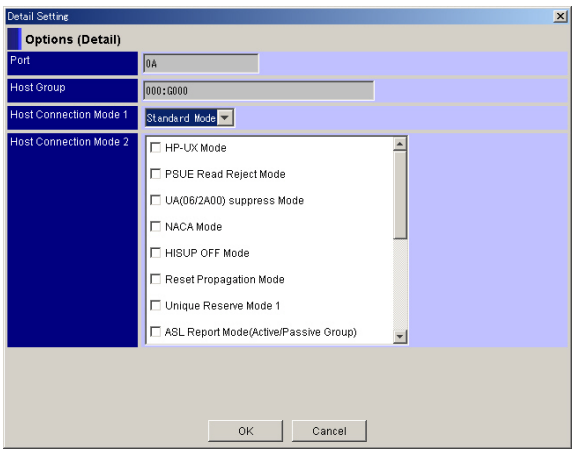
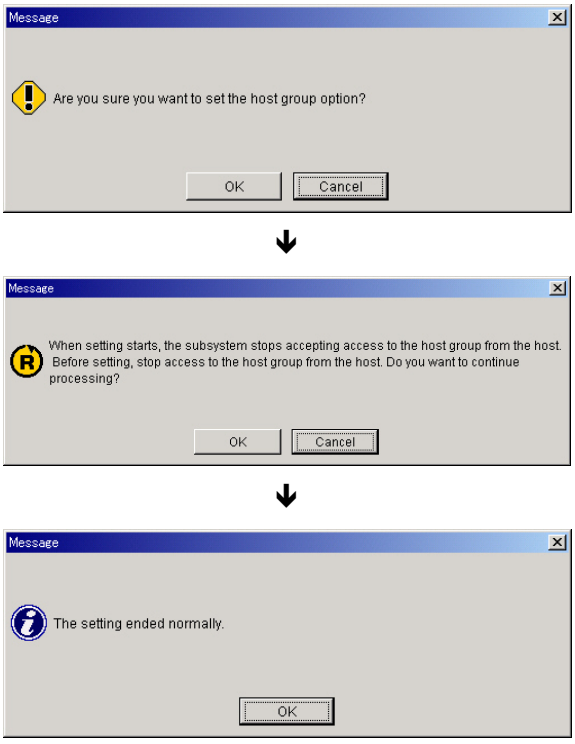


No.	Menu item	Contents		Factory setting
		Parameter	How to set	
1	Additional Parameters	Logical Unit Number more than or equals to 8 can be recognized by HP-UX.	Select	Not selected
		TrueCopy(*1) is used by HP-UX		
		VERITAS Database Edition /Advanced Cluster for Oracle RAC (Solaris) is used		
		Egenera BladeFrame is used		

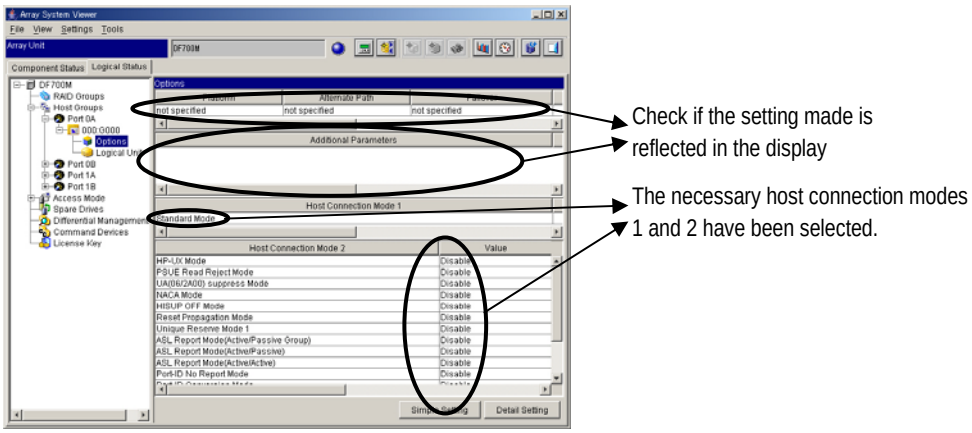
*1 : TrueCopy displayed means TrueCopy remote replication and TrueCopy Extended Distance.



(vii) Click the [Detail] button as occasion demands.

Copyright © 2005, 2006, Hitachi, Ltd.

(viii) Select [Host Connection Mode 1] and [Host Connection Mode 2] and click the [OK] button.

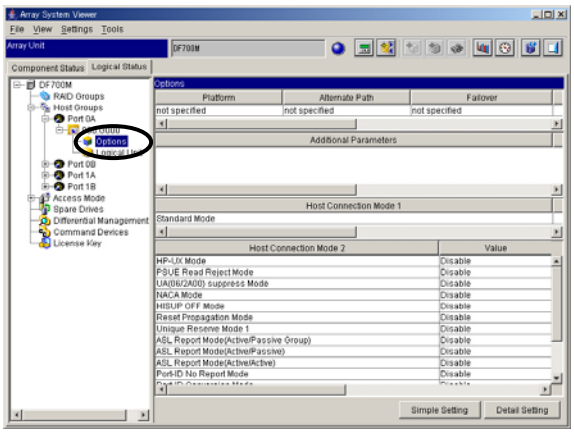


(ix) Click the [OK] button in the "Options (Detail)" window.

Copyright © 2005, Hitachi, Ltd.

(x) The setting that has been made is displayed.
Make sure that the selected host environment (platform, alternative path, and fail-over) and the Additional Parameter are reflected in the display. Besides, when you have set the host connection mode 1 and 2 directly, make sure that the mode that has been set is reflected in the display.

NOTE : For the RKH, the port number 0C, 0D, 1C, or 1D is displayed depending on the installation status of the Interface Board(‡1).



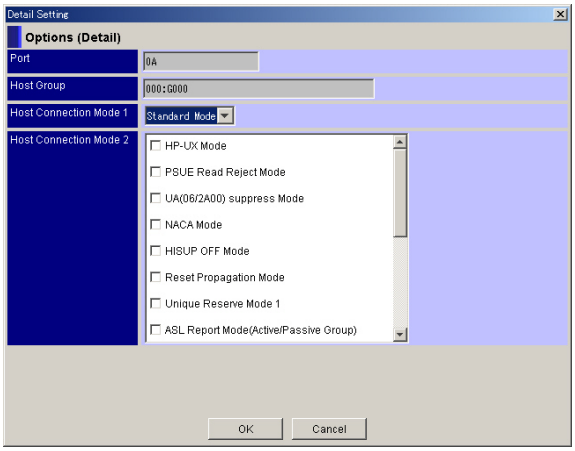
(xi) Make the settings for the rest of the ports in the same way.

‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Detail setting

(i) Display the 000:G000 by double clicking the [Controller] which is an object of the setting and then double clicking the [Port] in the unit window.
Display the [Options] and [Logical Unit] by clicking the [000:G000], and then click the [Options].



NOTE : For the RKH, the port number 0C, 0D, 1C, or 1D is displayed depending on the installation status of the Interface Board(‡1).

(ii) Click the [Detail Setting] button that is displayed at the lower right part of the window.

‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) The "Options (Detail)" window is opened.
Set a [Host Connection Mode 1 (select one mode)] and a [Host Connection Mode 2 (more than one mode can be selected)].

Host Connection Mode 1 : See No. 1 in Table 2.2.3, "List of Host Group Setting Items".
Host Connection Mode 2 : See No. 2 in Table 2.2.3, "List of Host Group Setting Items".

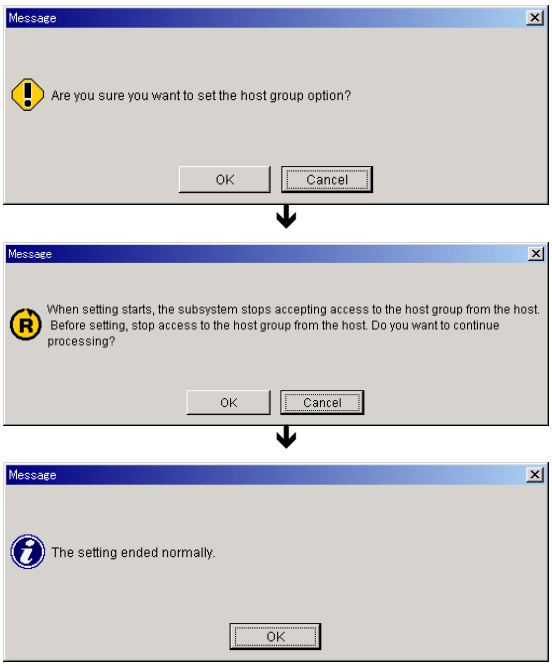


Table 2.2.3 List of Host Group Setting Items

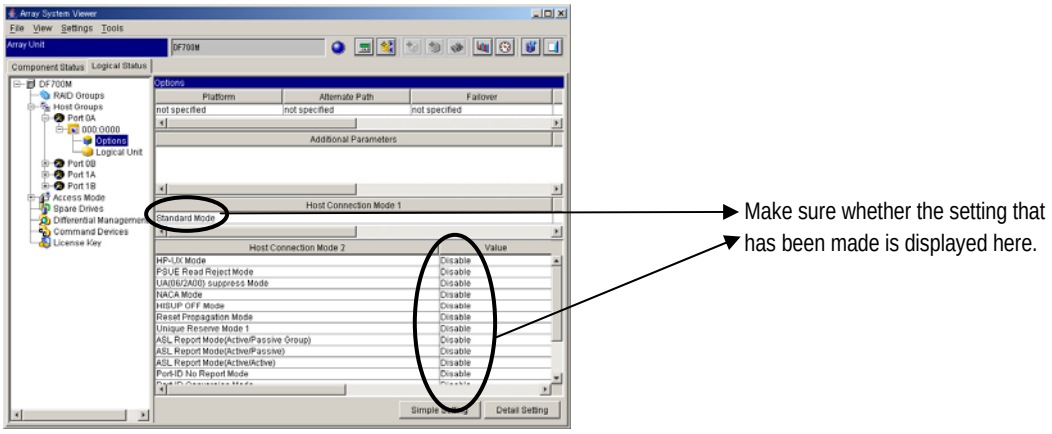
No.	Menu item	Contents		Factory setting
		Parameter	How to set	
1	Host Connection Mode 1 (Only one mode can be selected.)	Standard Mode : Open system emulation mode	Select	Basic mode
		Open VMS Mode : VMS mode		
		TRESPASS Mode : TRESPASS mode		
		Wolfpack Mode : WolfPack mode		
2	Host Connection Mode 2 (Two or more modes may be selected.)	HP-UX Mode: This mode makes LUs, whose LU numbers are 8 up to 63, recognized when the subsystem is connected to the HP server.	Select	Not selected
		PSUE Read Reject Mode : Set it when the fence level of TrueCopy remote replication is used with Data and the pair status suppresses the read access to P-VOL at the time of PSUE transition.	Select	Not selected
		UA (06/2A00) suppress Mode : Unit attention (06/2A00) is suppressed.	Select	Not selected
		NACA Mode : Supports NACA (Normal Auto Contingent Allegiance) that is a standard on SCSI-3.	Select	Not select
		HISUP OFF Mode : Not use	Select	Not selected
		Reset Propagation Mode : Set it when the own port also resets the command while another port received the command reset instruction.	Select	Not select
		Unique Reserve Mode 1 : Supports Persistent Reserve command.	Select	Not select
		ASL Report Mode (Active/Passive Group) : Not use	Select	Not selected
		ASL Report Mode (Active/Passive) : Not use	Select	Not selected
		ASL Report Mode (Active/Active) : Not use	Select	Not selected
		Port-ID No Report Mode: Not use	Select	Not selected
		Port-ID Conversion Mode: When using the DBE_AC with direct connection.	Select	Not selected
		Tru Cluster Mode: When using Tru Cluster, you need to set this mode.	Select	Not selected



Copyright © 2005, 2006, Hitachi, Ltd.

No.	Menu item	Contents		Factory setting
		Parameter	How to set	
2	Host Connection Mode 2 (Two or more modes may be selected.)	Product Serial Response Mode : This mode enables each LU to be assigned a unique DID in the SUN Cluster 3.0 system.	Select	Not select
		Same Node Name Mode : This mode enables that each port of same array responses same World Wide Node Name.	Select	Not selected
		CCHS Mode : CCHS convert Mode	Select	Not selected
		SPC-2 Mode : Set it when it indicates the conformity to SPC-2 in the Inquiry data and responds to Inquiry. Do not set it usually.	Select	Not selected

(iv) The confirmation window is display. Click the [OK] button.

(v) The detail of the setting that has been made is displayed.
Make sure that the setting that has been made is reflected on the display.

NOTE : For the RKH, the port number 0C, 0D, 1C, or 1D is displayed depending on the installation status of the Interface Board(‡1).

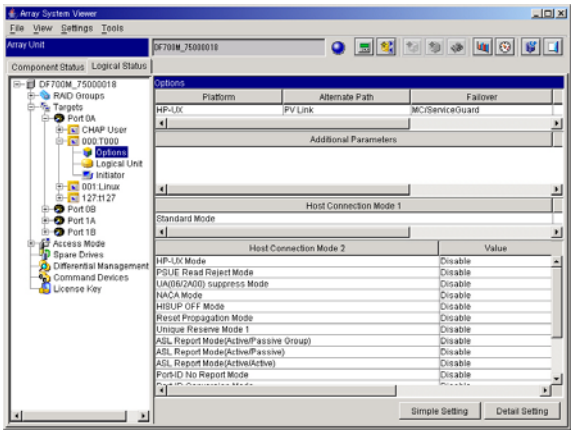
(vi) Make the setting for the other ports in the same way.

‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) For iSCSI model(‡1)

There are two methods for setting the options, that is, the simple setting and detail setting. When making the simple setting, select elements of an environment of the host computer to be connected. When the selection is made, the targets options (host connection mode 1 and 2) necessary for the host computer to be connected are set automatically.



When making the detail setting, directly set the necessary targets options (host connection mode 1 and 2) in the same way as conventional one.

(a) Simple setting

Set the host group options (host connection mode 1 and 2) necessary for the host computer to be connected by selecting elements of the environment of the host, that is, platform, alternative path, fail-over, and additional parameter. Since some host environments require detail setting as well as the simple setting, refer to the table of host connection parameters.

(i) Click the [Logical Status] tab in the unit window.

(ii) Display the [000:T000] by clicking the port through a controller for which you want to set the host connection mode. Then display the options and logical unit by double clicking on the [000:T000] and select the options.

NOTE : In the case of the RKH, the port number 0C, 0D, 1C or 1D of the Fibre Channel is displayed according to the installation status of the Interface Board(‡2).

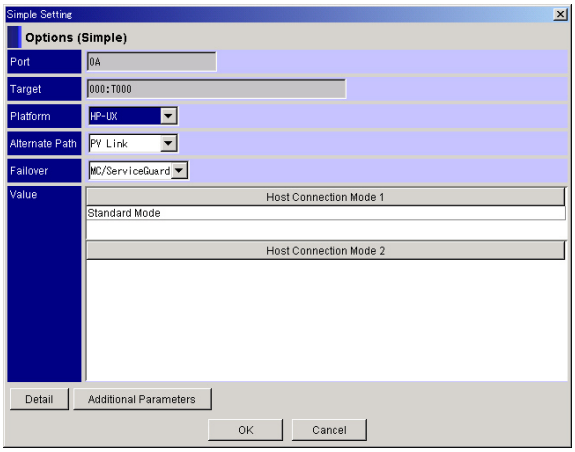
(iii) Click the [Simple Setting] button that is displayed at the lower right part of the window.

‡1 : Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

‡2 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(iv) "Options (Simple)"Property window is opened.
Select [Platform], [Alternative Path], and [Fail-Over] according to an environment of the host to be connected.



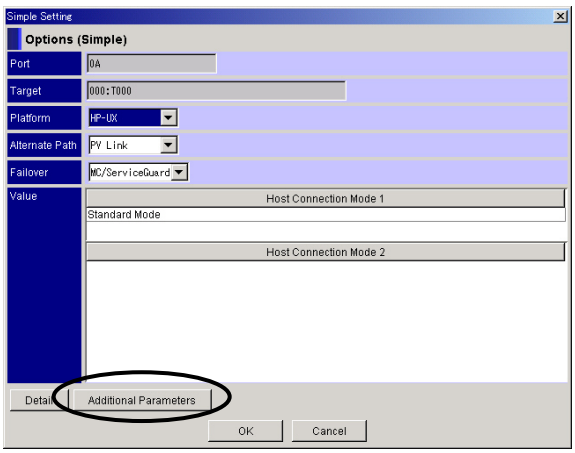


Table 2.2.4 Simple Setting Item List

No.	Menu item	Contents		Factory setting
		Parameter(*1)	How to set	
1	Platform	Not specified	Select one of the items	Not selected
		HP-UX		
		Solaris		
		AIX

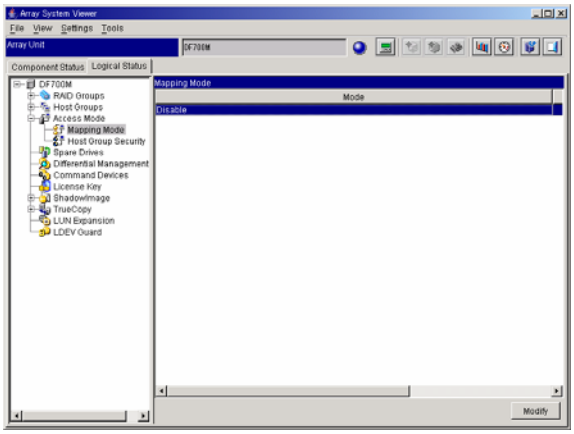
(v) The detail of the setting that has been made is displayed.
Make sure that the setting that has been made is reflected on the display.

NOTE : In the case of the RKH, the port number 0C, 0D, 1C or 1D of the Fibre Channel is displayed according to the installation status of the Interface Board(‡1).

(vi) Make the setting for the other ports in the same way.

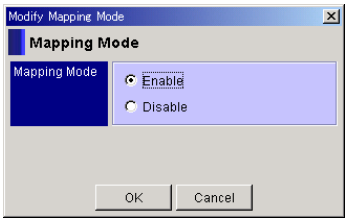
‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

Copyright © 2005, 2006, Hitachi, Ltd.



2.3 Setting LU mapping

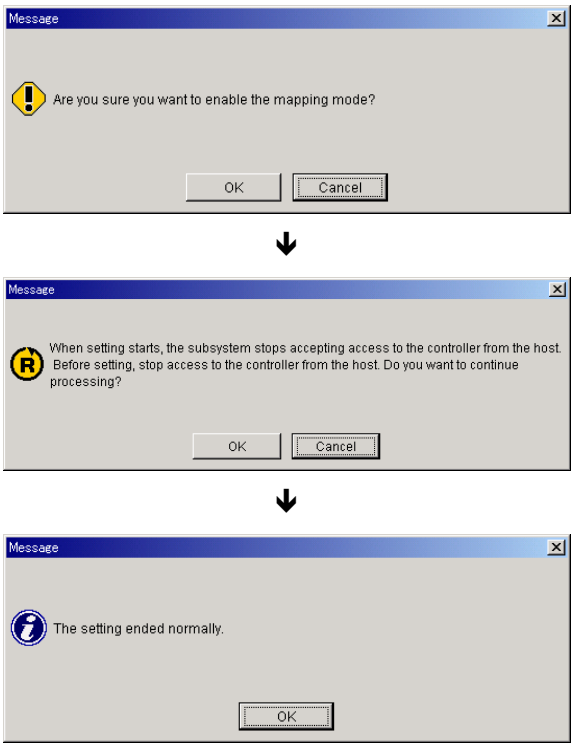
(1) For Fibre model/NAS model



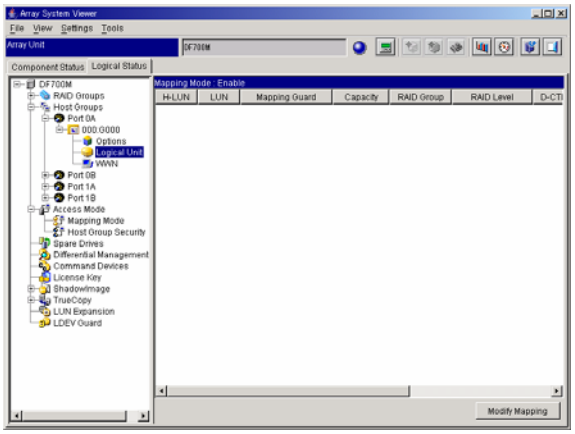
Set mappings of the Port ID, and Host LUN for a LUN so that they are used in the configuration set by a host computer. The setting of the mapping can be modified while an I/O is being executed using the existing mapping setting. However enabling mapping stops host I/O temporarily.

NOTE : When the array subsystem and the host computer are connected with the Fibre Channel interface, the logical unit of the array subsystem cannot be recognized unless the logical unit of number 0 is not created in the array subsystem depending on the host computer.
When using this host computer, create the logical unit of number 0 or map the logical unit to Host LUN (H-LUN) 0.

(a) In the unit window, click [Mapping Mode] after double clicking [Access Mode], and then select [Disable] from the [Mode] menu.
Click the [Modify] button that is displayed at the lower right part of the window.



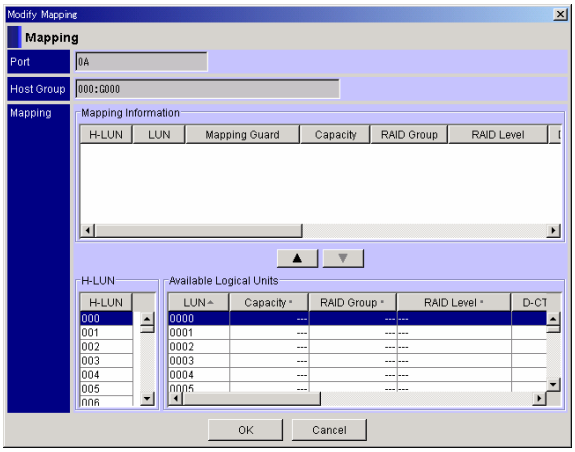
(b) Since the Modify Mapping Mode dialog box is displayed, select [Enable] for the [Mapping Mode] and click the [OK] button.



Copyright © 2005, 2006, Hitachi, Ltd.

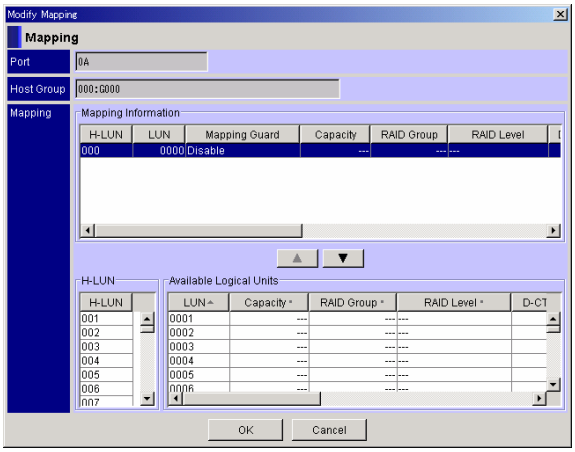
(c) The confirmation window is display. Click the [OK] button.

(d) In the unit window, display [000: G000] by double clicking the [Port XX] to be specified after double clicking the [Host Groups].
Display the [Options] and [Logical Unit] by clicking the [000:G000], and then click the [Logical Unit].



NOTE : For the RKH, the port number 0C, 0D, 1C, or 1D is displayed depending on the installation status of the Interface Board(‡1).

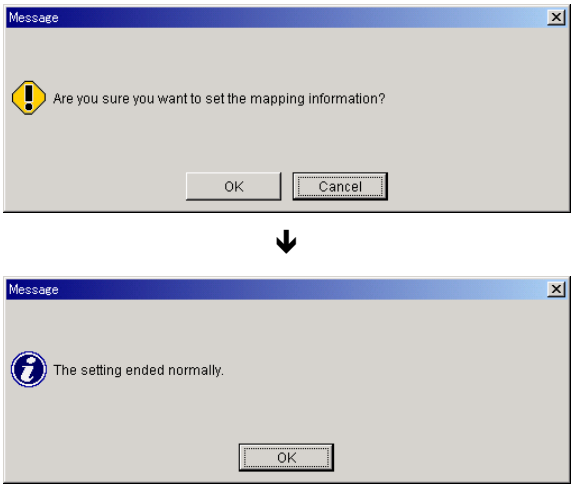
‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.



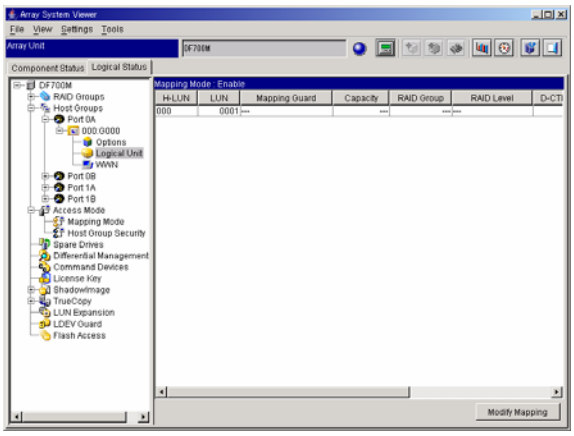
Copyright © 2005, 2006, Hitachi, Ltd.

(e) Click the [Modify] button that is displayed at the lower right part of the window.

(f) Select one H-LUN from the [H-LUN] list of the mapping. Then select one LUN you want to map on the H-LUN from the list of the [Available Logical Units] and click the [▲] button.



The H-LUN and LUN that were selected are moved to the [Mapping Information] list.



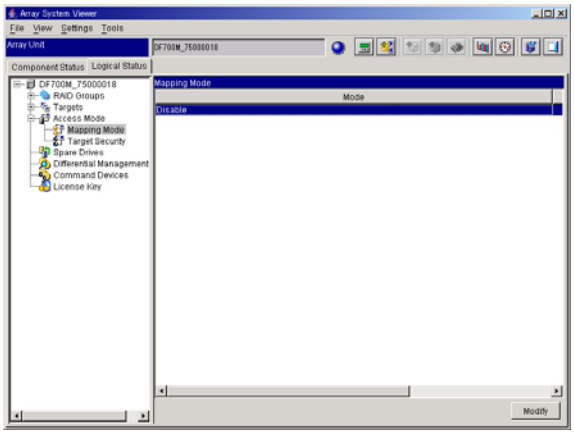
(g) Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

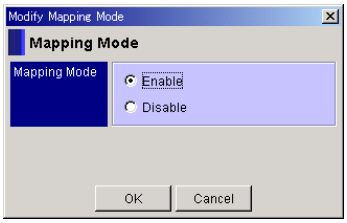
The mapping information is updated and the following window is displayed.

NOTE : For the RKH, the port number 0C, 0D, 1C, or 1D is displayed depending on the installation status of the Interface Board(‡1).



‡1 : The setting is supported in the Storage Navigator Modular Ver.3.10 or more.

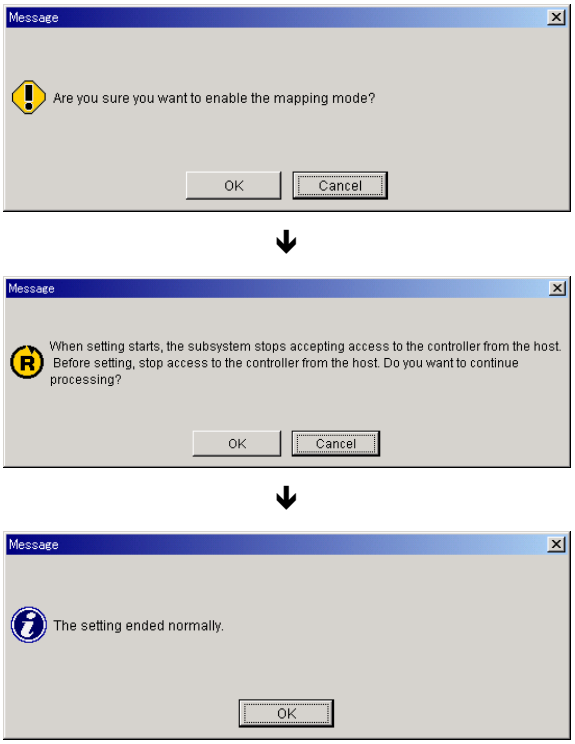
Copyright © 2005, 2006, Hitachi, Ltd.



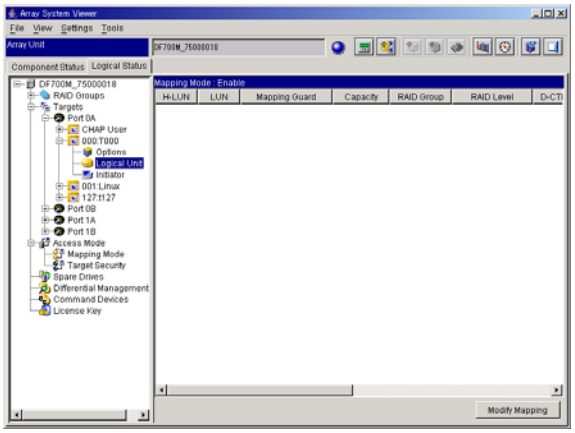
(2) For iSCSI model(‡1)

Set mappings of the Port ID, and Host LUN for a LUN so that they are used in the configuration set by a host computer. The setting of the mapping can be modified while an I/O is being executed using the existing mapping setting. However enabling mapping stops host I/O temporarily.

(a) In the unit window, click [Mapping Mode] after double clicking [Access Mode], and then select [Disable] from the [Mode] menu.
Click the [Modify] button that is displayed at the lower right part of the window.



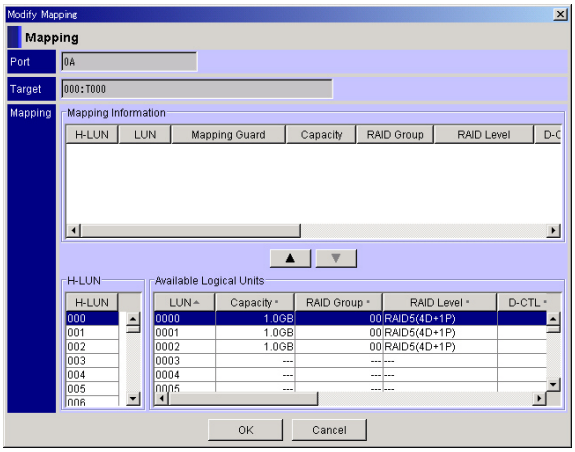
(b) Since the Modify Mapping Mode dialog box is displayed, select [Enable] for the [Mapping Mode] and click the [OK] button.



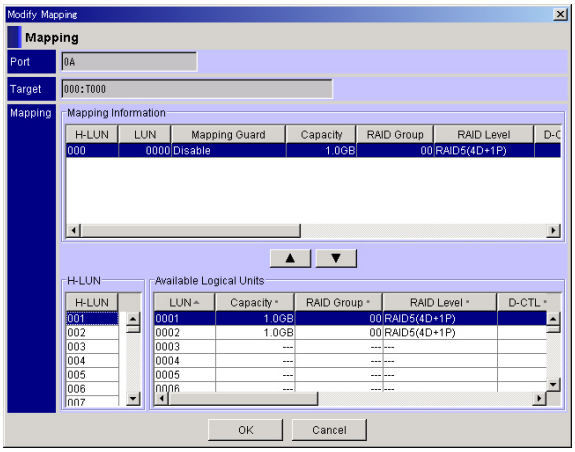
‡1 : Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) The confirmation window is display. Click the [OK] button.



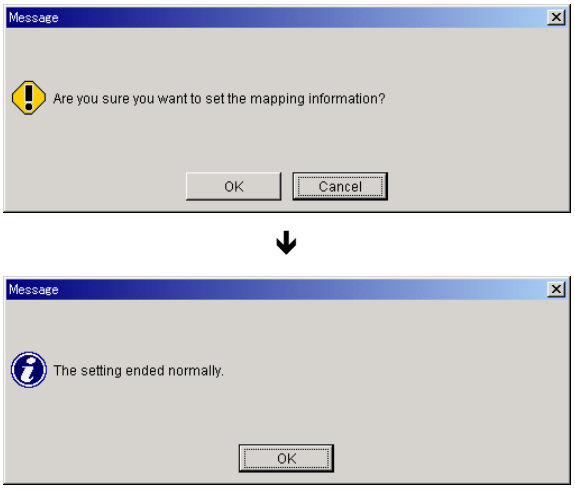
(d) In the unit window, display [000: T000] by double clicking the [Port XX] to be specified after double clicking the [Targets].
Display the [Options] and [Logical Unit] by clicking the [000:T000], and then click the [Logical Unit].



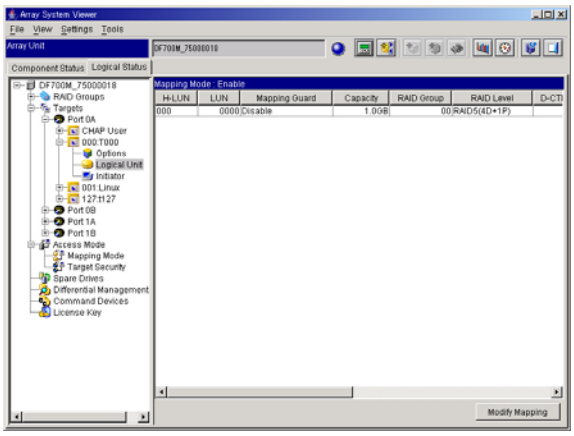
Copyright © 2005, Hitachi, Ltd.

(e) Click the [Modify] button that is displayed at the lower right part of the window.

(f) Select one H-LUN from the [H-LUN] list of the mapping. Then select one LUN you want to map on the H-LUN from the list of the [Available Logical Units] and click the [▲] button.



The H-LUN and LUN that were selected are moved to the [Mapping Information] list.



(g) Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

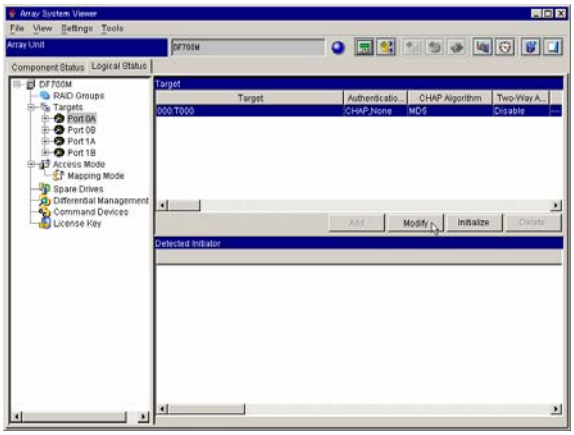
The mapping information is updated and the following window is displayed.

Copyright © 2005, Hitachi, Ltd.

2.4 Setting Target Information

Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

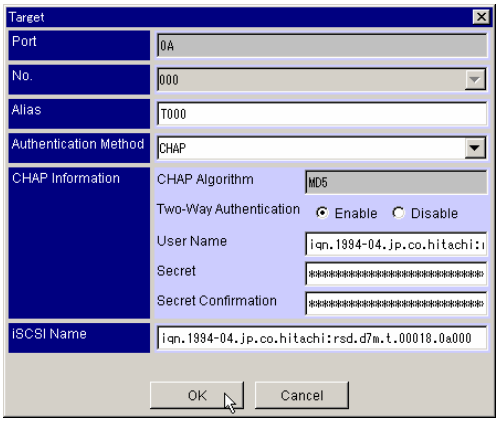
The Host Connection Mode, the mapping information of Logical Unit, and LUN security information are set to the targets, not to the ports at the time of iSCSI interface addition. This enables you to select the host computer to which the subsystem is connected depending on each target.



For targets, only the "000:T000" is supported.
Up to 128 targets can be set when the LUN Manager, which is an extra cost optional feature, is used. (The maximum of 255 for the microprogram of the version 0750/A or more)

(1) Changing the Target Information

This enables you to change the iSCSI Name, Name Authentication Method, and CHAP User information of Two-Way Authentication about the Target.

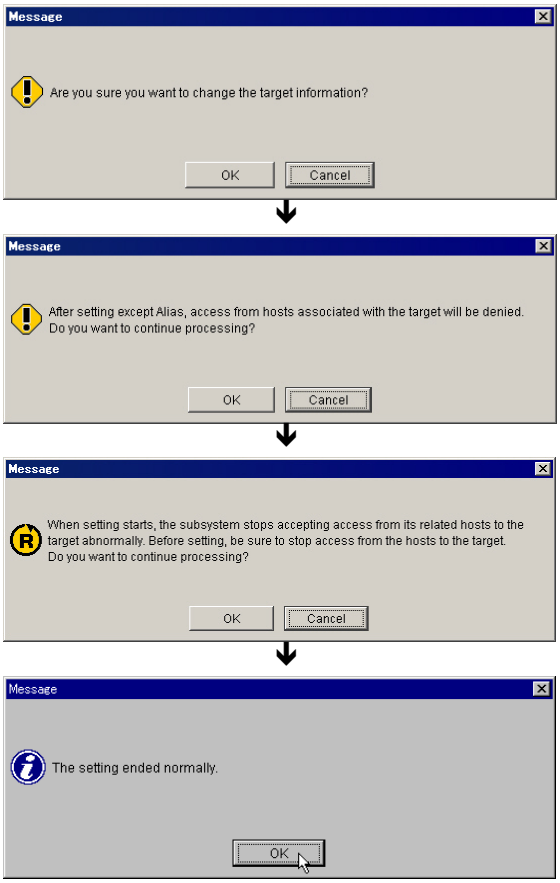


(a) Click the [Logical Status] tab in the unit screen.

(b) Double-click the port which changes the information on the two-way authentication, select [000:T000], and click the [Modify] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) The “Target” dialog is displayed. In the “Target” dialog, enter the “Alias” and “iSCSI Name”. Select the “Authentication Method” from the drop-down list.

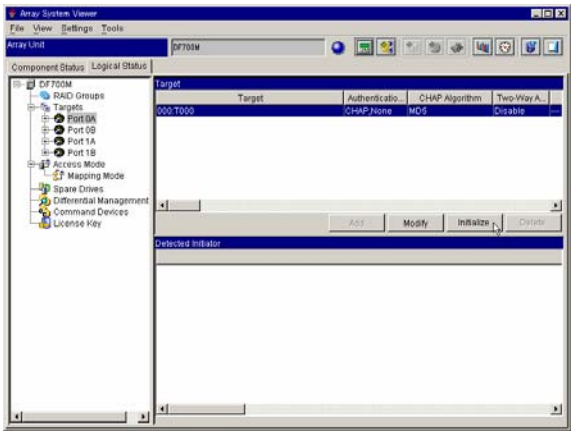


① [Alias] : Enter the Alias of the Target with 32 or less alphanumeric character. (Excluding \, /, :, ;, *, ?, “, <, >, | and ‘)
Spaces at the top or end are ignored. An identical name cannot be used in an identical Port.

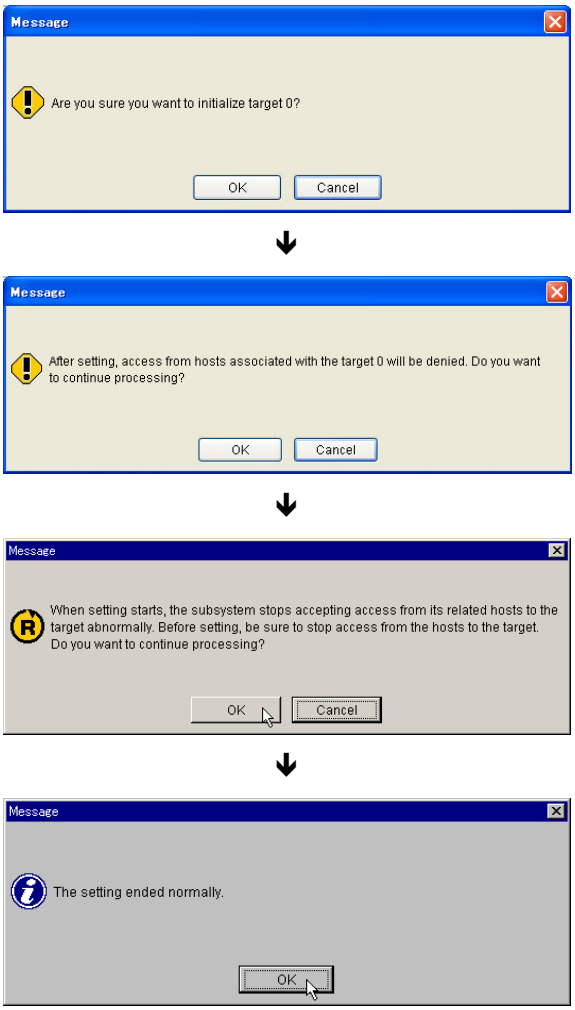
② [Authentication Method] : Select the “CHAP”, “None”, or “CHAP,None”.

③ [iSCSI Name] : Enter the name of the iSCSI Name with 233 or less alphanumeric character. A period (.), hyphen (-), and colon (:) can be used.

(d) Click the [OK] button.
(e) The confirmation message is displayed. Select the [OK] button.



Copyright © 2005, 2006, Hitachi, Ltd.



(2) Initializing the Target Information

(a) Click the [Logical Status] tab in the unit window.

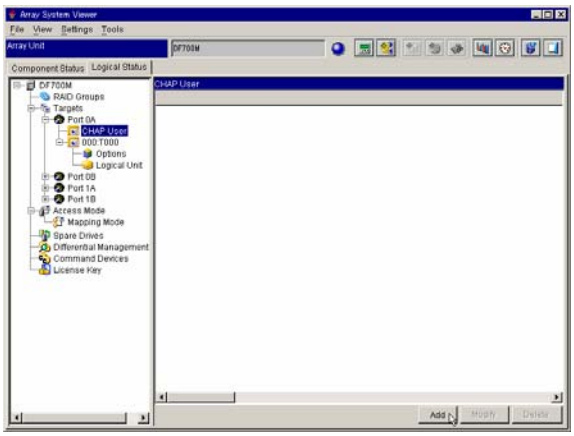
(b) Double-click the port which initializes the target information, select [000:T000], and click the [Initialize] button.

(c) The confirmation message is displayed. Select the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

2.5 Setting CHAP Authentication

Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.



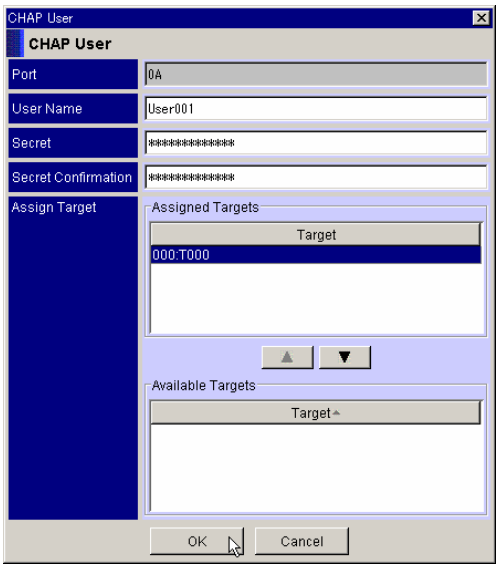
The disk array subsystem can authenticate the iSCSI User both Initiator Authentication and Two-Way Authentication (Target Authentication) with the CHAP (Challenge Handshake Authentication Protocol).
Set the same iSCSI User information (User Name/Secret) both host side and disk array subsystem side for Initiator Authentication.
Set the same iSCSI User information (User Name/Secret) both host side and disk array subsystem side for Two-Way Authentication (Target Authentication).

(1) Adding a CHAP User

To authenticate the initiator, set the CHAP User to the port and assign it to the Target.

(a) Click the [Logical Status] tab on the Unit screen.

(b) Double-click the Port to which you want to add the CHAP User and select [CHAP User].



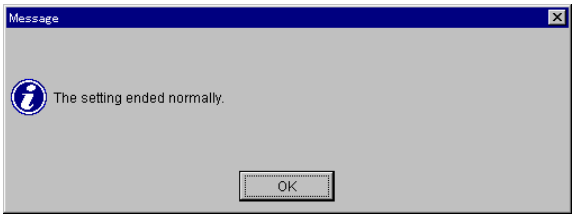
(c) Select the [Add] button.

The “CHAP User” dialog is displayed.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) In the “CHAP User” dialog, enter the [User Name], [Secret], and [Secret Confirmation].

① [User Name] : Enter the name of the User with 256 or less alphanumeric character. The following symbols can be used: (. - + @ _ = : / [ ] , ~ (space))



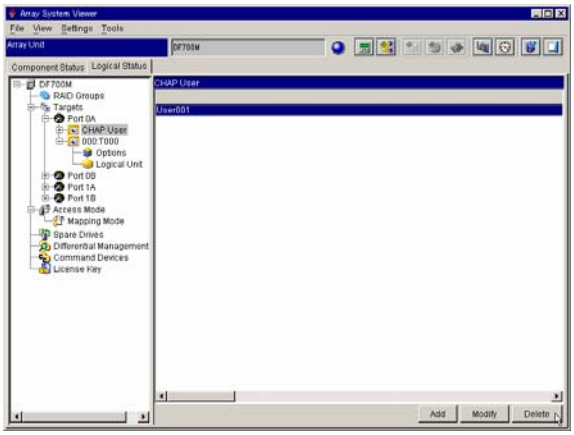
② [Secret] : Enter the Secret from 12 through 32 alphanumeric characters. The following symbols can be used: (. - + @ _ = : / [ ] , ~ (space))

③ [Secret Confirmation] : Enter the characters that enter into the [Secret].

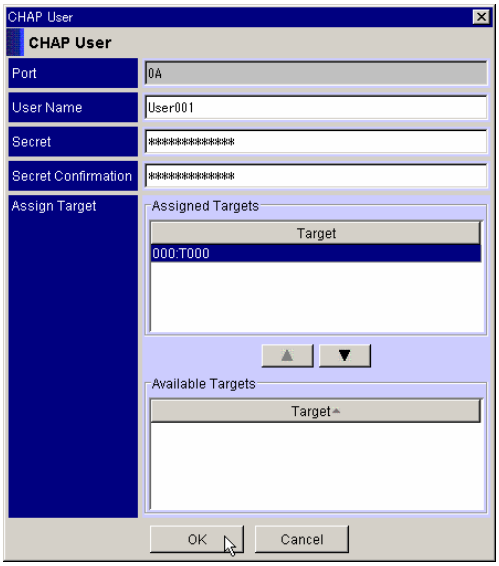
(e) From the “Available Targets” list, select the target to be assigned, select the ▲ button.

(f) Click the [OK] button.

(g) The confirmation message is displayed. Select the [OK] button.



Copyright © 2005, Hitachi, Ltd.

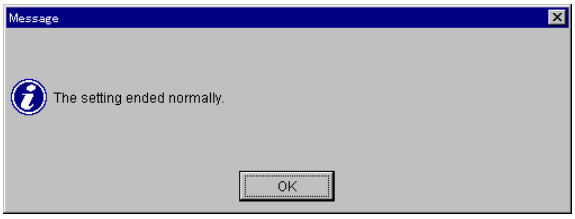


(2) Changing the CHAP User

(a) Click the [Logical Status] tab on the Unit screen.

(b) Double-click the Port of which you want to change the CHAP User, and then select the [CHAP User].

(c) Select the CHAP User to be changed from the [CHAP User] list. Select the [Modify] button.

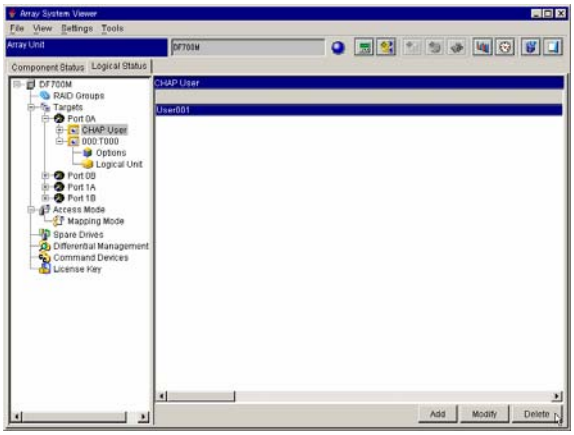


The “CHAP User” dialog is displayed.

(d) As necessary, enter the [User Name], [Secret], and [Secret Confirmation]. And then select the [OK] button.

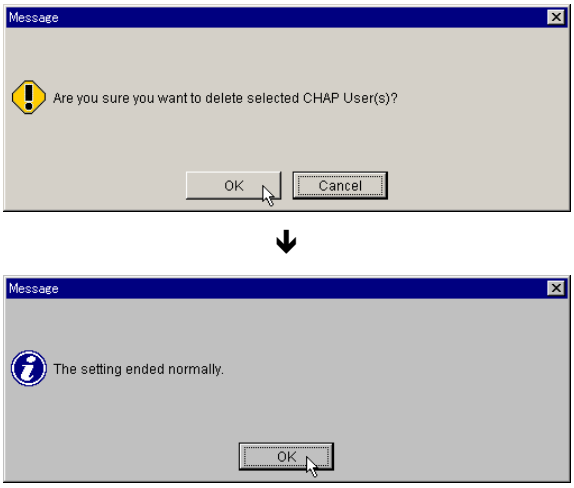
Copyright © 2005, Hitachi, Ltd.

(e) The confirmation message is displayed. Select the [OK] button.



Copyright © 2005, Hitachi, Ltd.

(3) Deleting the CHAP User

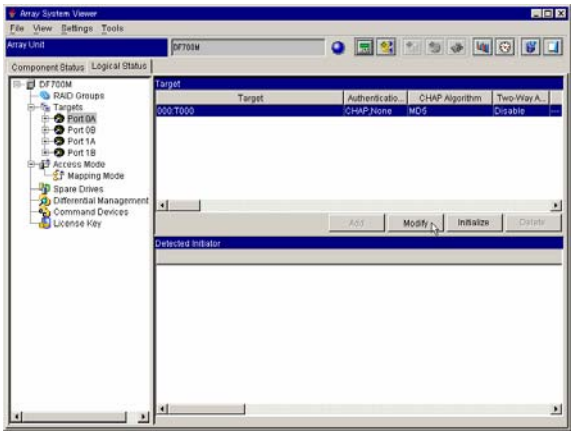


(a) Click the [Logical Status] tab on the Unit screen.

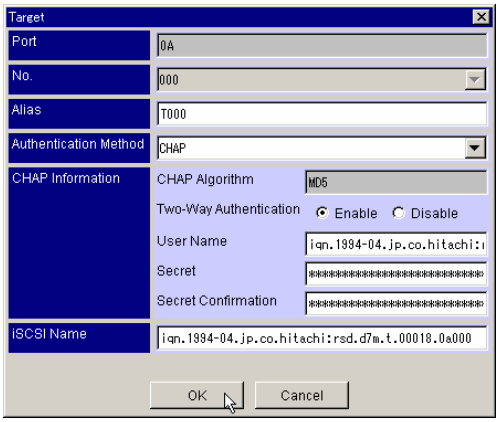
(b) Double-click the Port of which you want to delete the CHAP User and select [CHAP User].

(c) Select the CHAP User to be deleted from the [CHAP User] list. Select the [Delete] button.

(d) The confirmation message is displayed. Select the [OK] button.



Copyright © 2005, Hitachi, Ltd.



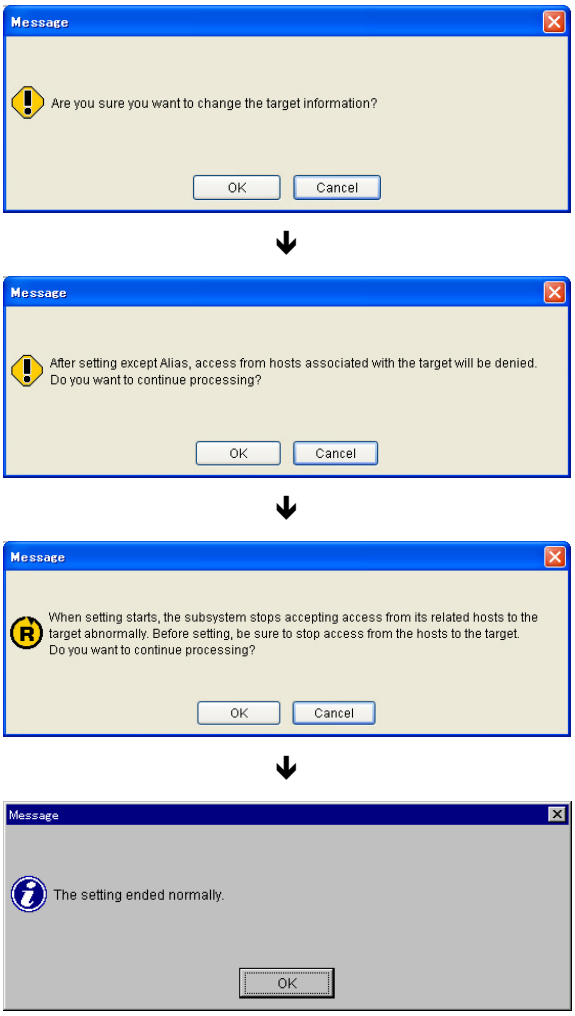
(4) Changing the Two-Way Authentication Information

(a) Click the [Logical Status] tab on the Unit screen.

(b) Double-click the port which changes the information on the two-way authentication, select [000:T000], and click the [Change] button.

(c) Select [Enable] for the “Two-Way Authentication”.

① [User Name] : Enter the name of the User with 256 or less alphanumeric character.
The following symbols can be used: (. - + @ _ = : / [ ] ~ (space))



② [Secret] : Enter the Secret from 12 through 32 alphanumeric characters.
The following symbols can be used: (. - + @ _ = : / [ ] ~ (space))

③ [Secret Confirmation] : Enter the characters that enter into the [Secret].

(d) Select the [OK] button.

Copyright © 2005, Hitachi, Ltd.

(e) The confirmation message is displayed. Select the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 3. Setting the RAID/LU/Spare Disk

This function performs the RAID group setting, LU setting, LU formatting, and Spare Disk setting. Further, it can make the following settings.

Procedure Flow diagram for setting RAID groups, LUs and Spare Disks.

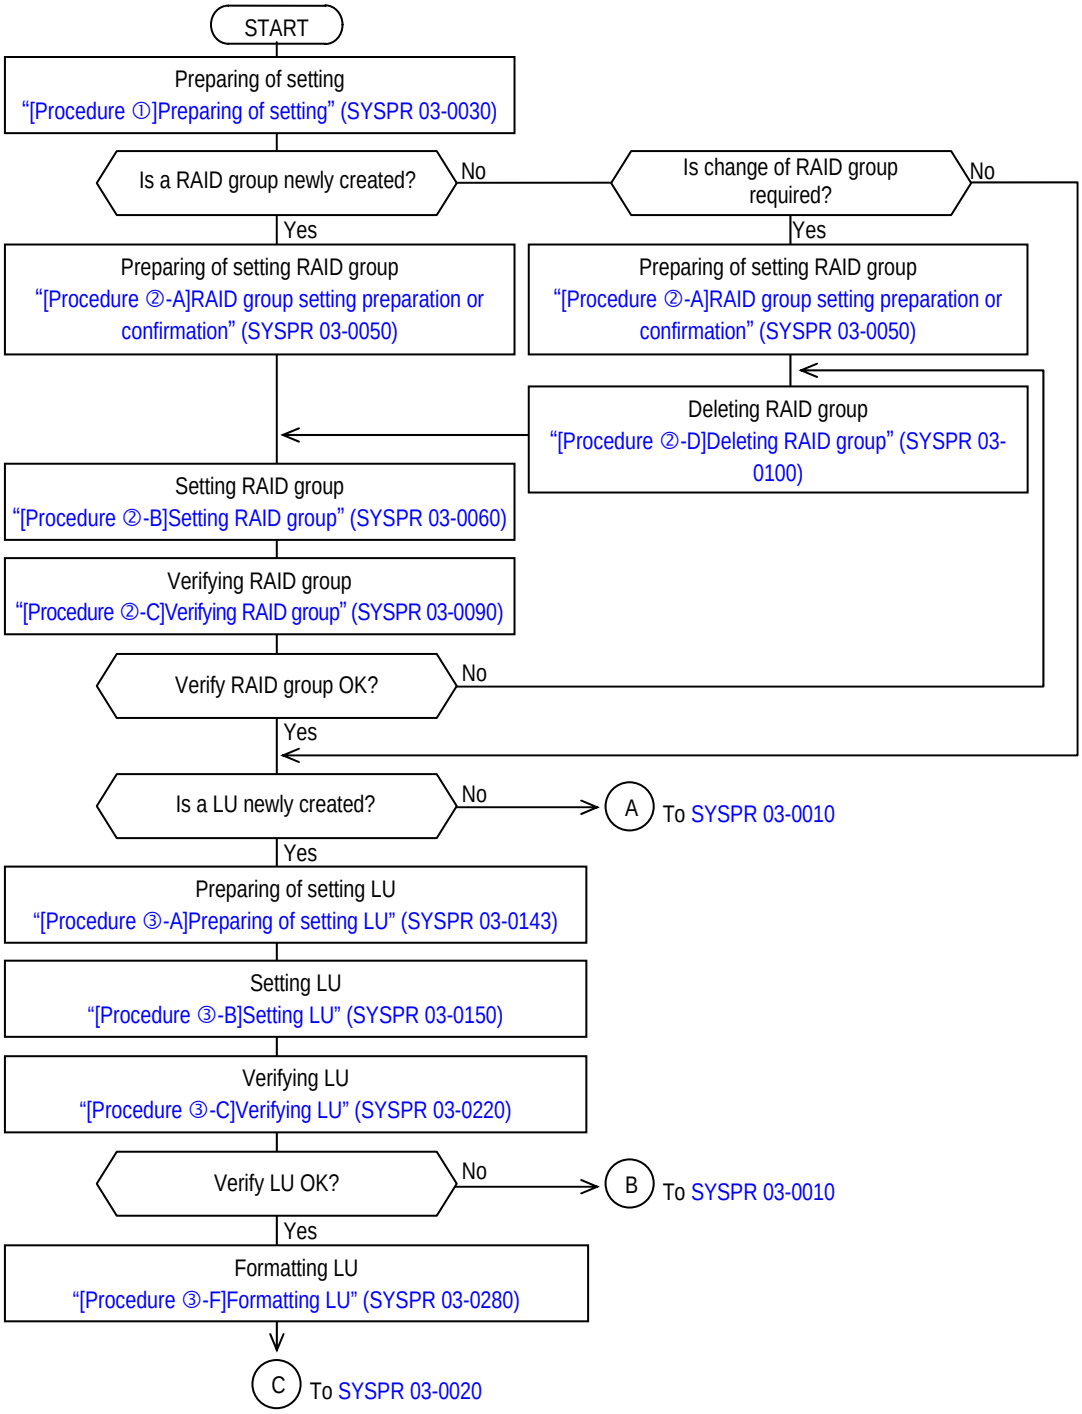


Figure 3.1.1 (1/3)Setting Flow the RAID/LU/Spare Disk

Copyright © 2005, 2006, Hitachi, Ltd.

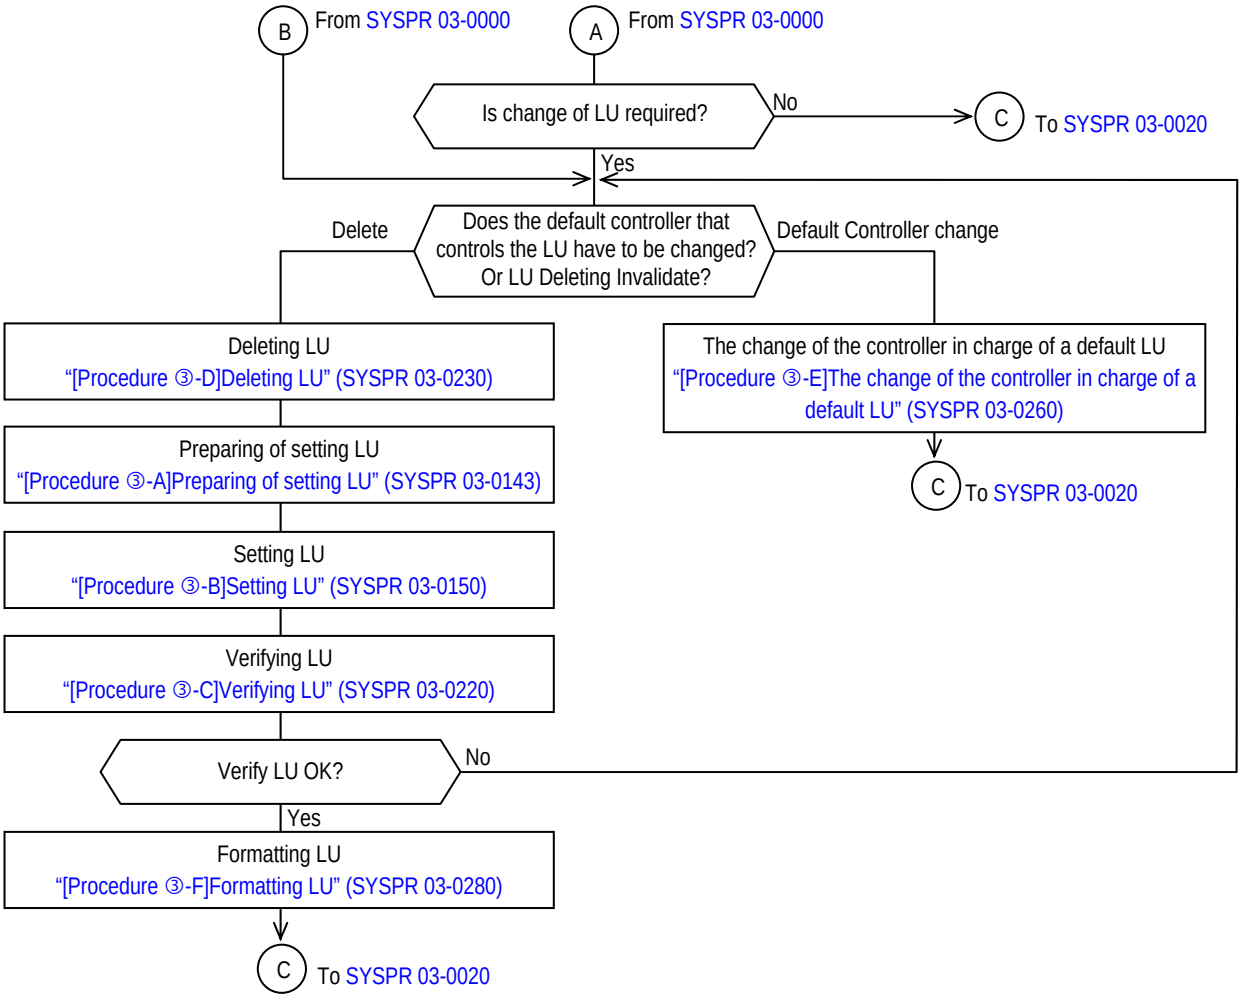

Figure 3.1.1 (2/3)Setting Flow the RAID/LU/Spare Disk

Copyright © 2005, 2006, Hitachi, Ltd.

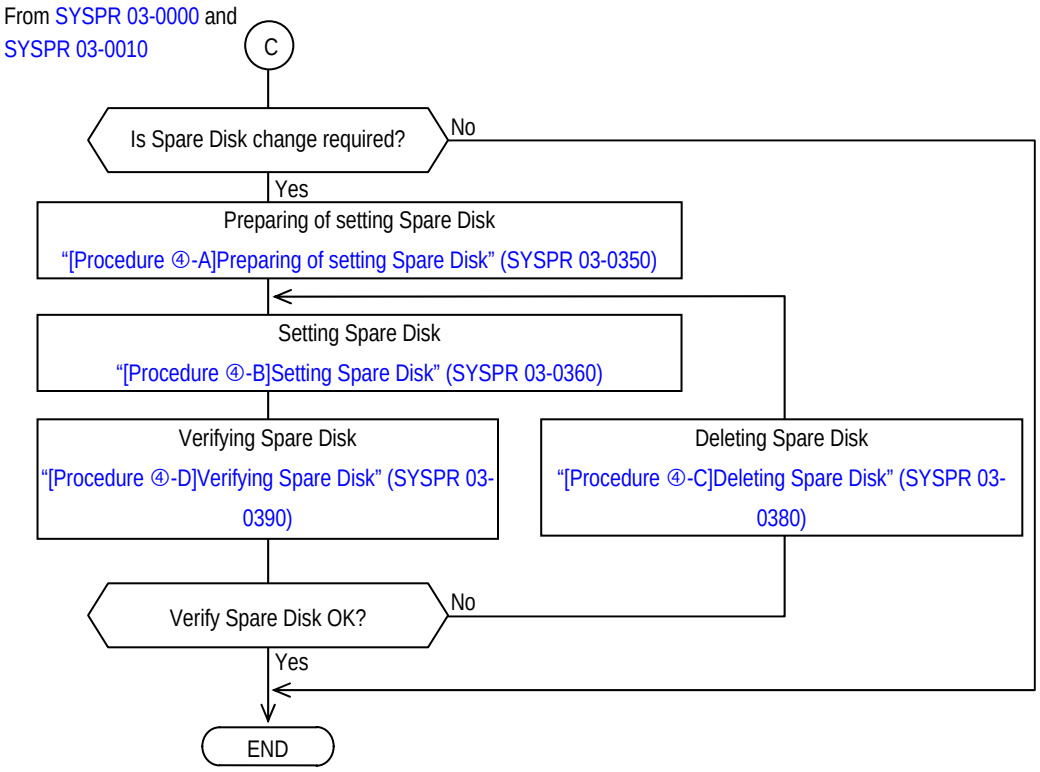

Figure 3.1.1 (3/3) Setting Flow the RAID/LU/Spare Disk

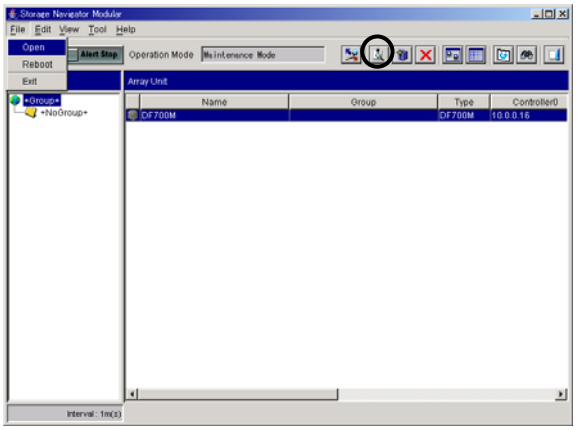
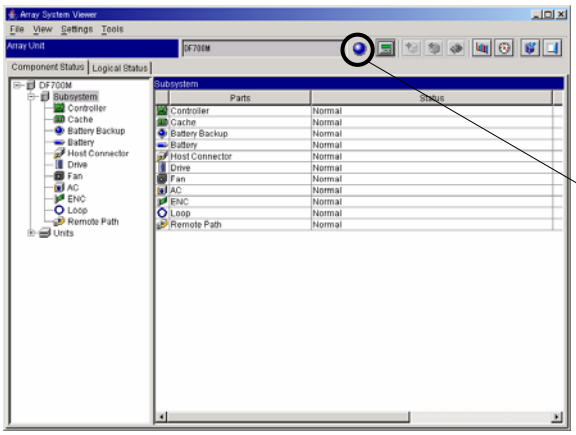


Copyright © 2005, Hitachi, Ltd.

3.1 Preparation of RAID/LU setting

[Procedure ①]Preparing of setting

(1) Start the Storage Navigator Modular and set the operation mode to "Management Mode"(‡1).
(2) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]



NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

‡1 : For details of the setting method, refer to the Subsection "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050)

Copyright © 2005, Hitachi, Ltd.

(3) Check that the unit is ready.

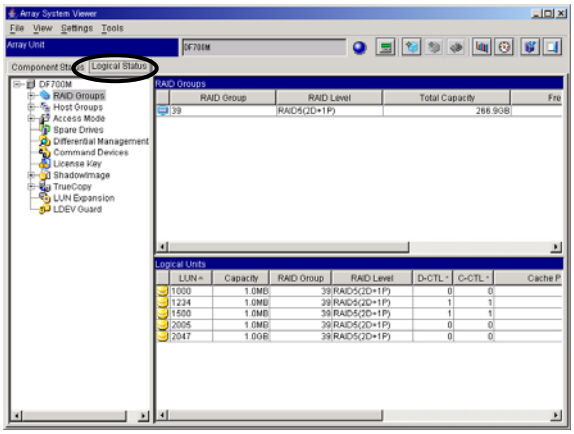
Displayed in green in the ready state.

(4)
- When newly creating or changing a RAID group, go to "3.2 RAID group setting" (SYSPR 03-0050).
- Go to "3.3 Setting of LU" (SYSPR 03-0140) when changing an LU without changing a RAID group.
- When neither the RAID group nor LU is to be changed, select [Mode] – [Exit] or click [: Exit].

Copyright © 2005, Hitachi, Ltd.

3.2 RAID group setting

This setting is used to set, delete and reference a RAID group. This function can be used in the device ready state. (The unit does not need to be re-booted.)



NOTE : Deletion of a RAID group indicates that all the user data of the deleted RAID group are lost. Before deleting the RAID group, back up the user data. For the RAID group and RAID levels which can be set by this device, refer to Theory "4.7 Setting RAID Group" (THEO 04-0260).

NOTE : • It is recommended to set at least four RAID Groups in order to make the NAS system LU for the usual operation, NAS system LU for the backup, and the NAS user LU into another RAID Group. Refer to DF700 NAS SOFTWARE Maintenance Manual "3.2.1 Construction of NAS System LU" (NAS 03-0010) for the detail.

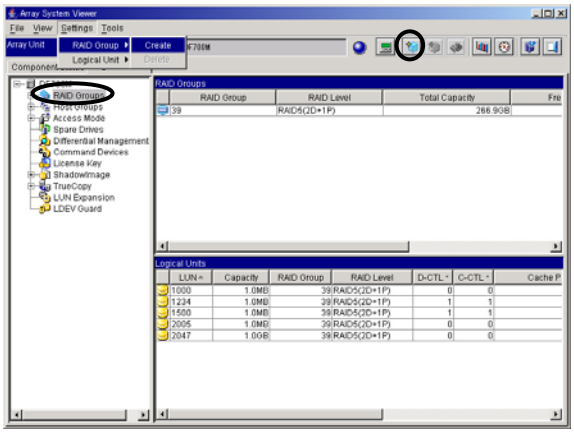
• The deletion of the RAID Group used at the time of the NAS Unit connection has restrictions in the opportunity to execute. Refer to "3.9 Restrictions of the operation opportunity for the system LU/user LU of the NAS" (SYSPR 03-0560) for the restrictions of the execution opportunity.

[Procedure ②-A]RAID group setting preparation or confirmation

(1) Click the [Logical Status] tab in the unit window.

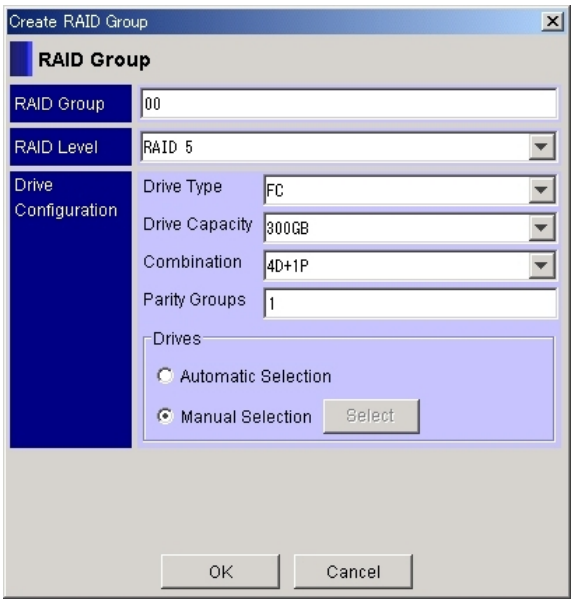
RAID groups and logical units defined for the disk array subsystem are displayed.

[RAID Group] : Information on all RAID groups defined for the disk array subsystem are displayed.



[Logical Unit] : Information on all Logical Units defined for the disk array subsystem are displayed.

Copyright © 2005, 2006, Hitachi, Ltd.

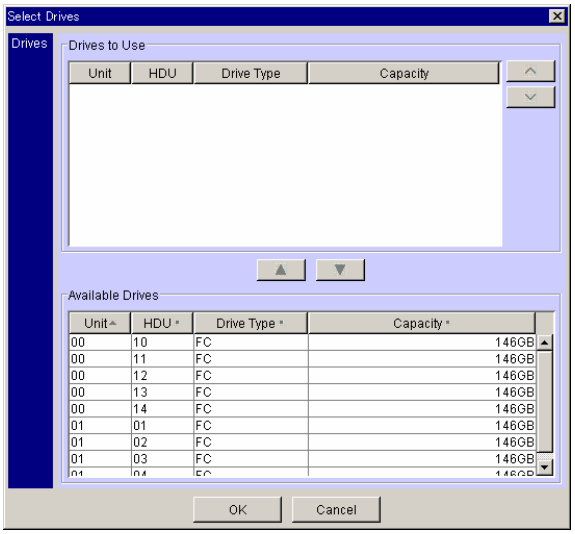


[Procedure ②-B]Setting RAID group

(1) When creating a RAID group by selecting a drive manually

(a) Click [RAID Groups] in the unit window and then select [Settings] – [RAID Group] – [Create], or click the [: RAID Group Settings] button.

(b) Since the Create RAID Group dialog box is displayed, select or enter the [RAID Level] and [Drive Configuration] (drive type, combination, and number of parity groups).



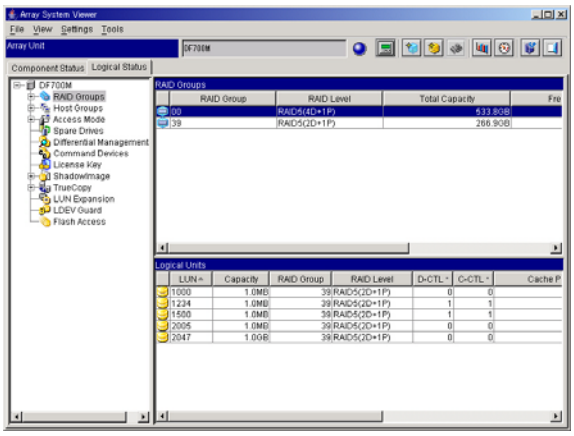
(c) Select [Manual Selection] for the [Drives] and click the [Select] button.

Copyright © 2005, Hitachi, Ltd.

(d) Since the Select Drives dialog box is displayed, select the drive you want to assign to a RAID group from [Available Drives] by operating the [Shift] key.

NOTE : It is possible to create the RAID Group by selecting either one optional Disk Drive of FC and SATA among the Disk Drives which are not set in the RAID Group or the Spare Disks and not blocked.
However, the Disk Drives of the even-numbered slots are allocated in Loop #0 and the Disk Drives of the odd-numbered slots are allocated in Loop #1 in the Basic Chassis and the Additional Chassis, so that it is recommended to evenly select the Disk Drives of the even-numbered slots and the odd-numbered slots in the chassis as the Disk Drives which configure the RAID Group in consideration of the load distribution of the back-end path.
When selecting the Disk Drives to configure the RAID Group manually, it is recommended to continuously select the Disk Drives in the Basic Chassis and the Additional Chassis (either one Disk Drive of FC and SATA which are not set in the RAID Group or the Spare Disks and not blocked) with Storage Navigator Modular.

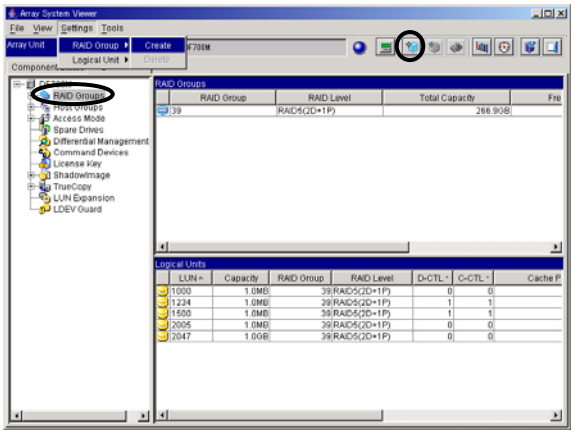
(e) Move the selected drive to the [Drives to Use] box by clicking the [▲] button and click the [OK] button.
(f) Since the Create RAID Group dialog box returns, click the [OK] button.
(g) The confirmation window is display. Click the [OK] button.



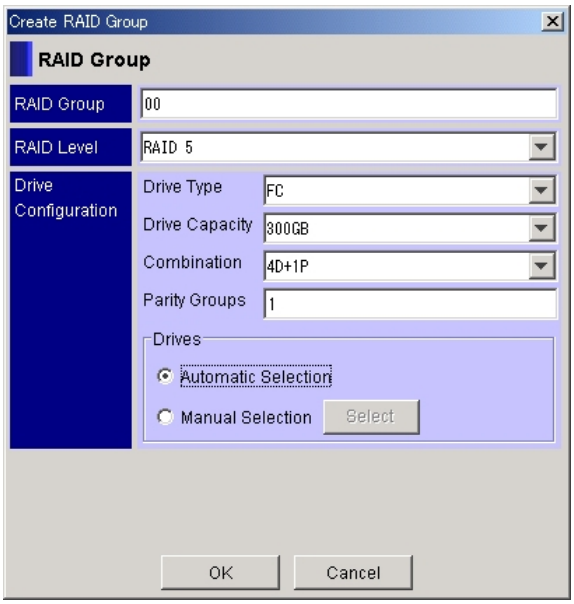
Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) The screen from which a RAID group was updated is displayed.



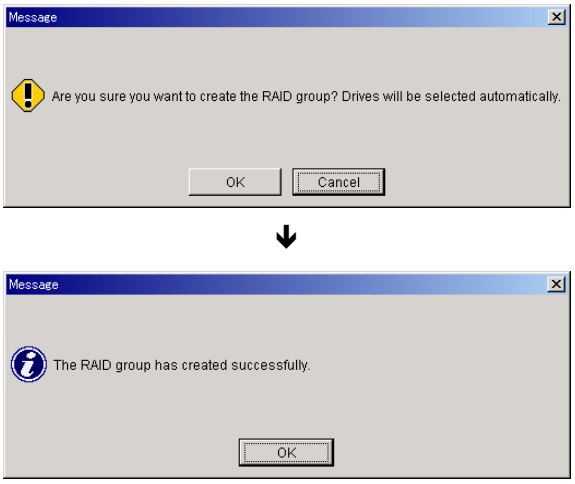
- When setting the multiples RAID Group, return to the "[Procedure ②-B]Setting RAID group" (SYSPR 03-0060), and specify the rest of RAID Group to be set.
- When verifying RAID group [OK], go to "3.3 Setting of LU" (SYSPR 03-0140).
- When verifying RAID group [NG], go to "[Procedure ②-D]Deleting RAID group" (SYSPR 03-0100).



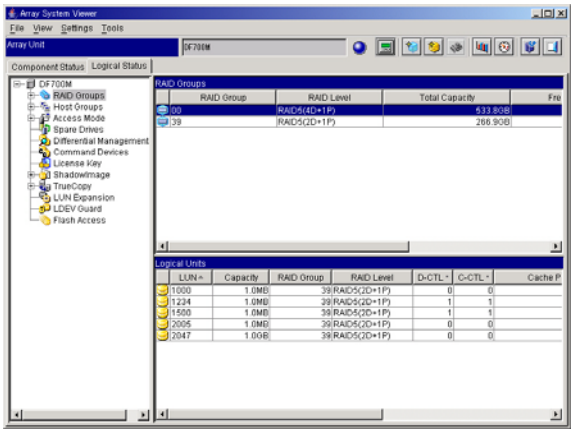
Copyright © 2005, 2006, Hitachi, Ltd.

(2) When the Disk Drive is selected automatically and the RAID Group is created

(a) Click [RAID Groups] in the unit window and then select [Settings] – [RAID Group] – [Create], or click the [ : RAID Group Settings] button.



(b) Since the Create RAID Group dialog box is displayed, select or enter the [RAID Level] and [Drive Configuration] (drive type, combination, and number of parity groups).

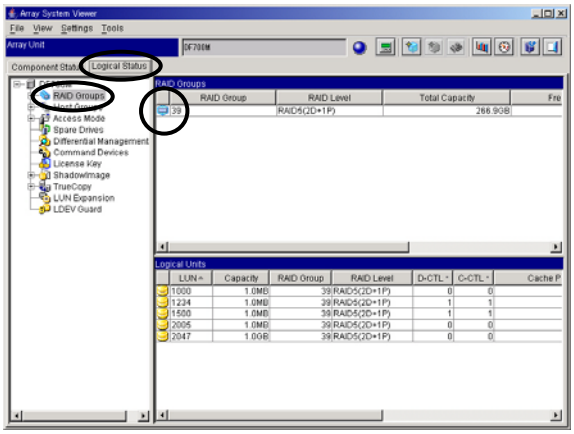


(c) Select [Automatic Selection] for the [Drives] and click the [Select] button.

Copyright © 2005, Hitachi, Ltd.

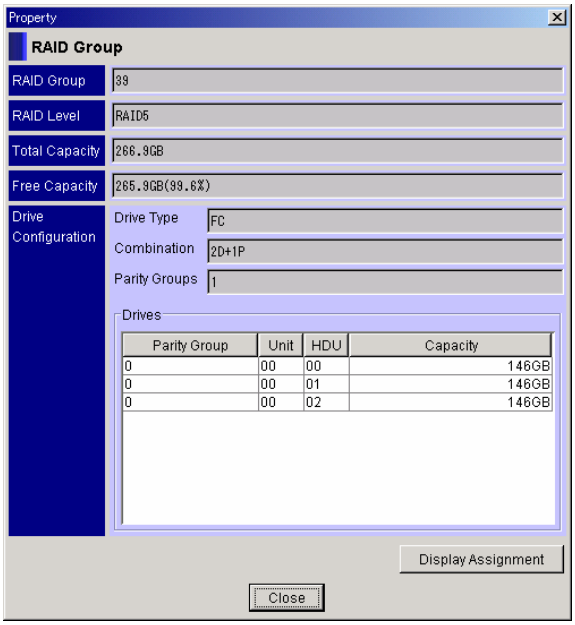
(d) The confirmation window is display. Click the [OK] button.(‡1)
When the capacity of the Disk Drive (single unit) to be created in the RAID group exceeds the capacity of the Spare Disk in the subsystem, the error message is displayed.(‡1)

(e) The screen from which a RAID group was updated is displayed.



- When setting the multiples RAID Group, return to the "[Procedure ②-B]Setting RAID group" (SYSPR 03-0060), and specify the rest of RAID Group to be set.
- When verifying RAID group [OK], go to "3.3 Setting of LU" (SYSPR 03-0140).
- When verifying RAID group [NG], go to "[Procedure ②-D]Deleting RAID group" (SYSPR 03-0100)

‡1 : Check the Disk Drive capacity (referring to Subsection "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).), replace the Disk Drive with that having the appropriate capacity, and set the RAID group again.



Copyright © 2005, 2006, Hitachi, Ltd.

[Procedure ②-C]Verifying RAID group

(1) Click the [Logical Status] tab in the unit window. Also, click [RAID Groups].

(2) The setting made in [Procedure ②-B] can be referred to by double clicking on the icon of the RAID group created.

- When setting the multiples RAID Group, return to the "[Procedure ②-B]Setting RAID group" (SYSPR 03-0060), and specify the rest of RAID Group to be set.
- When verifying RAID group [OK], go to "3.3 Setting of LU" (SYSPR 03-0140).
- When verifying RAID group [NG], go to "[Procedure ②-D]Deleting RAID group" (SYSPR 03-0100).

Copyright © 2005, 2006, Hitachi, Ltd.

[Procedure ②-D]Deleting RAID group

The RAID Group can be deleted even when LUs are defined in the specified RAID Group.

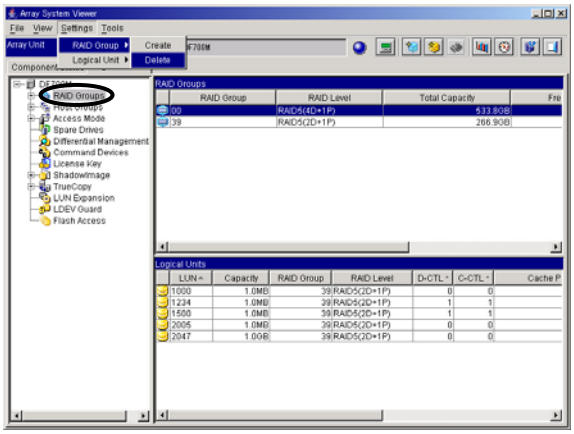
NOTE : All user data is lost by deleting the RAID group and its associated LU. Backup user data before deleting the RAID group.

[Conditions of deletion]

- When the LU, whose status of the forced parity correction is any of "Correcting", "Waiting", "Waiting Disk Drive Recovery", "Uncorrected", "Uncorrected 1" and "Uncorrected 2", is in the RAID Group of the deletion target, this RAID Group cannot be deleted.
  Change the status of the LU to "Restored" or "Skip" by executing or skipping the forced parity correction for this LU, and then delete the RAID Group which has this LU.
- The RAID Group cannot be deleted when Sub LUs of the unified LU(‡1) remain in the RAID Group to be deleted. In the case of the finally defined Sub LU, delete the RAID Group after separating the Sub LU from the unified LU. If it is not the finally unified Sub LU, separate all the unified Sub LUs from the Main LU, and delete the RAID Group after separating them from the unified LU.
- The RAID Group cannot be deleted when there are the following LUs in the RAID Group to be deleted.
  - LUs set to the pair of ShadowImage in-system replication
  - LUs set to the pair of Copy-on-write SnapShot
  - LUs set to the pair of TrueCopy remote replication
  - LUs set to the pair of TrueCopy Extended Distance
  - LUs set to the command device
  - DM-LUs
  - System LUs of NAS
  - User LUs of NAS
  - Reserve LUs of Modular Volume Migration
  - LUs registered in the data pool
- When the Dynamic sparing/Correction copy/Copy back is operating in the RAID Group to be deleted, delete the RAID Group after the Disk Drives are restored.
- When there are LUs executing the LU switching processing in the RAID Group to be deleted, the RAID Group cannot be deleted because the microprogram is executing the internal processing. Wait for one minute or so, and delete the RAID Group.
- When there are LUs of the pair whose status of Modular Volume Migration is COPY in the RAID Group to be deleted, the RAID Group cannot be deleted. Delete the RAID Group after the pair status of Modular Volume Migration becomes PSUS.

‡1 : Support a function (LUN Expansion function) that creates a unified LU by combining LUs. The LUN Expansion function is an optional function.

Copyright © 2005, 2006, Hitachi, Ltd.

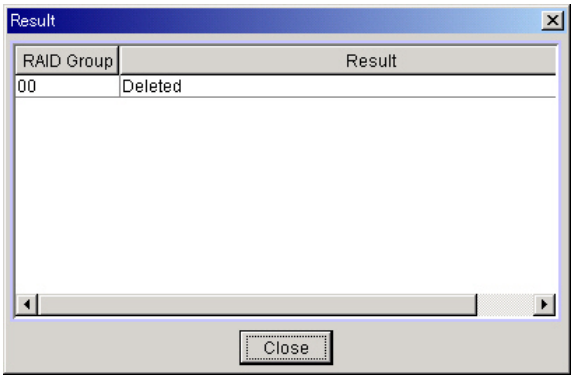


To use the LUN Expansion function, the P-002D-J304 is required separately. For the procedure to dissolve the unification of the unified LU, refer to the manual supplied with the P-002D-J304.

Copyright © 2005, 2006, Hitachi, Ltd.

- The RAID Group cannot be deleted when there LUs whose attribute is any of "Read Only", "Protect" and "Can't Guard" in the Data Retention Utility setting, whose S-VOL setting is "Setting impossible (invalid)", and whose mode is either of "Read Capacity 0 (Zer)" and "Inquiry command shielding (Zer/Inv)". Set the attribute to "Read/Write" in the Data Retention Utility setting, the S-VOL setting to "Setting possible (valid)" and the mode to "Unset", and delete the RAID Group.
- The RAID Group to which the Power Saving function is set cannot be deleted. Delete the RAID Group after checking with the customer that the setting of the Power Saving function is released and Power Saving Status is "Normal (Spin Up)".

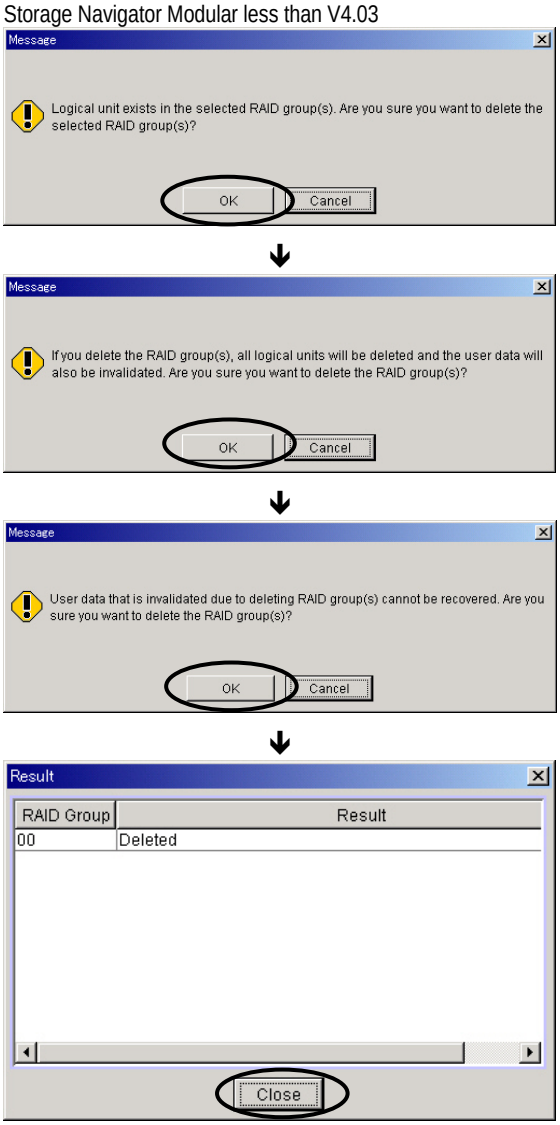
(1) Click [RAID Groups] in the unit window, and then select all the RAID Groups to be deleted by clicking them while pressing the Shift key.

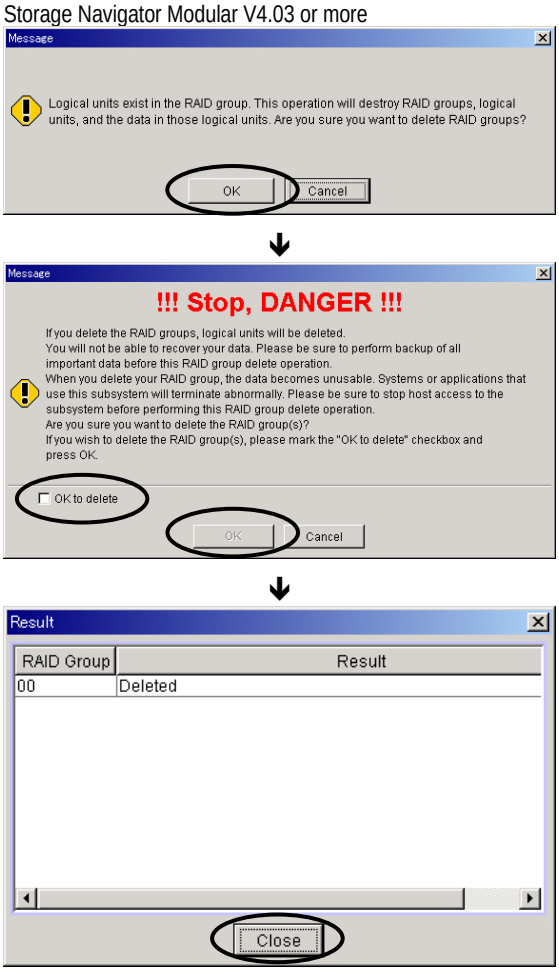


(2) Select [Settings] – [RAID Group] – [Delete].

(3) If the confirmation message is displayed. Click the [OK] button.

- When there is no formatted LU in a RAID group

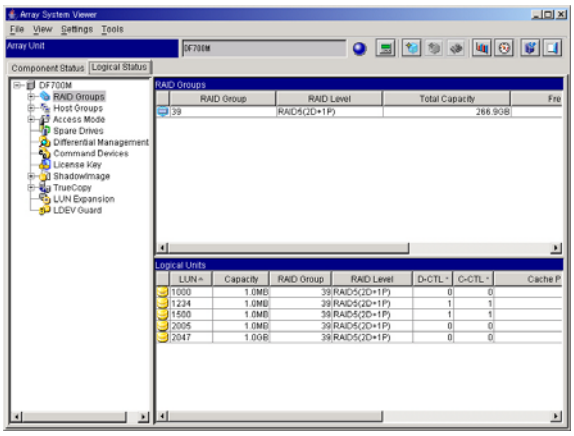




Copyright © 2005, 2006, Hitachi, Ltd.

- When there is a formatted LU in a RAID group

Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03



Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more

Copyright © 2005, 2006, Hitachi, Ltd.

(4) The screen from which selected RAID groups were deleted is displayed.

- When setting the RAID group, go to "[Procedure ②-B]Setting RAID group" (SYSPR 03-0060).

Copyright © 2005, 2006, Hitachi, Ltd.

3.3 Setting of LU

This setting is used to set, delete, reference and formatting an LU.
This function can be used in the device ready state.

NOTE : The LUs in the RAID Group to which the Power Saving function is set cannot be set.
Set the LUs after checking with the customer that the setting of the Power Saving function is released and Power Saving Status is "Normal (Spin Up)".

[The areas of LUs]

The areas of LUs are shown in Figure 3.3.1.

(1) Setting areas of LUs

- The areas where LUs can be created are "unused free area" and "area where LUs are deleted". At the time when the RAID Group is created, the user data area all becomes "unused free area".
- LUs are created in "unused free area" in default. When creating LUs, select the unused free area as needed.
- LUs are created in the free area where the address is consecutive from the small LBA (logical block address). The free areas of (A) to (B) cannot create one LU that matches (A) and (B) because they are not consecutive on the address in the user data area.
  LUs can be created for each of the free area of (A), (B) or (c) within the range of the capacity.
- The LU capacity becomes the value entered with the Storage Navigator Modular at the time of the LU creation. The LU capacity that can be confirmed from the Storage Navigator Modular or the host computer is the value entered with the Storage Navigator Modular. However, when the RAID Group which creates LUs is nD+mP or nD+qD, the user data area is ensured on the microprogram management with the value of multiples of 1[M byte] $\times$ n. Therefore, the LU capacity which can be created may be less than that calculated by the value entered with the Storage Navigator Modular.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Deleted areas of LUs

- The LUs other than the LUs of the value whose LBA (logical block address) at the head of the area is the largest can also be deleted.
- LUs may not be able to be deleted depending on the setting or status of the LUs (example: LUs set to the pair of ShadowImage in-system replication).
- The free capacity of the user data area increases by only the capacity of the deleted LUs by deleting LUs. However, whether the free capacity of the user data area is all used to create one LU is depending on the position of the free area of LUs in the user data area.
- When two or more "areas where LUs are deleted" are consecutive on the address by deleting LUs, those areas are merged, and they become one "free area where LUs are deleted".
- When "free area where LUs are deleted" and "unused free area" are consecutive on the address, those free areas are merged, and become one "unused free area". Although LUs other than the LUs adjacent to "unused free area" shown in Figure 3.3.1 are deleted, the capacity of "unused free area" does not increase.
- If the LUs created between the user data areas are deleted, the areas where LUs are deleted ((A) and (B)) are made. LUs can be created again in each divided free area of (A) and (B) within the capacity range of each free area.

NOTE : Changing (Deletion) of LU and formatting of LU indicates that all the user data of the deleted RAID group are lost.
Before deleting the RAID group, back up the user data.

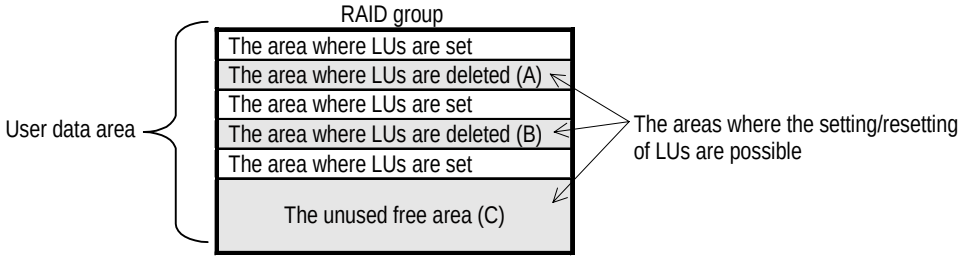


Figure 3.3.1 The Areas of LUs

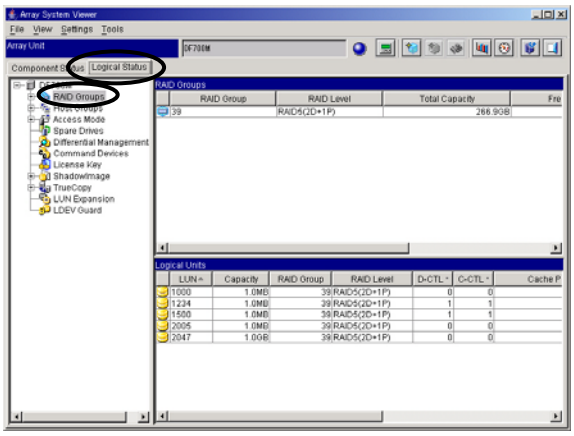
Copyright © 2005, 2006, Hitachi, Ltd.

[Restrictions at the time of the NAS Unit connection]

Set up only the system LU at the time of the NAS Unit connection according the following restrictions.

No.	Internal LU number (*1)	System LU	Capacity restriction		Control Unit in charge(*2)
			Bytes	Blocks	
1	0	For the system Disk Drive (CTL 0)	14,013 M bytes (or more)	28,698,624 blocks (or more)	0
2	1	For the system Disk Drive (CTL 1)	14,013 M bytes (or more)	28,698,624 blocks (or more)	1
3	2	For the volume for the dump storage (CTL 0)	4,925 M bytes (or more)	10,086,400 blocks (or more)	0
4	3	For the volume for the dump storage (CTL 1)	4,925 M bytes (or more)	10,086,400 blocks (or more)	1
5	4	For the command device	35 M bytes (or more)	71,680 blocks (or more)	0
6	5	For work for the dump edit result storage	4,195 M bytes (or more)	8,591,360 blocks (or more)	0
7	6	For the system common volume	2,537 M bytes (or more)	5,195,776 blocks (or more)	0
8	7	Volume for the common volume backup	2,537 M bytes (or more)	5,195,776 blocks (or more)	0
9	8	Volume 2 for the common volume backup	2,537 M bytes (or more)	5,195,776 blocks (or more)	0

*1 : An Internal LU number is a recommended value. There is no problem in the system operation even if a value other than the one described is set.



*2 : An Control Unit in charge is a recommended value. There is no problem in the system operation even if a value other than the one described is set.

NOTE :
- At the time of the NAS Unit connection, it is recommended to set the NAS system LU for the usual operation, the NAS system LU for the backup, and the NAS user LU to another RAID group. Refer to DF700 NAS SOFTWARE Maintenance Manual "3.2.1 Construction of NAS System LU" (NAS 03-0010) for the detail.
- The deletion or the format of the system LU and the user LU used at the time of the NAS Unit connection has restrictions of the opportunity to execute. Refer to "3.9 Restrictions of the operation opportunity for the system LU/user LU of the NAS" (SYSPR 03-0560) for the restrictions of the execution opportunity.
- When intermixing Fibre Channel/iSCSI and NAS interfaces in RKH, it is recommended to set user LUs and system LUs for NAS on RAID groups that are NOT used for LUs used for Fibre Channel/iSCSI access.
- When intermixing Fibre Channel/iSCSI and NAS interfaces in RKH, it is recommended to use different partitions for NAS logical units and Fibre Channel/iSCSI logical units by using Cache Partition Manager function.
- It is possible to access the same LU from Fibre Channel interface and iSCSI interface, as was with multiple Fibre Channel ports. However, if exclusive access is necessary at the application level, then it is recommended to install exclusive access by LU mapping, as was with multiple Fibre Channel ports.
- When making the ShadowImage I/O switch mode enabled, create system LU and P-VOL of the ShadowImage in-system replication at the time of NAS connection in different RAID groups respectively.
- When the array subsystem and the host computer are connected with the Fibre Channel interface, the logical unit of the array subsystem cannot be recognized unless the logical unit of number 0 is not created in the array subsystem depending on the host computer.
  When using this host computer, create the logical unit of number 0 or map the logical unit to Host LUN (H-LUN) 0.

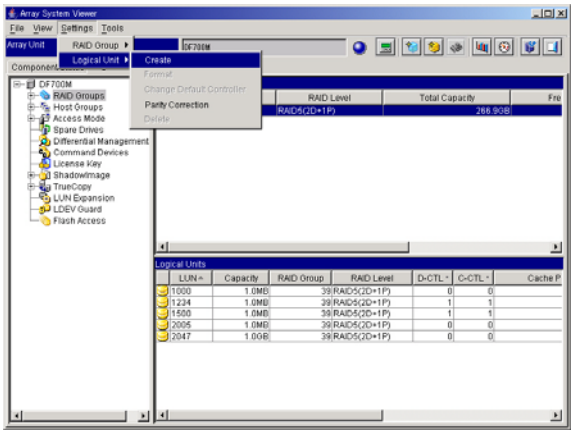
Copyright © 2005, 2006, Hitachi, Ltd.

[Procedure ③-A]Preparing of setting LU

(1) Click the [Logical Status] tab in the unit window. Also, click [RAID Groups].

[RAID Group] : Information on all RAID groups defined for the disk array subsystem are displayed.
- [RAID Group] : A number of the RAID group is displayed.
- [RAID Level] : A RAID level that has been specified is displayed.
- [Total Capacity] : A whole capacity of a RAID group is displayed.
- [Free Capacity] : A remaining capacity of a RAID group is displayed.
- [Type] : A type of a drive assigned to a RAID group is displayed.

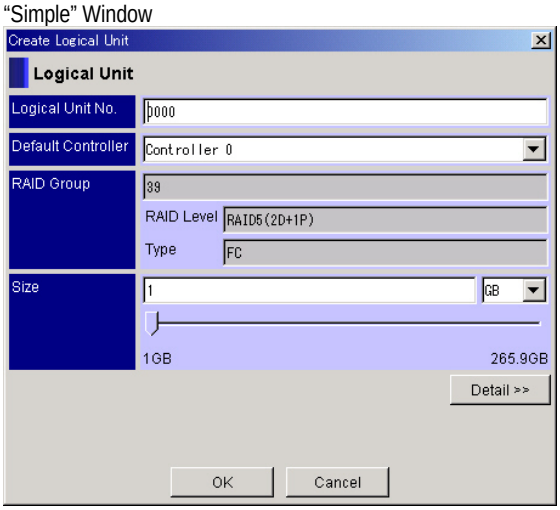
[Logical Unit] : Information on all the logical units, to which the disk array unit is assigned, is displayed.
- [LUN] : A number of the logical unit (xxx) is displayed.
- [Capacity] : A capacity specified for the logical unit is displayed.
- [RAID Group] : The RAID group defined as the logical unit is displayed.
- [RAID Level] : A RAID level of the RAID group defined as the logical unit is displayed.
- [D-CTL] : A number of a controller, which controls the logical unit according to the default setting, is displayed.
- [C-CTL] : A number of a controller, which controls the logical unit according to the current setting, is displayed.
- [Cache Partition] : Cache Partition No.
- [Type] : A type of a drive defined as a logical unit is displayed.
- [Status] : A status of the logical unit is displayed.



Copyright © 2006, Hitachi, Ltd.

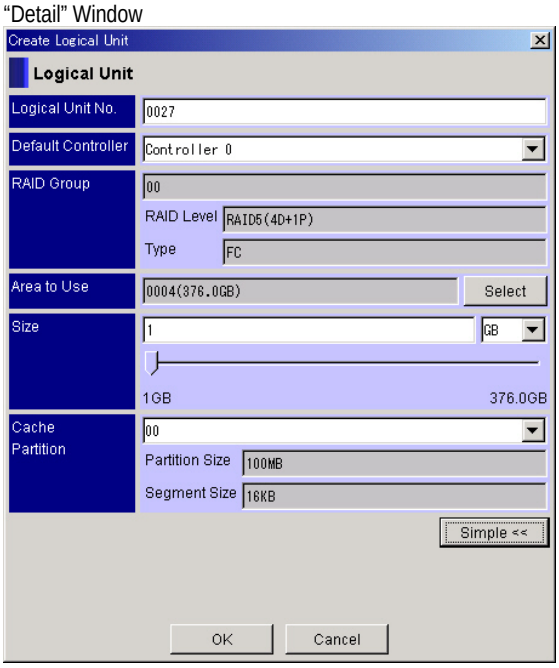
This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.



[Procedure ③-B]Setting LU

(1) Click the RAID group for which an LU is to be created, and then select [Settings] – [Logical Unit] – [Create] or click [: Create New Logical Unit].



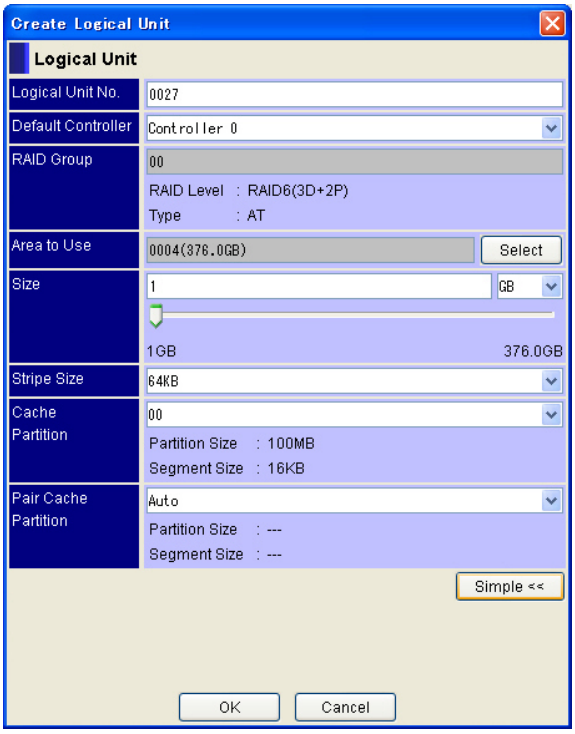
(2) Enter the capacity value and select the controller that controls the LU using the "Controller" boxes.
When setting LUs again in the area where LUs are deleted, click the [Detail] button and display the [Detail] setting window.

"Simple" Window

"Detail" Window

For an LU number, the number of an LU to be created is displayed, and for a RAID group number, the number of a RAID group to be created is displayed.
An LU with any number can be created.
When setting the LU, enter a number of the LU you want to create in the LU setting dialog box.

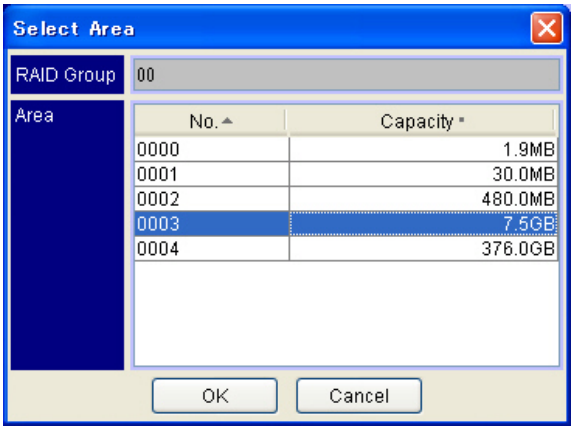
Copyright © 2005, 2006, Hitachi, Ltd.



(a) Capacity specification method

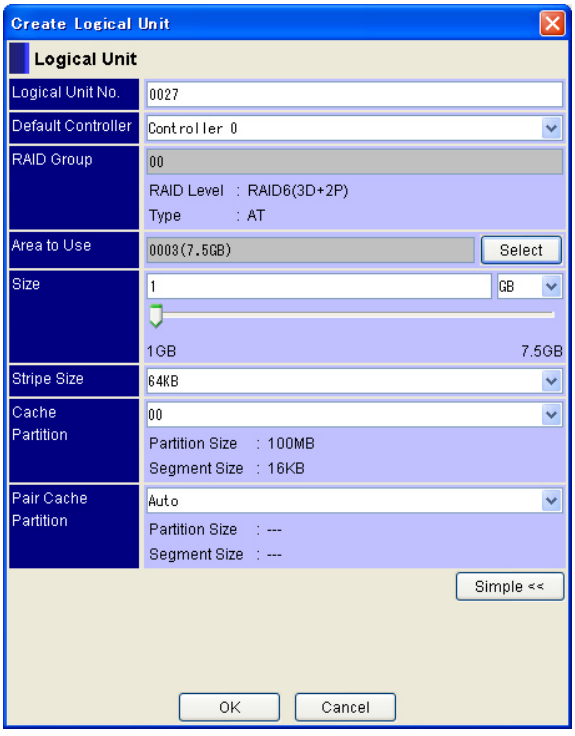
When explicitly specifying a value, select the [Specified Value] radio button and specify a capacity (the number of blocks) using a decimal number.

Besides, for the specification of the number of blocks, refer to "(c) Setting value of the number of logical blocks" (SYSPR 03-0170). (Besides, you can also enter the capacity value by the M byte or G byte in the case of Storage Navigator Modular.)



When setting LUs again in the area where LUs are deleted, select that in which area on the user data area to set the LUs according to the following procedure.

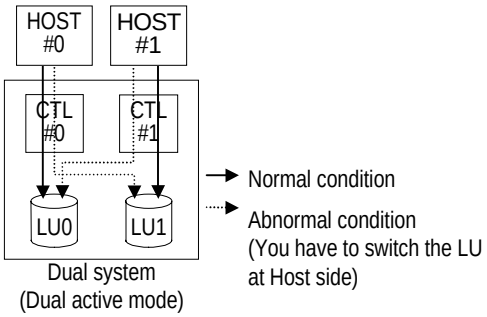
(i) Click the [Select] button in the "Detail" setting window.



Copyright © 2005, 2006, Hitachi, Ltd.

(ii) Select the setting area, and click the [OK] button.
In the example shown in the window below, No.0000, No.0001, No.0002 and No.0003 are the areas where LUs were deleted before, and LUs can be set again. No. 0004 is the unused free area.

(iii) Set the capacity within the range of the capacity displayed in the "Detail" setting window.



Copyright © 2006, Hitachi, Ltd.

(b) "Controller No." specification method

Select the [Controller 0] or [Controller 1] radio button and specify a Controller in charge of an LU to be set (if the Controller is incorrectly specified, note that LU switching occurs and performance is deteriorated).

Even if a Controller in charge is specified when a dual system is connected, nothing is displayed when a single system is connected.

NOTE : If the dual active mode is selected in a dual system, a controller in charge needs to be specified when setting an LU. Refer to the following diagram to perform the setting of the LU for which the controller in charge was specified. When changing the specification of the controller in charge, refer to the "[Procedure ③-E]The change of the controller in charge of a default LU" (SYSPR 03-0260) to change the controller in charge.

- The function of "Dual active mode"

  Specify a Controller which accesses an LU from a host computer for the Controller in charge of the LU.

  In an example of the above diagram, CTL0 and CTL1 are the controllers in charge of LUs for LU0 and LU1 respectively. In this example, select the "CTL0" radio button at LU0 setting, and select the "CTL1" radio button at LU1 setting.

Copyright © 2006, Hitachi, Ltd.

(c) Setting value of the number of logical blocks

(i) Logical Units can split all the RAID Groups to the maximum of 512(RKS/RKXS), 2,048(RKM) or 4,096(RKH), respectively.

(ii) Set the number of logical blocks set for each logical unit using the following multiples in accordance with RAID levels.

Table 3.3.1 Number of Logical Blocks and RAID Levels

RAID level	RAID width	Logical block number
RAID 0	2D	4,096
	3D	6,144
	4D	8,192
	5D	10,240
	6D	12,288
	7D	14,336
	8D	16,384
	9D	18,432
	10D	20,480
	11D	22,528
	12D	24,576
	13D	26,624
	14D	28,672
	15D	30,720
	16D	32,768
RAID 1	1D+1D	2,048
RAID 5	2D+1P	4,096
	3D+1P	6,144
	4D+1P	8,192
	5D+1P	10,240
	6D+1P	12,288
	7D+1P	14,336
	8D+1P	16,384
	9D+1P	18,432
	10D+1P	20,480
	11D+1P	22,528
	12D+1P	24,576
	13D+1P	26,624
	14D+1P	28,672
	15D+1P	30,720
RAID 6	2D+2P	4,096
	3D+2P	6,144
RAID 6	4D+2P	8,192
	5D+2P	10,240
	6D+2P	12,288
	7D+2P	14,336
	8D+2P	16,384
	9D+2P	18,432
	10D+2P	20,480
	11D+2P	22,528
	12D+2P	24,576
	13D+2P	26,624
	14D+2P	28,672
	15D+2P	30,720
	16D+2P	32,768
	17D+2P	34,816
	18D+2P	36,864
	19D+2P	38,912
	20D+2P	40,960
	21D+2P	43,008
	22D+2P	45,056
	23D+2P	47,104
	24D+2P	49,152
	25D+2P	51,200
	26D+2P	53,248

	3D+3D	6,144
	4D+4D	8,192
	5D+5D	10,240
	6D+6D	12,288
	7D+7D	14,336
	8D+8D	16,384

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) When dividing RAID groups into multiple logical units, set the sum total of the number of logical blocks of each logical unit below the number of logical blocks per parity shown below. However, when creating multiple parity groups in each RAID group, set them below the number of logical blocks of one parity group multiplied by the number of parity groups.

(iv) The number of logical blocks of one parity group is shown below.

Table 3.3.2 Number of Logical Blocks of One Parity Group

Disk Drive capacity / RAID configuration (*1) (*2)		71.3 G bytes	143.3 G bytes	245.7 G bytes	287.6 G bytes	393.4 G bytes	491.9 G bytes
		Number of Logical Blocks	Number of Logical Blocks	Number of Logical Blocks	Number of Logical Blocks	Number of Logical Blocks	Number of Logical Blocks
RAID 0	2D	278,556,672	559,788,032	-	1,123,549,184	-	-
	3D	417,835,008	839,682,048	-	1,685,323,776	-	-

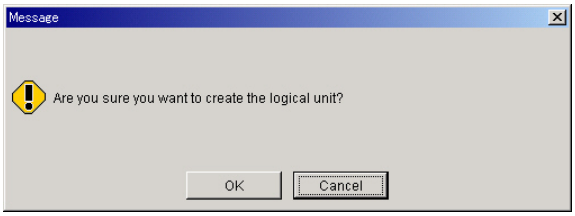
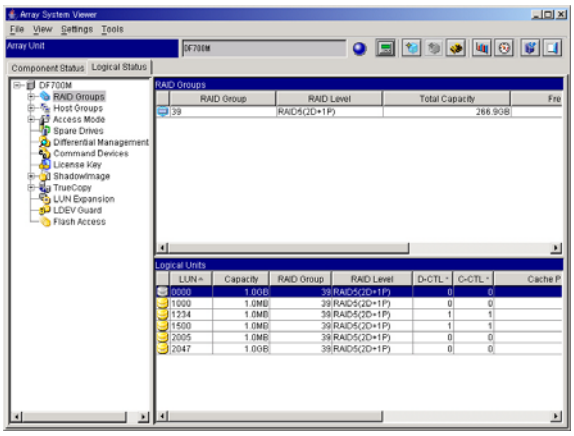
Copyright © 2005, Hitachi, Ltd.

(3) After completion of the setting, click [OK] button.



"Simple" Window

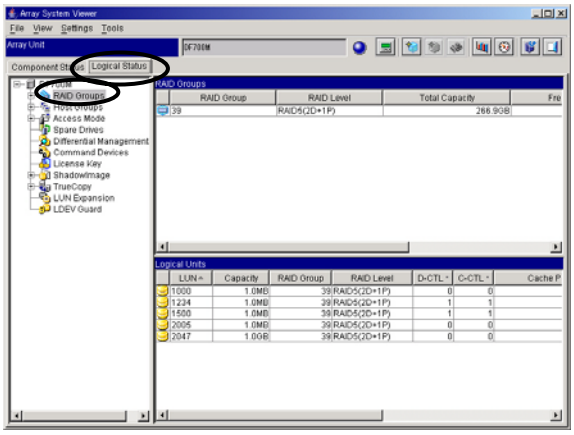
"Detail" Window



(4) The confirmation window is display. Click the [OK] button.

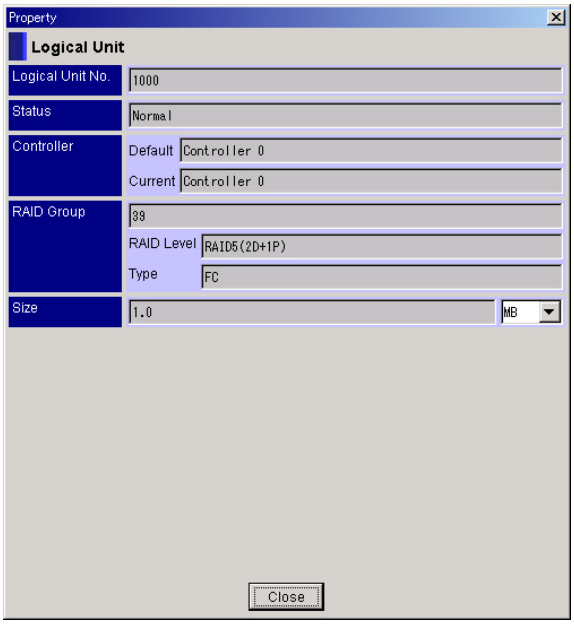
Copyright © 2005, 2006, Hitachi, Ltd.

(5) Preset LU information is updated and the screen is displayed.



For a "Controller No." at LU creation, specify a controller in charge of a default LU. "Current controller" when an LU was created becomes equal to the current of the controller in charge of the default LU. However, if LU switching might have occurred, it does not become equal.

(6) When both Fibre Channel/iSCSI and NAS interfaced are used, be sure to perform LU mapping on all created LUs, and make sure that LUs used by Fibre Channel/iSCSI and LUs used by NAS are mapped exclusive of each other.
For details on how to do LU mapping, refer to "2.3 Setting LU mapping" (SYSPR 02-0100).



Copyright © 2005, 2006, Hitachi, Ltd.

[Procedure ③-C]Verifying LU

(1) Click the [Logical Status] tab. Usually, when the setting of an LU is completed, the [Logical Status] tab is in the clicked state. Also, click [RAID Groups].

(2) The setting made in [Procedure ③-B] can be referred to by a double clicking on the icon of the RAID group created.

- If the confirmation of LU is OK, go to the "[Procedure ③-F]Formatting LU" (SYSPR 03-0280).
- If the confirmation of LU is NG, and if the change of LU in charge is required, go to the "[Procedure ③-E]The change of the controller in charge of a default LU" (SYSPR 03-0260).
- If the setting of Default LU controller, go to the "[Procedure ③-D]Deleting LU"(SYSPR 03-0230).

Copyright © 2005, Hitachi, Ltd.

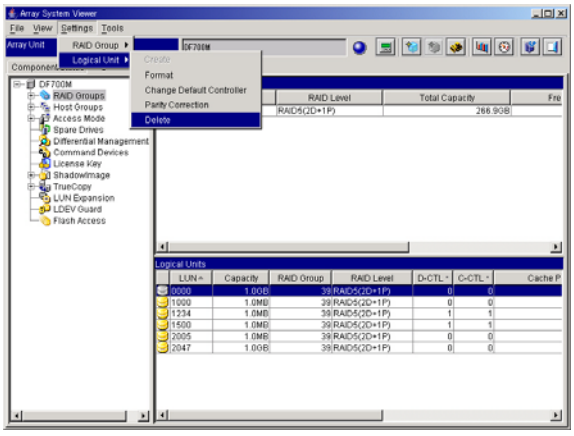
[Procedure ③-D]Deleting LU

NOTE : All user data is lost by deleting the LU. Backup user data before deleting the RAID group.

[Conditions of deletion]

- When the LU, whose status of the forced parity correction is any of "Correcting", "Waiting", "Waiting Disk Drive Recovery", "Uncorrected", "Uncorrected 1" and "Uncorrected 2", this LU cannot be deleted.
  Change the status of the LU to "Restored" or "Skip" by executing or skipping the forced parity correction for this LU, and then delete this LU.
- The Sub LUs of the unified LU(‡1) cannot be deleted. In the case of the finally unified Sub LU, delete the LUs after separating the Sub LU from the unified LU. If it is not the finally unified Sub LU, separate all the unified Sub LUs from the Main LU, and delete the LUs after separating them from the unified LU.
- The following LUs cannot be deleted. Perform the release for the LUs, and delete the LUs.
  - LUs set to the pair of ShadowImage in-system replication
  - LUs set to the pair of Copy-on-write SnapShot
  - LUs set to the pair of TrueCopy remote replication
  - LUs set to the pair of TrueCopy Extended Distance
  - LUs set to the command device
  - DM-LUs
  - System LUs of NAS
  - User LUs of NAS
  - Reserve LUs of Modular Volume Migration
  - LUs registered in the data pool
- When the Dynamic sparing/Correction copy/Copy back is operating, delete the LUs after the Disk Drives are restored.
- When there are LUs executing the LU switching processing, the LUs cannot be deleted because the microprogram is executing the internal processing. Wait for one minute or so, and delete the LUs.
- The LUs of the pair whose status of Modular Volume Migration is COPY cannot be deleted. Delete the LUs after the pair status of Modular Volume Migration becomes PSUS.
- The LUs whose attribute is any of "Read Only", "Protect" and "Can't Guard" in the Data Retention Utility setting, whose S-VOL setting is "Setting impossible (invalid)", and whose mode is either of "Read Capacity 0 (Zer)" and "Inquiry command shielding (Zer/Inv)" cannot be deleted. Set the attribute to "Read/Write" in the Data Retention Utility, the S-VOL setting to "Setting possible (valid)", and the mode to "Unset", and delete the LUs.

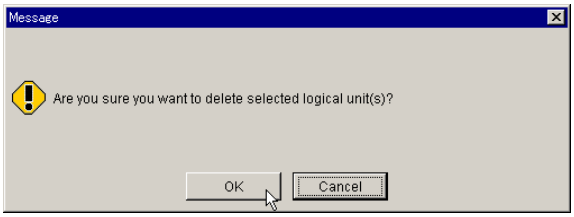
‡1 : Support a function (LUN Expansion function) that creates a unified LU by combining LUs. The LUN Expansion function is an optional function.
To use the LUN Expansion function, the P-002D-J304 is required separately. For the procedure to dissolve the unification of the unified LU, refer to the manual supplied with the P-002D-J304.



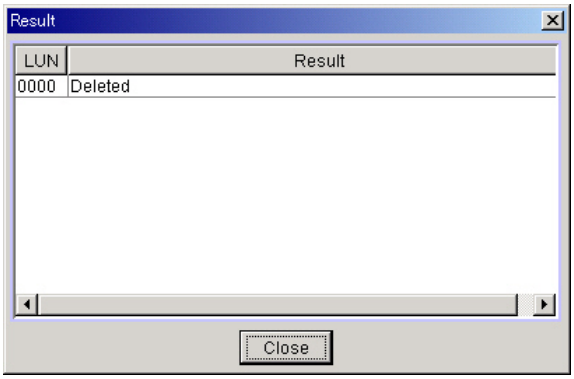
Copyright © 2005, 2006, Hitachi, Ltd.

(1) Deleting the LU

(a) Click [RAID Groups] in the unit window, and then click the logical unit to be deleted from [Logical Unit].



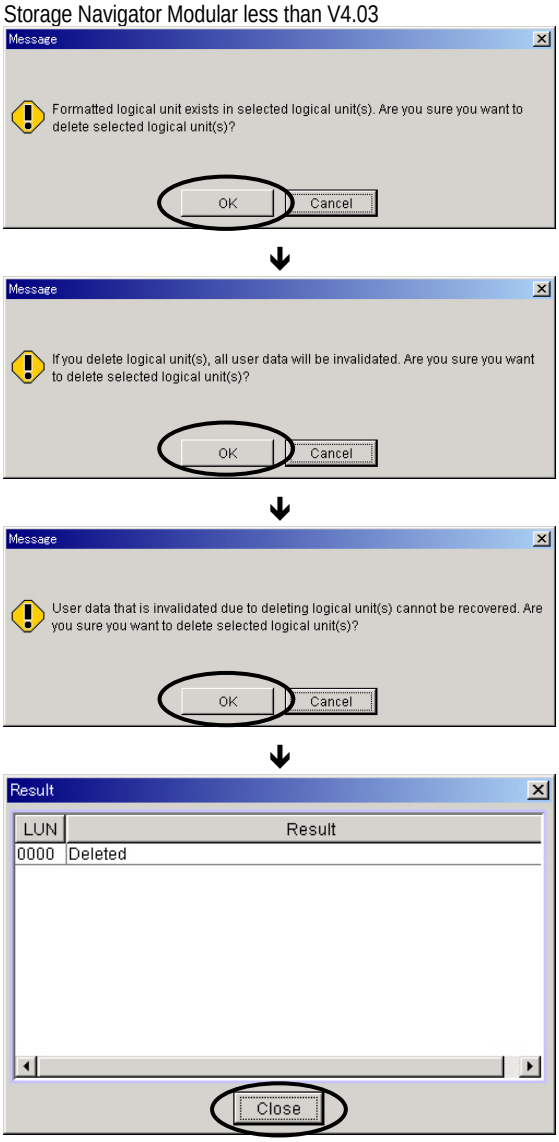
When you select multiple logical units, hold down the [Ctrl] key and click the icons of the logical units that you wish to delete.

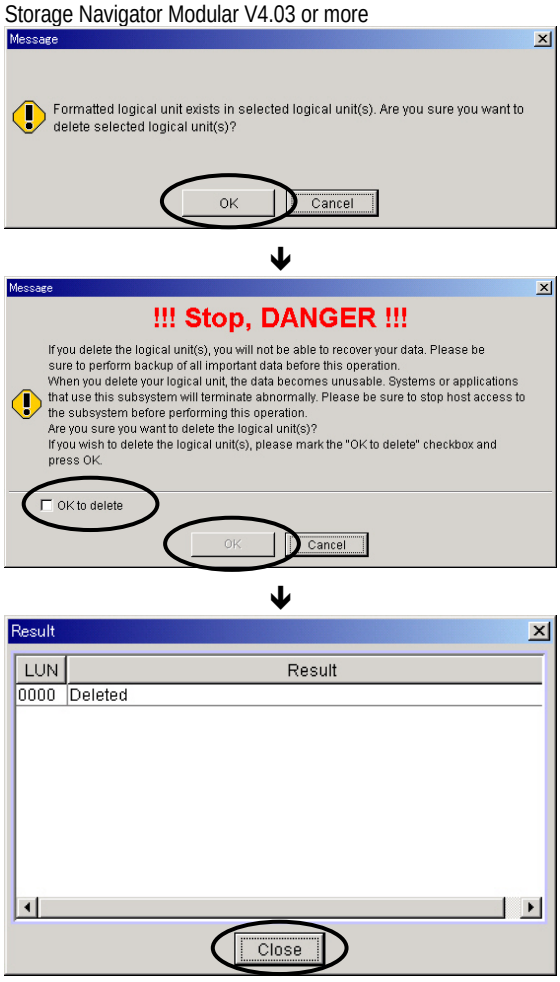


(b) Select [Settings] – [Logical Unit] – [Delete].

(c) A confirmation message is displayed indicating whether last LUs should be deleted or not.

- When there is no formatted LU in a RAID group

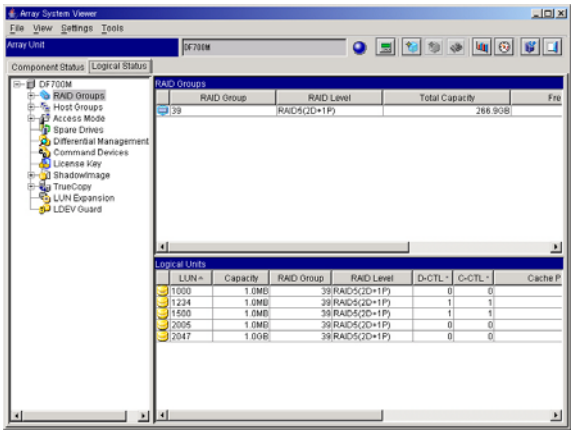




Copyright © 2005, 2006, Hitachi, Ltd.

- When there is a formatted LU exists

Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03



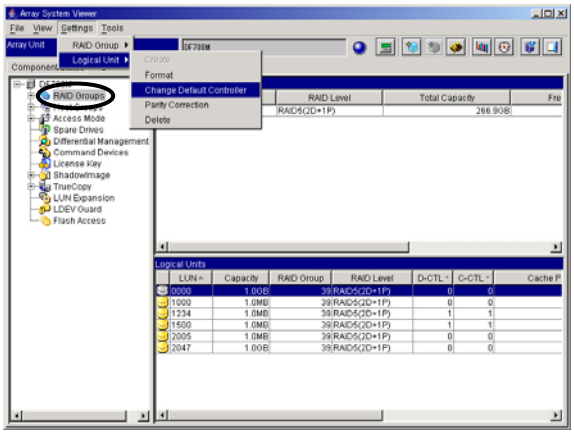
Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more

Copyright © 2005, 2006, Hitachi, Ltd.

(d) The LU information in which last LUs have been deleted is updated and the window is displayed.

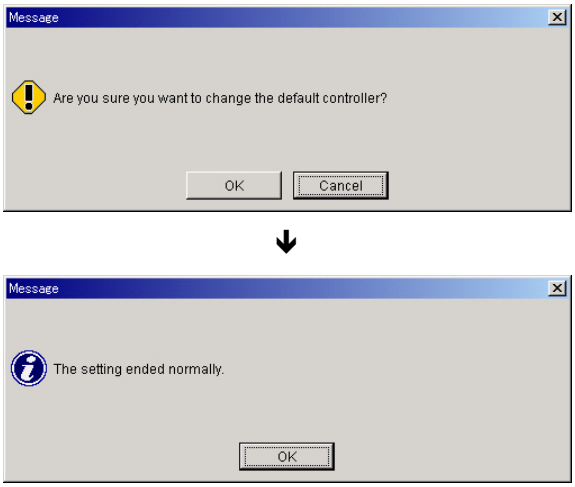
- When setting the LU, go to "[Procedure ③-B]Setting LU" (SYSPR 03-0150).

Copyright © 2006, Hitachi, Ltd.



This page is for editorial purpose only.

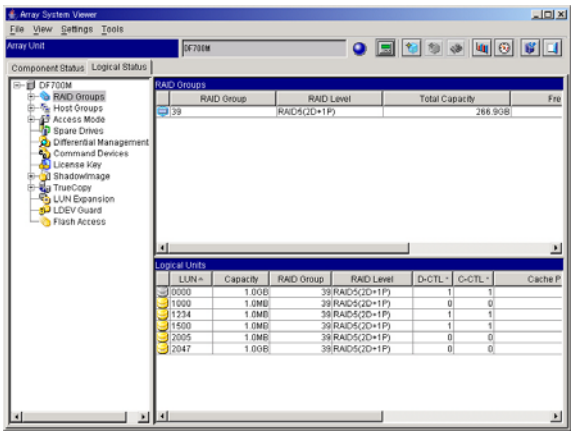
Copyright © 2006, Hitachi, Ltd.



[Procedure ③-E]The change of the controller in charge of a default LU

NOTE : The change of the controller in charge of a default LU can be used only for the dual active mode configuration of a dual system.

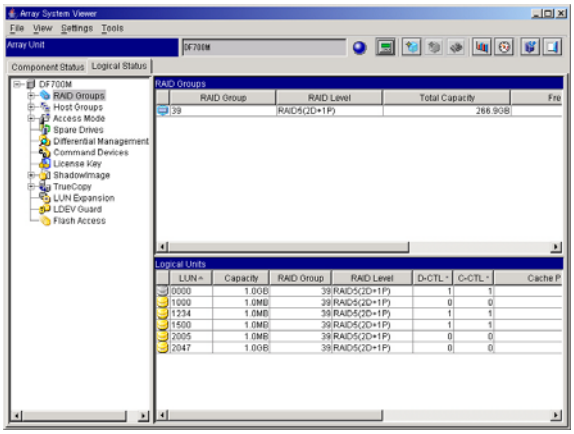
(1) Click [RAID Groups] in the unit window, and then click an icon of an LU the default Controller controlling which is to be changed, and then select [Settings] – [Logical Unit] – [Change Default Controller].



(2) The confirmation window is display. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

The window, in which information on the changed LU is updated, is displayed.



- Go to "[Procedure ③-C]Verifying LU" (SYSPR 03-0220).

Copyright © 2005, Hitachi, Ltd.

[Procedure ③-F]Formatting LU

An LU is formatted.

(1) Formatting while online

The format data, the parity data and the check code are written in the entire area of the LU. The subsystem ensures the consistency of the data by writing this check code in the Disk Drive.

The host immediately makes the specified LUs usable and the operation at the early stage of the system enabled by executing the format in the background.

The maximum number of LUs in which the format can be specified at the same time is the number of LUs that can be created for per subsystem. Also, when the number of LUs executing the format is less than the number of LUs that can be created per subsystem, the LU to be formatted can be added from the Storage Navigator Modular.

However, the LU that internally executes the format at the same time becomes the maximum of 6 LUs/Control Unit.

Even when Storage Navigator Modular is quit while the formatting is being executed, the formatting is continued.

Even when the Storage Navigator Modular is terminated during the format execution, the format is continued without stopping. After that, if the Storage Navigator Modular is started again and the [Logical Status] tab is clicked, the progress ratio (Quick Formatting (×%)) of the format is displayed in the status column of the logical unit in the list view.

Copyright © 2005, 2006, Hitachi, Ltd.

Table 3.3.4 LU Formatting Mode and while Online Description of Operation

No.	Connection mode of array disk management mode and device configuration Single system Dual system	Restriction
1	Can be executed during online processing.	• For ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance and Copy-on-write SnapShot, pair definition cannot be executed when LU is in quick format. • The unification and the separation of a logical unit cannot be executed for a logical unit in format. • The data pool cannot be set for a logical unit in format. • Copy-on-write SnapShot, and P-VOL of image (V-VOL) cannot be specified for a logical unit in the format. • The forced parity correction cannot be executed for a logical unit in format. • Do not start or restart the NAS OS until the format is completed when formatting the LUs of the same RAID Group as the NAS system LUs. This could result in boot failure or increase in boot time of NAS OS. Also, the download time of the NAS Dump may increase as well or the download may fail, so that do not download the NAS Dump until the format is completed when formatting the LUs of the same RAID Group as the NAS system LUs. • When a data loss occurs owing to a power failure and battery exhaustion, an LU being formatted enters the Unrestored status. Basically, use the LU after the formatting is completed.

Prerequisites : • Host access performance deteriorates during format.
Formatting will impact the host access performance, especially on the LU being formatted and on the LU in the same RAID Group as the LU being formatted. Please do formatting during off-hours with less host access.

• When the fail-over or the fail-back is executed between the clusters during the NAS connection, check if the formatting is being executed. If it is being executed, change the format priority mode to "Host". Also, when the formatting is executed during the execution of the fail-over or the fail-back, change the format priority mode to "Host". If the format priority mode is not changed to the "Host", the fail-over or the fail-back is terminated abnormally.
When the fail-over or the fail-back is completed after changing the format priority mode, return the format priority mode to the original setting (it is usually "Standard"). Refer to "4.2 (13) Setting of Format Mode" (SYSPR 04-0230) for the method of changing the format priority mode.

• The LUs in the RAID Group to which the Power Saving Function is set cannot be formatted.
Format the LUs after checking with the customer that the setting of the Power Saving function is released and Power Saving Status is "Normal (Spin Up)".

Copyright © 2006, Hitachi, Ltd.

NOTE : • The progress and the operation status of the format are succeeded over the planned shutdown.
- When PIN OVER occurs during format, a formatting is interrupted. The formatting is resumed automatically after PIN OVER is recovered. Refer to Troubleshooting "6.1.11 A failure occurred during operation : Case 1 (PIN over)" (TRBL 06-0550).
- When the host I/O is executed to the LUs being formatted, the termination processing may delay. In that case, the termination processing of the format may take the maximum of 400 seconds after the progress ratio of the format becomes 99 %.
- If the owner right to the LU is switched, the formatting operation becomes standby status depending on the number of operations in the Control Unit in charge.
  When the Control Unit having the owner right is formatting five LUs or less in case that the owner right of the LU being formatted is switched or when the Control Unit is not executing the format, the LU whose owner right is switched continues to be formatted.
  When the Control Unit having the owner right is formatting six LUs or more in case that the owner right of the LU being formatted is switched, the order of LUs that the Control Unit executes the format becomes the order of which the format is specified from the Storage Navigator Modular. At this time, the LU whose owner right is switched is continuously formatted or becomes the standby status.

The LU format cannot be executed in the following cases. When formatting them, follow the actions to be taken for each case.

- The LU format cannot be performed when the subsystem is restarting. Restart the subsystem, and perform the format after it becomes the Ready status.
- The LU format cannot be performed for the P-VOL or the S-VOL of ShadowImage in-system replication, TrueCopy remote replication and TrueCopy Extended Distance. Perform the LU format after releasing the pair.
- The LU format cannot be performed for the P-VOL or the V-VOL (SnapShot image) of Copy-on-write SnapShot. Perform the LU format after releasing the pair.
- The LU format cannot be performed in the status that the microprogram of only one Control Unit is replaced in the dual controller system. Perform the LU format after completing the replacement of the microprogram of both Control Units.
- When the specified LUs do not exist, perform the LU format after specifying correct LUs in CLI.
- The Sub LUs of the unified LU cannot be formatted. Specify the Main LU of the unified LU, and format it. When you want to format the Sub LUs of the unified LU, separate the Sub LUs from the unified LU, and format the Sub LUs.

Copyright © 2006, Hitachi, Ltd.

- The LU format cannot be performed for the P-VOL or the S-VOL which executing Modular Volume Migration. Perform the LU format after completing Modular Volume Migration. If you want to format it immediately, cancel Modular Volume Migration, and then perform the LU format.
- The LUs registered in the data pool cannot be formatted. Delete the LUs from the data pool, and perform the LU format.
- When the Disk Drive blockade mode is set valid, if the status of the specified LUs are Normal or Regression, it cannot be formatted. Set the Disk Drive blockade mode to invalid, and perform the LU format. Return the Disk Drive blockade mode to valid after executing the format.
- When either of the "Read Only" and "Protect" is set for the access attribute of the LUs in Data Retention Utility, either of "Read Capacity 0 (Zer)" and "Inquiry command shielding (Zer/Inv)" is set for the mode, and "Setting impossible (invalid)" is set for the S-VOL setting, the LU format cannot be performed. Return the access attribute of the LUs to "Read/Write (default)", and perform the LU format.
- If two or more LUs are formatted using the Disk Drives whose capacity is 500 Gbytes or more, the resources to format the LUs may be insufficient inside the subsystem. Perform the LU format after completing the LU format which is being executed.
- The format cannot be performed if the Disk Drives which configure the RAID Group in which the specified LUs belong are uninstalled or blocked (one Disk Drive is blocked in the case other than RAID6 and two are blocked for RAID6). Perform the maintenance for the Disk Drives which install or block the Disk Drives, and perform the LU format.
- The LU format cannot be performed when the status of the forced parity correction of the specified LUs is any of "Uncorrected", "Parity Correcting", "Waiting Parity Correction", "Waiting Drive Reconstruction", "Uncorrected and Drive Detached" and "Correction Aborted". Perform the LU format after changing the status of the forced parity correction of the LU to "Correction Skipped" or "Recovery Completed" referring to Troubleshooting "6.1.3 The failure occurred immediately after being ready (Forced parity correction)' (TRBL 06-0060)".
- The LU format cannot be performed for system LUs or user LUs of NAS. Release the LUs from the allocation of the NAS system LUs or the NAS user LUs, and perform the LU format.

When you specify the formatting, you can specify which of the formatting or host access you give priority throughout the system. (Refer to "4.2 (13) Setting of Format Mode" (SYSPR 04-0230).) The specification can be changed in the online status.

Although the format priority mode is set to "Standard" by default, the copy performance or the restore performance may be deteriorated substantially when any one of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance and Copy-on-write SnapShot of the priced options is executing the copy or restore for the pair at the time of the format execution. In that case, set the format priority mode to "Host" and restrict the format processing.

When the formatting is specified, whether the formatted data is made default or 0 (zero) can be specified for the entire system. (Refer to "4.2 (13) Setting of Format Mode" (SYSPR 04-0230).) The specification concerned can be changed online, but it is formatted by the format data of the point in time when the format is indicated.

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : Use the 0 (zero) specification of the format data only when it is necessary to clear the logical unit 0 (zero) at the time of connecting to SANRISE USP or SANRISE NSC.

Copyright © 2005, 2006, Hitachi, Ltd.

< Standard time required for an LU Formatting >

An LU Formatting takes a long time from start to completion. (Refer to Table 3.3.4.1) Table 3.3.4.1 shows the standard of the time required of the LU Formatting when selecting optional numbers of the Disk Drives which configure the RAID Group. The time required of the LU Formatting also increases as the number of the FC or S-ATA Disk Drives that configures the RAID Group increases. Figure 3.3.2 and Figure 3.3.3 shows the graph where the standard of the time required of the LU Formatting can be confirmed in the case of all the numbers. A horizontal axis corresponds to the number of the Disk Drives, and the vertical axis corresponds to the time required of the LU Formatting.

NOTE : The data above are standard times required for an LU Formatting for one or two RAID groups.
Further, the times required for the restoration vary depending on the Disk Drive capacity, number of Disk Drives, and RAID configuration.
Besides, as to some types of Disk Drives, the times required for the restoration is shortened by 10 to 20 percent.

Table 3.3.4.1 Standard Time Required for an LU Formatting (‡1) (‡2)

Unit: min

Item	Disk Drives (G bytes)(*1)			71.3	143.3	245.7	287.6	393.4	491.9
SANRISE AMS500 AMS200	4 Disk Drives	RAID 6	(2D+2P)	40	75	290	150	460	570
	6 Disk Drives		(4D+2P)	45	80	330	170	520	640
	10 Disk Drives		(8D+2P)	70	140	500	270	810	990
	14 Disk Drives		(12D+2P)	100	200	700	400	1120	1390
	18 Disk Drives		(16D+2P)	150	290	710	590	1150	1450
	30 Disk Drives		(28D+2P)	250	510	900	1060	1450	1810
	3 Disk Drives	RAID5	(2D+1P)	25	45	280	90	450	470
	5 Disk Drives		(4D+1P)	40	75	310	140	440	510
	9 Disk Drives		(8D+1P)	65	130	480	270	760	820
	11 Disk Drives		(10D+1P)	85	170	580	340	930	990
	13 Disk Drives		(12D+1P)	100	200	690	410	1120	1180
	16 Disk Drives		(15D+1P)	130	250	730	500	1180	1360
	4 Disk Drives	RAID1+0	(2D+2D)	25	80	290	95	440	490
	8 Disk Drives		(4D+4D)	35	90	440	120	700	720
	16 Disk Drives		(8D+8D)	65	190	710	240	1150	1330
	2 Disk Drives	RAID1	(1D+1D)	25	45	270	80	430	460

*1 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

‡1 : The time shown above is a general guideline of a recovery time for a case where no I/O operation is requested by a host computer. If an I/O operation is requested by a host computer, the time becomes longer.

‡2 : It is the standard of the format time when executing one LU at a time. When the multiple formatting is performed for two or more LUs (n LUs), it is completed less than the time of which n times the standard time.

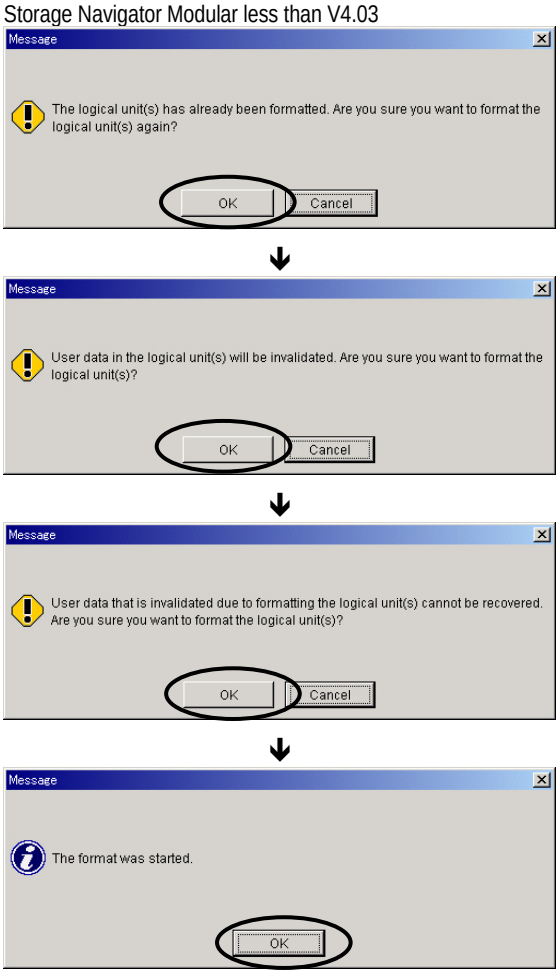
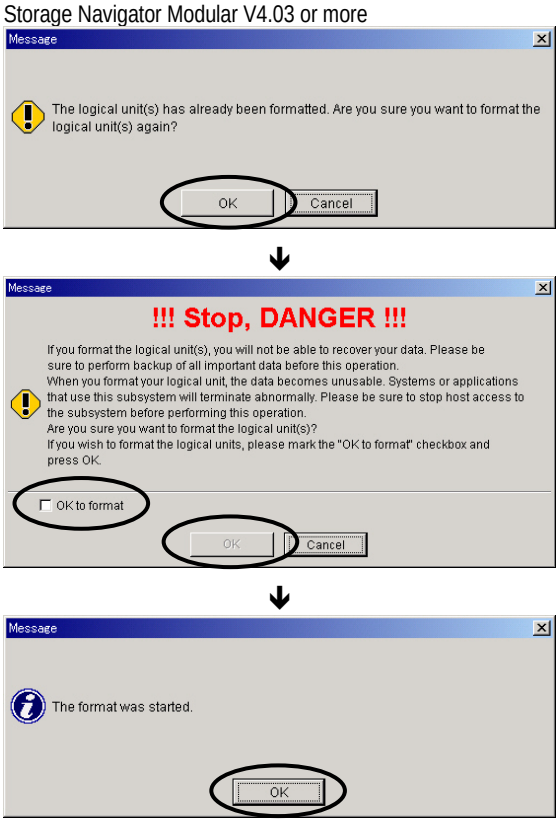
(a) Select an LU or LU's to be formatted, and then select either of the [Settings] – [Logical Unit] – [Format].

(b) If the confirmation message is displayed. Click the [OK] button.



• When an LU that has been "Quick" formatted does not exist

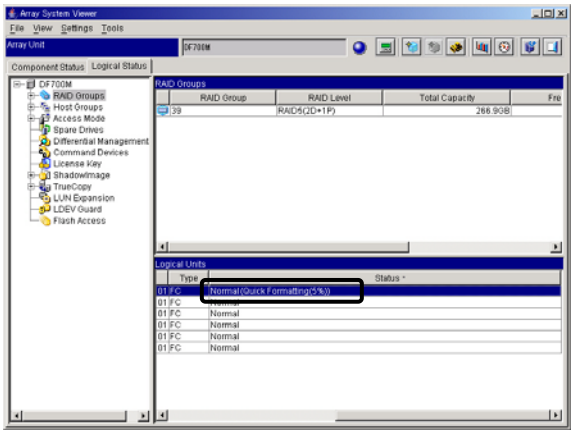


Copyright © 2005, Hitachi, Ltd.

• When an LU that has been “Quick” formatted exists

Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03

Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more



Copyright © 2005, 2006, Hitachi, Ltd.

(c) If [OK] is clicked, the specified LU is formatted(‡1).
At this point, this LU can be recognized from the host computer.

(d) When the format starts, the progress of the LU format executed in the background is displayed in [Status] of the logical unit on the window. The message in the format is displayed in the column of the status of the logical unit.

NOTE : The value of percentage is not updated unless the subsystem status is referred to through selections of [Display] and [Latest Information] in this order.

‡1 : When a specified LU is formatted, the user data within the specified LU is lost. When incorrectly specifying an LU, press the [Cancel] button and redo processing by selecting an LU to be reformatted.

Copyright © 2005, Hitachi, Ltd.

If formatting terminates abnormally, refer to Table 3.3.5.

Table 3.3.5 Contents of Display of Execution Result Screen

No.	Status		Result
1	"Abnormal end"	"CHECK CONDITION (xx-xxxx)" is displayed(*1) Sense key Sense code	Unsuccessful Format Unit Unsuccessful command
2		A message is displayed.	Unsuccessful Other errors than the above

*1 : Because this function internally uses the Format Unit command, it displayers a sense key and a sense code when the pertinent command returns the Check Condition status.

When "Abnormal" is indicated on "Status", sense-key, sense-code or message-text is indicated.

When sense key and sense code = 02-xx xx, 03-xx xx, 04-xx xx or 0B-xx xx;

For the above code, a hardware fault is assumed. When the subsystem is not recovered from the failure after retrying, remove the cause of the error considering the type and meaning of the error. (Refer to Message "Chapter 9. Failure Analysis by Sense Data" (MSG 09-0000) of the Maintenance Manual.

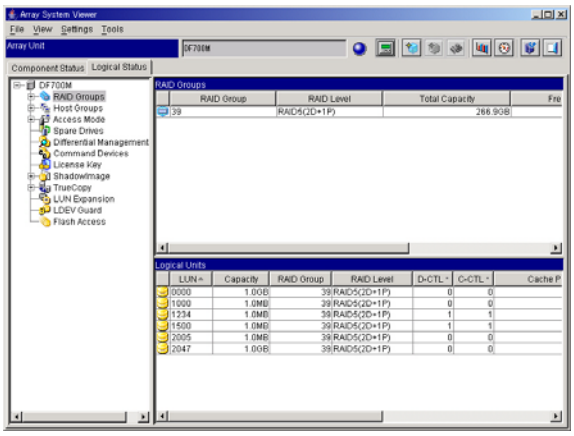
When sense key and sense code = 05-xxxx;

For the above code, an operation error is assumed. Upon checking the following items and re-execute processing. If the error is not recovered, contact our company.

① Is logical unit 0 defined? Codes which will occur are 05-25 00 and 25-25 81.

② In spite of none of drive mounted states, is ALL RAID specified and is an LU specified for ALL CAPA formatted? A code which will occur is 05-26 00.

③ Is an attempt made to define an LU exceeding the capacity of the defined RAID group? A code which will occur is 05-25 80.



When sense key and sense code = 0B-FD01;

Switching of a controller in charge of an LU occurred during formatting. Check the controller in charge and re-execute formatting from the controller in charge.

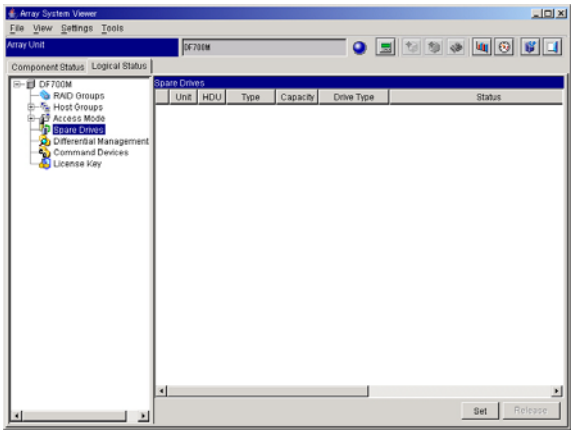
When message-text is indicated, take measure according to the message.

Copyright © 2005, Hitachi, Ltd.

(f) Preset LU information is updated and the screen is displayed.

- The formatting LU has terminated, go to "3.4 Setting of Spare Disk" (SYSPR 03-0350).

Copyright © 2005, Hitachi, Ltd.



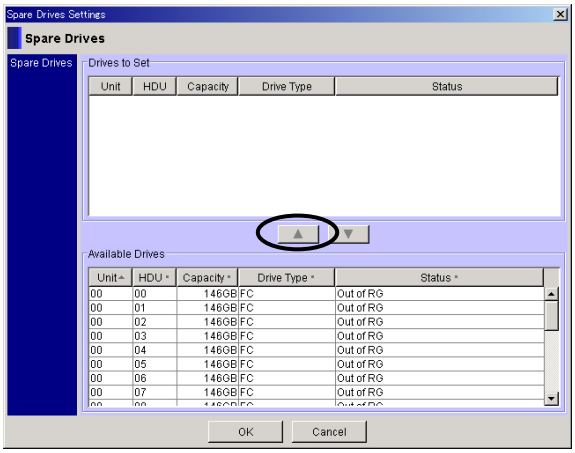
3.4 Setting of Spare Disk

This setting is used to set, delete and reference a Spare Disk.
The drive that can be set as the Spare Disk is a data disk.

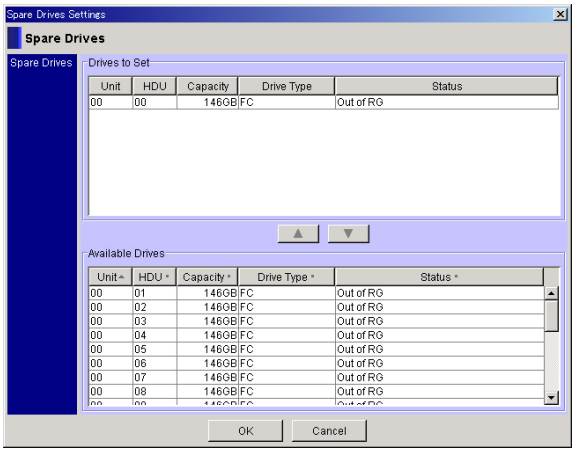
NOTE : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS/RKXS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

[Procedure ④-A]Preparing of setting Spare Disk

(1) Select a [Spare Drives] from the tree.



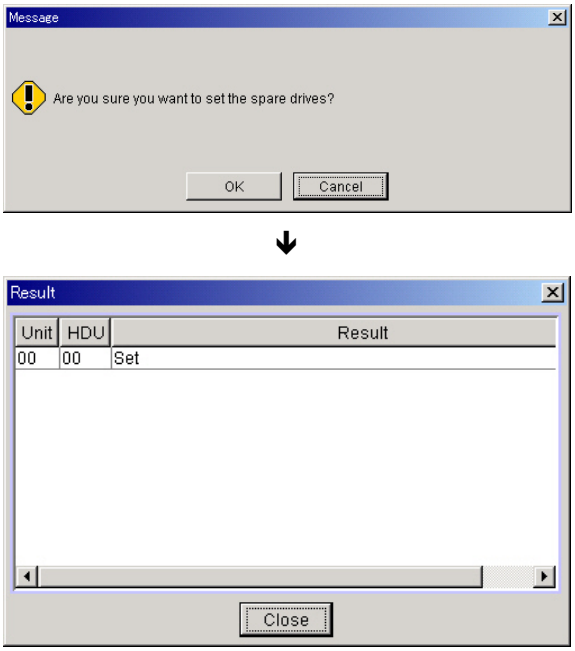
(2) Click the [Set] button that is displayed at the lower right part of the window.



Copyright © 2005, 2006, Hitachi, Ltd.

[Procedure ④-B]Setting Spare Disk

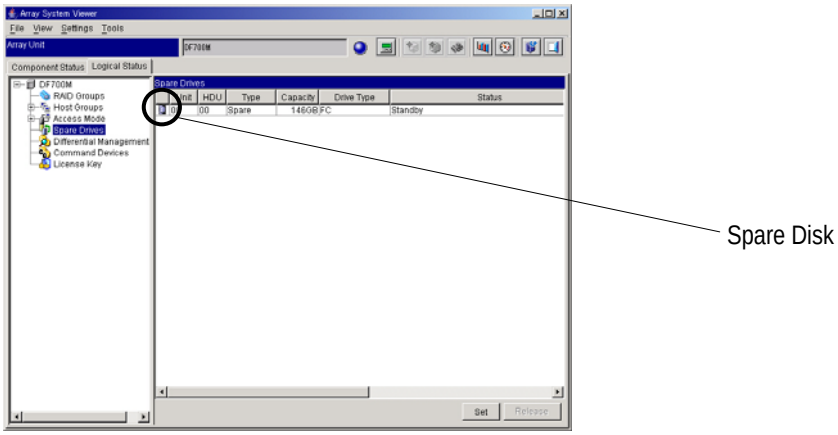
(1) Select an HDU you want to specify as a spare drive from the [Available Drives] list and click the [▲] button.



(2) The selected HDU is moved to the [Drives to Set] list. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

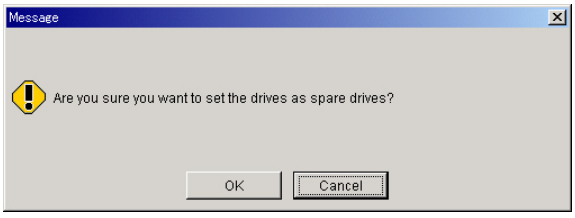
(3) The confirmation window is display.
When incorrectly specifying a Disk Drive, press the [Cancel] button and redo processing by [Procedure ④-B].



- When verifying the Spare Disk, go to "[Procedure ④-D]Verifying Spare Disk" (SYSPR 03-0390).

Copyright © 2005, Hitachi, Ltd.

[Procedure ④-C]Deleting Spare Disk

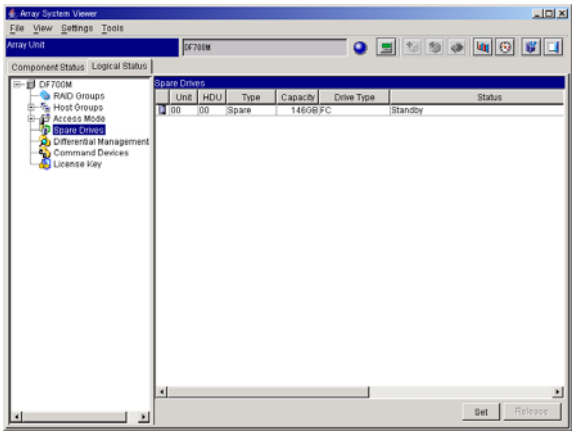


(1) Select the [Spare Drives] from the tree and select the Spare Disk to be removed from the [Spare Drives] by clicking it.

 : Data Disk  : Spare Disk

(2) Click the [Release] button that is displayed at the lower right part of the window.

(3) The Spare Disk reset confirmation is displayed.
Click the [OK] button. When incorrectly specifying a Disk Drive, press the [Cancel] button and redo processing by [Procedure ④-C].



- When setting the Spare Disk, go to "[Procedure ④-B]Setting Spare Disk" (SYSPR 03-0360).

NOTE : When you have set a configuration of the [RAID Group] or [Logical Unit], be sure to execute the [Update to the Latest Information] after closing the parameter window in order to make the RAID group icon in the unit window the latest.

Copyright © 2005, Hitachi, Ltd.

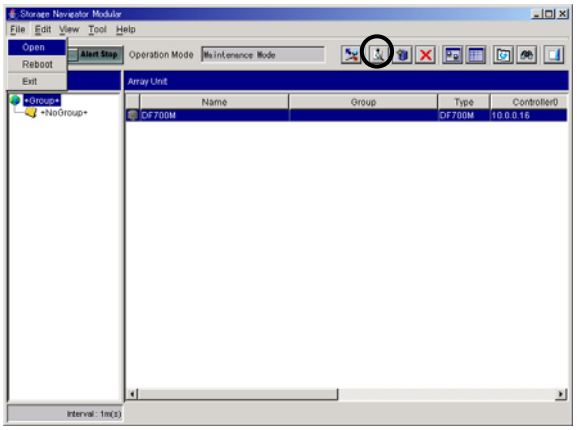
[Procedure ④-D]Verifying Spare Disk

(1) You can make sure of the spare drive that has been set on the right side of the window by selecting [Spare Drives] from the tree in the unit window.

 : Data Disk  : Spare Disk

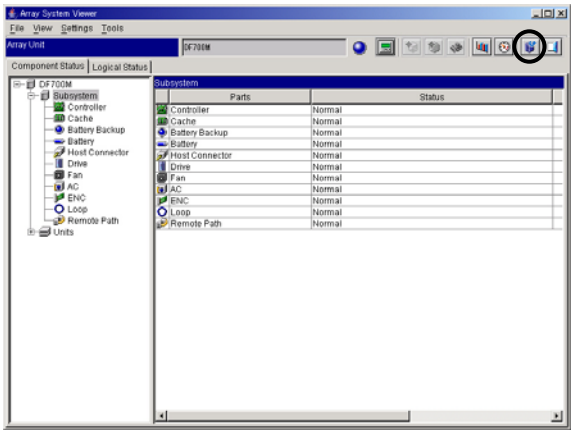
- If confirmation is OK, go to "Chapter 2. Setting Host Group/Targets" (SYSPR 02-0000)
- If confirmation is NG, go to "[Procedure ④-C]Deleting Spare Disk" (SYSPR 03-0380)

Copyright © 2005, Hitachi, Ltd.



3.5 Checking the status of Disk Drive

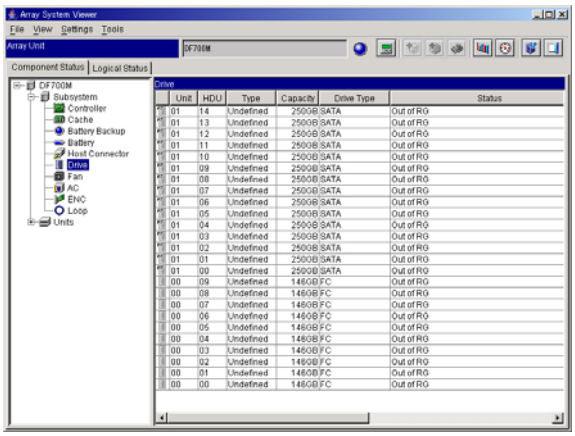
Display the array unit component status and information by using icons. When you double-click each icon, the information of the component part indicated by the icon is displayed.



(1) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(2) To update the component display, on the View menu, select Refresh or click [ : Refresh] button in the tool bar.

Copyright © 2005, Hitachi, Ltd.

(3) When you double-click Drive icon, the property screen of the component part is displayed.

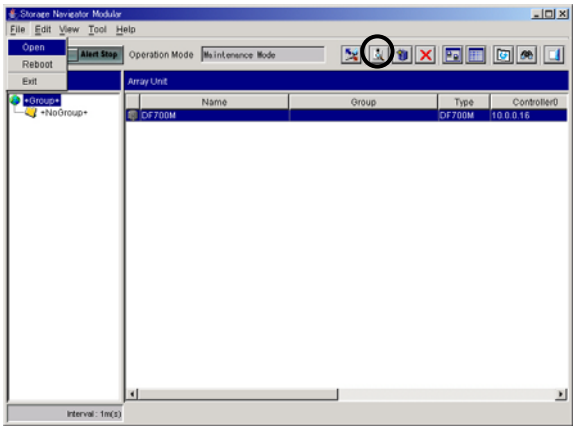
NOTE : Vendor ID, Product ID, Revision, and Serial No. may not be displayed depending on the drive mounting and drive status.

[Unit] : Unit No.
[HDU] : HDU No.
[Type] : Drive using form
- Data : Data drive
- Spare : Spare drive
- Undefine : Normal (LU not defined)

[Capacity] : Storage capacity of a drive
[Drive Type] : Drive type
[Status] : Drive status
- Normal : Normal
- Detached : Blockade
- Detached (Unmount) : The drive in the blockade status is not installed.
- Standby : Normal (LU not defined)
- Out of RG : Normal (RAID not defined)
- Undefine : Normal (LU not defined)
- Unmount : The drive is not installed.
- Recovery : Under recovery (correction copy or copy-back in progress)
- Unitx HDUy : Position of a corresponding data drive when using spare Disk Drives.
- Waiting : Spare drive not used

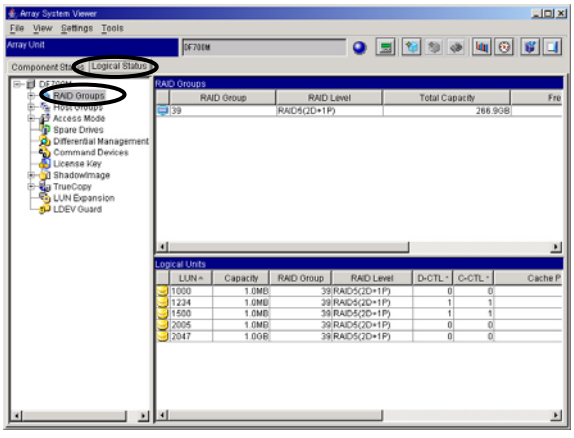
[Vendor ID] : Vendor ID of drive
[Product ID] : Product ID of drive
[Revision] : Firmware revision of drive
[Serial No.] : Serial No. of a drive

Copyright © 2005, Hitachi, Ltd.



3.6 Checking the Disk Drive which configures the RAID Group

(1) Start the Storage Navigator Modular and set the operation mode to "Management Mode"(‡1).

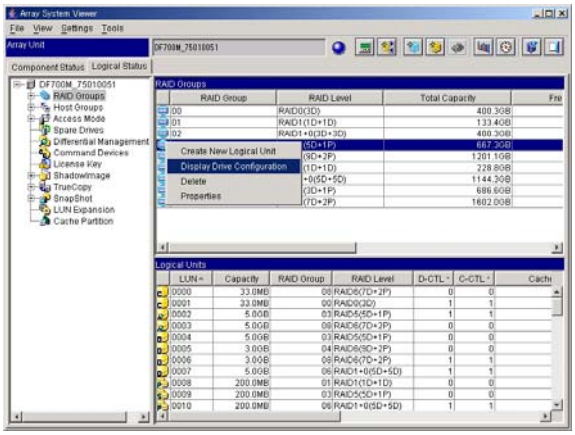


(2) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

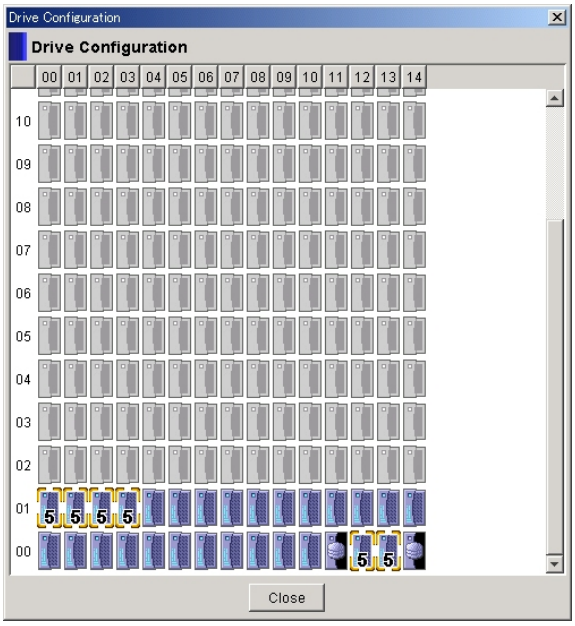
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

(3) Double click [Logical Status] in the unit window, and select the RAID Groups icon from the tree view.



(4) Select the target RAID Group icon from the list view in the unit window.



‡1 : For details of the setting method, refer to the Subsection "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050)

Copyright © 2005, Hitachi, Ltd.

(5) Click the right mouse button for the selected RAID Group icon, and select the Disk Drive configuration display from the context menu.

(6) The Disk Drive which configures the target RAID Group is highlighted in the Drive Configuration window.

Copyright © 2005, Hitachi, Ltd.

3.7 Allocation of the system LU/user LU of the NAS

Allocation of the system LU and the user LU used at the time of the NAS connection has restrictions of the opportunity to execute. Refer to "3.9 Restrictions of the operation opportunity for the system LU/user LU of the NAS" (SYSPR 03-0560) for the restrictions of the execution opportunity.
The setting of the command device needs to be completed before performing the setting of the system LU allocation.
Refer to "3.8 Setting the command device indispensable as the system LU of the NAS" (SYS 03-0520) for the setting of the command device.

3.7.1 Setting, change or deletion the system LU allocation

The capacity of the system LU has the following restrictions.
Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

Table 3.7.1 Capacity Restrictions of System LU

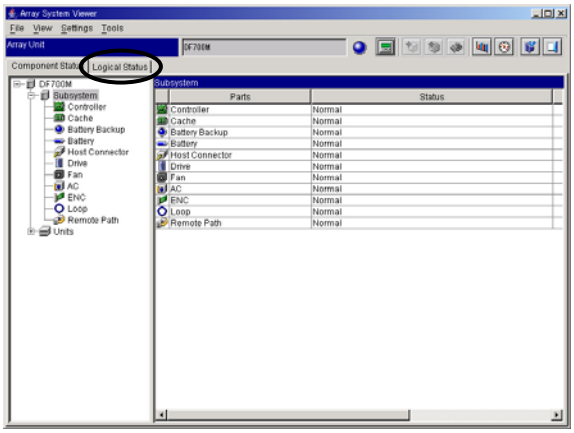
No.	System LU	Capacity restriction	
		Bytes	Blocks
1	System Disk(CTL0)	14,013 M bytes (or more)	28,698,624 blocks (or more)
2	System Disk(CTL1)	14,013 M bytes (or more)	28,698,624 blocks (or more)
3	Volume for Dump(CTL0)	4,925 M bytes (or more)	10,086,400 blocks (or more)
4	Volume for Dump(CTL1)	4,925 M bytes (or more)	10,086,400 blocks (or more)
5	Command Device	35 M bytes (or more)	71,680 blocks (or more)
6	Working Area for Dump	4,195 M bytes (or more)	8,591,360 blocks (or more)
7	System Common Volume	2,537 M bytes (or more)	5,195,776 blocks (or more)
8	Backup Volume for Common	2,537 M bytes (or more)	5,195,776 blocks (or more)
9	Backup Volume for Common 2	2,537 M bytes (or more)	5,195,776 blocks (or more)

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : The LUs in the RAID Group to which the Power Saving function is set cannot be set to the NAS system LUs. Set the NAS system LUs after checking with the customer that the setting of the Power Saving function is released and Power Saving Status is "Normal (Spin Up)".

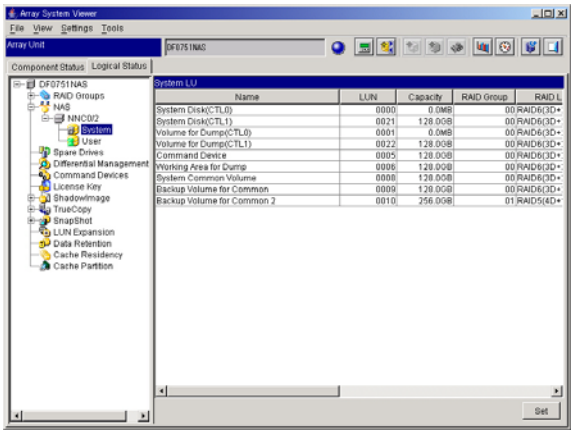
(1) Before performing Setting/change/deletion of the system LU allocation

(a) Turn on the AC input power supply on NAS Unit.



(b) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

(c) Click an icon of the disk array subsystem you want to set in the main window. There are three ways of the selection methods as shown below.

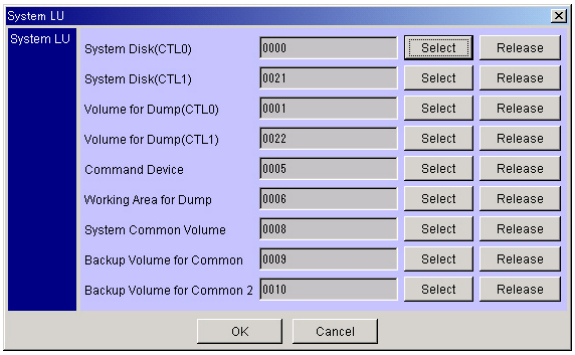


- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

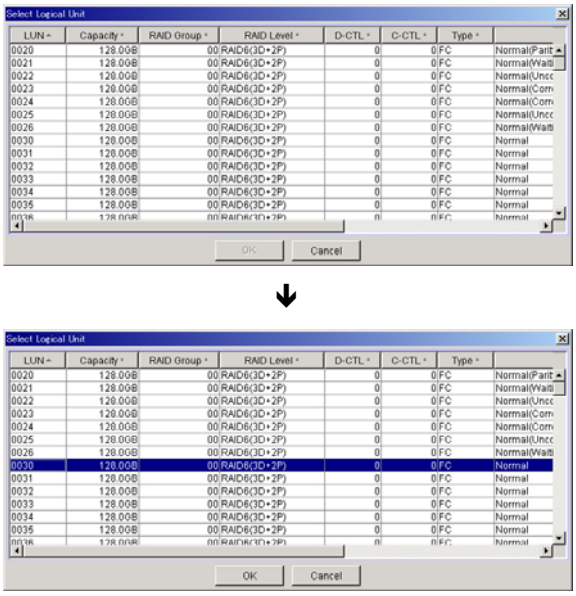
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

(d) On the unit window, click the [Logical Status] tab.

(e) Double click [NAS] and display [NNC0/2]. Also, double click [NNC0/2], display [System] and [User], and select [System]. The list of the system LU is displayed. (The following window assumes the time of change or deletion.)

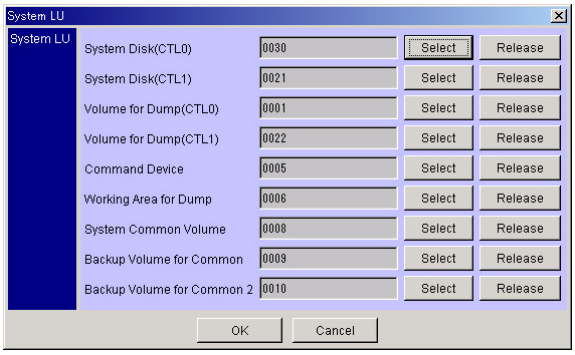


Copyright © 2005, 2006, Hitachi, Ltd.



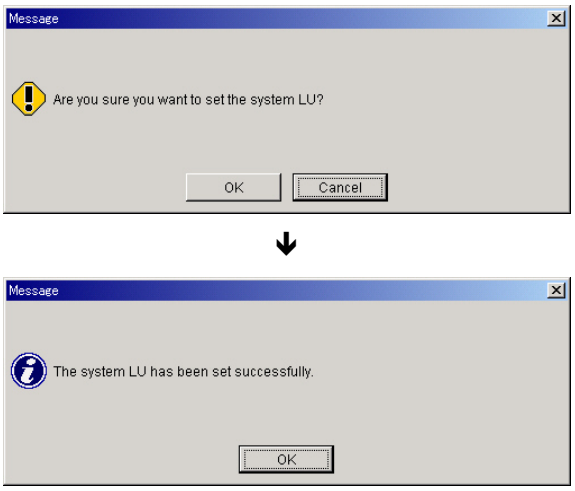
(2) Setting or change the system LU allocation

(a) Click the [Set] button displayed at the lower right of the window.



(b) Click the [Select] button of the system LU to be set.

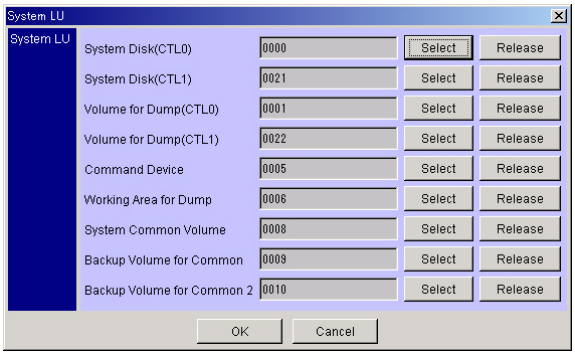
(c) Select the LUN to be allocated, and click the [OK] button.

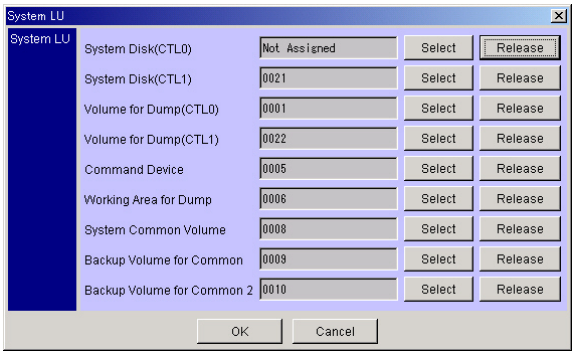


(d) Check that the selected LU is reflected, and click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) The confirmation message is displayed. Click the [OK] button.

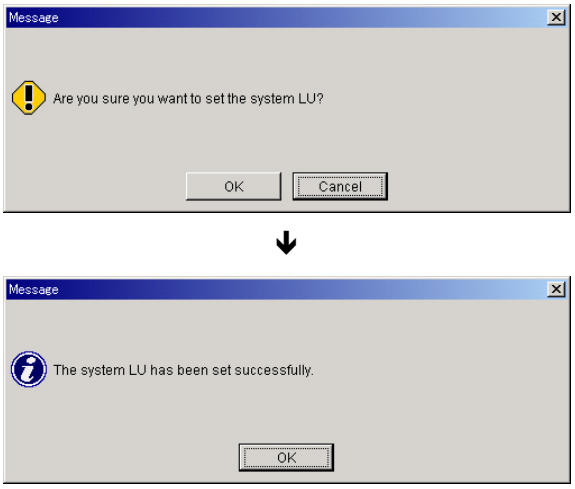




Copyright © 2005, 2006, Hitachi, Ltd.

(3) Deletion the system LU allocation

(a) Click the [Set] button displayed at the lower right of the window.



(b) Click the [Release] button of the system LU to be set.

(c) Click the [OK] button.

(d) The confirmation message is displayed. Click the [OK] button.

Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

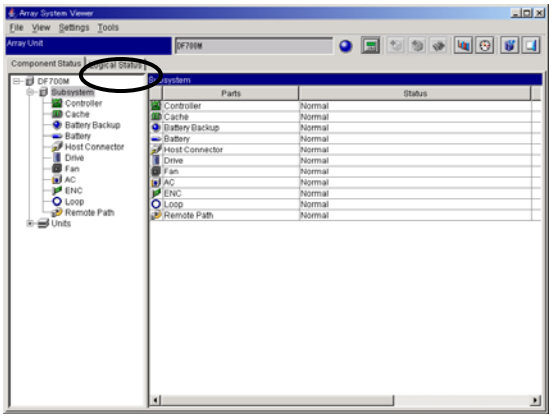
3.7.2 Setting, change or deletion the user LU allocation

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

NOTE : The LUs in the RAID Group to which the Power Saving function is set cannot be set to the NAS User LUs. Set the NAS User LUs after checking with the customer that the setting of the Power Saving function is released and Power Saving Status is "Normal (Spin Up)".

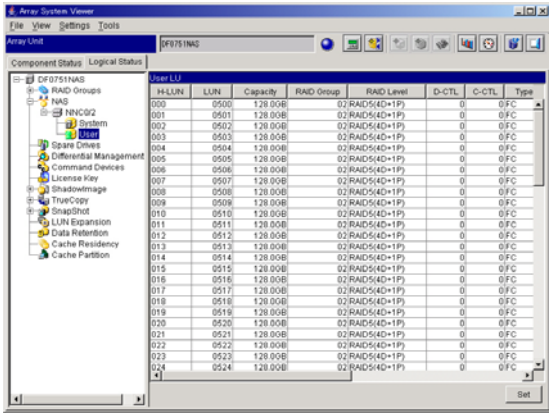
(1) Before performing Setting/change/deletion of the user LU allocation

(a) Turn on the AC input power supply on NAS Unit.



(b) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050), "Registering the newly introduced DF in the Storage Navigator Modular" in Subsection 1.1.

(c) Click an icon of the disk array subsystem you want to set in the main window. There are three ways of the selection methods as shown below.

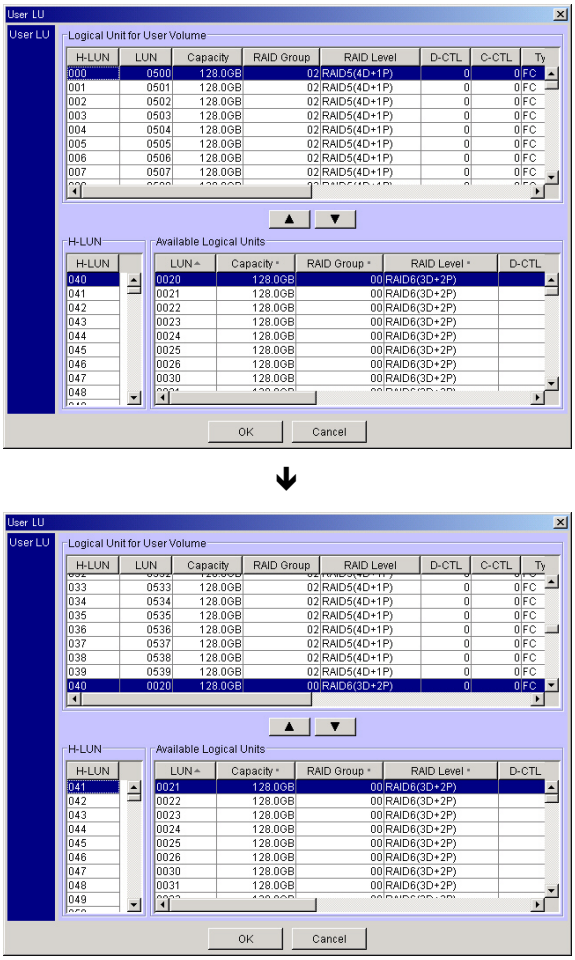


- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

(d) On the unit window, click the [Logical Status] tab.

(e) Double click [NAS] and display [NNC0/2]. Also, double click [NNC0/2], display [System] and [User], and select [System]. The list of the system LU is displayed. (The following window assumes the time of change or deletion.)

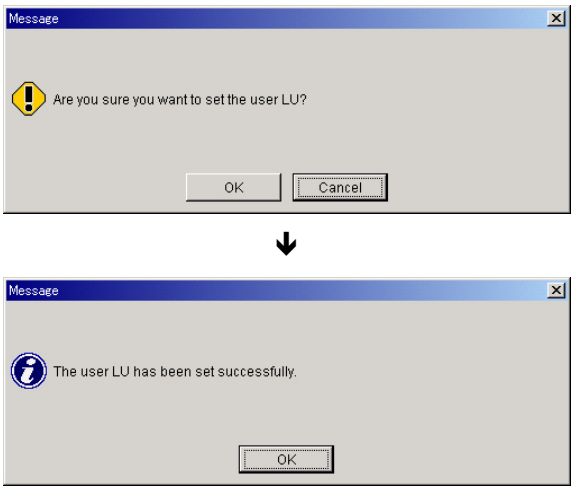


Copyright © 2005, 2006, Hitachi, Ltd.

(2) Setting or change the user LU allocation

(a) Click the [Set] button displayed at the lower right of the window.

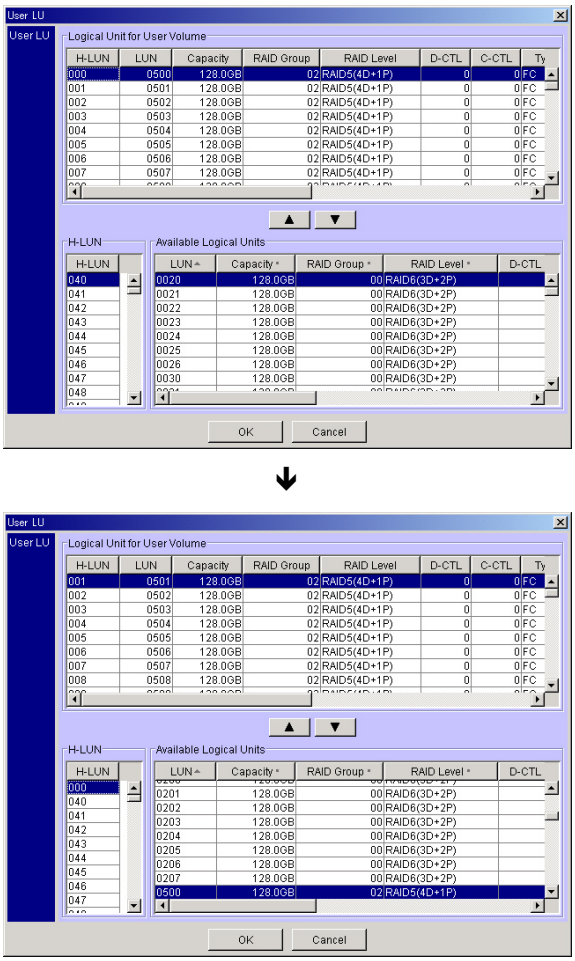
(b) Select one H-LUN from the [H-LUN] list of the user LU, select one LUN that wants to be allocated in the H-LUN from the list of [Available Logical Units], and click the ▲ button.



The selected H-LUN and LUN move to [Logical Unit for User Volume].

(c) Repeat the operation of (b), move all the LUNs that want to be allocated to [Logical Unit for User Volume], and click the [OK] button.

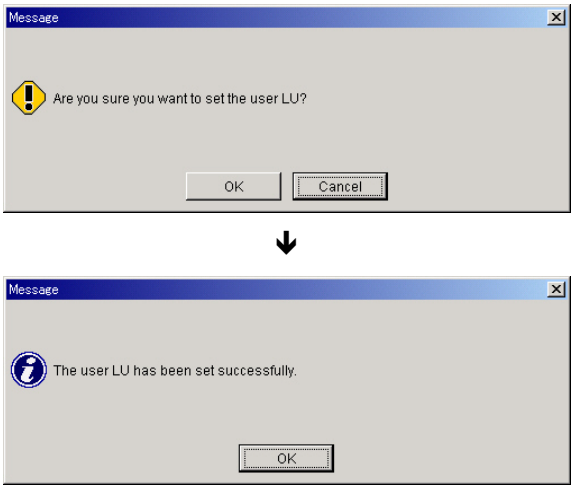
Copyright © 2005, Hitachi, Ltd.



(d) The confirmation message is displayed. Click the [OK] button.

(3) Deletion the user LU allocation

(a) Click the [Set] button displayed at the lower right of the window.



(b) Select the LUN to release from the “Logical Unit for User Volume”, and click the ▼ button.

Copyright © 2005, Hitachi, Ltd.

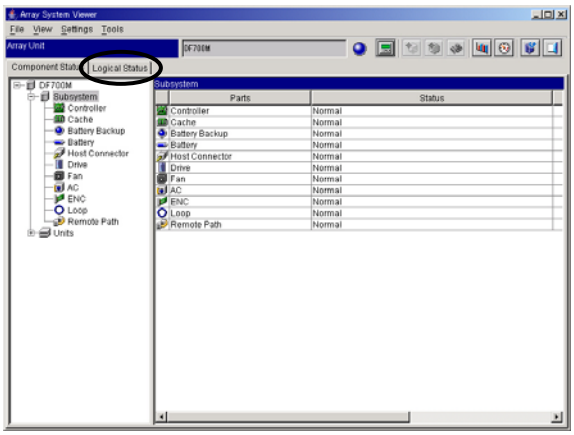
(c) Repeat the operation of (b), move all the LUNs that want to be released to [Available Logical Units], and click the [OK] button.

(d) The confirmation message is displayed. Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.

3.8 Setting the command device indispensable as the system LU of the NAS

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

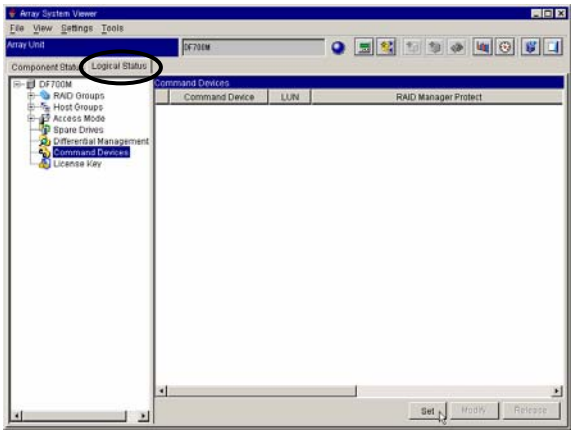


The command device is the interface with the RAID Manager on the NAS Unit.
The commands for ShadowImage in-system replication, NAS Backup Restore, etc. are issued from the RAID Manager for the command device of the disk subsystem.
Setting the command device is required for the RAID Manager to accept the Read/Write command for ShadowImage in-system replication and NAS Backup Restore executed by the disk subsystem and to return the reading demand to the NAS Unit.
One command device is set for one disk subsystem. The Storage Navigator Modular is used to set the command device.

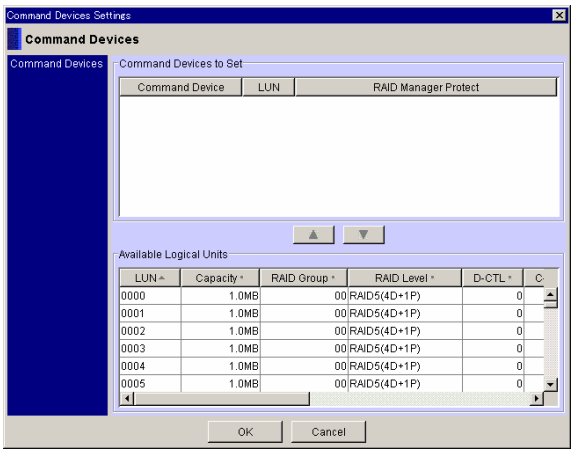
NOTE : • The logical unit to be allocated to the command device needs to be created using the Storage Navigator Modular and formatted beforehand. Also, the capacity of the logical unit is necessary by 35 M bytes or more.
• Up to two command devices can be set for one disk subsystem, but the command device that can be allocated to the NAS Unit is only one.
• The command device cannot be set to the LU which is already allocated to the system LU.

(1) Before performing Setting/change/deletion of the command device
(a) Turn on the AC input power supply on NAS Unit.
(b) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050), "Registering the newly introduced DF in the Storage Navigator Modular" in Subsection 1.1.
(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
• Selecting [File] – [Open]
• Double-clicking an icon of the disk array subsystem you want to set
• Clicking [: Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

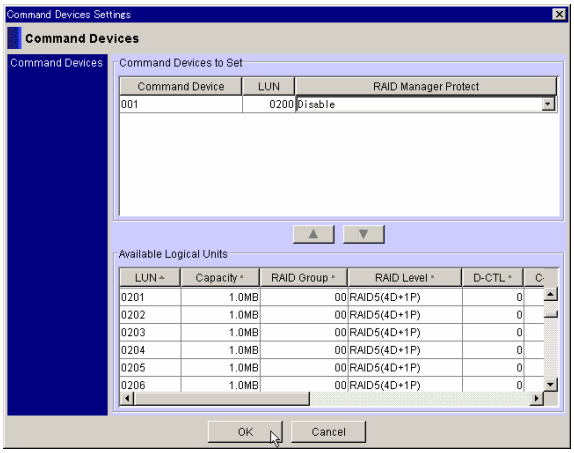


(d) On the unit window, click the [Logical Status] tab.



Copyright © 2005, 2006, Hitachi, Ltd.

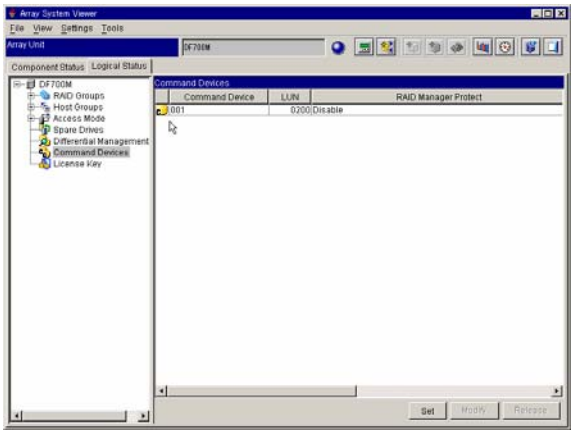
(2) Setting or change the command device



(a) Click [Command device], and click the [Setting] button at the lower right of the window.

(b) Select the LUN that wants to be set to the command device from [Logical unit list that can be used], and click the ▲ button.

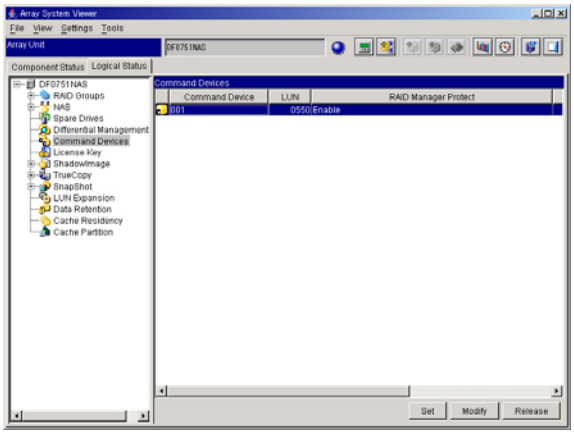
(c) It moves to "Command Devices to Set" that the selected LUN sets.
For using the protecting function of the RAID Manager, select [Enable] from the pull-down menu of "RAID Manager protect". Click the [OK] button.



Copyright © 2005, Hitachi, Ltd.

(d) The confirmation message is displayed. Click the [OK] button

The set content is displayed.



NOTE : Refer to "RAID Manager System Administrator Guide (SANRISE AMS series)" for the protection function of the command device.

Copyright © 2005, Hitachi, Ltd.

(3) Deletion the command device

(a) Click [Command device], and click the [Release] button at the lower right of the window.

(b) The confirmation message is displayed. Click the [OK] button

The set content is displayed.

Copyright © 2005, Hitachi, Ltd.

3.9 Restrictions of the operation opportunity for the system LU/user LU of the NAS

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

The operation of the system LU/user LU of the NAS may not be possible depending on the status of the NAS OS. Check the status of the NAS OS referring to WEB "Chapter 2 The Normal Mode Operation Procedure" (WEB 02-0000).

Table 3.9.1 Restrictions of the Operation Opportunity for the System LU

○: Operation enabled -: Operation disabled

No.	Operation	NAS OS Status	Operation Enabled or Disabled
1	LU format, Change/Release of the system LU (Excluding the System Disk Drive) allocation	It is stopping normally (STOP)	○
		Excluding that it is stopping normally (STOP)	-
2	Change/Release of the system LU (System Disk Drive) allocation	Under uninstallation (NEW), normal stop (STOP), abnormal stop (DOWN), and stop processing (SHUTDOWN)	○
		Other than the above	-
3(*1)	RAID Group deletion including the system LU, LU deletion, unification of the LU, and separation of the unified LU, Command device setting of the LU, Secondary volume specification of ShadowImage in-system replication	It is stopping normally (STOP)	-
		Excluding that it is stopping normally (STOP)	-
4	The operation of the system LU other than No.1 and 2.	It is stopping normally (STOP)	○
		Excluding that it is stopping normally (STOP)	○

*1 : The operation is impossible regardless of the status of the NAS OS unless the system LU allocation is released.

Copyright © 2005, 2006, Hitachi, Ltd.

Table 3.9.2 Restrictions of the Operation Opportunity for the User LU

○: Operation enabled -: Operation disabled

No.	Operation	NAS OS Status	Operation Enabled or Disabled
1	LU format, (*2) Unification of the LU, Separation of the unified LU	It is stopping normally (STOP)	○
		Excluding that it is stopping normally (STOP)	-
2	Change/Release of the user LU allocation	It is stopping normally (STOP)	○
		The NAS OS is normally operating.	(*1)
		Excluding that it is stopping normally (STOP)	-
3(*3)	RAID Group deletion including the user LU, LU deletion, Command device setting of the LU, Pair formation of ShadowImage in-system replication (*4), Pair formation of TrueCopy(*5) (both primary and secondary volumes), Pair formation of Copy-on-write SnapShot (both primary and secondary volumes)	It is stopping normally (STOP)	-
		Excluding that it is stopping normally (STOP)	-
4	Operation for the user LU other than items 1, 2, and 3	It is stopping normally (STOP)	○
		Excluding that it is stopping normally (STOP)	○

*1 : When the NAS OS is attaching the LU, the operation execution is impossible, and when the NAS OS is detaching the LU, the operation execution is possible.

*2 : The LU in the unformatted status can be formatted regardless of the status of the NAS OS.

*3 : The operation is impossible regardless of the status of the NAS OS unless the user LU allocation is released.

*4 : When the primary volume is the user LU specification, the pair formation of ShadowImage in-system replication is possible regardless of the status of the NAS OS. If the file system is created for the user LU of the NAS, the access attribute of S-VOL Disable of Data Retention Utility is automatically set. Therefore, when the secondary volume is the user LU specification, if the file system is already created, the pair formation of ShadowImage in-system replication is impossible regardless of the status of the NAS OS.

*5 : TrueCopy means TrueCopy remote replication and TrueCopy Extended Distance.

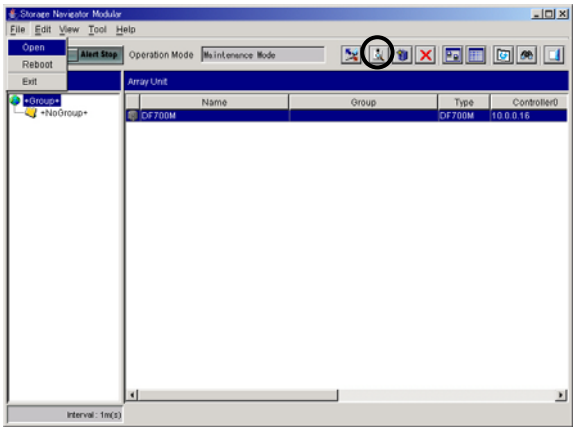
.

Chapter 4. Setting Configuration Information

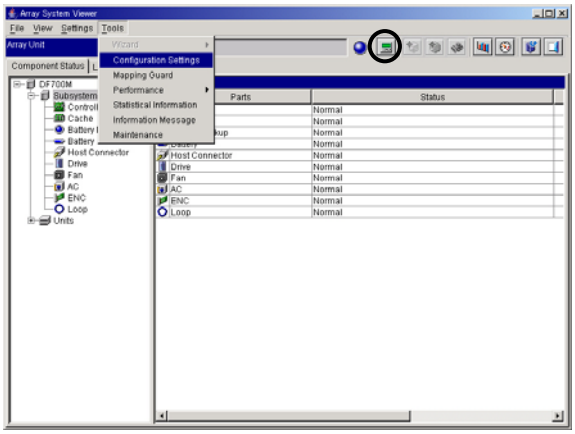


4.1 Before setting configuration information

NOTE : If the setting is changed while an I/O is being executed, the I/O may be abnormally stopped or the succeeding I/O may be unable to be executed. Therefore, change the setting after stopping the I/O.
Besides, the setting on the host computer side must be changed depending on the host computer.

Operation as described below.

(1) Turn on the power supply.
(2) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode"(‡1).
(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]



NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

‡1 : For details of the setting method, refer to the Subsection "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

Copyright © 2005, Hitachi, Ltd.

4.2 Setting the subsystem configuration information

The setting of the configuration information has the other functions as shown below.

- The name of the configuration setting shows indication of a tag in the "Parameter" window.
- The setting entered is validated when the [Apply] button at lower right part of the "Parameter" window is clicked.
- The setting of each parameter of the "Port Option", "Fibre Option" and "iSCSI" must be made for each port (each of Port 0A, 0B, 1A, and 1B).

Table 4.2.1 The menu items of setting parameter

No.	Menu item	Use	Contents	Factory setting	Reference page
1	Boot Options	Sets parameters necessary for the reboot of the subsystem.	① Setting the system start attributes	Depending on the configuration at shipment	"(1) Setting Boot Options" (SYSPR 04-0040)
			② Setting the Delay Planned Shutdown	0 minute	
			③ Setting the Drive blocking mode	Disable	
			④ Setting the Vender ID	HITACHI	
			⑤ Setting the Product ID	DF600F	
			⑥ Setting the ROM Microprogram Version	Not set	
			⑦ Setting the RAM Microprogram Version	Not set	
2	System Parameter	To be used to set the system parameters.	① Selection of system parameters	—	"(2) Setting of System Parameter" (SYSPR 04-0070)
			② Setting of an action against a processor failure	Reset of occurred.	
			③ Web title	—	
			④ Setting of the mode for executing the Write and Verify	ON	
3	LAN	Reference to and setting of the LAN configuration information.	① Maintenance Port IP Address Automatic Change Mode(*2)	Disable	"(3) Setting of LAN" (SYSPR 04-0080)
			② Reference to and/or setting of enable(*1) or disable of the DHCP mode.	OFF	
			③ Reference to and setting of IP Address.	192.168.0.16	
			④ Reference to and setting of SUB NET MASK.	255.255.255.0	
			⑤ Reference to and setting of Default Gateway.	0.0.0.0	
			⑥ Reference to and setting of Negotiation. (*3)	Auto	
			⑦ Reference to the Ether Address.	—	
4	Maintenance LAN	Refer to/set the maintenance port IP address.	① Reference to and setting of IP Address.	Control Unit #0: 10.0.0.16 Control Unit #1: 10.0.0.17	"(4) Setting of Maintenance LAN" (SYSPR 04-0100)"

*1 : When DHCP mode is valid, IP address is obtained from the DHCP server.
When the DHCP server has not started up or DHCP function has been miss-set, obtaining the IP address fails and the device IP address remains to be "0.0.0.0". (Storage Navigator Modular or WEB cannot be used via LAN.)
In this case, the device IP address can be obtained by starting up the DHCP server or setting DHCP function correctly if necessary.
When the IP address of this subsystem is acquired using the DHCP function with the configuration which uses this subsystem as an external disk drive of the DHCP server, if the network address of the reserved IP address for the maintenance port is assigned as an IP address, the IP addresses of the ports for user control and maintenance) compete, and they cannot be operated normally. In this case, request the system administrator not to assign "10.0.0.x," "192.168.0.x," "192.168.233.x" "172.23.211.x," or "10.197.181.x" to the DHCP server as an IP address.
*2 : Microprogram Ver.0735/B, Ver.0740/B or more.
*3 : Microprogram Ver.0750/A or more.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Menu item	Use	Contents	Factory setting	Reference page
5	Port Options	Set the port options of a controller	① Reference/setting of the port option for each port	—	"(5) Setting of Port Options" (SYSPR 04-0110)
6	Restore Options	Refers to and/or sets an option of drive restoration.	① Reference to and/or setting of the mode for Drive Restoration Mode.	Interleave (Normal)	"(6) Setting of Restore Options" (SYSPR 04-0120)
			② Reference to and/or setting of the occasion for Drive Restoration.	Automatic	
			③ Reference to and/or setting of the interval time, processing unit size.	(*1)	
			④ Reference to and setting of Dynamic Sparing.	Execute (Read& Online Verify mode)	
			⑤ Reference to and setting of Spare Drive operation.	Variable	
			⑥ Reference to and setting of Applying No Copy Back Mode on All the Units operation. (*2)	Not selected (Disable)	
7	Online Verify	Refers to and/or sets validity or invalidity of online verification.	① Refers to and/or sets validity or invalidity of online verification.	Yes (Execute mode)	"(7) Setting of Online Verify" (SYSPR 04-0140)
8	Constitute	Writes system parameters and configuration information such as the RG/LU onto (a) file(s) or reads them from (a) file(s).	① Output of system parameters and configuration information to (a) file(s).	—	"(8) Setting of Constitute" (SYSPR 04-0150)
			② Input of system parameters and configuration information to (a) file(s).		
9	Fibre Channel(*3)	Reference to and setting of information regarding the Fibre Channel.	① Reference of Node Name.	—	"(9) Setting of Fibre Channel" (SYSPR 04-0170)
			② Reference of Port Name.	—	
			③ Reference/setting of Topology Information for each port	Loop	
			④ Setting of Port Address for each port.	0000EF	
			⑤ Setting of Transfer Rate for each port.	Auto	
10	iSCSI(*4)	Reference to and setting of information regarding the iSCSI.	① Reference of IP address.	port 0A : 192.168.0.200 port 0B : 192.168.0.201 port 1A : 192.168.0.204 port 1B : 192.168.0.205	"(10) Setting of iSCSI" (SYSPR 04-0192)
			② Reference of Sub Net Mask.	255.255.255.0	
			③ Reference/setting of Gateway for each port	0.0.0.0	
			④ Setting of TCP/IP Port number for each port.	3260	
			⑤ Keep Alive Timer	60	
11	Micro Update	Down load and replace the microprogram.	① Setting of down load of the microprogram.	—	"(11) Setting of Micro Update" (SYSPR 04-0200)
			② Setting of replacement of the microprogram.		
12	RTC	Reference to and setting of date, time.	① Setting procedure.	—	"(12) Setting of RTC" (SYSPR 04-0220)
			② Reference to and setting of the date.		
			③ Reference to and setting of the time.		

*1 : Interval time : 0 (× 10 ms)
Recoverable data size : 1 (× 128 block)
*2 : It is possible to refer to the status of the function or set the function in the combination of the microprogram revision 0740/C or more and the Storage Navigator Modular Ver.4.05 or more.
*3 : When the FC Interface Board of the is not installed in the Control Unit, this tab is not displayed.
*4 : When the iSCSI Interface Board is not installed in the Control Unit, this tab is not displayed.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Menu item	Use	Contents	Factory setting	Reference page
13	Format Mode	Setting of Format mode.	① Reference to and setting Format Mode. ② Reference to and setting Format Data.	Normal Default	"(13) Setting of Format Mode" (SYSPR 04-0230)
14	SNMP	Writes SNMP information onto (a) file(s) or reads them from (a) file(s).	① Output of SNMP information to (a) file(s). ② Input of SNMP information to (a) file(s).	—	"(14) Setting of SNMP" (SYSPR 04-0240)
15	Time Zone	Do the reference to/setting of the time zone and the NTP server IP address.	① Reference to/setting of the time zone ② Reference to/setting of the NTP server IP address	—	"(15) Setting of Time Zone" (SYSPR 04-0260)
16	NNC LAN(*1)	Do the reference to/setting of the NNC control port.	① Reference to/setting of the IP address ② Reference to/setting of the Subnet mask ③ Reference to/setting of the MTU ④ Reference to/setting of the Negotiation	—	"(16) Setting of NNC LAN" (SYSPR 04-0280)
17	LAN Port Number (*2)	Do the setting of the LAN Port Number on the subsystem side.	① Setting of the LAN Port Number on the subsystem side	2000	"(17) Setting of LAN Port Number" (SYSPR 04-0300)
18	iSNS(*3)	Do the reference to/setting of the iSNS.	① Specify whether to use iSNS Server or not	—	"(18) Setting the iSNS Server Information" (SYSPR 04-0360)
19	Ping(*3)	Reference to and setting of information regarding the Ping.	① Select the port to be sending ping ② Specify the IP Address of the initiator	—	"(19) Sending Ping" (SYSPR 04-0370)
20	Backend Diagnosis (*4)	Set the automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side of the subsystem.	① Setting of the automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side of the subsystem	10	"(20) Setting of the automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side" (SYSPR 04-0390)

*1 : When the NAS Interface Board is not installed in the Control Unit, this tab is not displayed.
*2 : Microprogram Ver.0726/E or more.
*3 : When the iSCSI Interface Board is not installed in the Control Unit, this tab is not displayed.
*4 : Microprogram Ver.0740/D or more.

(1) Setting Boot Options

Parameter settings, which are shown in the "List of DF700 Boot Option/System Parameter Settings" in the "Read before you start" supplied with the subsystem, have been made when the subsystem is shipped from the factory. Reset the boot options when necessary.
When any of the Boot Options is changed, the subsystem becomes unable to receive access from a host computer until the reboot is completed. Reset the Boot Options after making sure that access from the host computer has been stopped.

NOTE : Do not perform setting Boot Options while the READY LED (green) on the front of the Basic Chassis lights up is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).

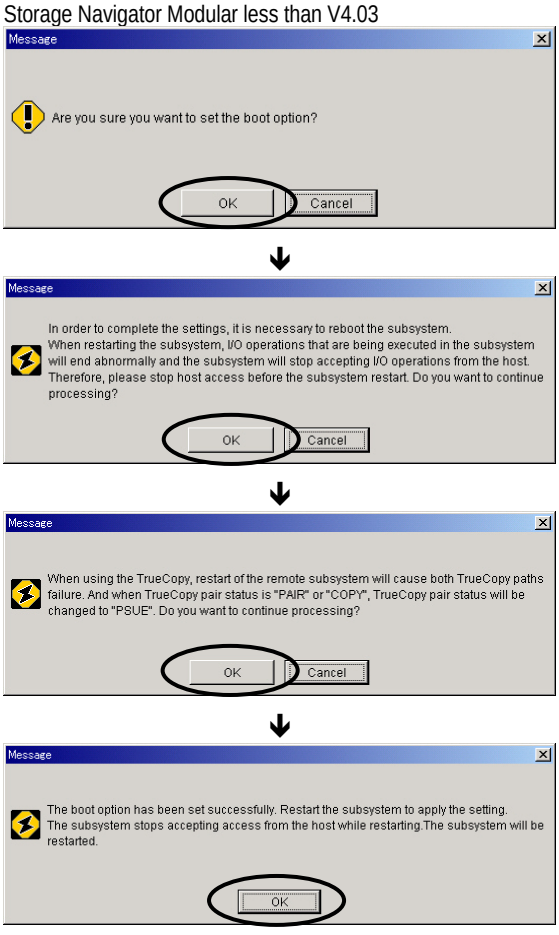
NOTE : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

(a) Click the [Boot Options] tab. A window for setting the boot options is displayed in the [Parameter] window.

Copyright © 2005, 2006, Hitachi, Ltd.

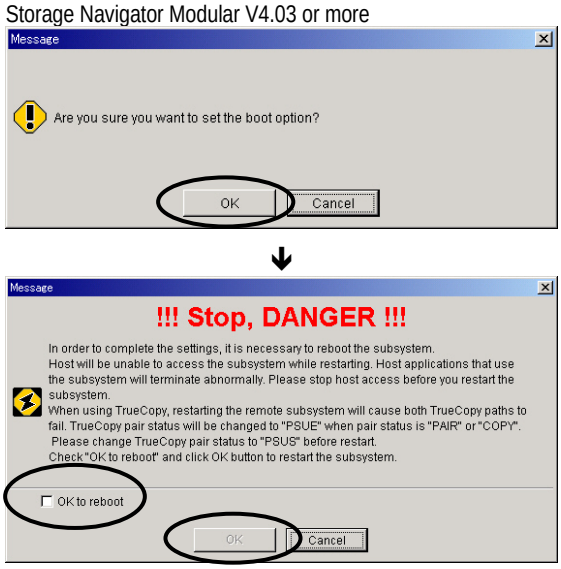
No	Parameter name	Construction	Kind of parameter		Default setting
1	System start attributes(*1)	Specifies the system start attributes.	Single mode	Made in the case of the single Control Unit configuration.	Depending on the configuration at shipment
			Dual Active mode	Made in the case of the dual Control Unit configuration.	
2	Delay Planned Shutdown	Specifies the delay time until the start of the deliberate shutdown by the minute.	0 to 60 minutes	Specifies the delay time until the start of the deliberate shutdown by the minute.	0 minute
3	Drive Detach mode	Specifies an operation to be performed when a drive failure occurs in the same RAID group.	Disable	When a failure also occurs in the second(third) Disk Drive while one Disk Drive is blocked due to a failure in one RAID Group of RAID 1/1+0/5(6), do not make the second(third) Disk Drive blocked.	Disable
			Enable	When a failure occurs in the second(third) Disk Drive while one Disk Drive is blocked due to a failure in one RAID Group of RAID 1/1+0/5(6), block the second(third) Disk Drive and make the LUs in the RAID Group concerned blocked (unformatted status).	
4	Vender ID	Specifies the Vender ID	8 or less half size alphabetic characters and/ or numerals.	The value that has been set is reported at 8th to 15th bytes of the Standard Inquiry. Normally, no change from the default value, “HITACHI”, is required.	HITACHI
5	Product ID	Specifies the Product ID	16 or less half size alphabetic characters and/ or numerals.	The value that has been set is reported at 16th to 31th bytes of the Standard Inquiry. Normally, no change from the default value, “DF600F”, is required.	DF600F
6	ROM Microprogram Version	Specifies the ROM Microprogram Version	2 or less half size alphabetic characters and/ or numerals.	The value that has been set is reported at 32th to 35th bytes of the Standard Inquiry. Normally, no change from the default value, “Not set”, is required.	Not set
7	RAM Microprogram Version	Specifies the RAM Microprogram Version	2 or less half size alphabetic characters and/ or numerals.		

*1 : The NAS Unit connection configuration does not support “Single mode”.
Be sure to select “Dual Active mode”.



Copyright © 2005, 2006, Hitachi, Ltd.

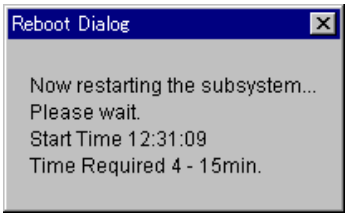
(b) Verify that the changes that have been made are correct and click the [Apply] button.
When the [Reset] button is clicked, the change is canceled.



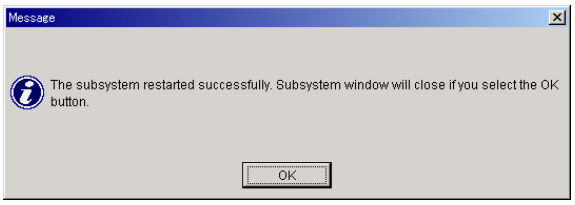
(c) The confirmation window is display.
The former setting is valid until the subsystem is restarted.
When the subsystem is restarted, it does not accept accesses from a host computer until the restarting is completed. So, restart the subsystem after making sure that accesses from a host computer has ceased.

NOTE : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03



Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more



Copyright © 2005, 2006, Hitachi, Ltd.

(d) When you choose to restart the subsystem, the time the restart began is displayed. This usually takes approximately four to fifteen minutes. (about five to fifteen minutes in case of the RKH)

NOTE : It may take time for the subsystem to respond, depending on the condition of the subsystem. If it does not respond after 15 minutes or more, check the condition of the subsystem.

(e) A message appears, stating that the restart is successful. Click the [OK] button.

The Unit screen is closed. To perform other operations on the Main screen, select an array unit from the Main screen and open the selected Unit screen.

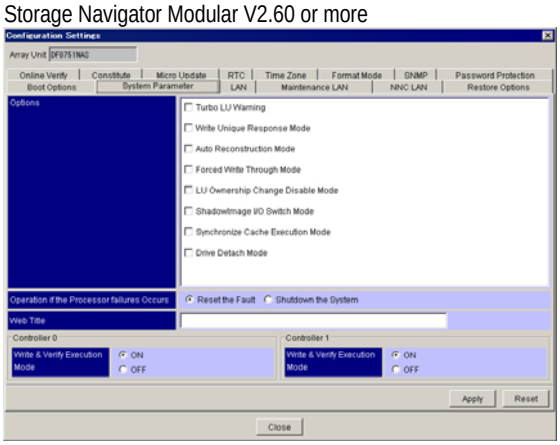
Copyright © 2005, Hitachi, Ltd.



(2) Setting of System Parameter

(a) Click the [System Parameter] tab. The window for setting the "System Parameter" is displayed in the Parameter window.

Storage Navigator Modular V2.00 or less

Storage Navigator Modular V2.60 or more

No.	Parameter name		Construction	Kind of parameter		Default setting
1	Option	Turbo LUN Warning	This parameter is to be specified when the Turbo LU setting function is used.	Disable (Not checked)	When the write operation is received within the PIN range, the write command is executed in the Write-Through mode (*1).	Disable
				Enable (Checked)	Even if the write operation is received within the PIN range, the Cache memory is used when the write command is received.	
2		Write Unique Response Mode	This parameter is to be specified when a host of the NX series is connected.	Disable (Not checked)	The cache memory is used when the write command is received.	Disable
				Enable (Checked)	The write command is executed unconditionally in the Write-Through mode.(*1) (However, the write command for the LUs of RAID 1 and RAID 1+0 are excluded.)	
3		Auto Reconstruction Mode	This parameter specifies operations to be performed when a disk drive is pulled out.	Disable (Not checked)	Even when a disk drive is pulled out, the correction copy to a spare disk drive is not performed.	Disable
				Enable (Checked)	When a disk drive is pulled out, the correction copy to a spare disk drive is performed.	
4		Forced Write Through Mode	This parameter specifies the way to execute the write command to be used after the CTL detachment or a power failure occurs.	Disable (Not checked)	Even if the CTL detachment or a power failure has occurred, the cache memory is used when the write command is received.	Disable
				Enable (Checked)	When the CTL detachment or a power failure has occurred, the write command is executed in the Write-Through mode. (*1)	
5		LU Ownership change Disable Mode (*2)	This parameter specifies an operation to re-assign an LU to a controller that is not controlling the LU when the controller attempts to access the LU.	Disable (Not checked)	Request the internal processing to the Control Unit in charge of the LU. However, when there is no access for one minute from the Control Unit side in charge of the LU, reallocate the Control Unit in charge of the LU.	Disable
				Enable (Checked)	The access is always made by a Control Unit that controls the LU concerned by request without re-assigning the LU to a Control Unit that wants to access the LU.	

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The Write-Through means the operation to write the write data to the Disk Drive and respond to the host computer immediately after the subsystem received the write data from the host computer. Therefore, the response time of the command to the host computer delays when the subsystem executes the Write-Through.
*2 : When the NAS Interface Board is installed in the Control Unit, be sure to select “Disable” for “LU Ownership change Disable Mode”.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Parameter name		Construction	Kind of parameter		Default setting
6	Option	ShadowImage I/O Switch Mode	This parameter specifies an operation of a ShadowImage in-system replication P-VOL to be performed when a disk drive double failure occurs.	Disable (Not checked)	When a double failure occurs in disk drives of a P-VOL in the PAIR status of ShadowImage in-system replication, the status is changed to PSUE.	Disable
				Enable (Checked)	When a double failure occurs in disk drives of a P-VOL in the PAIR status of ShadowImage in-system replication, the executor of the host I/O is switched to an S-VOL to continue the execution.	
7		Synchronize Cache Execution Mode	This parameter specifies an operation to be performed when the Synchronize Cache command is received.	Disable (Not checked)	No operation is performed when the Synchronize Cache command is received.	Disable
				Enable (Checked)	When the Synchronize Cache command is received, the whole data in the cache memory is written to disk drives.	
8		Drive Detach Mode(*1)	Specifies an operation to be performed when a drive failure occurs in the same RAID group.	Disable (Not checked)	When a failure occurs in the second(third) Disk Drive in the same RAID Group while one Disk Drive of RAID 1/1+0/5 (or two Disk Drives of RAID 6) is blocked due to a failure, do not make the second(third) Disk Drive blocked.	Disable
				Enable (Checked)	When a failure occurs in the second(third) Disk Drive in the same RAID Group while one Disk Drive of RAID 1/1+0/5 (or two Disk Drives or RAID 6) is blocked due to a failure, block the second(third) Disk Drive and make the LUs in the RAID Group concerned blocked (unformatted status).	
9	Operation if the processor failure occurs		This parameter specifies an operation to be performed when a processor failure occurs.	Reset of occurred	The parameter resets the failure and reboots the Control Unit. (If the power supply is not turned off after the first reboot, the Control Unit is blocked when the processor failure occurs at the second time.)	Reset of occurred
				System down	The parameter blocks the Control Unit where the failure occurred.	
10	WBE Title		In the case where the Web function that is built in the disk array subsystem is displayed with the browser, this parameter specifies characters to be displayed on the title bar of the browser.	32 or less half size alphabetic characters and/ or numerals.	Characters to be entered are half size alphabetic characters, numerals, and/or characters other than numerals (excluding ', ", and \).	Not set
11	Write and verify mode		This parameter specifies an execution mode for write and verify operation for the Control Unit #0 or Control Unit #1.	ON	Only the write operation is executed skipping the verify operation to the write and verify command issued by the host.	ON
				OFF	Both the write and verify operations are executed to the write and verify command issued by the host.	

*1 : It can be set in the microprogram revision 0726/A or more and the Storage Navigator Modular V2.60 or more.

(b) Check if the changes that have been made are correct and click the [Apply] button. When the [Reset] button is clicked, the settings that have been made are cancelled. To terminate the setting, click the [Close] button.

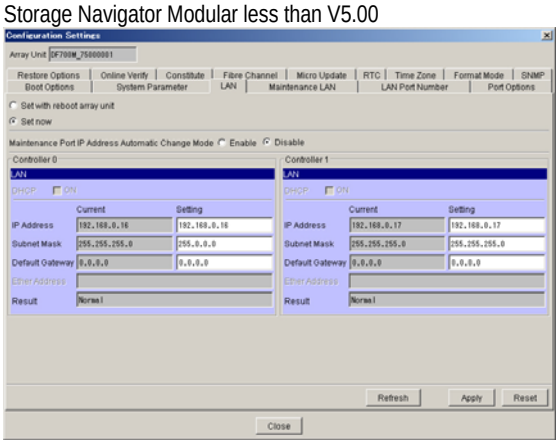
(3) Setting of LAN

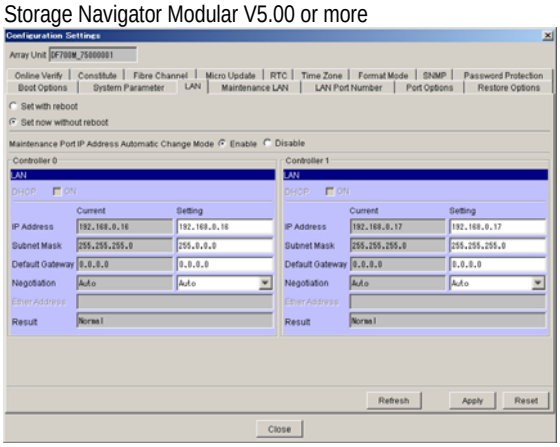
According to the following combination of microprogram and Storage Navigator Modular, refer the appropriate section.

Microprogram	Storage Navigator Modular	Reference section
Ver.0735/B, Ver.0740/B or more	Ver.3.53, Ver.4.01 or more	Refer to "(3-1) When the microprogram is Ver.0735/B, Ver.0740/B or more and the Storage Navigator modular is Ver.3.53, Ver.4.01 or more" (SYSPR 04-0080).
Ver.0740/A, Ver.0731/A or more, less than Ver.0735/B	Ver.4.00, Ver.3.00 or more, less than Ver.3.53	Refer to "(3-2) When the microprogram is Ver.0740/A, Ver.0731/A or more, less than Ver.0735/B and the Storage Navigator modular is Ver.4.00, Ver.3.00 or more, less than Ver.3.53" (SYSPR 04-0085).
other than those above	other than those above	Refer to "(3-3) When the microprogram is less than Ver.0731/A or the Storage Navigator Modular is less than Ver.3.00" (SYSPR 04-0088).



(3-1) When the microprogram is Ver.0735/B, Ver.0740/B or more and the Storage Navigator modular is Ver.3.53, Ver.4.01 or more

NOTE : When there is the LAN access such as the Storage Navigator Modular, the WEB, and the SNMP to the LAN port to be set, the setting of the LAN cannot be performed.
Request the customer to stop the LAN access to the LAN port to be set.
Furthermore, when there is a Web connection to the LAN port to be set, the setting of the LAN cannot be performed.
Request the customer to stop the LAN access to the LAN port to be set.
(The microprogram revision is 0740/C or more and the Storage Navigator Modular is Ver.4.05 or more) when the [Apply] button is clicked although there is the LAN access, an error message is displayed.
According to the error message, refer to "netstat.inf" file in the directory where Storage Navigator Modular is installed, request the customer to stop the LAN access to the LAN port to be set, and try again.



Copyright © 2005, 2006, Hitachi, Ltd.

(a) Click the [LAN] tab. The setting window of "LAN" is displayed in the Parameter window. Check "Set now" (Storage Navigator Modular less than V5.00)/"Set now without reboot" (Storage Navigator Modular V5.00 or more).

Storage Navigator Modular less than V5.00

Storage Navigator Modular V5.00 or more

However, when you want to change the DHCP function, select "Set it after restarting". In that case, be careful of the following.

NOTE :
- When the [Apply] button is clicked after entering the LAN information, the display returns to the value before the input, but the setting value is reflected by performing the restart of the subsystem.
- Do not perform the setting of the LAN to restart the subsystem while the READY LED (green) is blinking at high-speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
- If the array subsystem connected to the NAS Unit restarts, the cluster between the NAS Units stops.
  When restarting the array subsystem unavoidably, stop the cluster between the NAS Units, stop the NAS OS of both NAS Units, and then execute it. Start the cluster between the NAS Units again after completing the restart of the array subsystem.
- When the TrueCopy remote replication/TrueCopy Extended Distance is enabled, and the array subsystem to be restarted is the remote disk subsystem, transit the pair status of the TrueCopy remote replication/TrueCopy Extended Distance (S-VOL) to the PSUS, and then perform the restart.
  If the restart is executed, it becomes a path blockade, and the notice of SNMP Agent Support Function and TRAP occur. Perform the notice and the check to the Failure Monitoring Department in advance.
  The path blockade of TrueCopy remote replication/TrueCopy Extended Distance automatically recovers after restarting.
- When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
  Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
  If the spin-down fails, execute the spin-down again.

Copyright © 2006, Hitachi, Ltd.

(b) Set "Maintenance Port IP Address Automatic Change Mode".

① [Disable] : Only the IP address of user management port is set.
The IP address in the same network address as the network address of the IP address currently specified for the port for the maintenance cannot be set.

② [Enable] : The IP address of maintenance port is changed automatically by IP address of user management port as follows. If maintenance port is used, be careful to maintenance port changed automatically.
- 10.xxx.xxx.xxx --- CTL0 : 192.168.0.16, CTL1 : 192.168.0.17
- other than 10.xxx.xxx.xxx --- CTL0 : 10.0.0.16, CTL1 : 10.0.0.17

However, in the case of following, this option is cannot be selected.
- "DHCP" is enabled.
- using the NAS model.

NOTE : In changing IP address process, following IP address of maintenance port may be set temporarily. Check following IP address is not used in the network of maintenance LAN port.

NOTE : If changing IP address is failed, the IP address of maintenance port may be set above IP address.

No.	Current IP address of user management port	Setting IP address of user management port	Temporarily IP address of maintenance port
1	172.xxx.xxx.xxx	10.xxx.xxx.xxx	CTL0:192.168.0.16, CTL1:192.168.0.17
2	other than 172.xxx.xxx.xxx	other than 10.xxx.xxx.xxx	CTL0:10.0.0.16, CTL1:10.0.0.17
3	10.xxx.xxx.xxx	172.xxx.xxx.xxx	CTL0:192.168.0.16, CTL1:192.168.0.17
4	other than 10.xxx.xxx.xxx	other than 172.xxx.xxx.xxx	CTL0:172.23.211.16, CTL1:172.23.211.17
5	other than 10.xxx.xxx.xxx, and other than 172.xxx.xxx.xxx	172.xxx.xxx.xxx	CTL0:10.0.0.16, CTL1:10.0.0.17
6	other than 10.xxx.xxx.xxx, and other than 172.xxx.xxx.xxx	other than 172.xxx.xxx.xxx	CTL0:172.23.211.16, CTL1:172.23.211.17

(c) Perform the setting of the LAN information.

① [DHCP] : The DHCP function is set.
When the checkbox is checked, the DHCP mode becomes enabled.
It cannot be selected when "Set now" (Storage Navigator Modular less than V5.00)/"Set now without reboot" (Storage Navigator Modular V5.00 or more).

② [LAN] : The LAN parameter is set.
When the checkbox of [DHCP] is checked, it becomes a gray display.

[IP Address] : The IP Address is set.
Do not set same IP address as the NNC control port when connecting it to the same network as the NNC control port with the NAS system configuration.

[Subnet Mask] : Subnet Mask is set.

[Default Gateway] : Default Gateway is set.
When network address of the default gateway is different from network address of IP address, the gateway address cannot be set.
If no Gateway address is specified, set "0.0.0.0".

Copyright © 2006, Hitachi, Ltd.

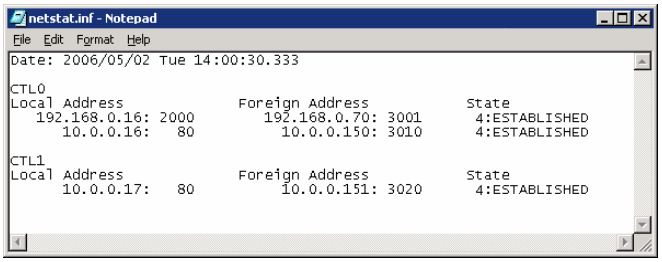
[Negotiation] : The negotiation is set.
It cannot be set when the microprogram version is less than 0750/A and the Storage Navigator Modular version is less than 5.00. In that case, it operates by the automatic negotiation.

NOTE : Use it matching the subsystem and the negotiation set to the device connected to the subsystem. When the negotiation differs between the devices, it may not be able to communicate normally.
In the combination of the negotiations set to the subsystem and set to the device connected to the subsystem, the patterns that can be operated are shown below.

		Devices connected to the subsystem				
		Auto	10 Mbps Half	10 Mbps Full	100 Mbps Half	100 Mbps Full
Subsystem	Auto	○	×	×	×	×
	10 Mbps Half	×	○	×	×	×
	10 Mbps Full	×	×	○	×	×
	100 Mbps Half	×	×	×	○	×
	100 Mbps Full	×	×	×	×	○

○ : Communication possible, × : Communication impossible

[Ether Address] : The Ethernet address (MAC address) is displayed. It cannot be changed.



[Result] : The result of the setting processing of the LAN is displayed.
The setting results and the actions to be taken to be displayed are as shown below.

No.	Setting result	Description	Recovery method
1	-	The setting result value which is not assumed with the Storage Navigator Modular was received.	Press the [Refresh] button again. If the display becomes "---" no matter how many times it is done, set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
2	Normal	The setting processing was completed normally.	Completed normally
3	Now setting	This indicates that the setting is being processed.	Press the [Refresh] button again after waiting for a while (about five minutes). If it is still the same display no matter how many times it is updated, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
4	Abnormal (Time out)	The setting processing was not completed though it passed the fixed time.	Close all the SNMs and WEBs of the terminal connected to the user control port, and set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
5	Abnormal (A failure occurs in the disk array subsystem)	The setting processing terminated abnormally due to the internal failure occurrence.	Maintain it referring to the information message on WEB. After that, set up the LAN again immediately. When it is displayed although no failure occurs, set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))

Copyright © 2006, Hitachi, Ltd.

(d) If it is checked that the changed content is correct and the [Apply] button is clicked, the setting confirmation window is displayed. Click the [OK] button.
If "Maintenance Port IP Address Automatic Change Mode" is enabled, the unit window closes. So, register the subsystem with new IP address of maintenance port.
If the [Reset] button is clicked, the change content is cancelled. Click the [Close] button to terminate the setting.

If the microprogram revision is 0740/C or more and the Storage Navigator Modular is Ver.4.05 or more, when the [Apply] button is clicked although there is the LAN access, an error message is displayed. According to the error message, refer to "netstat.inf" file in the directory where Storage Navigator Modular is installed, request the customer to stop the LAN access to the LAN port to be set, and try again.

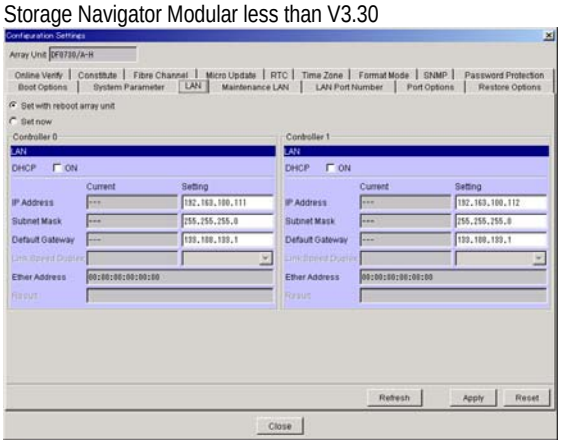
[Local Address] : IP address of the subsystem and LAN port number
[Foreign Address] : IP address of PC and LAN port number connecting with the subsystem
[State] : Status of TCP connection
Regardless of "Status" in the netstat.inf file, stop the all appreciation currently connecting from "Foreign address"

- 0:CLOSE : There are no connections
- 2:SYN_SENT : Waiting for reply of connection request
- 3:SYN_RCVD : Waiting for confirmation of connection reply
- 4:ESTABLISHED : Establishing connection
- 5:CLOSE_WAIT : Waiting for request of connection termination from application
- 6:FIN_WAIT_1 : Waiting for request of connection termination, or waiting for reply of connection termination sent
- 7:CLOSING : Waiting for reply of request for connection termination
- 8:LAST_ACK : Waiting for confirmation of request for connection termination
- 9:FIN_WAIT_2 : Waiting for request of connection termination
- 10:TIME_WAIT : Waiting for connection termination
- 99:--- : The status which is not assumed

(e) When "Setting result" is displayed as "Now setting", it is changing the setting.
Click the [Refresh] after waiting for a while (about five minutes).
If "Setting Result" all becomes "Normal", the setting change is completed.

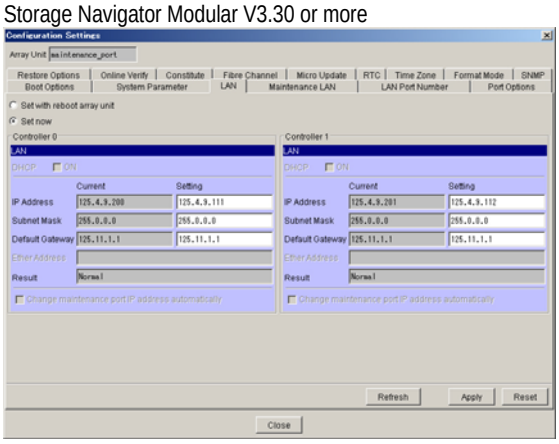
Copyright © 2006, Hitachi, Ltd.

(f) When the setting change is completed, request the customer to check if it can be connected to the port for the user control.
If it cannot be connected to the user control port, check the setting content and set it again.



(g) Request the customer to delete the subsystem registration with the IP address before the setting, and perform the subsystem registration again the IP address after the setting with the Storage Navigator Modular.

(3-2) When the microprogram is Ver.0740/A, Ver.0731/A or more, less than Ver.0735/B and the Storage Navigator modular is Ver.4.00, Ver.3.00 or more, less than Ver.3.53



NOTE : When there is the LAN access such as the Storage Navigator Modular, the WEB, and the SNMP to the port for the user control of the Control Unit to be set, the setting of the LAN cannot be performed.
Request the customer to stop the LAN access to the port for the user control to be set.
Furthermore, when there is a Web connection to the LAN port to be set, the setting of the LAN cannot be performed.
Request the customer to stop the LAN access to the LAN port to be set.

(a) Click the [LAN] tab. The setting window of "LAN" is displayed in the Parameter window. Check "Set now".

Storage Navigator Modular less than V3.30

Storage Navigator Modular V3.30 or more

Copyright © 2006, Hitachi, Ltd.

However, when you want to change the DHCP function, select "Set with reboot array unit"

NOTE : • When the [Apply] button is clicked after entering the LAN information, the display returns to the value before the input, but the setting value is reflected by performing the restart of the subsystem.
• Do not perform the setting of the LAN to restart the subsystem while the READY LED (green) is blinking at high-speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
• If the array subsystem connected to the NAS Unit restarts, the cluster between the NAS Units stops.
When restarting the array subsystem unavoidably, stop the cluster between the NAS Units, stop the NAS OS of both NAS Units, and then execute it. Start the cluster between the NAS Units again after completing the restart of the array subsystem.
• When the TrueCopy remote replication/TrueCopy Extended Distance is enabled, and the array subsystem to be restarted is the remote disk subsystem, transit the pair status of the TrueCopy remote replication/TrueCopy Extended Distance (S-VOL) to the PSUS, and then perform the restart.
If the restart is executed, it becomes a path blockade, and the notice of SNMP Agent Support Function and TRAP occur. Perform the notice and the check to the Failure Monitoring Department in advance.
The path blockade of TrueCopy remote replication/TrueCopy Extended Distance automatically recovers after restarting.
• When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

(b) Perform the setting of the LAN information.
① [DHCP] : The DHCP function is set.
When the checkbox is checked, the DHCP mode becomes enabled.
It cannot be selected when "Set now".
② [LAN] : The LAN parameter is set.
When the checkbox of [DHCP] is checked, it becomes a gray display.
[IP Address] : The IP Address is set.
The IP address in the same network address as the network address of the IP address currently specified for the port for the maintenance cannot be set.
Also, do not set same IP address as the NNC control port when connecting it to the same network as the NNC control port with the NAS system configuration.
[Subnet Mask] : Subnet Mask is set.
[Default Gateway] : Default Gateway is set.
The same IP address as the IP address currently specified for the port for the maintenance cannot be set to the default gateway.
When network address of the default gateway is different from network address of IP address, the gateway address cannot be set.
If no Gateway address is specified, set "0.0.0.0".

Copyright © 2006, Hitachi, Ltd.

[Ether Address] : The Ethernet address (MAC address) is displayed. It cannot be changed.

[Result] : The result of the setting processing of the LAN is displayed. The setting results and the actions to be taken to be displayed are as shown below.

No.	Setting result	Description	Recovery method
1	-	The setting result value which is not assumed with the Storage Navigator Modular was received.	Press the [Refresh] button again. If the display becomes "---" no matter how many times it is done, set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
2	Normal	The setting processing was completed normally.	Completed normally
3	Now setting	This indicates that the setting is being processed.	Press the [Refresh] button again after waiting for a while (about five minutes). If it is still the same display no matter how many times it is updated, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
4	Abnormal (Time out)	The setting processing was not completed though it passed the fixed time.	Close all the SNMs and WEBs of the terminal connected to the user control port, and set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
5	Abnormal (A failure occurs in the disk array subsystem)	The setting processing terminated abnormally due to the internal failure occurrence.	Maintain it referring to the information message on WEB. After that, set up the LAN again immediately. When it is displayed although no failure occurs, set the LAN again. If it is still the same display, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))

③ [Change maintenance port IP address automatically] :

If you use this option, select "Set with reboot array unit". When the checkbox is checked, maintenance port is changed automatically by IP address of user management port as follows,

- CTL0 : 10.0.0.16 or 192.168.0.16
- CTL1 : 10.0.0.17 or 192.168.0.17

However, in the case of following, this option is cannot be selected.

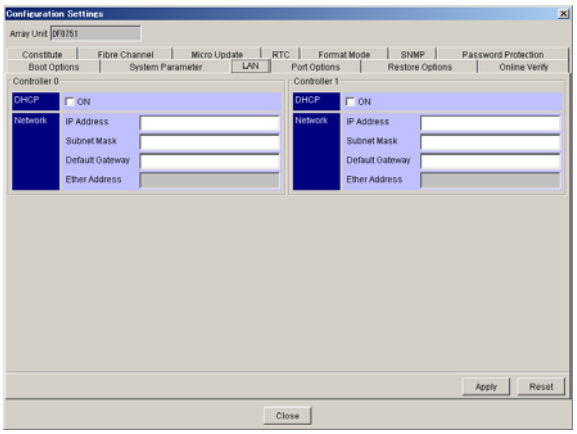
- the microprogram is less than Ver.0733 and the Storage Navigator Modular is less than Ver.3.30.
- "Set now" is selected.
- "DHCP" checkbox is checked.
- using the NAS model.

(c) If it is checked that the changed content is correct and the [Apply] button is clicked, the setting confirmation window is displayed.
Click the [OK] button.
If the [Reset] button is clicked, the change content is cancelled. Click the [Close] button to terminate the setting.
When "Setting result" is displayed as "Now setting", it is changing the setting.

(d) Click the [Refresh] after waiting for a while (about five minutes).
If "Setting Result" all becomes "Normal", the setting change is completed.

Copyright © 2006, Hitachi, Ltd.

(e) When the setting change is completed, check if it can be connected to the port for the user control.
If it cannot be connected to the user control port, check the setting content and set it again.



(f) Request the customer to delete the subsystem registration with the IP address before the setting, and perform the subsystem registration again the IP address after the setting with the Storage Navigator Modular.

(3-3) When the microprogram is less than Ver.0731/A or the Storage Navigator Modular is less than Ver.3.00

NOTE : • Do not perform setting of LAN while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

- When the array subsystem connected to the NAS Unit restarts, the cluster between the NAS Units stops.
  When the array subsystem is restarted unavoidably, stop the cluster between the NAS Units, stop the NAS OS of both NAS Units, and then execute it.
  Start the cluster between the NAS Units again after completing the restart of the array subsystem.
- When the TrueCopy remote replication/TrueCopy Extended Distance is enabled, and the array subsystem to be restarted is the remote disk subsystem, transit the pair status (S-VOL) of the TrueCopy remote replication/TrueCopy Extended Distance to the PSUS, and then perform the restart.
  If the restart is executed, it becomes a path blockade, and the notice of SNMP Agent Support Function and TRAP occur. Perform the notice and the check to the Failure Monitoring Department in advance.
  The path blockade of TrueCopy remote replication/TrueCopy Extended Distance automatically recovers after restarting.
- When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
  Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then restart the subsystem.
  If the spin-down fails, execute the spin-down again.

(a) Click the [LAN] tab. The setting window of “LAN” is displayed in the Parameter window.

Copyright © 2006, Hitachi, Ltd.

(b) Perform the setting of the LAN information.

① [DHCP] : The DHCP function is set.
When the checkbox is checked, the DHCP mode becomes enabled.

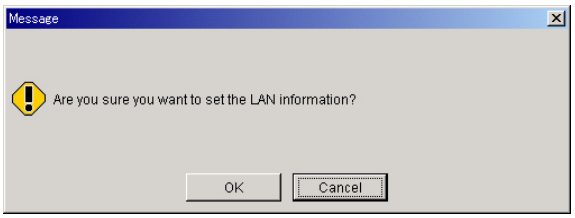
② [LAN] : The LAN parameter is set.
When the checkbox of [DHCP] is checked, it becomes a gray display.

[IP Address] : The IP Address is set.
The IP address in the same network address as the network address of the IP address currently specified for the port for the maintenance cannot be set.
Also, do not set same IP address as the NNC control port when connecting it to the same network as the NNC control port with the NAS system configuration.

[Subnet Mask] : Subnet Mask is set.

[Default Gateway] : Default Gateway is set.
The same IP address as the IP address currently specified for the port for the maintenance cannot be set to the default gateway.
When network address of the default gateway is different from network address of IP address, the gateway address cannot be set.
If no Gateway address is specified, set "0.0.0.0".

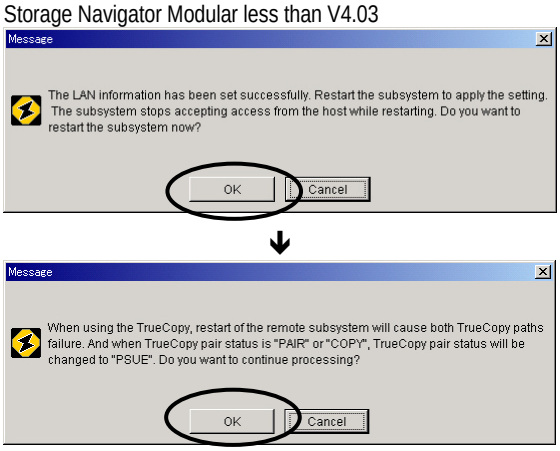
[Ether Address] : The Ethernet address (MAC address) is displayed. It cannot be changed.



The LAN can be set to the Control Unit which connects the LAN cable.
For the dual Control Unit, connect the LAN cable to one of the Control Units and set the LAN, and then reconnect the LAN cable to the other Control Unit and set the LAN again.
Or, when setting the information of both Control Units at the same time, set LAN after connecting the LAN cable to each Control Unit.

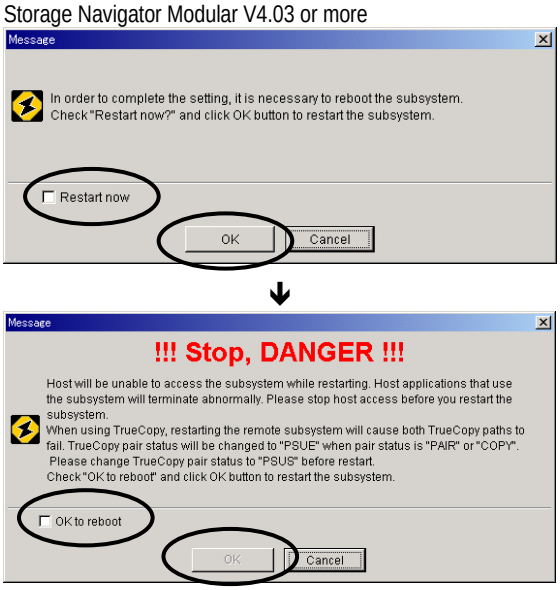
(c) If it is checked that the changed content is correct and the [Apply] button is clicked, the setting confirmation window is displayed.
If the [Reset] button is clicked, the change content is cancelled. Click the [Close] button to terminate the setting.

NOTE : The display returns to the value before the input by clicking the [Apply] button after entering the LAN information, but the setting value is reflected by performing the restart of the subsystem.
Check if the setting content is reflected correctly after restarting.

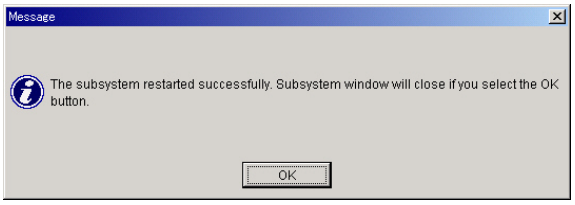


Copyright © 2005, 2006, Hitachi, Ltd.

(d) Click the [OK] button.



(e) To restart the array subsystem, click the [OK] button.



Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03

Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more

(f) When the setting is completed, the completion window is displayed. Click the [OK] button.

(g) When the setting change is completed, check if it can be connected to the port for the user control.

If it cannot be connected to the user control port, check the setting content and set it again.

(h) Request the customer to delete the subsystem registration with the IP address before the setting, and perform the subsystem registration again the IP address after the setting with the Storage Navigator Modular.

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Setting of Maintenance LAN

NOTE : • Do not make the setting of the Maintenance LAN while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

- If the following Microprogram revision or Storage Navigator Modular is used, this function will not work when connected to the maintenance port. Connect LAN cable to the user port and perform the setting.
  - Microprogram revision of the subsystem is 0730/A
  - Microprogram revision of the subsystem is 0726/E or less.
  - Storage Navigator Modular revision is 3.00
  - Storage Navigator Modular revision is 2.60 or less.
- When there is a connection in the maintenance port, the setting of the Maintenance LAN cannot be changed (it becomes "Connection waiting time-out"). Close all the programs which perform the communication to the maintenance port when changing the setting of the Maintenance LAN.
- If setting of user port is incorrect, the setting of maintenance port will be fail.
  Set correct setting for user port according to error message. (Refer to "4.2 (3) Setting of LAN" (SYSPR 04-0080).)
- If "Maintenance Port IP Address Automatic Change Mode" is enabled, the IP address of maintenance port can not be changed.
  If you change maintenance LAN setting, set "Maintenance Port IP Address Automatic Change Mode" to "Disable". (Refer to "4.2 (3) Setting of LAN" (SYSPR 04-0080).)

(a) Click the "Maintenance LAN" tab. The "Maintenance LAN" setting window appears is displayed in the "Parameters" window.

For the Maintenance mode

[IP address] : This is to be used to sets the IP address of the maintenance port. (When RKNAS is not connected, "NNC x" is not displayed.)

[Current] : This displays the an IP address currently set is displayed.

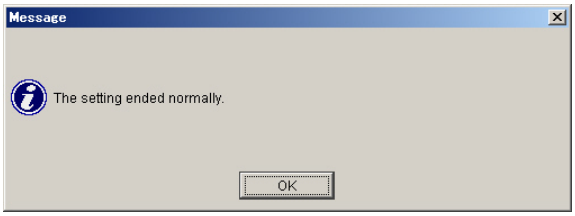
Copyright © 2005, 2006, Hitachi, Ltd.

[Setting] : This is to be used to sets an the IP address. It selects a network address from a pull-down menu.
The same network address as the network address of the IP address which is currently specified for the user control port cannot be set.
In the Maintenance mode, at he host address can also be selected also.

[Setting Result] : This displays a result of the IP address change process is displayed.
The setting results to be displayed and corresponding actions to be taken are shown below.

No.	Setting result	Description	Actions to be taken
1	-	An unexpected setting result value was received from through Storage Navigator Modular.	Press the [Refresh] button again. If the display becomes "---" no matter how many times it is done, set the Maintenance LAN again. If the same information is displayed in spite of the above operation, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
2	Normal	The setting result is completed normally.	(Normal completion)
3	Setting	This indicates that the setting is being processed.	Wait far a while (about five minutes), and press the [Refresh] button again. When the same information is displayed no matter how many times the update is repeated, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
4	Alert (Time-out of Disconnection)	The setting processing was not completed though it passed the fixed time.	Close all the SNMs and WEBs of the terminal connected to the maintenance port, and make the setting again. If the same information is displayed in spite of the operation above, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
5	Alert (Internal Error)	The setting processing terminated abnormally due to the internal failure occurrence.	Maintain it referring to the information message on WEB. Make the setting again immediately after the recovery. When this indication is displayed although no failure has occurred, make the setting again. If the same information is displayed in spite of the above operation, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
6	Not Specified	The NAS Unit is not started.	Wait until the NAS Unit becomes ready and press the [Refresh] button again. If the same information is displayed no matter how many times the update is repeated, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
7	Setting Reserved	The NAS Unit stops.	Wait until the NAS Unit restarts, and press the [Refresh] button again. When the same information is displayed no matter how many times the update is repeated, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))

Copyright © 2006, Hitachi, Ltd.



No.	Setting result	Description	Actions to be taken
8	Alert (Time-out of Setting Completion)	The setting result is not returned from the NAS OS.	Check that no trouble has occurred in the NAS Unit and make the setting again. If the same information is displayed in spite of the above operation, replace the Control Unit, PCI Express, and/or NAS Chassis. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390), DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
9	Alert (NAS OS Internal Error)	A trouble occurred in the NAS OS during the process.	Check that no trouble has occurred in the NAS Unit and make the setting again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
10	Alert (Time-out of Setting)	A time-out occurred in the NAS OS during the process.	Check that no trouble has occurred in the NAS Unit and make the setting again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
11	Alert (Segment Duplication)	The network address of the IP address intended to be set is already used for a port of the NAS Unit.	Set the other IP address of the maintenance port. When the same information is displayed no matter which IP address is specified, set the maintenance port IP address, which has been set before the change, again, and change the duplicate IP address of the port.

(b) When you check that the changes is correct and click the [Apply] button, the setting confirmation window is displayed.
If you click the [Reset] button, the change is canceled. To terminate the setting, click the [Close] button.

(c) Click the [OK] button in the setting confirmation window.

(d) The following confirmation window is displayed when the setting change is received. Click the [OK] button. The change process is started.

Copyright © 2006, Hitachi, Ltd.

(e) Close the unit window, and check that the Storage Navigator Modular can be connected to the subsystem by the set IP address (refer to "1.1 Procedure for connecting Storage Navigator Modular with the subsystem" (SYSPR 01-0010).).
When it cannot be connected even if five minutes or more passed after starting the setting change, connect it to the subsystem with the IP address before the change, and maintain it according to the message of the setting result displayed in the setting window of "Maintenance LAN".

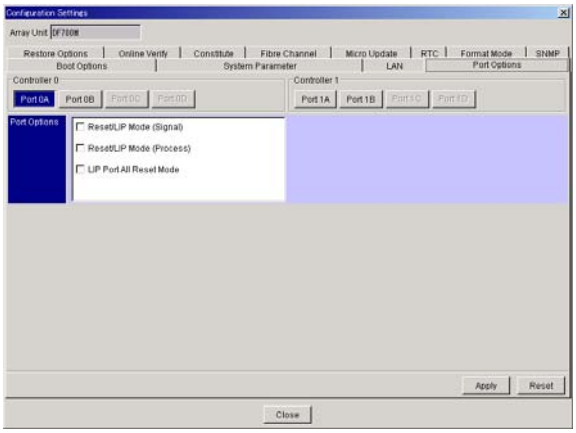
(5) Setting of Port Options

(a) Click the [Port Options] tab. The window for setting the "Port Options" is displayed in the Parameter window.

(b) Click the [Port 0A] button.

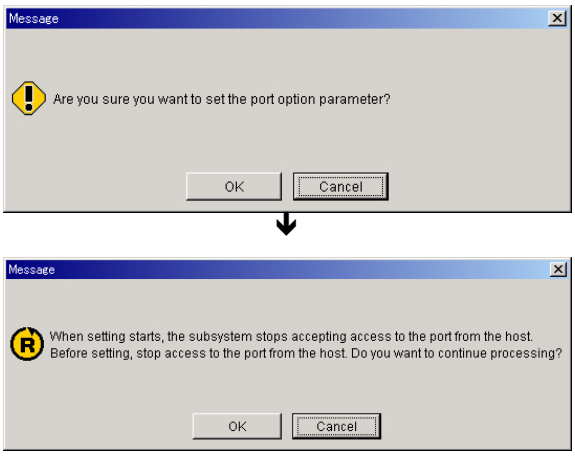
[Port Options] : Specify a port options. Select an option you want to set by clicking its check box.



[Reset/LIP Mode 'Signal] : This is a mode for transmitting the Reset/LIP signal to another port.

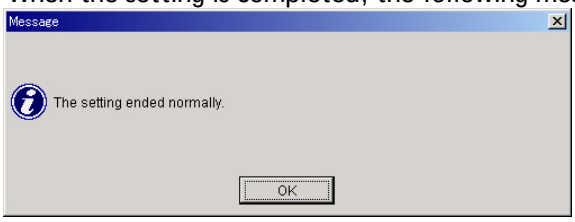
[Reset/LIP Mode (Process)] : This is a mode for propagating the reset operation to another port.

[Reset ALL LIP Port Mode] : This is a mode for executing the reset operation when the LIP is received.



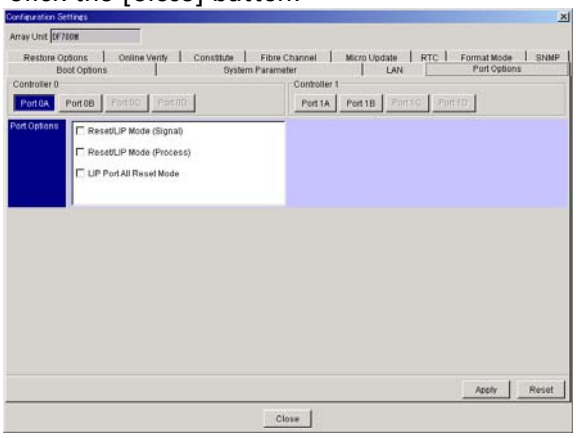
NOTE : The Reset/LIP mode (signal transmission) is effective when the Reset/LIP mode (processing transmission) is set.

(c) When the changes is completed, click the [Apply] button at lower right corner of the "Parameter" window. When the [Reset] button is clicked, the change is cancelled.



Copyright © 2005, 2006, Hitachi, Ltd.

(d) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



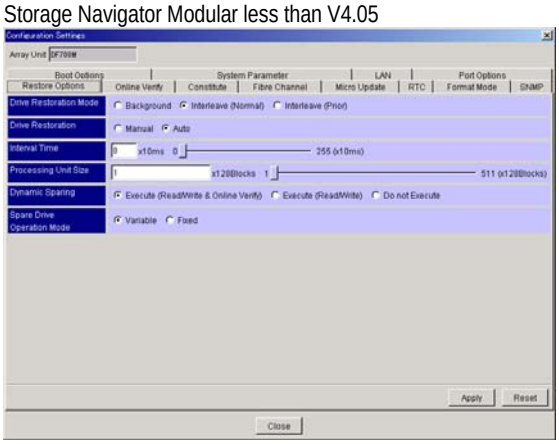
(e) When the setting is completed, the following message is displayed. Click the [OK] button.

(f) The setting/verification of the port 0A is completed. Do the same for the other ports.

(g) Click the [Close] button.

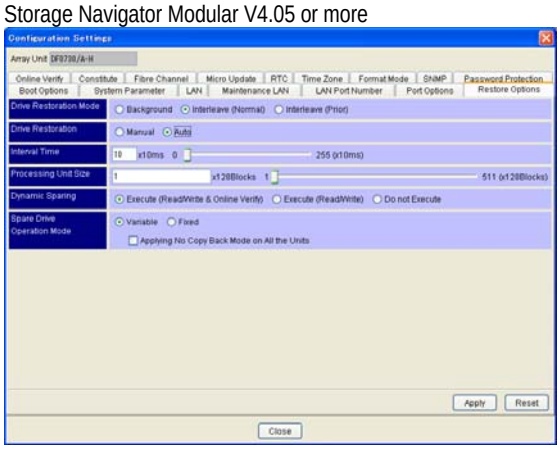
Copyright © 2005, 2006, Hitachi, Ltd.

This page is for editorial purpose only.



Copyright © 2005, 2006, Hitachi, Ltd.

(6) Setting of Restore Options



It becomes availableness as soon as possible when an option is set up by using this function during the drive is being restored.

(a) Click the [Restore Options] tab. The window for setting the "Restore Option" is displayed in the Parameter window.

Microprogram less than Ver.4.0C,
Storage Navigator Modular less than V4.05

Microprogram Ver.4.0C or more,
Storage Navigator Modular V4.05 or more

① [Drive Restoration Mode] : Specify a method of drive restoration.

[Background] : The restoration is performed at a free time when no host I/O operation is performed.

[Interleave (Normal)] : The restoration is performed regularly (at fixed intervals) in a manner in which priority is given to a host command. (The restoration is performed after a host command execution is completed.)

[Interleave (Prior)] : The restoration is performed regularly (at fixed intervals) in a manner in which priority is taken to a host command.

② [Drive Restoration] : Specify whether to start operations (data restoration onto a failed drive, data restoration onto a spare drive, data copying from a spare drive to an original drive, and dynamic sparing) automatically or manually.

[Manual] : A data restoration and data copying from a Spare Drive to an original drive are started manually. (Not supported)

[Auto] : A data restoration and data copying from a Spare Drive to an original drive are started automatically.

③ [Interval Time] : Specify an interval of the restoration.
The default value is 0x10 ms. Concurrently with I/Os from the host, the restorations are performed in succession.
Treat 10ms as the unit and specify a multiplier within a range of 0 to 255.

Copyright © 2005, 2006, Hitachi, Ltd.

④ [Processing Unit Size] : Specify a size of data to be restored.
The default value is 128 blocks; data of 64kbytes is restored at a time. When "Interleave" is specified, specified size of data is restored, a time specified as the "interval time" is waited for, and the next restoration is performed.
Treat 512 bytes (1 block) as the unit and specify a multiplier within a range of 1 to 511.

⑤ [Dynamic Sparing] : Specify a mode (for restoring data onto a Spare Drive) to be used when the failure count exceeds a threshold value controlled in the preventive maintenance.

[Execute (Read/Write & Online Verify)] : When the count of read/write errors or online verification errors exceeds a threshold value, data is restored onto a spare drive (in the case where the spare drive is unused) and failed drive is detached.

[Execute (Read/Write)] : When the count of read/write errors exceeds a threshold value, data is restored onto a Spare Drive (in the case where the Spare Drive is unused) and failed drive is detached.
When the count of online verification errors exceeds a threshold value, the dynamic sparing is not performed.

[Do not Execute] : When the count of read/write errors or online verification errors exceeds a threshold value, the dynamic sparing is not performed.

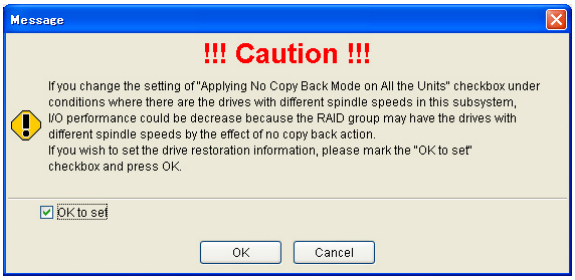
⑥ [Spare Drive] : Set whether to make the copy backless function (‡1) enable or disable.
It is set as [Variable] in default, and the Copy backless function is enabled.

Table 4.2.2 Setting and Operation Specifications of "Spare Drive" and "Applying No Copy Back Mode on All the Units"

Spare Drive	Applying No Copy back Mode on All the Units	Operation specification				
		The relationship between the Failed Disk Drive and the Spare Disk Drive				Restrictions / Notes
		The capacity and the rotational speed are corresponding	The capacity and the rotational speed are not corresponding	Only the capacity is corresponding	Only the rotational speed is corresponding	
Fixing (Fixed)	-	Copy back	Copy back	Copy back	Copy back	The location of the Disk Drive which configures the RAID Group never changes from the time of creating the RAID Group. Therefore, this parameter is set when fixing the location of the Disk Drive which configures the RAID Group.

‡1 : For details of the Copy backless function, refer to Theory "4.6 (3) Operation after replacing the failed Disk Drive" (THEO 04-0240)

Copyright © 2005, 2006, Hitachi, Ltd.

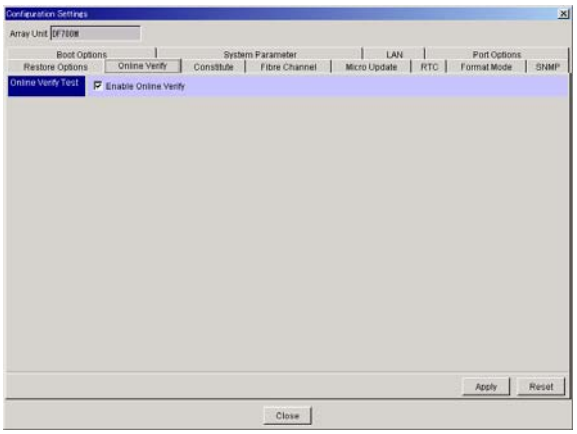


Spare Drive	Applying No Copy back Mode on All the Units	Operation specification				Restrictions / Notes
		The relationship between the Failed Disk Drive and the Spare Disk Drive				
		The capacity and the rotational speed are corresponding	The capacity and the rotational speed are not corresponding	Only the capacity is corresponding	Only the rotational speed is corresponding	
Variable (Variable) (*1) (This is set in default.)	Microprogram revision less than 0740/C					
	-	Copy backless (However, the Disk Drive of RKA is Copy back.)	Copy back	Copy back	Copy back	-
	Microprogram revision 0740/C or more					
	Disable	Copy backless (However, the Disk Drive of RKA is Copy back.)	Copy back	Copy back	Copy back	(This is set in default.)
	Enable	Copy backless	Copy back	Copy backless	Copy back	This parameter is set when making the Disk Drive of the RKA a target of the Copy backless. However, it is required to observe the restrictions on the operation shown below when setting this parameter. Basically, observe the operational restriction shown in (a). In an unavoidable case, observe the operational restriction shown in (b). (a) The FC Disk Drive to be installed in the subsystem must be unified to the Disk Drive of the same rotational speed. (b) When the FC Disk Drives whose rotational speeds are different exist in the subsystem, the I/O performance for the FC Disk Drives to be installed in the subsystem, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance must be all designed as the FC Disk Drives of 10,000 min^{-1} rotation. When the FC Disk Drives of 10,000 min-1 rotation and 15,000 min-1 rotation are mixed in the subsystem, if the Copy backless operates, the RAID Group may be configured of the FC Disk Drives of 10,000 min^{-1} rotation and 15,000 min^{-1} rotation. If this condition occurs, the FC Disk Drives of 10,000 min^{-1} rotation are newly added to the Disk Drives which configure the RAID Group even though the RAID Group is created by the FC Disk Drives of 15,000 min^{-1} rotation, and the I/O performance for the LU created in the RAID Group, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance are deteriorated. Also, when the setting is changed to “Invalid”, investigate if there is a RAID Group in which the FC Disk Drives of different rotational speeds are mixed, and check that there is no problem on the I/O performance, the copy performance of the copy system function of the priced options (ShadowImage in-system replication, etc.), the format performance and the Disk Drive restoration performance.

*1 : When the Power Saving function is installed and enabled, if the Spare Disk setting is made for the Disk Drives #0 to #4 of the RKM/RKS/RKXS, the Disk Drives #0 to #4 corresponding to unit ID#0 connected to the RKH, or the Disk Drives #0 to #3 of the Additional Chassis (RKAJ or RKA), the Copy backless does not operate during the data recovery to the Disk Drive set as a Spare Drive, and the Copy back surely operates after changing the Disk Drive.

Copyright © 2006, Hitachi, Ltd.

(b) Verify that the changes that have been made are correct and click the [Apply] button. When the [Reset] button is clicked, the change is canceled. To terminate the setting, click the [Close] button.



(c) Click the [OK] button following the displayed message.
However, the following message is displayed in the combination of the microprogram revision 0740/C or more and the Storage Navigator Modular Ver. 4.05 or more.
When changing the setting of “Copy backless permission of all chassis”, check that the customer/SE can strictly observe the restrictions on the operation shown in the underlined part of the Table 4.2.2 above, and click the [OK] button after turning on the [Agree] checkbox following the message.

Copyright © 2006, Hitachi, Ltd.

(7) Setting of Online Verify

(a) Click the [Online Verify] tab. The window for setting the "Online Verify" is displayed in the Parameter window.

① [Online Verify Test] : Set whether or not to carry out the online verification test. When the check box is checked, the test is carried out. However, the online verify test is not executed for the Disk Drives in the RAID Group to which the Power Saving function is set.

(b) Verify that the changes that have been made are correct and click the [Apply] button. When the [Reset] button is clicked, the change is canceled. To terminate the setting, click the [Close] button.

Copyright © 2005, 2006, Hitachi, Ltd.

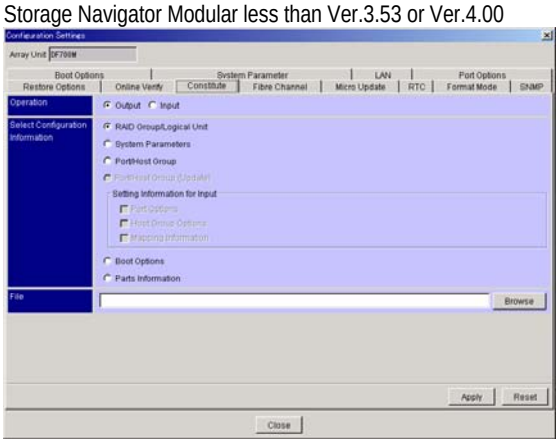
(8) Setting of Constitute

Output configuration information of the disk array subsystem to a text file or set the configuration by using the text file.

The configuration information to be output to a text file includes RAID group/logical unit, system parameters, and port/host group information.

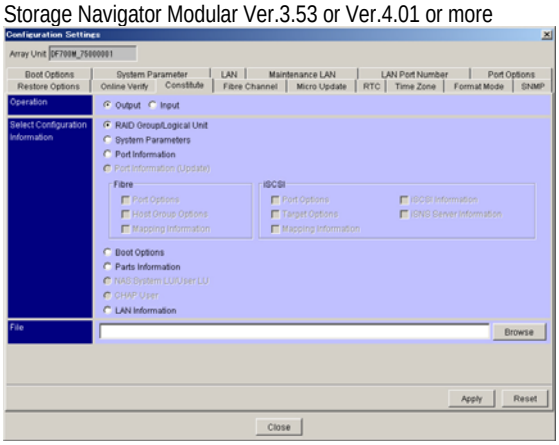
The configuration to be set includes RAID group/logical unit, system parameters, and port/host group information.

Each element of the configuration, that is, RAID group/logical unit, system parameters, or port/host group information is operated by a respective file.



You can copy the configuration from/to the disk array subsystems by outputting the configuration information from the disk array subsystem to a text file and setting it for another disk array subsystem using the text file that has been output.

You can set a disk array subsystem by editing the text file. Use this function to create the same disk array subsystem. Change the element of the configuration using a respective function.



NOTE : Do not perform the text input of Boot Options of the configuration copy information while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH). (Do not select [Input] or [Boot Options].)

(a) Click the [Constitute] tab. The window for setting the "Constitute" is displayed in the Parameter window.

Storage Navigator Modular less than Ver.3.53 or Ver.4.00

Storage Navigator Modular Ver.3.53 or Ver.4.01 or more

① [Operation] : Output the set information to a text file or enter the information to be set.

[Output] : Selected information is output to a text file with a specified file name.

[Input] : Selected information is loaded and set with a specified file name.

② [Select Configuration Information] : Select information to be output to the text file or to be set through a reading of a text file.

[RAID Group/Logical Unit] : This is information on definition of the RAID group/logical unit set for the disk array subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

[System Parameters] : This is the setting of system parameters made for the disk array subsystem.

[Port/Host Group] : This is information on the port/host group set for the disk array subsystem.

[Port/Host Group (Update)] : This is port/host group information to be set for the disk array subsystem.

[Setting Information for Input] : Select information to be set from the following items.

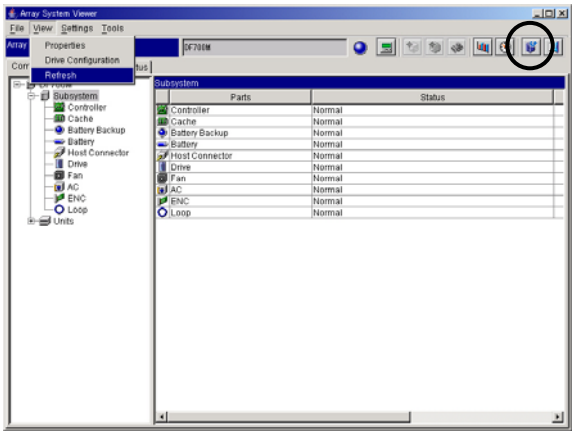
[Port Options] : Specify this when setting a port option.

[Host Group Options] : Specify this when setting a host group option.

[Mapping Information] : Specify this when setting a mapping information.

[Boot Option] : This is the setting of Boot Option made for the disk array subsystem.

[Parts Information] : This is the setting of parts information made for the disk array subsystem.



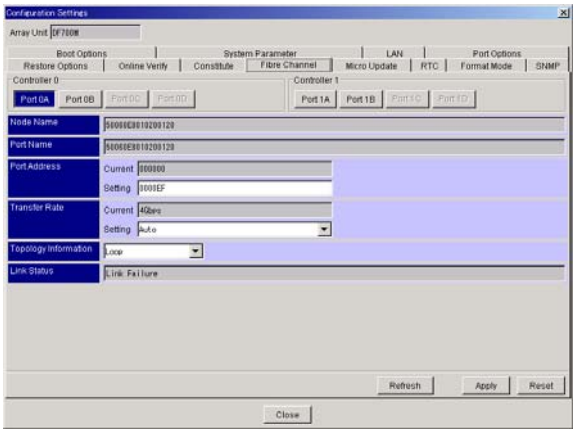
[LAN Information] : This is the setting of LAN information for user management port and maintenance port. (It is effective when the microprogram is Ver.0735/B or Ver.0740/B or more, and the Storage Navigator Modular is Ver.3.53 or Ver.4.01 or more.)

NOTE : When you input LAN Information file, note following.

- If the “Maintenance Port IP Address Automatic Change Mode” is “ON” in the file; the IP address of maintenance port written in the file will be ignored. However, do not delete the setting of maintenance port written in the file.
- If “Maintenance Port IP Address Automatic Change Mode” is “OFF” in the file; only the network address for the IP address of maintenance port written in the file is reflected.

(b) To terminate the setting, click the [Close] button.

(c) The unit screen is displayed. When you set the composition of [RAID/Logical Unit File], click the RAID group for which an LU is to be created, and then select [View] – [Refresh] or click [ : Refresh].



Copyright © 2005, 2006, Hitachi, Ltd.

(9) Setting of Fibre Channel

(a) Click the [Fibre Channel] tab. The window for setting the "Fibre Channel" is displayed in the Parameter window.

(b) Click the [Port 0A] button.

① [Node Name] : Data of eight bytes is displayed with a hexadecimal number (16 characters).

② [Port Name] : Data of eight bytes is displayed with a hexadecimal number (with 16 characters).

③ [Port Address] : A port address is displayed or set with a six-figure hexadecimal number.

<Current Value>

A current port address is displayed with a six-figure hexadecimal number.

<Setting>

A port address you want to set with a six-figure hexadecimal number.

Copyright © 2005, 2006, Hitachi, Ltd.

④ [Transfer Rate] : A transfer rate of the Fibre Channel can be displayed or set.

<Current Value>

A current transfer rate of the Fibre Channel is displayed.

<New Value>

[1Gbps] : Set this when using the Fibre Channel at a fixed transfer rate of 1Gbps.

[2Gbps] : Set this when using the Fibre Channel at a fixed transfer rate of 2Gbps.

[4Gbps] : Set this when using the Fibre Channel at a fixed transfer rate of 4Gbps.

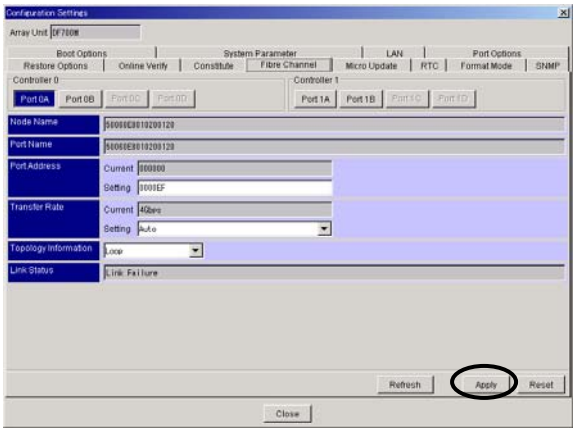
[Auto] : Set this when using the Fibre Channel at a transfer rate that is changed automatically.

NOTE : Set [Transfer Rate] of Fibre Channel to the same value as the transfer rate of devices connected directly with an array subsystem.
Also, when connecting it to SANRISE Universal Storage Platform, SANRISE Network Storage Controller or SANRISE 9900V directly, set the transfer speed of both Fibre Channel ports to the same fixed speed (any of [1 G bps], [2 G bps] and [4 G bps]).

Transfer Rate of Devices Connected with an Array Subsystem	Transfer Rate of an Array Subsystem
1G bps	1G bps
2G bps	2G bps
4G bps	4G bps
Auto (*1)	Transfer Rate (*2)

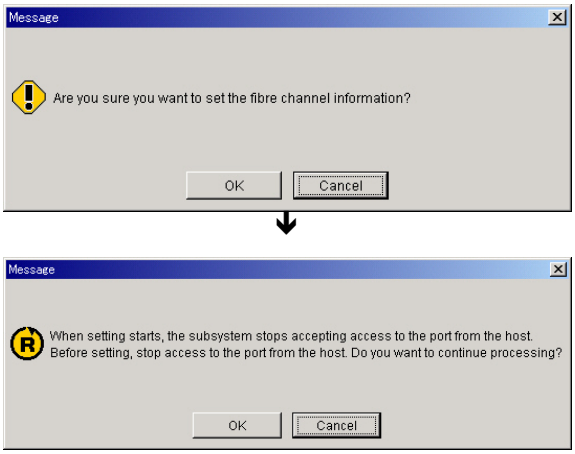
*1 : When Array Subsystem is connected to Devices(SANRISE Universal Storage Platform, SANRISE Network Storage Controller, SANRISE 9900V directly) as an external storage, set the transfer rate of Devices to other than "Auto", and set the transfer rate of Array Subsystem to the same transfer rate as Transfer Rate of Devices.

*2 : Set Transfer Rate of an Array Subsystem as follows.



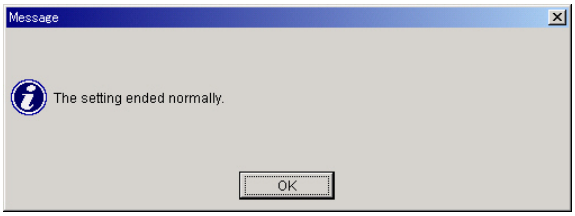
Transfer Rate of Devices [MAX Speed]	Transfer Rate of an Array Subsystem
Auto [2G bps]	2G bps
Auto [4G bps]	4G bps
Auto [unknown]	Auto

⑤ [Topology Information] : The topological setting value is specified through a selection from a pull down menu. When connecting it to SANRISE Universal Storage Platform, SANRISE Network Storage Controller or SANRISE 9900V directly, specify [Loop].



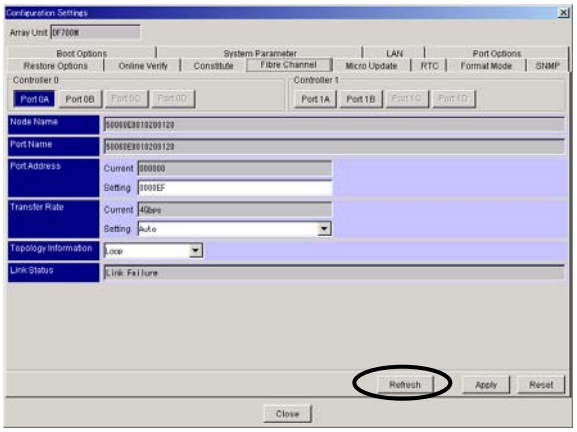
⑥ [Link Status] : This item cannot be set for the DF700.

Copyright © 2005, 2006, Hitachi, Ltd.

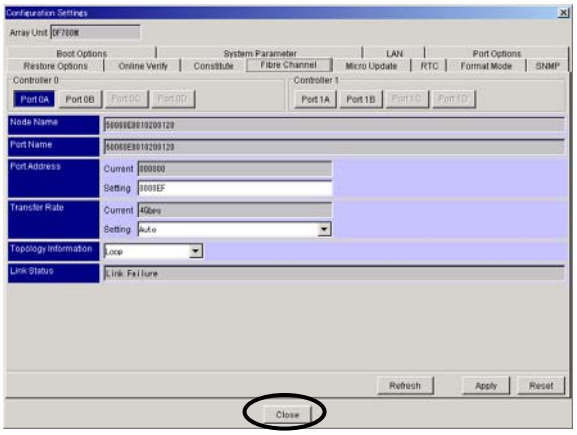


(c) When the changes is completed, click the [Apply] button at lower right corner of the "Configuration Settings" window.

(d) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



(e) When the setting is completed, the following message is displayed. Click the [OK] button.

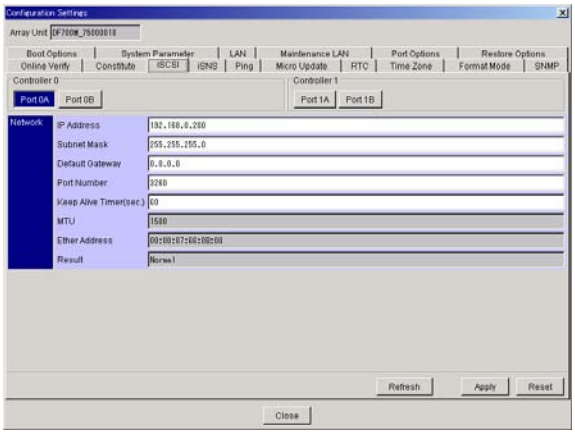


Copyright © 2005, 2006, Hitachi, Ltd.

(f) Click the [Latest Information Display] button at the lower right part of the "Parameter" window to check if the setting is reflected on the display.

(g) The setting /verification for the Port 0A is completed. Do the same for the other ports.

(h) When the setting for all the ports are completed, click the [Close] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(10) Setting of iSCSI

Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

(a) Click the [iSCSI] tab. The window for setting the "iSCSI" is displayed in the Parameter window.

(b) Click the [Port 0A] button.

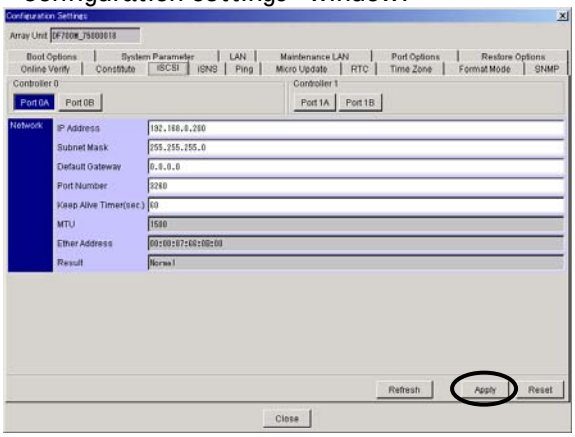
① [IP Address] : The IP Address can be set in the decimal number form.

② [Subnet Mask] : The Subnet Mask can be set in the decimal number form.

③ [Default Gateway] : The Default Gateway can be set in the decimal number form.

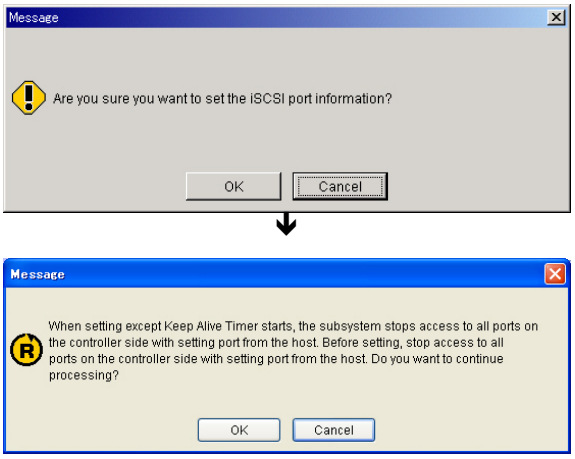
④ [Port Number] : The Port Number can be set in the decimal number form.

⑤ [Keep Alive Timer(sec.)] : The Keep Alive Timer(sec.) can be set in the decimal number form.



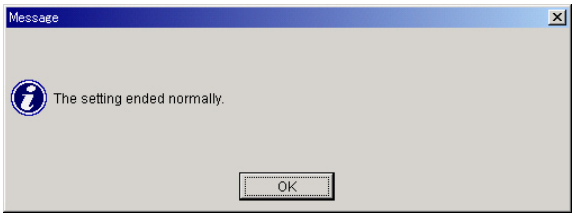
⑥ [MTU] : This item cannot be set for the DF700.

⑦ [Ether Address] : This item cannot be set for the DF700.



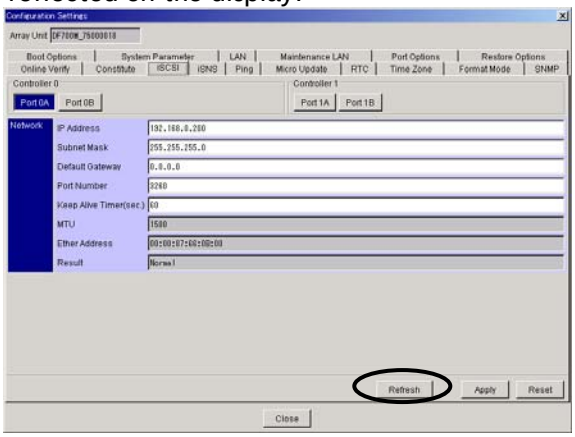
⑧ [Result] : This item cannot be set for the DF700.

Copyright © 2005, 2006, Hitachi, Ltd.

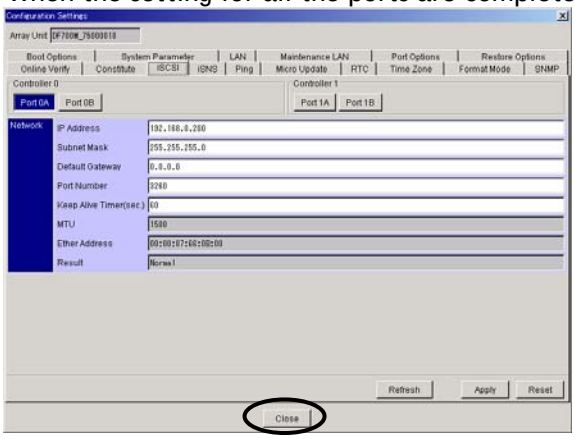


(c) When the changes is completed, click the [Apply] button at lower right corner of the "Configuration Settings" window.

(d) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



(e) When the setting is completed, the following message is displayed. Click the [OK] button.

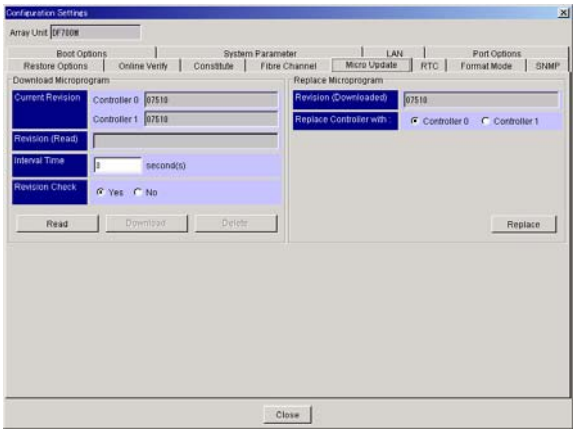


Copyright © 2005, 2006, Hitachi, Ltd.

(f) Click the [Refresh] button at the lower right part of the window to check if the setting is reflected on the display.

(g) The setting /verification for the Port 0A is completed. Do the same for the other ports.

(h) When the setting for all the ports are completed, click the [Close] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(11) Setting of Micro Update

Replace microprograms of the controllers with the microprogram downloaded onto the disk array subsystem.

When performing the replacement, be sure to replace microprograms of the both controllers (controller #0 and controller #1).

(a) Click the [Micro Update] tab. The window for setting the "Micro Update" is displayed in the Parameter window.

<Download Microprogram>

① [Current Revision] : The microprogram revision of each controller of the disk array subsystem is displayed.

② [Revision(Read)] : The revision of the microprogram loaded on to the computer, in which Storage Navigator Modular is installed, is displayed. When the microprogram is not loaded, a blank is displayed.

③ [Interval Time] : Set an interval of downloading. Set it within a range of 1 to 60 seconds.

NOTE : You can use it while an I/O requested by a host computer is executed, however, the I/O performance of the host computer is lowered when the downloading is performed. To prevent the performance from the lowering, make the interval longer.

④ [Revision Check] : Instruct to perform the revision check of the microprogram to be downloaded.

[Yes] : Select it when upgrading the version of the microprogram by the online replacement ([Yes] is selected by default).

[No] : Select it when downgrading the version of the microprogram.

⑤ [Read] : Load the microprogram onto the computer in which Storage Navigator Modular is installed. Specify the directory in which the microprogram is installed following the instructions given in the window.

Copyright © 2005, Hitachi, Ltd.

⑥ [Download] : Download the microprogram onto the disk array subsystem.

NOTE : When the microprogram is not loaded, this item is grayed and cannot be selected.

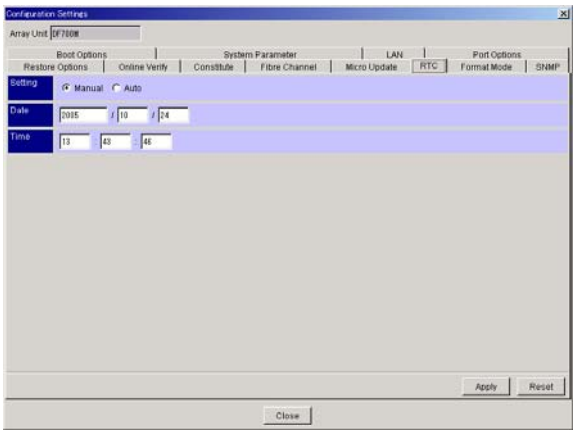
⑦ [Delete] : Delete the microprogram loaded onto the computer in which Storage Navigator Modular is installed.

NOTE : When the microprogram is not loaded, this item is grayed and cannot be selected.

<Replace Microprogram>

① [Revision(Downloaded)] : The microprogram that has been read in is downloaded to the disk array subsystem.

② [Replace Controller with] : Replace the microprogram of the controller specified.



NOTE : When the replacement is performed for only one of the controllers, the disk array subsystem is given a warning. The warning is cancelled when the microprogram of another controller is replaced. When replacing the microprogram, be sure to perform the replacement for the both controllers continuously.

(b) To terminate the setting, click the [Close] button.

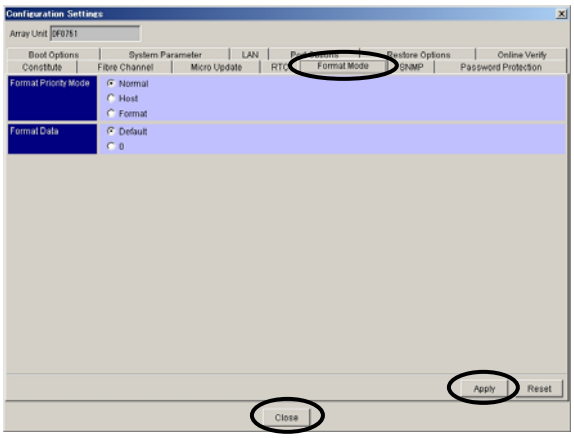
Copyright © 2005, Hitachi, Ltd.

(12) Setting of RTC

(a) Click the [RTC] tab. The window for setting the "RTC" is displayed in the Parameter window.

① [Setting] : Specify the method for the setting.
[Manual] : Set a date and time to be set.
[Auto] : Set the time of the personal computer or server workstation that executes Storage Navigator Modular.

② [Date] : The date currently set can be displayed or set.



③ [Time] : The time currently set can be displayed or set.

(b) Verify that the changes that has been made is correct and click the [Apply] button. When the [Reset] button is clicked, the change is canceled. To terminate the setting, click the [Close] button.

Copyright © 2005, Hitachi, Ltd.

(13) Setting of Format Mode

(a) Click the [Format Mode] tab. The window for setting the "Format Mode" is displayed in the Parameter window.

[Format Priority Mode] : Select a mode for giving/not giving priority to a formatting.

[Normal] : When the load of the host I/O is low, the format processing is executed continuously, and if not, it is executed in every constant interval. This is the setting of default.

[Host] : When the format priority mode is "Normal" and the format is performed during the copy/restoration of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance, or Copy-on-write SnapShot, the copy/restoration performance may be greatly deteriorated. In that case, make the format priority mode "Host" and limit the operation of the format.
The format processing is executed in every constant interval according to the load of the host I/O. The deterioration of the host I/O performance is reduced.

[Format] : The "Format" of the format priority mode is a mode that makes the effect by the host access a minimum and completes the format quickly for the format online by the Disk Drive addition or the format online by the recovery work for the dual failures of the Disk Drive.
The format processing is executed regardless of the load of the host I/O. The host access performance may be deteriorated in the meantime because the host I/O processing which can be executed per unit of time decreases substantially.

[Format Data(‡1)] : Select to a format Data.

[Default] : A formatting is performed when default Data.

[0] : A formatting is performed when 0.
This is set when it is necessary to clear the logical unit by the data of 0(zero) connecting the subsystem to SANRISE Universal Storage Platform or SANRISE Network Storage Controller.

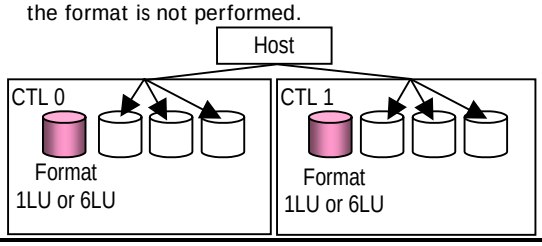
‡1 : Format Data is supported in Storage Navigator Modular Revision Ver.2.00 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : Be careful that "Format" or the format priority mode which restricts the command from the host significantly influences the access performance of the host.
Also, in the case shown below, if the format priority mode is made "Format", the host access performance may be greatly deteriorated, or the command may be time-out, so that do not set the format priority mode to "Format".

- When the host access is performed for LU in the RAID Group which is the same as the LU in format
- When the format is performed while ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance, or Copy-on-write SnapShot is in use
- When the format is performed during execution of the forced parity correction.

The host performance and the standard of the format time when each format priority mode is specified are shown below. (*3)

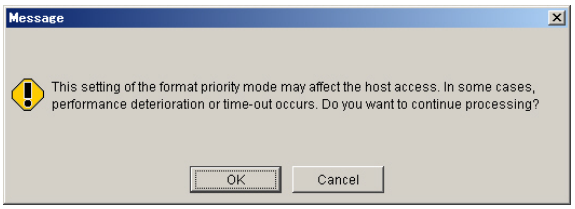


No.	Mode	1 LU/CTL format			6 LU/CTL format		
		Without host access	With host access		Without host access	With host access	
		Format performance (*1)	Host performance (*2)	Format performance (*1)	Format performance (*1)	Host performance (*2)	Format performance (*1)
1	Normal (*1)	100 %	75 %	7 %	100 %	75 %	25 %
2	Host	7 %	85 %	5 %	30 %	90 %	20 %
3	Format	100 %	35 %	90 %	100 %	30 %	90 %

*1 : The format performance is described as 100 % when the format priority mode is set to "Standard" and the format is executed in the condition that there is no access from the host computer.

*2 : The host performance is 100 % when the format is not performed.

*3 : The comparative performance is for the following configuration, and it changes according to the configuration or the amount of the host access. Also, the comparative performance changes for the host access for the LU in format.
Configuration of the performance measurement and explanation of the condition

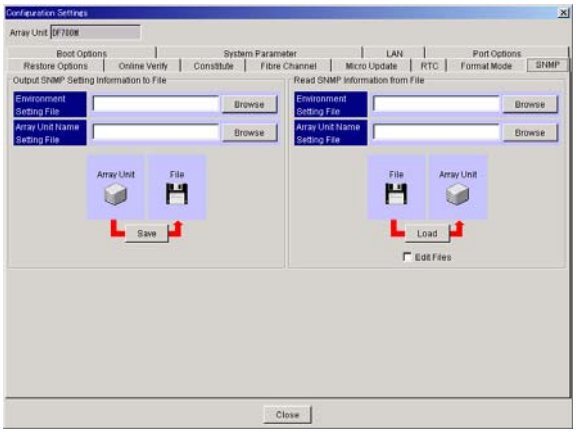


- All the LUs are created in another RAID Group, and the host I/O of random RD/WR=75 %:25 %, length 4 k bytes and TAG8 is executed in the LU (3 LU/CTL) that the format is not performed.

(b) Verify that the changes that has been made is correct and click the [Apply] button. When the [Reset] button is clicked, the change is canceled.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) If the Format Priority Mode is select to “Format”, the following window is displayed. Click [OK] button to set it to “Format”.



(d) To terminate the setting, click the [Close] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(14) Setting of SNMP

NOTE : Do not perform setting of SNMP while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).

(a) Click the [SNMP] tab. The window for setting the "SNMP" is displayed in the Parameter window.

<Output SNMP Setting Information to File>

① [Environment Setting File] : Environment setting file is output to a text file with a specified file name.

② [Array Unit Name Setting File] : Array Unit Name setting file is output to a text file with a specified file name.

<Read SNMP Information from File>

① [Environment Setting File] : Environment setting file is loaded and set with a specified file name.

② [Array Unit Name Setting File] : Array Unit Name setting file is loaded and set with a specified file name.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Setting the operation environment and the disk array subsystem name

(i) Preparation of the operation environment setting file and the disk array name setting file

- The samples of the operation environment setting file (config.txt) and the disk array subsystem name setting file (name.txt) are stored in the priced option program (SNAP). Edit them according to the SNAP environment beforehand.

  NOTE : Refer to the manual attached to the priced option program for the editing method.

- Store the edited files (config.txt and name.txt) in the service PC.
  Example) \\Windows (or WinNT)\Temp\

(ii) Loading the edited files

- Specify the path, in which the operation environment setting file (config.txt) is stored, in the column of the operation environment setting file of the "Setting SNAP Information from File".
- Specify the path in which the disk array subsystem name setting file (name.txt) is stored, in the column of the disk array subsystem name setting file.
- Click the [Load] button.

(c) Checking the settings

(i) Outputting the edited files

- Specify the path in which the operation environment setting file (config.txt) is stored, in the column of the operation environment setting file of the "Output SNMP Setting Information to File"
- Specify the path in which the disk array subsystem name setting file (name.txt) is stored, in the column of the disk array subsystem name setting file.
- Click the [Save] button.

(ii) Checking the operation environment setting file and the disk array subsystem name setting file

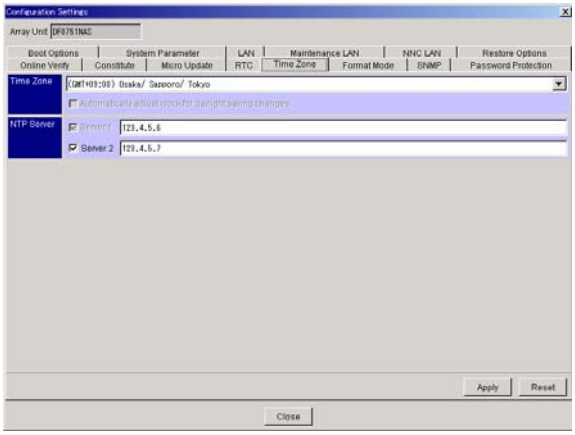
- Open the operation environment setting file (config.txt) and the disk array subsystem name setting file (name.txt) stored in the specified paths and check if the settings are reflected appropriately.
- If the setting is wrong or not reflected, terform the procedure (c) after correcting the setting file.
  The correction of the setting and the reflection in the subsystem can be performed by making the check box of "Edit" effective and by clicking the [Load] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(15) Setting of Time Zone

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

When it is the time of the NAS unit connection, setting the Time Zone is necessary. Except for this connection, setting the Time Zone isn't necessary. If there is the NTP server in users's site and the user want to synchronize the clock of disk array subsystem to NTP server, execute this setting.



(a) Before setting Time Zone

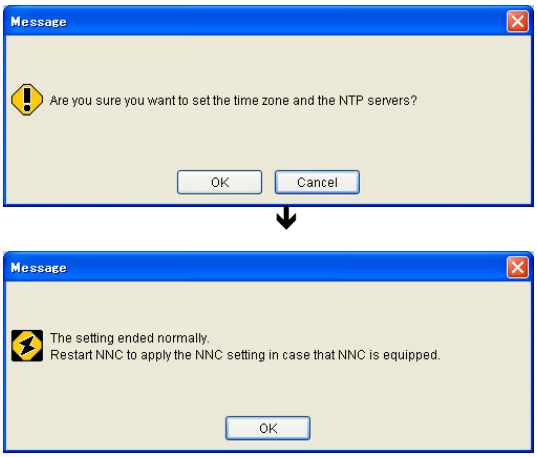
When setting the Time Zone at the time of the NAS Unit connection, it is necessary to restart the NAS OS of the NAS Unit after clicking the [Apply] button in (c).

When setting the Time Zone online at the time of the NAS unit connection, check that the fail-over of the NAS Unit by the user is completed before performing the operations following (b). Restart the NAS OS of the NAS Unit after clicking the [Apply] button in (c) (refer to Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320)).

Then, check that the fail-back by the user is completed.

(b) Click the [Time Zone] tab. The setting window of "Time Zone" is displayed on the parameter window.

① [Time Zone] : Refer to/set the time zone.
The default value is "(GMT+9:00) Osaka/ Sapporo/ Tokyo".
[Automatically adjust clock for daylight saving changes]: Specify whether to use the summer time.



② [NTP Server] : Refer to and set the IP address of the NTP server.

NOTE : Input is surely required for "Server 1". Because "Server 2" is for standby, input is not indispensable.

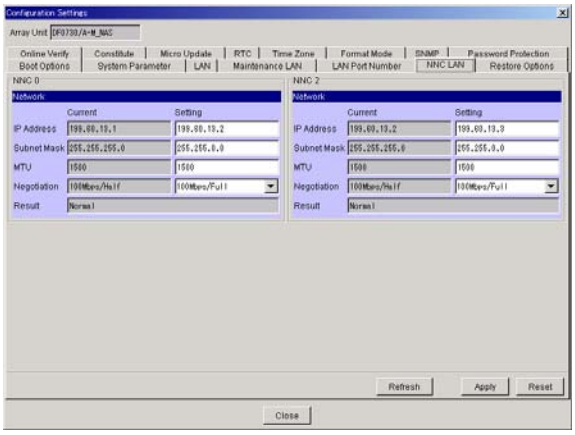
(c) Check that the changes content is correct and click the [Apply] button. The content of the change is canceled by clicking the [Reset] button. Click the [Close] button to end the setting.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) A message asking you to verify the setting is displayed.

NOTE : When the NAS OS is stopped or uninstalled, disregard this message.

Copyright © 2005, Hitachi, Ltd.



(16) Setting of NNC LAN

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

NOTE : At the time of setting the NNC LAN, do not perform the configuration change of the NNC control LAN (insertion/pulling out of the LAN cable, etc.).

(a) Click the [NNC LAN] tab. The setting window of "NNC LAN" is displayed on the parameter window.

NOTE : The combination of the NNC to be set differs depending on the subsystem configuration. The following window shows NNC 0 and NNC 2, but the combination may be NNC 1 and NNC 3 according to the subsystem configuration. There is no difference for the setting items.

① [Network] : Refer to/set the network setting of the NNC control port.

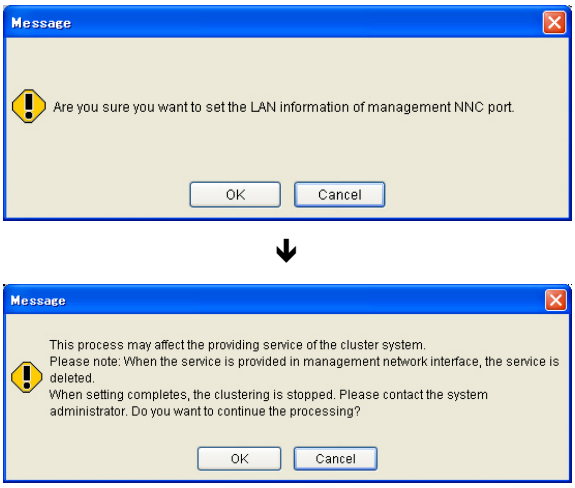
[IP Address] : Specify the display of the current value of the IP address and the setting value.

[Subnet Mask] : Specify the display of the current value of the subnet mask and the setting value.

[MTU(‡1)] : Specify the display of the current value of the MTU and setting value. The setting value can specify the range of 1500 to 16110 only with a number. The same value must be set for both NNCs. The default value and the recommended value are "1500".

[Negotiation] : Specify the display of the current value of the negotiation and setting value.

‡1 : The MTU indicates the maximum value of the data which can be sent at one transfer through the communication network.



Copyright © 2005, 2006, Hitachi, Ltd.

No.	Setting result	Description	Actions to be taken
1	-	An unexpected setting result value was received from through Storage Navigator Modular.	Press the [Refresh] button again. If the display becomes "---" no matter how many times it is done, set the Maintenance LAN again. If the same information is displayed in spite of the above operation, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
2	Normal	The setting result is completed normally.	(Normal completion)
3	Setting	This indicates that the setting is being processed.	Wait far a while (about five minutes), and press the [Refresh] button again. When the same information is displayed no matter how many times the update is repeated, replace the Control Unit. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390))
4	Alert (Cluster status is illegal)	The processing was rejected because the status of the NAS Unit in the cluster is not normal.	Check the status of both NAS Units in the cluster (WEB "2.4 (d) NNC (NAS Unit)" (WEB 02-0110)), and if a failure occurs, reset it after recovering the failure (Troubleshooting "Chapter 1. Flowchart for troubleshooting" (TRBL 01-0000)), and if the NAS OS stops, reset it after starting the NAS OS (Installation "1.7.3 Stop/Start/Restart of the NAS OS" (INST 01-0320)).
5	Alert (System LU is being set)	The processing was rejected because the NAS OS is setting the system LU.	Wait for a while (about 25 minutes), and set it again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
6	Alert (System LU is being recovery)	The processing was rejected because the NAS OS is recovering the system LU.	Wait for a while (about 15 minutes), and set it again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
7	Alert (Setting completion waiting time-out)	The setting result is not returned from the NAS OS.	Check if there is no abnormality in the NAS Unit, and set it again. If the same information is displayed in spite of the above operation, replace the Control Unit, PCI Express, and NAS Chassis. (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390), DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1, 2)" (NAS 07-0120))
8	Alert (NAS OS internal failure)	An abnormality occurred in the NAS OS during the processing.	Check if there is no abnormality in the NAS Unit, and set it again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
9	Alert (Setting time-out)	A time-out occurred in the NAS OS during the processing.	Check if there is no abnormality in the NAS Unit, and set it again. If the same information is displayed in spite of the above operation, replace the NAS Chassis. (DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120))
10	Alert (Segment duplicated error)	The network address of the IP address to be set is used for another port of the NAS Unit.	Set another IP address. When the display is the same even if any IP address is specified, set the IP address which was set before the change again, and change the IP address of the duplicated port.

Copyright © 2006, Hitachi, Ltd.

(b) When the changes is completed, click the [Apply] button at the lower right of the "NNC LAN" parameter window.
The content of the change is canceled by clicking the [Reset] button.

(c) The message of the setting confirmation is displayed.
Click the [OK] button.

NOTE : This caution message is displayed only when the setting of "IP Address" or "Subnet Mask" was changed.

(d) When the setting ends, the following message is displayed. Click the [OK] button.

NOTE : Check to the user that it can be operated from the NAS Manager Modular after the setting.

(e) The setting result can be checked by clicking the [Refresh] button. When "Being set" is displayed in the setting result, check the setting result again after it passes for a while.
If the setting result is all displayed as "Normal", and the input setting value and the value displayed in "Current" are all the same, the setting is completed.

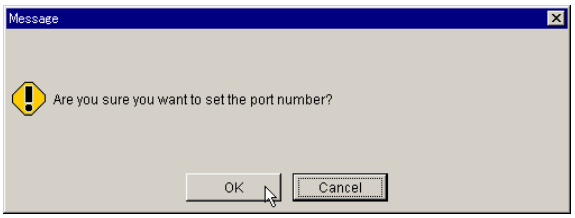
(17) Setting of LAN Port Number

The port number of the TCP/IP connection used for the communication between the array subsystem and the Storage Navigator Modular can be set with the optional LAN Port Number (the range of 1024 to 49151). (The array subsystem default value is "2000".)
The LAN port number of the array subsystem is set in the Storage Navigator Modular, and the LAN port number which the Storage Navigator Modular uses is set by editing the "services" file of the computer in which the Storage Navigator Modular is installed.
It is required that each LAN port number communicated between the array subsystem and the Storage Navigator Modular is set to the same value. Also, the LAN port number of the array subsystem can be set per Control Unit. This LAN port number is common to the LAN port for the user control and the LAN port for the maintenance per Control Unit.

[When LAN is connected to both Control Units and the setting change is performed]

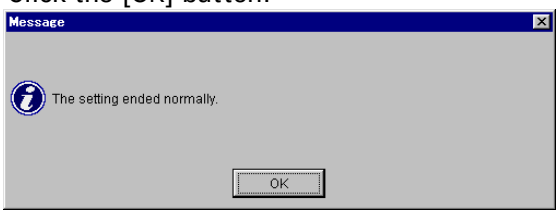
(a) Click the [LAN Port Number] tab. The setting window of "LAN Port Number" is displayed on the parameter window.
Only the information on the Control Unit side connected to the service PC through LAN is displayed in the activated status.
Fist of all, the work procedure is displayed here based on the case where the service PC is connected to the Control Unit 0 of the array subsystem.

① [Port Number] : Refer to/set the LAN Port Number.



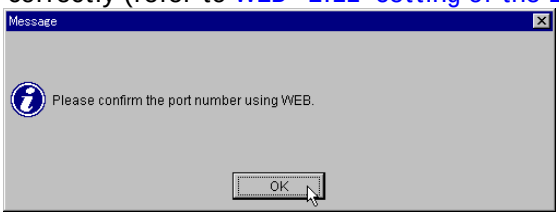
(b) Click the radio button of the Control Unit 0, and enter the LAN Port Number to be set.
Enter a port number that is not used by the OS that is operating Storage Navigator Modular, various types of applications, etc. in the port number field.

NOTE : Set the LAN Port Number one side each. Here, the operation set in the order of the Control Unit 0 to the Control Unit 1 is shown.

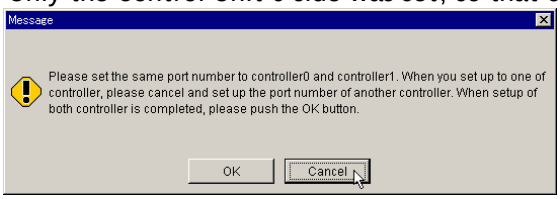


(c) Click the [Apply] button.

Copyright © 2005, 2006, Hitachi, Ltd.



(d) The following message appears. Click the [OK] button.



(e) Click the [OK] button.

(f) The following message appears. Click the [OK] button after referring to WEB that it is set correctly (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).

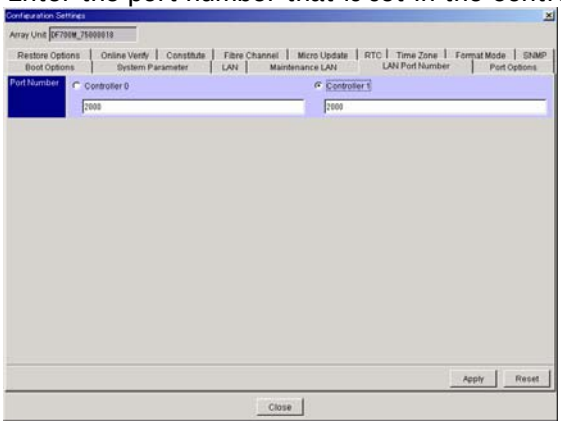
(g) Only the Control Unit 0 side was set, so that click the [Cancel] button.

(h) Close the window, and return to the main window.

(i) Replace the LAN cross cable from the Control Unit 0 to the Control Unit 1.

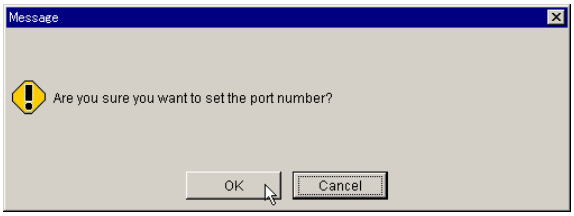
(j) Select [Edit] – [Add] in the main window. The simple registration window of the array subsystem is displayed.

(k) Enter only the IP address of the LAN port for the maintenance of the Control Unit 1 in the simple registration window, and click the [OK] button.
The simple registration window is closed automatically.



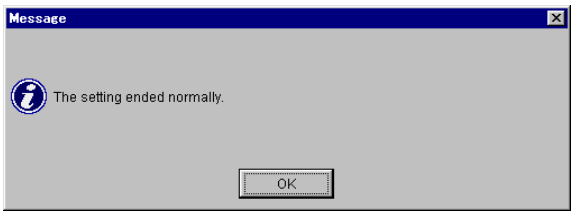
(l) Click the icon of the array subsystem for the Control Unit 1 registered immediately before in the main window, and display the unit window.

(m) Select [Tools] – [Configuration Settings] from the menu bar in the unit window. The configuration setting window is displayed.



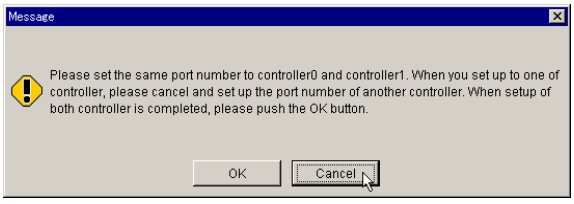
(n) Click the [LAN Port Number] tab in the configuration setting window. The setting window of "LAN Port Number" is displayed in the Parameter window. Only the information on the Control Unit 1 side is displayed here as the activated status.

Copyright © 2005, 2006, Hitachi, Ltd.



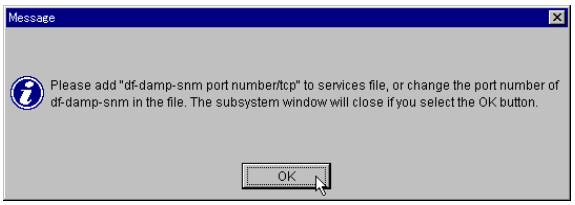
(o) Click the radio button of the Control Unit 1, and enter the LAN Port Number to be set.
Enter the port number that is set in the Control Unit 0.

(p) Click the [Apply] button.
(q) The following message appears. Click the [OK] button.



(r) Click the [OK] button.

(s) The following message appears. Click the [OK] button after referring to WEB that it is set correctly (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).



(t) Both Control Units were set to the same LAN Port Number, so that click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(u) Click the [OK] button.

The Unit screen is closed.

(v) After creating the backup file of the services file for the service PC, open the original services file, add the LAN port number which the Storage Navigator Modular uses (underlined part), and then overwrite and save it. Enter the same number as the set number in the array subsystem for the LAN Port Number.
When adding it to the last line, the return code is needed at the end of the input line.

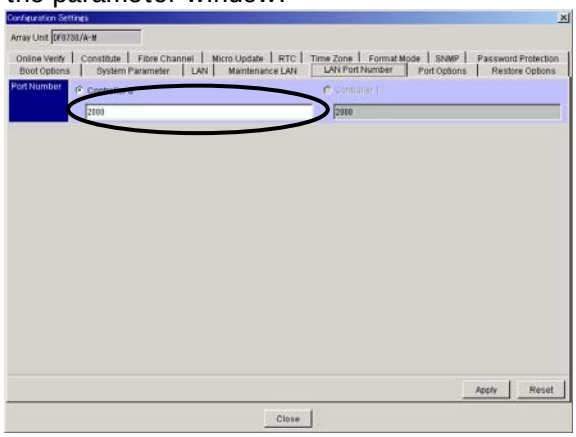
df-damp-snm           2001/tcp                        # Storage Navigator Modular
nfs                   2049/tcp    nfsd
nfs                   2049/udp    nfsd
```

NOTE : When there is no line of "df-damp-snm" in the services file, use the LAN Port Number of "2000" and connect it.
Also, when it cannot be connected with the LAN Port Number specified in the file, use "2000" and connect it again.

(w) After starting the Storage Navigator Modular, click the icon of the array subsystem whose LAN Port Number was changed in the main window of the Storage Navigator Modular, and then check that the unit window is displayed.

When it is necessary to change the LAN port number used in the Storage Navigator Modular installed in the customer's computer, add the port information which the Storage Navigator Modular uses (a line where [service-name] is "df-damp-snm", [port/protocol] is "(set LAN Port Number)/tcp" and [comment] is "# Storage Navigator Modular"), to the services file, and then request the customer's network administrator to check that the unit window of the array subsystem is displayed.
Also, when the LAN port number used in the Storage Navigator Modular is set to other than "2000" for the services file for the service PC, reset the LAN port number to the default value "2000" after completing all works, and then save the services file.
Delete the backup file of the services file for the service PC as needed.



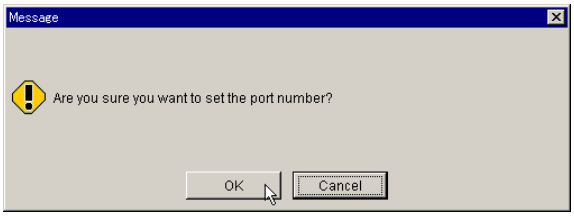
Copyright © 2006, Hitachi, Ltd.

[When LAN is connected to one of the Control Units and the setting change is performed]

Connect the PC to the Control Unit side where the setting change is performed, and open the configuration setting window of the Storage Navigator Modular. The procedure for setting the Control Unit 1 after setting the Control Unit 0 is displayed here.

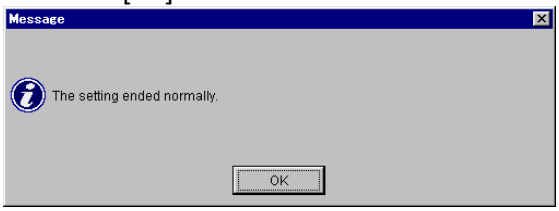
NOTE : When performing the setting change for one of every Control Units, perform the subsystem registration to the Storage Navigator Modular in one of every Control Units. It takes more than usual time when connecting it to one of the Control Units by using the subsystem registration information of both Control Units.

(a) Click the [LAN Port Number] tab. The setting window of "LAN Port Number" is displayed on the parameter window.



① [Port Number] : Refer to/set the LAN Port Number.

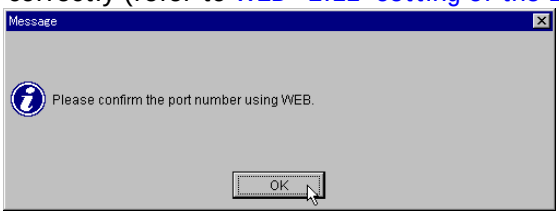
(b) Enter the LAN Port Number to be set.



Enter a port number that is not used by the OS that is operating Storage Navigator Modular, various types of applications, etc. in the port number field.

(c) Click the [Apply] button.

(d) The following message appears. Click the [OK] button.



(e) Click the [OK] button.

Also, when it cannot be connected with the LAN Port Number specified in the file, use “2000” and connect it again.

Copyright © 2006, Hitachi, Ltd.

(r) After starting the Storage Navigator Modular, click the icon of the array subsystem whose LAN Port Number was changed in the main window of the Storage Navigator Modular, and then check that the unit window is displayed.

When it is necessary to change the LAN port number used in the Storage Navigator Modular installed in the customer's computer, add the port information which the Storage Navigator Modular uses (a line where [service-name] is "df-damp-snm", [port/protocol] is "(set LAN Port Number)/tcp" and [comment] is "# Storage Navigator Modular"), to the services file, and then request the customer's network administrator to check that the unit window of the array subsystem is displayed.
Also, when the LAN port number used in the Storage Navigator Modular is set to other than "2000" for the services file for the service PC, reset the LAN port number to the default value "2000" after completing all works, and then save the services file.
Delete the backup file of the services file for the service PC as needed.

Copyright © 2006, Hitachi, Ltd.

(17-1) Recovery method

When a problem occurs during the LAN Port Number change work, recover it according to the following procedure.

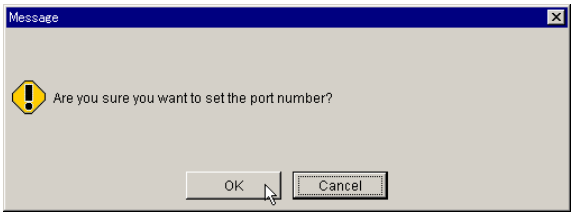
(a) When the setting of either Control Unit failed (Or, when setting the LAN Port Number for every Control Unit)

Connect the LAN cable only to the Control Unit to be set and perform the setting change of the LAN Port Number.

(i) Set the LAN Port Number of the Control Unit to be set in the services file.
If it is unknown, check it using the WEB browser (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).

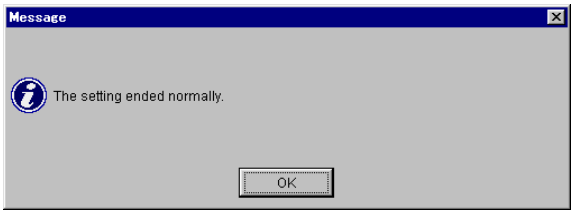
(ii) Connect the LAN cable only to the Control Unit to be set, and register it in the Storage Navigator Modular with the IP address of the Control Unit concerned.

(iii) Started the Storage Navigator Modular.



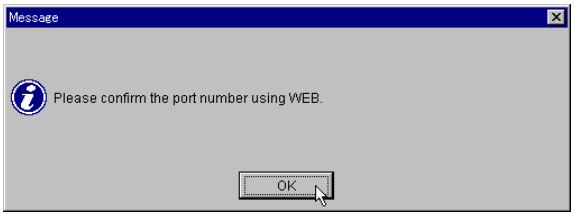
(iv) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

(v) Click the [LAN Port Number] tab.



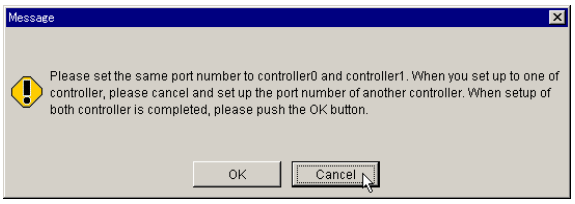
(vi) Select the radio button of the Control Unit to be set, and enter the LAN Port Number to be set in the text file of the [Port Number].
Setting the LAN Port Number of the other Control Unit which has already performed the setting change.

(v) Click the [Apply] button.

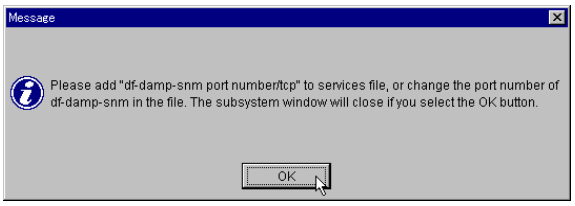


(vi) The following message appears. Click the [OK] button.

(vii) Click the [OK] button.



(viii) The following message appears. Click the [OK] button after referring to WEB that it is set correctly (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).



Copyright © 2005, 2006, Hitachi, Ltd.

(ix) Click the [OK] button.

(x) Click the [OK] button.

The Unit screen is closed.

(xi) Edit the services file to the new LAN Port Number.

(xii) Check that the Storage Navigator Modular can be started again.

(b) Although the LAN Port Number of the services file and the LAN Port Number set in the array subsystem are same, the Storage Navigator Modular cannot be accessed to the array subsystem.

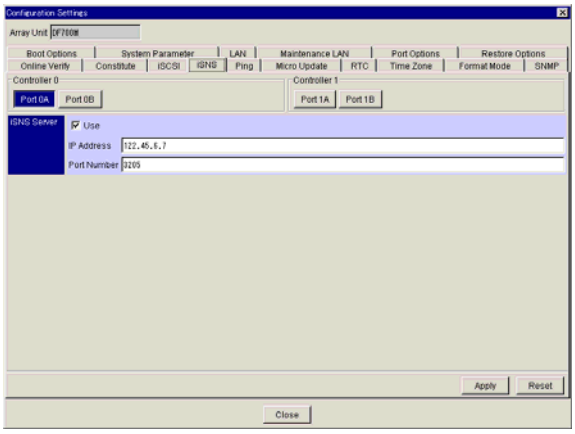
(i) Check the LAN Port Number of the services file and the LAN Port Number of the array subsystem by the WEB browser again (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).

(c) Already when it is not possible to accessed it from Storage Navigator Modular to the array subsystem.

(i) Confirm both Control Units are same LAN Port Number (refer to WEB "2.11 Setting of the LAN Port Number" (WEB 02-0240)).
Register to the services file, and start Storage Navigator Modular.

(ii) If they are still same, there is a possibility that LAN Port Number overlaps with other equipment.
When this is verified, connect LAN crossing cable directly with the LAN port of the control unit in the Subsystem and change the LAN port number.
Please set it by one (refer to "4.2 (17-1) (a)" (SYSPR 04-0340)).

Copyright © 2005, Hitachi, Ltd.

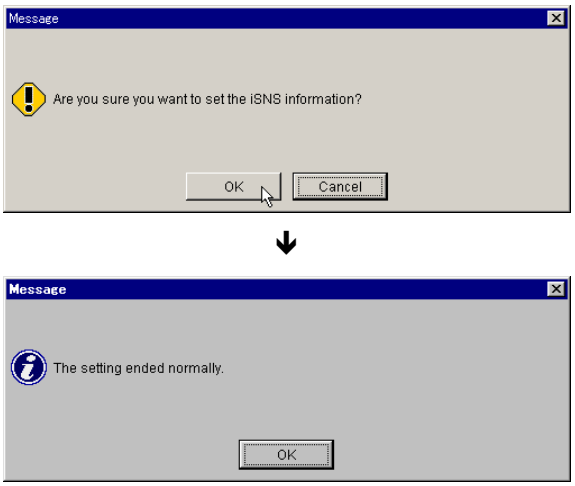


(18) Setting the iSNS Server Information

Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

iSNS(Internet Storage Name Service) provides the same function as the Name Server of the Fabric Switch on the Fibre Channel interface.

The disk array subsystem registers the iSCSI port information on the iSNS Server. The host as iSCSI initiator discovers the iSCSI target with iSCSI disk array subsystem information registered on the iSNS Server.

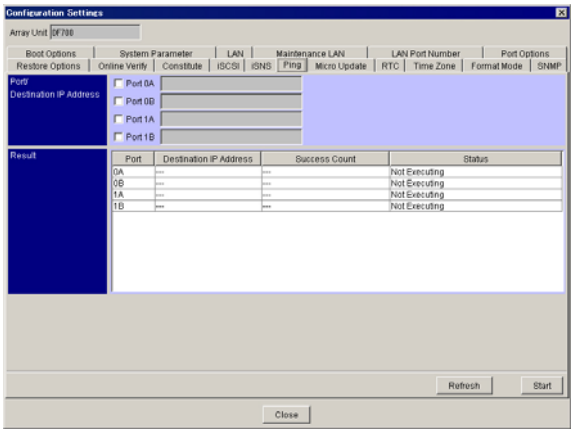


(a) Click the [iSNS] tab. The setting window of "iSNS" is displayed on the parameter window.

① [iSNS Server] : Specify whether to use iSNS Server or not. When using the iSNS server, specify the IP Address and Port Number of the iSNS Server.

(b) When the changes is completed, click the [Apply] button at the lower right of the window. The content of the change is canceled by clicking the [Reset] button.

(c) The message of the setting confirmation is displayed.
Click the [OK] button.



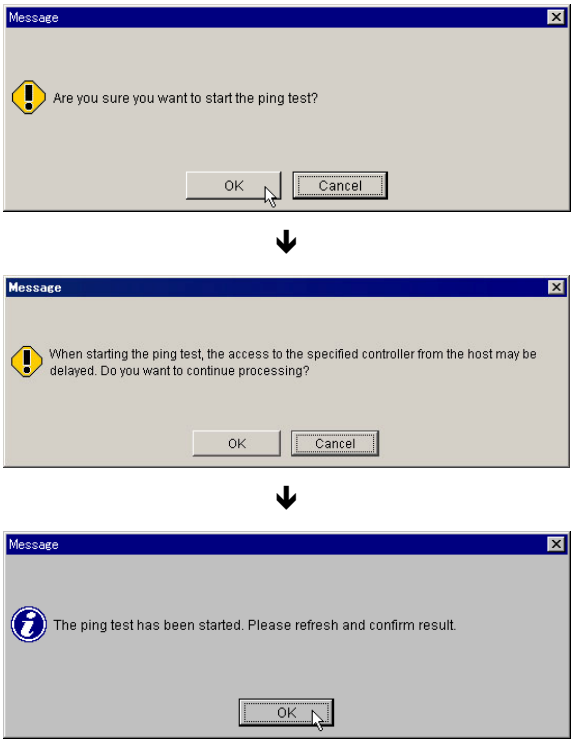
Copyright © 2005, 2006, Hitachi, Ltd.

(19) Sending Ping

Setting is supported in Storage Navigator Modular Revision Ver.3.00 or more.

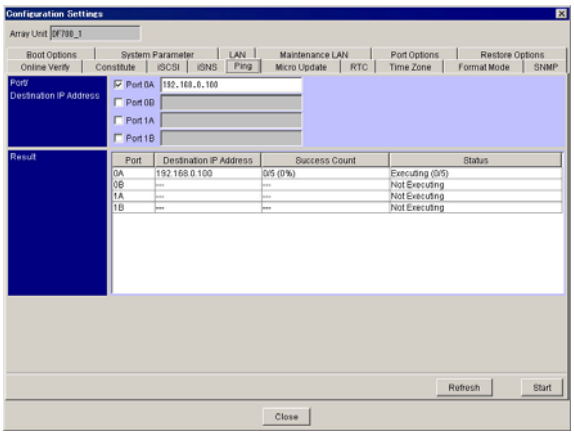
Sends the ping to the initiator (host) and displays the result of the sending.

(a) Click the [Ping] tab. The setting window of "Ping" is displayed on the parameter window.



① [Port] : Select the port to be sending ping.

② [Destination IP Address] : Specify the IP Address of the initiator.



(b) When the changes is completed, click the [Start] button at the lower right of the window.

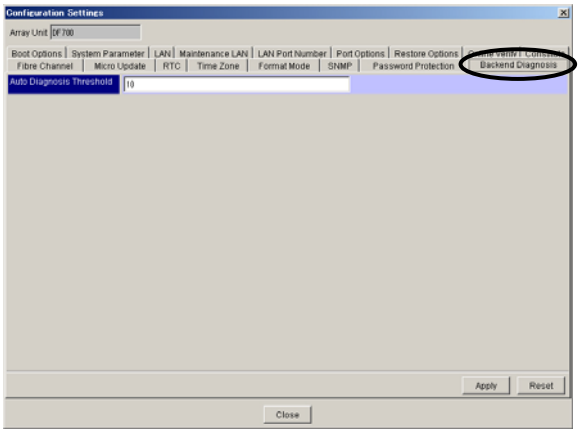
(c) The message of the setting confirmation is displayed. Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

The result is displayed.

(d) As necessary, select the [Refresh] button to display the latest information.

Copyright © 2005, Hitachi, Ltd.



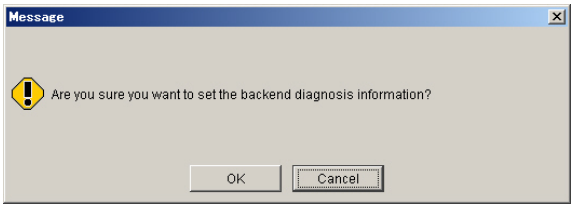
(20) Setting of the automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side

It can be set in the microprogram revision 0740/D or more and the Storage Navigator Modular Ver. 4.07 or more.

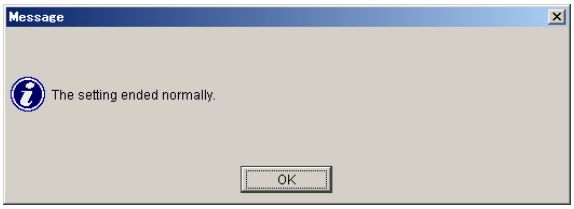
The automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side of the array subsystem can be set by the optional numerical values (the range of 1 to 255).

The default value is "10". However, this threshold value is not usually changed.

(a) Click the [Backend diagnosis] tab. The setting window of "Backend Diagnosis" is displayed on the Parameter window.



① [Automatic Diagnosis Threshold] : The automatic diagnosis threshold of the Fibre Channel loop on the Disk Drive side of the array subsystem is referred to and set.



(b) Enter the automatic diagnosis threshold to be set. (the range of 1 to 255)

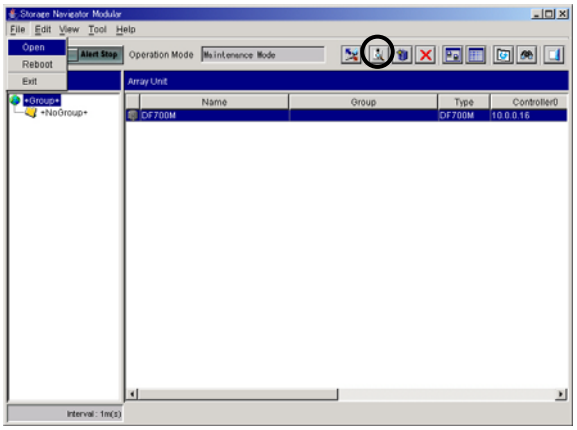
(c) Check that the set contents are correct, and click the [Apply] button. (The changes are cancelled by clicking the [Reset] button. When terminating the setting, click the [Close] button.)

(d) The confirmation message is displayed, so that click the [OK] button.

(e) Click the [OK] button.

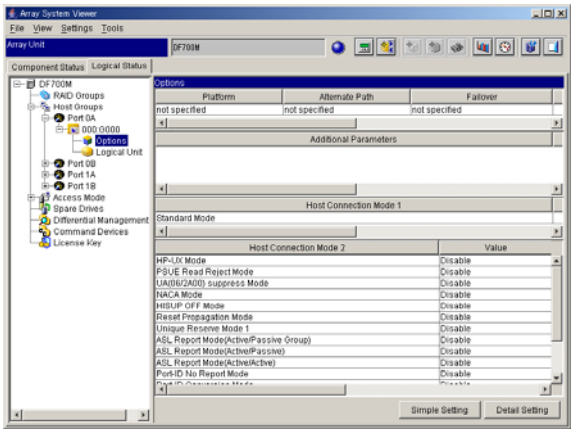
Copyright © 2005, 2006, Hitachi, Ltd.

.



Chapter 5. Setting Host Connection Parameters

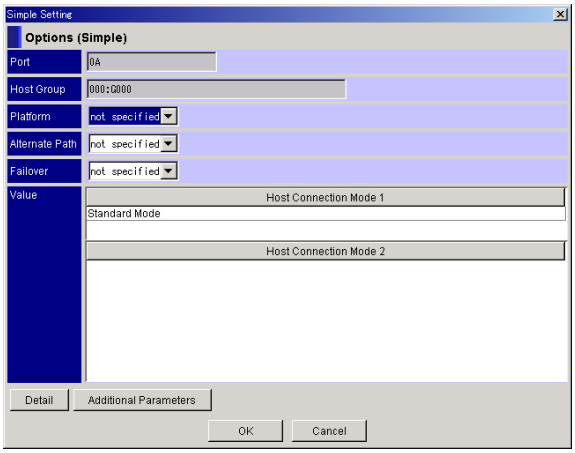
Set a subsystem from the Storage Navigator Modular. A procedure for setting the host connection parameters for the subsystem offline is shown below. Make the setting following the procedure.



5.1 Simple setting for Connecting to the Host Computer

(1) Turn on the power supply.
(2) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode". For the procedure for changing to the Maintenance Mode, refer to Section "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050).
(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

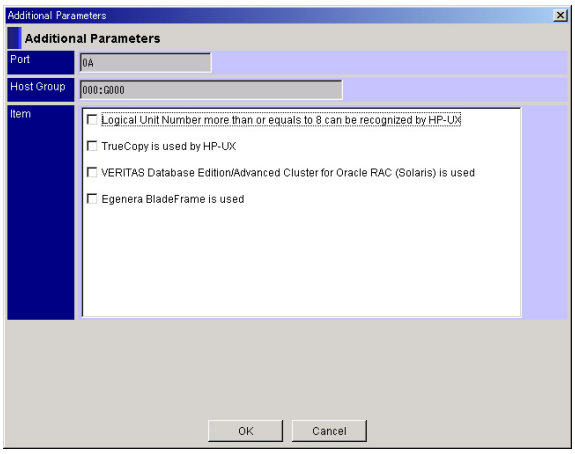
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(4) Click the [Logical Status] tab in the unit window.
(5) Display the [000: G000] by double clicking the [Port XX] for which you want to set the mode for connecting a host after double clicking the [Host Groups].
Display the option and logical unit by double clicking the [000: G000], and then click the [Options].

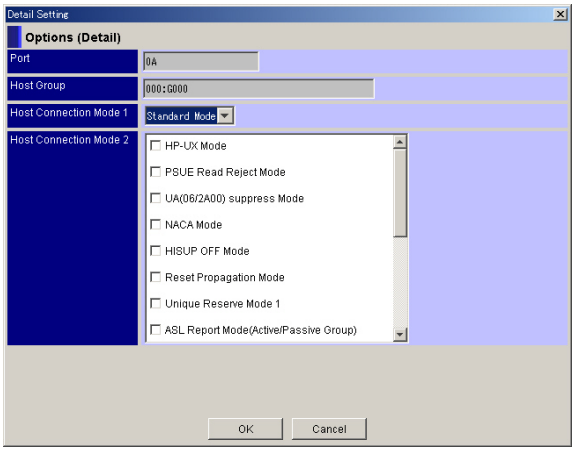
Copyright © 2005, Hitachi, Ltd.

(6) Click the [Simple Setting] button that is displayed at the lower right part of the window.



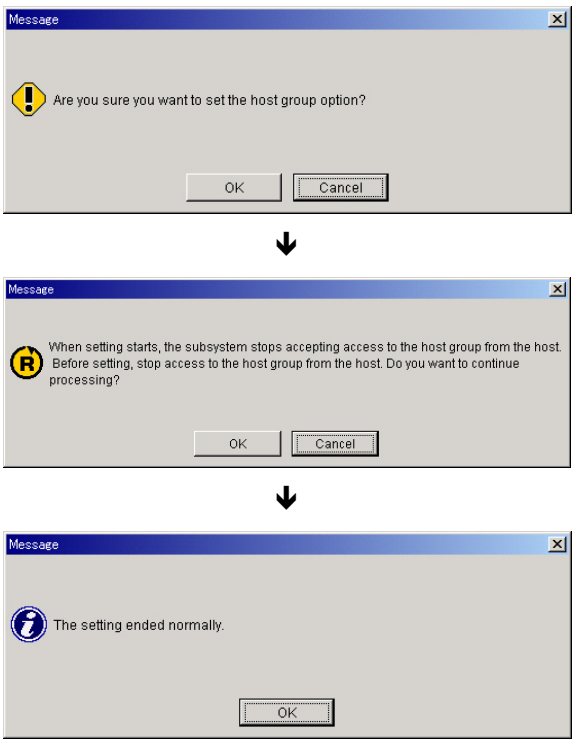
(7) The [Options (Simple)] dialog box is opened.
Select [Platform], [Alternative Path], and [Failover] that conform to the environment of a host to be connected.

No.	Menu Item	Description		Setting made at the factory
		Parameters	Selection Method	
1	Platforms	Not specified	Select one of items	Not specified
		HP-UX		
		Solaris		
		AIX		
		WindowsNT		
		Windows2000		
		Windows2003		
		Linux		
		Tru64		
2	Alternate Path	Not specified	Select one of items	Not specified
		PV Link		
		HDLM		
		VxVM		
		MPxIO		
3	Fail-over	Not specified	Select one of items	Not specified
		MC/ServiceGuard		
		SunCluster		
		VCS		
		HACMP		
		MSCS		
		TruCluster		



Copyright © 2005, Hitachi, Ltd.

(8) Click the [Additional Parameters] button. The [Additional Parameters] dialog box is opened. Select items as occasion demands and click the [OK] button.



No.	Menu Item	Description		Setting made at the factory
		Parameters	Selection Method	
1	Additional Parameter	Logical Unit Number more than or equals to 8 can be recognized by HP-UX	Selection	Not selected.
		TrueCopy(*1) is used by HP-UX	Selection	Not selected.
		VERITAS Database Edition/Advanced Cluster for Oracle RAC (Solaris) is used	Selection	Not selected.
		Egenera BladeFrame is used	Selection	Not selected.
*1 : TrueCopy displayed means TrueCopy remote replication and TrueCopy Extended Distance.				

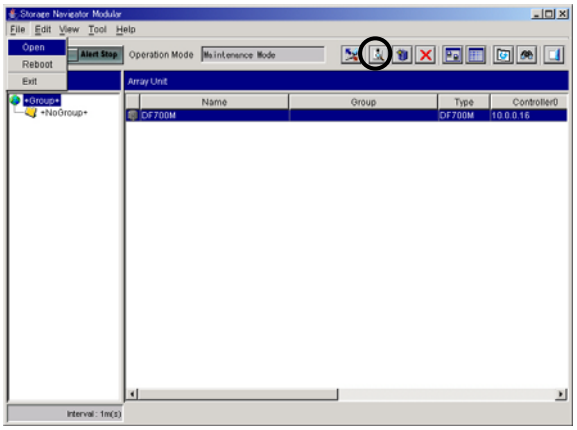
(9) Click the [Detail] button when necessary. Select the [Host Connection Mode 1] and [Host Connection Mode 2] and click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) The confirmation window is display. Click the [OK] button.

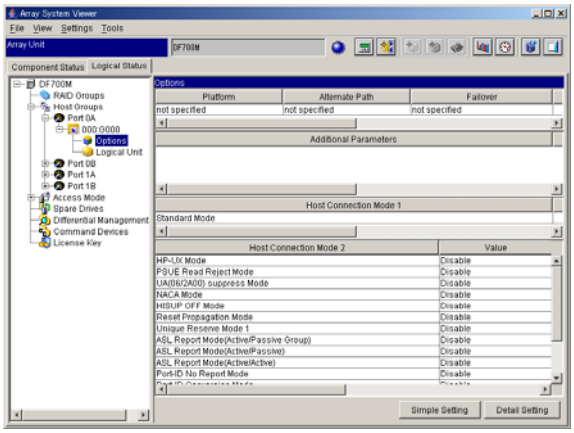
(11) The settings that have been made are displayed.

Verify that the display reflects the selected host environment (platform, alternative path, and fail-over) and the additional parameters. When the host connection modes 1 and 2 are set directly, verify that the display reflects the mode setting that has been made.



Copyright © 2005, Hitachi, Ltd.

5.2 Simple setting for Connecting to the Host Computer

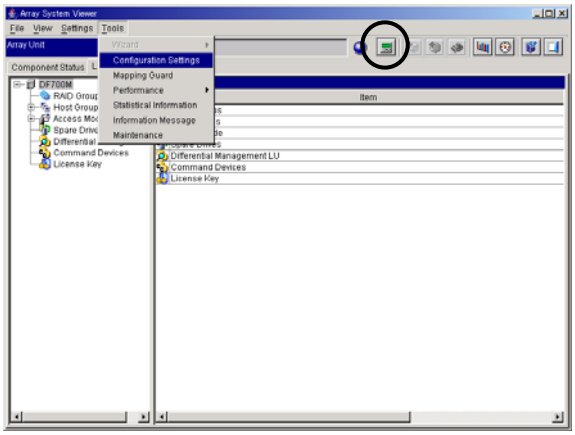


The following describes the procedure for setting a subsystem offline when the host group option setting is required for the combination that simple setting does not have.
To make the setting, follow these steps.

(1) Turn on the power supply.
(2) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode".
For the procedure for changing to the Maintenance Mode, refer to Section "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050).
(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

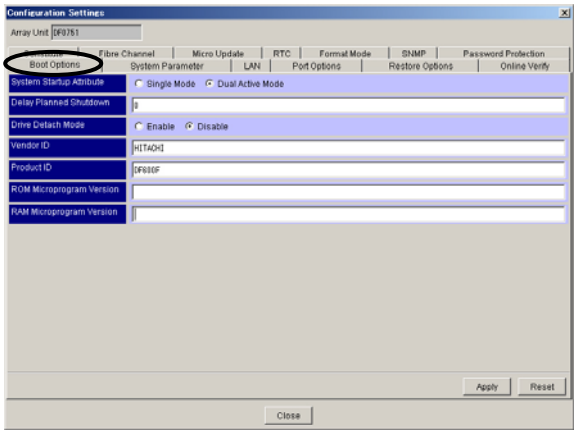
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

(4) Click the [Logical Status] tab in the unit window.
(5) Display the [000: G000] by double clicking the [Port XX] for which you want to set the mode for connecting a host after double clicking the [Host Groups].
Display the option and logical unit by double clicking the [000: G000], and then click the [Options].



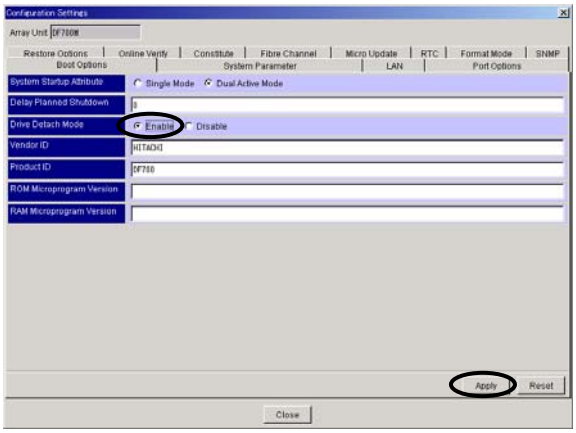
(6) Click the [Simple Setting] button that is displayed at the lower right part of the window.
(7) Perform the operation corresponding to a model to be set.

Copyright © 2005, Hitachi, Ltd.



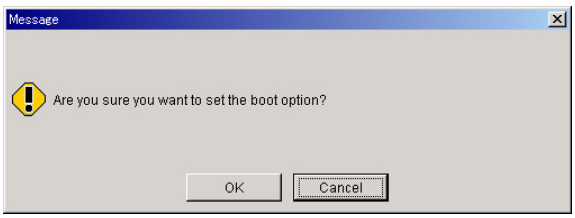
5.3 When using the subsystem in Drive Detach Mode

(1) When the microprogram revision is less than 0726/A



(a) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

(b) Click the [Boot Options] tab.

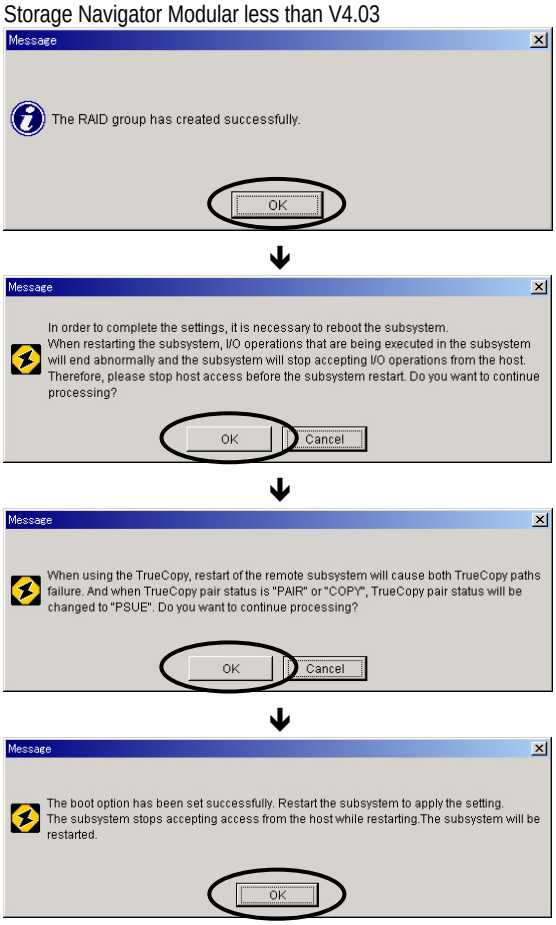


(c) For the [Drive Detach Mode], select the [Enable] radio button.

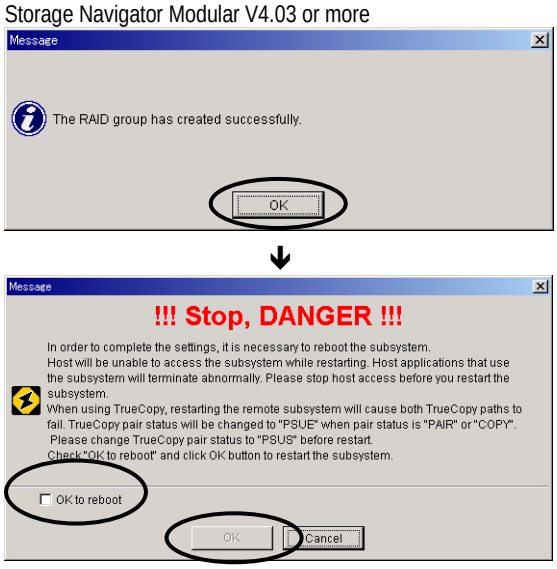
(d) After the setting is complete, click the [Apply] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) The confirmation window is display. Click the [OK] button.



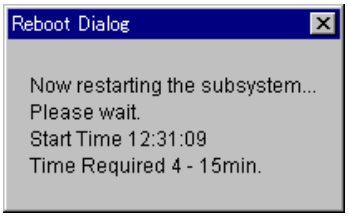
(f) The confirmation window is display.



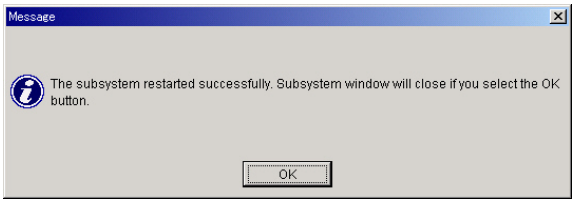
The former setting is valid until the subsystem is restarted.
When the subsystem is restarted, it does not accept accesses from a host computer until the restarting is completed. So, restart the subsystem after making sure that accesses from a host computer has ceased.

NOTE : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

Microprogram less than Ver.4.0B,
Storage Navigator Modular less than V4.03



Microprogram Ver.4.0B or more,
Storage Navigator Modular V4.03 or more

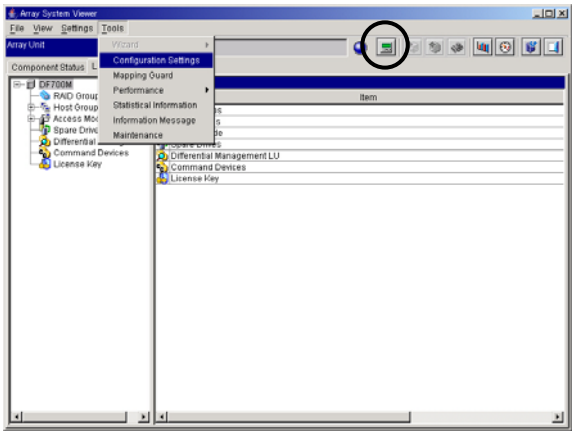


Copyright © 2005, 2006, Hitachi, Ltd.

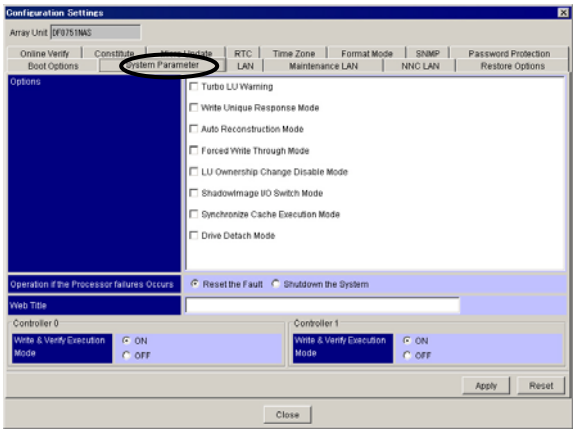
(g) When you choose to restart the subsystem, the time the restart began is displayed. This usually takes approximately four to fifteen minutes. (about five to fifteen minutes in case of the RKH)

NOTE : It may take time for the subsystem to respond, depending on the condition of the subsystem. If it does not respond after 15 minutes or more, check the condition of the subsystem.

(h) A message appears, stating that the restart is successful. Click the [OK] button.



The Unit screen is closed. To perform other operations on the Main screen, select an array unit from the Main screen and open the selected Unit screen.

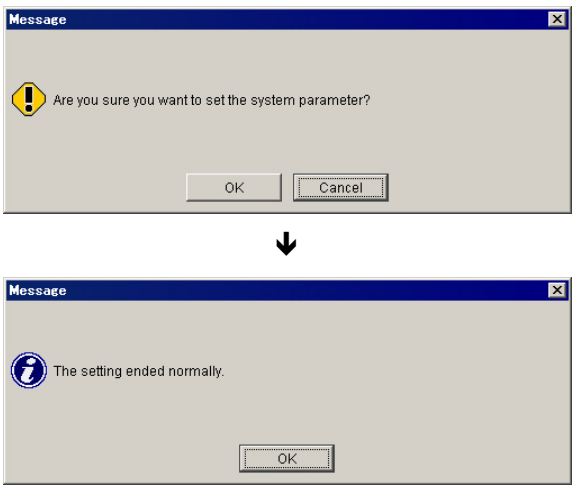


Copyright © 2005, 2006, Hitachi, Ltd.

(2) When the microprogram revision is 0726/A or more (Use the Storage Navigator Modular V2.60 or more)

(a) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

(b) Click the [System Parameter] tab.

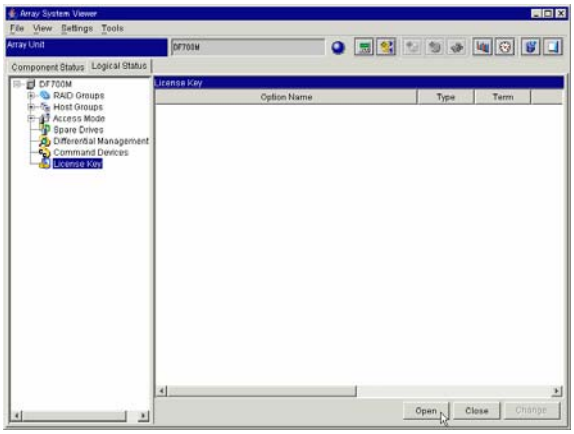


(c) Select the [Drive Detach Mode].

(d) After the setting is complete, click the [Apply] button.

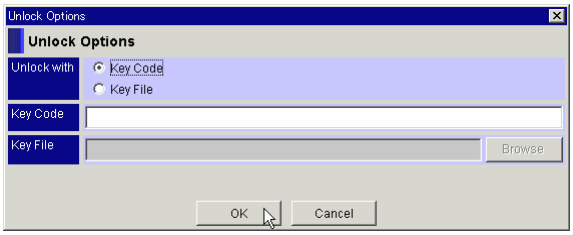
Copyright © 2005, 2006, Hitachi, Ltd.

(e) The confirmation window is display. Click the [OK] button.



(f) Click the [OK] button.

Copyright © 2005, Hitachi, Ltd.



Chapter 6. Setting an Extra-cost Optional Feature

(1) Click the [Logical Status] tab on the Unit screen.

(2) Click the [License Key] icon.

(3) Click the [Open] button.

(4) When you unlock the option using the key code, click the Key Code radio button, then set up the key code. For the key code of the priced optional features, refer to the priced optional features manual.
When you unlock the options using the key file, click the Key File radio button, and then set up the path for the key file. The [Browse] button is used, the path to a key file can be set correctly.

(5) Click the [OK] button.

NOTE : Depending on the option, the subsystem may need to be restarted in order to set the unlocking feature effective.

NOTE : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

For setting optional feature, refer to the installation or setting section in the manual attached to an extra-cost each extra-cost optional feature.

Copyright © 2005, Hitachi, Ltd.

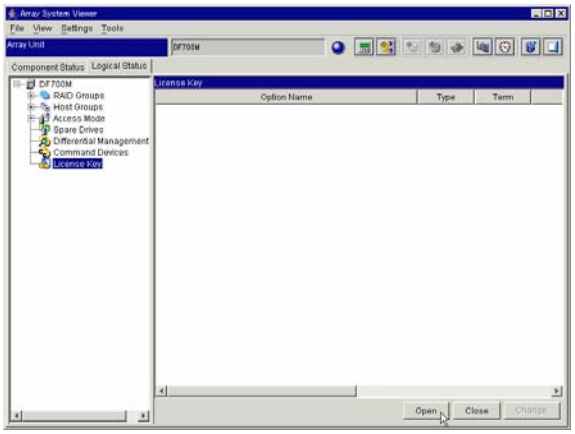
When connecting the NAS Unit, it is necessary to install the priced option indispensable only to the NAS system. Refer to the following procedure, and perform the installation of the priced option.

(1) Installation of the priced option indispensable to the NAS system

The NAS OS/Manager/Sync Image function of the Modular NAS system (hereafter, it is called the NAS-OS function) is the priced option, so that the NAS-OS function cannot be used normally (in the locked status). In order to use this function, it is necessary to change the status to that the NAS-OS function can be used (in the unlocked status).

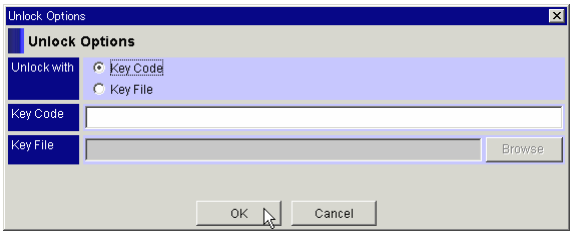
The setting procedure for the installation, uninstallation, validation, and invalidation of the NAS-OS function using the Storage Navigator Modular is shown here. Refer to the "Storage Navigator Modular User's Guide" for the operation of the Storage Navigator Modular.

Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.



NOTE : Perform the installation and uninstallation after checking that the disk array subsystem to operate is normal. In the status that the failure such as the Control Unit blockade occurs, neither installation nor uninstallation can be performed.

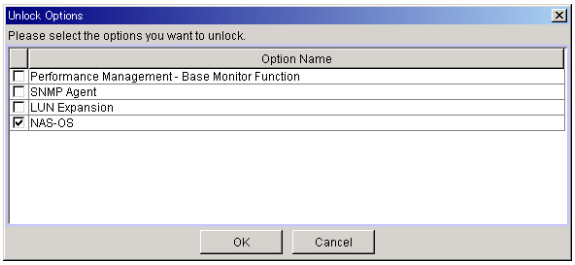
The key code or the key file supplied with the NAS-OS function is necessary for the installation.



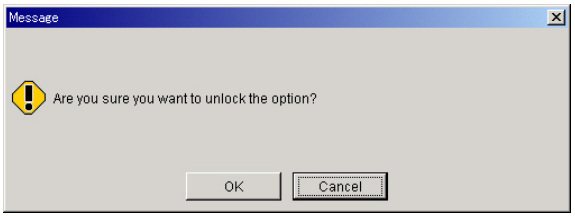
The procedure for installing the NAS-OS function is shown.

(a) Click the [Logical Status] tab on the Unit screen.

(b) Click the [License Key] icon. And Click the [NAS-OS].

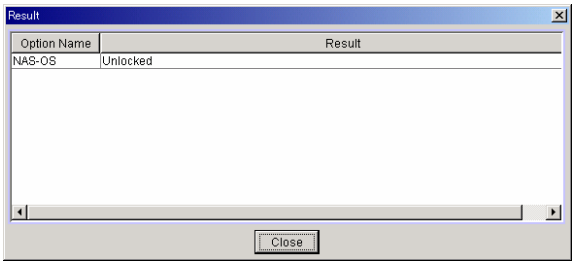


(c) Click the [Open] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(d) Input the key code of 48 characters in “Key Code”, or select the key file from “Unlock with” and input the path in “Key File”, and then click the [OK] button.



(e) When unlocking it by the key file, the option list window is displayed. Check that a check mark is put to “NAS-OS”, and click the [OK] button.

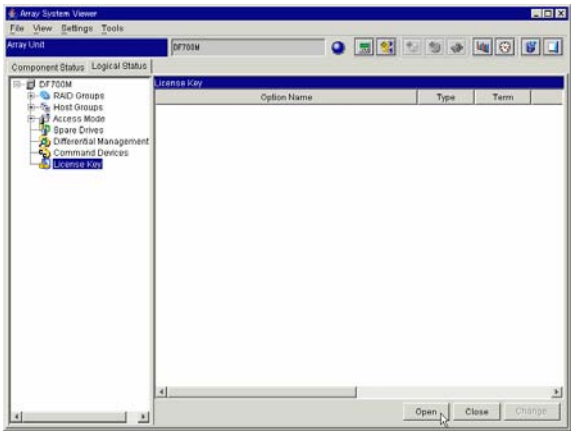
(f) The confirmation message is displayed. Click the [OK] button.

The NAS-OS is displayed in "Option Name" and the Unlocked is displayed in "Result".

(g) Click the [Close] button.

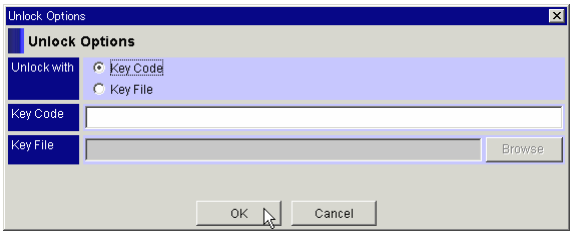
Copyright © 2005, Hitachi, Ltd.

(2) Un-installation



Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

The key code supplied with the NAS-OS function is necessary for the un-installation. Once it is uninstalled, the NAS-OS function cannot be used until it is unlocked again by the key code or the key file (in the locked status).



The procedure for un-installation the NAS-OS function is shown.

(a) Click the [Logical Status] tab on the Unit screen.

(b) Click the [License Key] icon. And Click the [NAS-OS].

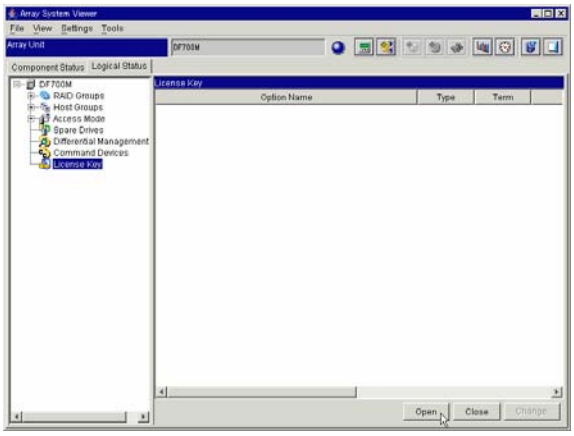
(c) Click the [Close] button.

(d) Input the key code of 48 characters in “Key Code”, and then click the [OK] button.

(e) The confirmation message is displayed. Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Set the validation and invalidation



Setting is supported in Storage Navigator Modular Revision Ver.2.60 or more.

The NAS-OS function can set the validation and invalidation for using the function in the installed status (in the unlocked status).

The procedure for set the validation and invalidation the NAS-OS function is shown.

(a) Click the [Logical Status] tab on the Unit screen.

(b) Click the [License Key] icon. And Click the [NAS-OS].

(c) Select the NAS-OS, and then click the [Change] button.

(e) The confirmation message is displayed. Click the [OK] button.

Chapter 7. System Parameter Setting List

(1) DF700 system parameter setting

The following table lists the parameter settings using Storage Navigator Modular.

System Parameter Setting for DF700

	System Parameter	
1	System Startup Attribute	Depends on System Configuration
2	Drive Detach mode enable	Disable (Standard setting)
3	Turbo LU Warning	Disable (Standard setting)
4	Operation if the Processor failures Occurs	Reset a Fault (Standard setting)
5	ROM Microprogram Version	No change is needed
6	RAM Microprogram Version	No change is needed
7	Write & Verify Executing Mode	On (Standard setting)
8	DHCP (*1)	OFF (Standard setting)
9	Maintenance port IP address	To be set according to the network setting
10	IP Address	To be set according to the network setting
11	Subnet Mask	To be set according to the network setting
12	Default Gateway	To be set according to the network setting
	Host Group	
1	LU Mapping Mode	Depends on System Configuration (*2)

*1 : When the DHCP mode is validated, the IP Address is acquired from the DHCP server.
If the DHCP server is not started up or the DHCP function has been wrongly set, the acquisition of the IP Address will fail and the IP Address of the subsystem will remain "0.0.0.0". (This is a state in which Storage Navigator Modular or the Web cannot be used via a LAN.)
In such a case, you can acquire the IP Address by starting up the DHCP server or by setting the DHCP function correctly when necessary.

*2 : When the SANRISE AMS500 is connected, the logical unit which is not wanted to be accessed by the port must be masked by means of the LU mapping mode.

Copyright © 2005, Hitachi, Ltd.

(2) Host Connection Parameters setting

When making the simple setting of the host group options, select items shown on gray backgrounds.

Only when using the combination not described in the simple setting, select the required parameter from detail settings.

Host Connection Parameters Setting (1/5)

✓: Parameter which is automatically set by the simple setting
blank: Parameter which is manually set if necessary

Host Group Option							
Simple Setting							
1	Platforms		HP-UX				
2	Alternate Path		None		PV Link		VxVM(*1)
3	Fail Over		None	MC/ ServiceGuard	None	MC/ ServiceGuard	None
Detail Setting: The following parameters will be selected automatically according to simple setting.							
	Host Connection Mode 1 (Select one of these modes)	Standard Mode	✓	✓	✓	✓	✓
		Open VMS Mode					
		Wolfpack Mode					
		TRESPASS Mode					
	Host Connection Mode 2 (Multiple selections)	HP-UX Mode					
		PSUE Read Reject Mode					
		UA(06/2A00) Suppress Mode					
		NACA Mode					
		HISUP OFF Mode					
		Reset Propagation Mode					
		Unique Reserve Mode 1					
		ASL Report Mode (Active/Passive Group)					
		ASL Report Mode (Active/Passive)					
		ASL Report Mode (Active/Active)					
		Port-ID No Report Mode					
		Port ID Conversion Mode					
		TruCluster Mode					
		Product Serial Response Mode					
		Same Node Name Mode					
		CCHS Conversion Mode					
		SPC-2 Mode					
Additional Parameter: Select these parameters only when you use the appropriate function. When selecting it, the parameter that belongs to the following host connection mode is automatically selected.							
4	Logical Unit Number more than or equals to 8 can be recognized by HP-UX		HP-UX Mode(*2)				
5	TrueCopy(*3) is used by Hp-UX		PSUE Read Reject Mode(*4)				
6	VERITAS Database Edition/Advanced Cluster for Oracle RAC (Solaris) is used		Not selected				
7	Egenera BladeFrame Is used		Not selected				

*1 : When using VERITAS Volume Manager(VxVM), Array Support Library (ASL) for AMS/WMS series is required. Please download from the Web screen of VERITAS.

*2 : Each host group can set the maximum of 256 logical units from the logical unit #0 to #511 for the RKXS/RKS, #0 to #2047 for the RKM and #0 to #4095 for the RKH to the mapping of the logical unit. However, the maximum number of the logical units of which the server can recognize differs depending on the platform.

*3 : TrueCopy displayed means TrueCopy remote replication and TrueCopy Extended Distance.

*4 : Set this mode when you use the Fence Level of TrueCopy remote replication with "DATA" and want to make the read access suppressed to the P-VOL at the time of the PSUE transition.

Copyright © 2005, 2006, Hitachi, Ltd.

Host Connection Parameters Setting (2/5)

✓: Parameter which is automatically set by the simple setting
blank: Parameter which is manually set if necessary

Host Group Option											
Simple Setting											
1	Platforms		Solaris								
2	Alternate Path		None			HDLM(*1)		VxVM(*2)		MpxIO(*5)	
3	Fail Over		None	Sun Cluster(*4)	VCS(*3)	None	Sun Cluster(*4)	None	VCS(*3)	None	Sun Cluster(*4)
Detail Setting: The following parameters will be selected automatically according to simple setting.											
	Host Connection Mode 1 (Select one of these modes)	Standard Mode	✓	✓	✓	✓	✓	✓	✓	✓	✓
		Open VMS Mode									
		Wolfpack Mode									
		TRESPASS Mode									
	Host Connection Mode 2 (Multiple selections)	HP-UX Mode									
		PSUE Read Reject Mode									
		UA(06/2A00) Suppress Mode									
		NACA Mode									
		HISUP OFF Mode									
		Reset Propagation Mode									
		Unique Reserve Mode 1									
		ASL Report Mode (Active/Passive Group)									
		ASL Report Mode (Active/Passive)									
		ASL Report Mode (Active/Active)									
		Port-ID No Report Mode									
		Port ID Conversion Mode									
		TruCluster Mode									
		Product Serial Response Mode									
		Same Node Name Mode									
		CCHS Conversion Mode									
		SPC-2 Mode									
Additional Parameter: Select these parameters only when you use the appropriate function. When selecting it, the parameter that belongs to the following host connection mode is automatically selected.											
4	Logical Unit Number more than or equals to 8 can be recognized by HP-UX		Not selected								
5	TrueCopy(*6) is used by Hp-UX		Not selected								
6	VERITAS Database Edition/Advanced Cluster for Oracle RAC (Solaris) is used		Not selected	Unique Reserve Mode 1 (*7)		Not selected		Unique Reserve Mode 1 (*7)		Not selected	
7	Egenera BladeFrame Is used		Not selected								

*1 : When using Hitachi Dynamic Link Manager (HDLM), take notice of the following:
(1) Vendor ID: If this text is changed, it cannot be managed by HDLM. Do not change this text.
(2) Serial Number: When the multiple storages of same types exist, a different Serial Number needs to be allocated for each disk array subsystem.

*2 : When using VERITAS Volume Manager (VxVM), Array Support Library (ASL) for AMS/WMS series is required. Please download from the Web screen of VERITAS.

*3 : VERITAS Cluster Server

*4 : The combination of the Sun Cluster and the HDLM needs to set the "Reset Propagation Mode" depending on the HDLM version.
Verify the Hardware note of the HDLM, and then set the Reset Propagation Mode from the detail setting.

*5 : SUN Multi Path (MPxIO)

*6 : TrueCopy displayed means TrueCopy remote replication and TrueCopy Extended Distance.

*7 : When using VERITAS Storage Foundation For Oracle RAC or the IO fencing function supported from the VCS Ver4.0, the Unique Reserve Mode 1 needs to be set.

Chapter 1. Adding Optional Components

1.1 Before Starting Addition of Optional Components

If you make a mistake in operation during an addition of the optional component, it is feared that user data in the subsystem is lost. Therefore, perform the following before starting the addition of the optional component to provide against an unexpected accident.

(1) Backup user data.
Backup user data in the subsystem by the operation on the host computer side.

(2) The work to add an optional component varies depending on the component and a location where the component is to be installed. Besides, perform the addition after making sure whether the work must be done with the subsystem power on or off.
- An addition with the subsystem power on :
  A status in which the subsystem power is turned on irrespective of whether the system (host computer) is turned on or off.
- An addition with the subsystem power off :
  A status in which the subsystem power is turned on irrespective of whether the system (host computer) is turned on or off.

(3) When adding the optional component, it is required to change the settings of the subsystem using a service PC connected via a LAN. Make the following preparations before starting the addition of the optional component.
- Prepare a PC in which Storage Navigator Modular is installed. The PC must be used in the LAN environment.
- Ask the customer whether the subsystem is operable via a LAN. If not, obtain customer's permission to operate the subsystem via a LAN.

(4) Promote mutual understanding with the user about the possibility of a system down in order to minimize damage caused by failures.

(5) When adding the optional component with the subsystem power on, the operation replacing dummy Disk Drive with Disk Drive has to be finished within 10 minutes.

(6) Do not make the addition work when the READY LED (green) on the front of the Basic Chassis is blinking at high speed. Perform the addition work after checking that the READY LED (green) on the front of the Basic Chassis lights up after waiting for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of RKH).

(7) When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the addition work. While this WARNING LED (orange) is blinking at high speed, the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the addition work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up in the maximum of 30 to 85 minutes.

(8) When adding DF600-RKA/RKAJAT/RKAJATL, understand the specification of the Power Unit/weight, etc. in the manual of DF600, and perform the installation and the addition work safely.

(9) When adding the DF600-RKA, install the Disk Drives whose capacity is 71.3 Gbytes or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) When RKA/RKAJAT/RKAJATL of the DF600 is connected, the version of the ENC/SENC firmware should be the following. Also, the purchase of the addition support kit of the DF-F700-K1BUP is indispensable.

(a) In the case of RKA

- SH firmware: 1A or more

(b) In the case of RKAJAT/RKAJATL

- SR firmware: 5.75 B or more
- H8S firmware: 02-02-07 or more

Perform the version check and the update of the firmware beforehand, referring to "Procedure for Offline ENC/SENC Firmware Download" of the DF600.

(11) If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

(12) If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.
When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

(13) When the iSCSI Interface Board is added to the Basic Chassis, it is required to make the microprogram version 0730/B or more.

(14) When the iSCSI Interface Board is added to the RKS, it is required to make the module revision F or more for the Control Unit.

(15) Do not add the optional parts while the array subsystem is being started.
When the array subsystem is being started, add the optional parts after the array subsystem becomes the Ready status.

(16) It is required to install the adaptable microprogram depending on the parts to be added.
Check the adaptable microprogram revision referring to Microprogram "1.9 Adaptable microprogram revision" (MICRO 01-0360).

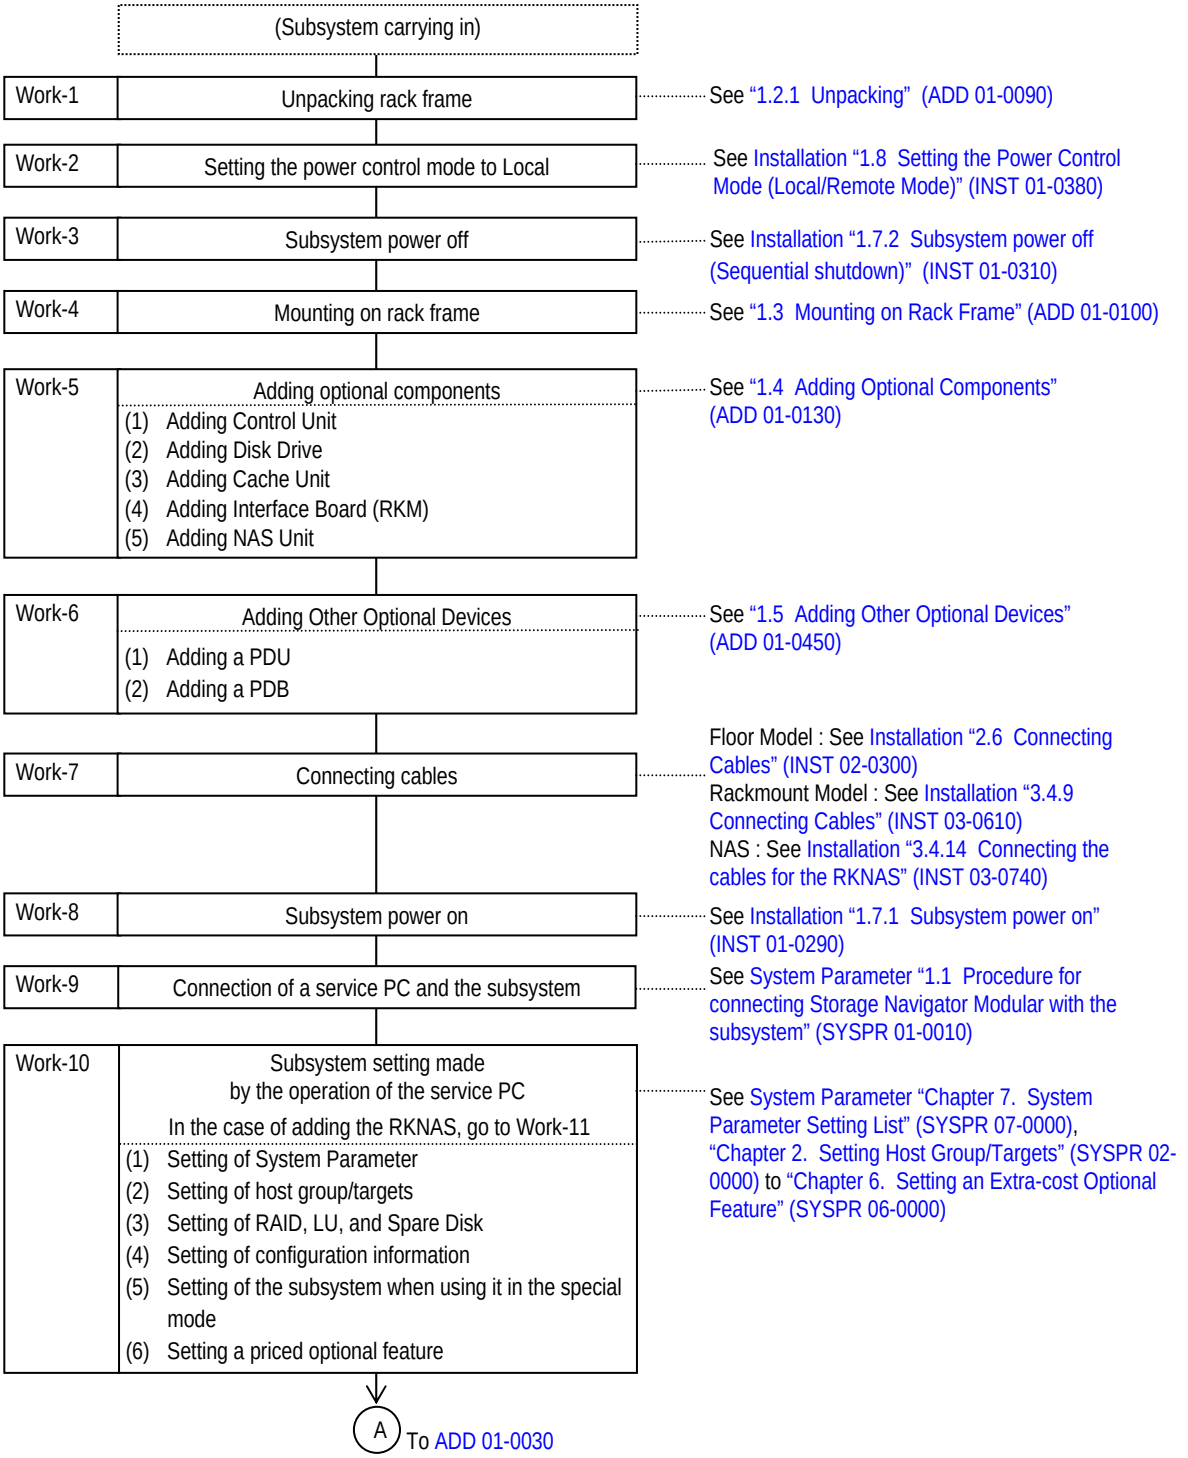
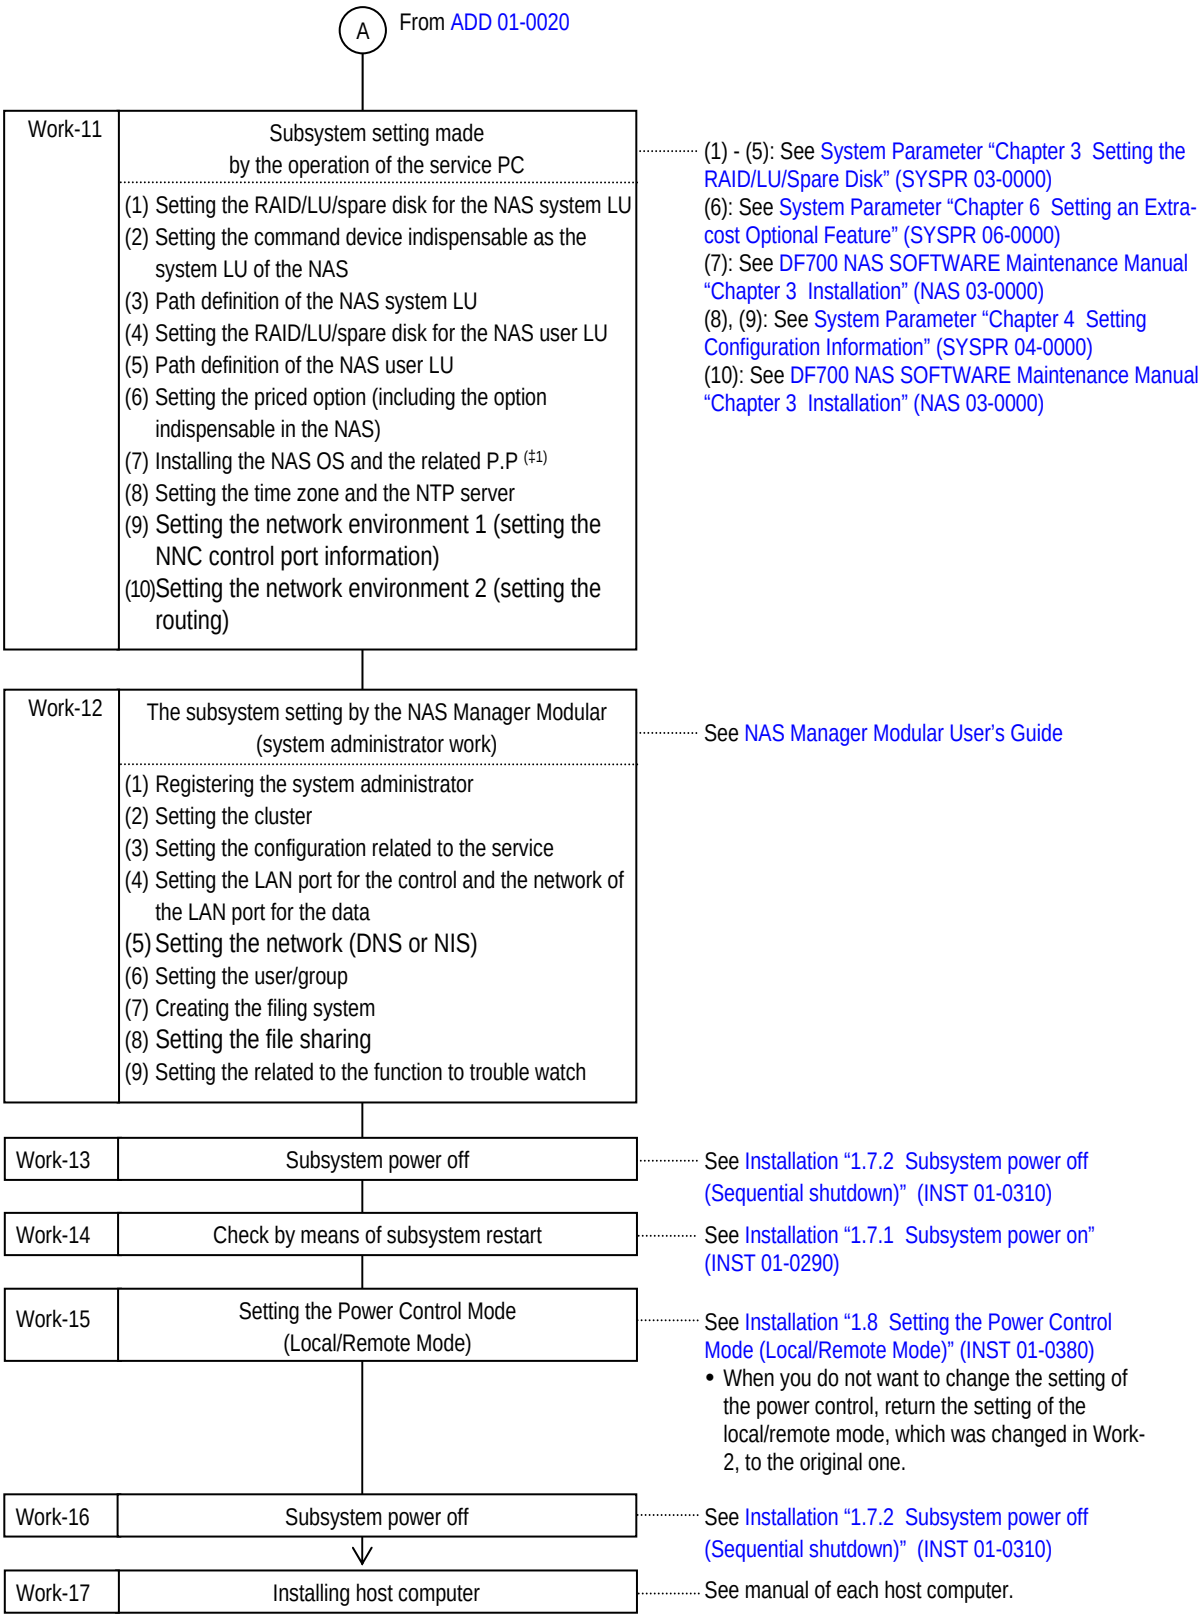
1.2 Procedures for Adding Optional Components

(1) Procedure for adding an optional component while the subsystem power online

NOTE : • For safety use, always close the front bezel after the operation.
• Service personnel must check if a customer has backed up user data. If the customer does not perform the backup, start the work after getting customer's permission.



‡1 : The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive. Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).



Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for adding the optional components offline (with the subsystem power turned off)

NOTE : • For safety use, always close the front bezel after the operation.
• For the see Installation "1.7.2 Subsystem power off (Sequential shutdown)" (INST 01-0310).
• Service personnel must check if a customer has backed up user data. If the customer does not perform the backup, start the work after getting customer's permission.

Copyright © 2005, 2006, Hitachi, Ltd.

‡1 : Normally, the microprogram and the NAS OS are installed when the subsystem is shipped from the factory.

Copyright © 2005, Hitachi, Ltd.

(3) Component to be added and condition of addition

(3-1) Rackmount disk array for extension

Component name	Model name	Specification	Requirements of addition	Condition of addition and number of item for referring to procedure	
				Power online (A host is in operation (*1).)	Power offline (with the subsystem power turned off)
Rackmount disk array for extension	DF700-RKAJ DF700-RKAJAT DF600-RKA DF600-RKAJAT DF600-RKAJATL	A set of an disk array and basic accessories to be mounted on a rack frame	• Prepare the following components at least for the disk array to be added. Two Disk Drives • Up to 14 RKAJs/RKAs can be connected to the one RKM. • Up to 14 RKAJATs can be connected to the one RKM • A mixed configuration, in which up to the 14 RKAJs/RKAs,RKAJATs are connected to the one RKM. • Up to 6 RKAJs can be connected to the one RKS. • Up to 6 RKAJATs can be connected to the one RKS. • A mixed configuration, in which up to the 6 RKAJs, RKAJATs are connected to the one RKS. • A mixed configuration, in which up to the 6 RKAJATs are connected to the one RKXS. • Up to 30 RKAJs/RKAs can be added to the one RKH. However, the chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only. • Up to 30 RKAJATs can be added to the one RKH. However, the chassis connectable to the RKH as the chassis of the unit ID #0 is the RKAJ only. • A mixed configuration, in which up to the 30 RKAJs/RKAs/RKAJATs are connected to the one RKH. Be sure to connect the RKAJ to the first unit when performing the connection in a mixed configuration.	Possible "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)	Possible "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)

*1 : Data is exchanged between a host computer and the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(3-2) Optional components for addition

Component name	Model name	Specification	Requirements of addition	Condition of addition and number of item for referring to procedure	
				Power online (A host is in operation (*1).)	Power offline (with the subsystem power turned off)
Control Unit	DF-F700-F1JM	Array Control Unit (2port) for duplication For RKM	• Install the Cache memory with a capacity same as that of the Cache memory of the installed Control Unit (#0 side). • The RKM requires the Interface Board.	Impossible	Possible "1.4.2 Adding a Control Unit" (ADD 01-0140)
	DF-F700-F1JS	Array Control Unit (1port) for duplication For RKS			
	DF-F700-F1JXS	Array Control Unit (1port) for duplication For RKXS			
Disk Drive(*2) (Including Spare Disk)	DF-F700-AGF72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 10,000 min^{-1})	• Select from the Disk Drives shown on the left according to the intended total capacity of the subsystem. • The Spare Disk Drives can be set up to 15 in the whole subsystem (up to 30 in case of the RKH).	Varies depending on the disk array to be added. "1.4.3 Adding a Disk Drive" (ADD 01-0190)	Varies depending on) the disk array to be added. "1.4.3 Adding a Disk Drive" (ADD 01-0190)
	DF-F700-AGH72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 15,000 min^{-1})			
	DF-F700-AGF146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 10,000 min^{-1})			
	DF-F700-AGH146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 15,000 min^{-1})			
	DF-F700-AGF300	3.5-inch Disk Drive (287.6 G bytes) (Disk rotational speed : 10,000 min^{-1})			
	DF-F700-ATE250R (RKXS/RKAJAT)	3.5-inch Disk Drive (245.7 G bytes) (Disk rotational speed : 7,200 min^{-1})			
	DF-F700-ATE400R (RKXS/RKAJAT)	3.5-inch Disk Drive (393.4 G bytes) (Disk rotational speed : 7,200 min^{-1})			
	DF-F700-ATE500R (RKXS/RKAJAT)	3.5-inch Disk Drive (491.9 G bytes) (Disk rotational speed : 7,200 min^{-1})			
Cache Unit	DF-F700-C1GJ	Cache memory (1,024 M bytes)	• For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.	Impossible	Possible "1.4.4 Adding a Cache Unit" (ADD 01-0380)
	DF-F700-C2GJ (Excluding RKXS)	Cache memory (2,048 M bytes)			
	DF-F700-C512JX (RKXS special use)	Cache memory (512 M bytes)			
FC Interface Board	DF-F700-DJ4G2W (RKS/RKXS)	Independent two-port FC Interface Board (corresponding to 4 G bps) (including host connectors for 4G bps (2))	• Install the interface board after removing the dummy interface board from the Control Unit.	Impossible	Possible "1.4.6 Adding a FC Interface Board" (ADD 01-0420)
	DF-F700-DJ4G2H (RKH)	4G bps FC Interface Board (including host connectors for 4G bps (2))			
iSCSI Interface Board	DF-F700-DJSC2 (RKM/RKS/RKXS)	iSCSI Interface Board	–	Impossible	Possible "1.4.7 Adding an iSCSI Interface Board" (ADD 01-0430)
	DF-F700-DJSC2H (RKH)				

*1 : Data is exchanged between a host computer and the subsystem.
*2 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

(3-3) Addition/subtraction of Disk Drive/disk array

No.	Unit of addition/ subtraction	Component to be added/subtracted	Addition for storage capacity expansion		Replacement for storage capacity expansion	
			Addition of the disk array(s) or the Disk Drive(s) in order to expand a storage capacity		Replacement with the Disk Drive(s) having larger capacity in order to expand a storage capacity	
			Power online (A host is in operation(*1))	Power offline (with the subsystem power turned off)	Power online (A host is in operation(*1))	Power offline (with the subsystem power turned off)
1	Subsystem	RKAJ/RKAJAT/RKA	Possible(*2) (The final RKAJ/ RKAJAT/RKA only)	Possible(*2) (The final RKAJ/ RKAJAT/RKA only)	–(*3)	–(*3)
			Refer to "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)	Refer to "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490)	–	–
2	Disk Drive	RKM /RKS/RKXS #0 to 4 or RKAJ corresponding to the unit ID #0 connected to the RKH #0 to 4	Possible(*4)	Impossible	Possible(*4)	Impossible
			Refer to "1.4.3 (2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0250)	–	Refer to "1.4.3 (3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0290)	–
3		RKM /RKS/RKXS #5 to 14 or RKAJ corresponding to the unit ID #0 connected to the RKH #5 to 14	Possible	Possible	Possible	Possible
			Refer to "1.4.3 (2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0250)	Refer to "1.4.3 (2-2) Procedure for adding the Disk Drives offline (with the subsystem power turned off)" (ADD 01-0260)	Refer to "1.4.3 (3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0290)	Refer to "1.4.3 (3-2) Procedure for replacing the Disk Drive (in order to expand a storage capacity) while the subsystem power is offline (with the subsystem power turned off)" (ADD 01-0310)

*1 : Data is exchanged between a host computer and the subsystem.

*2 : The additional subsystem can be added at the end of the configuration. An addition in the middle of the configuration cannot be done.

*3 : In the replacement for storage capacity expansion, it is not necessary to replace the disk array. Replace only the Disk Drive(s) installed in the disk array.

*4 : When adding or replacing the additional Disk Drives of #0 to #4 in the RKM/RKS/RKXS or the Disk Drives of #0 to #4 in the first RKAJ to be connected to the RKH, be sure to perform the addition work with the subsystem power turned on, and check that the system copy is started automatically in the added Disk Drives and completed. (‡1) When the system copy is completed, "I141xy (or I141HH) System copy completed (Unit-x, HDU-y)" is displayed in the Information Message on WEB. (Refer to "Microprogram '3.2 Procedure for checking the status of system copy complete' (MICRO 03-0020)".)

‡1 : The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive. Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the "1.4.3 (5) Restoring the system information" (ADD 01-0360).

1.2.1 Unpacking

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rainwater.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

(1) Checking exterior of optional component
Check the exterior of each component visually for distortion or damage owing to transport.

(2) Checking contents of package
Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

1.3 Mounting on Rack Frame

In the case of adding Disk Drives to a subsystem of the rackmount model, the additional subsystem must be added when vacant slots for the Disk Drives to be added are insufficient in the existing subsystem.

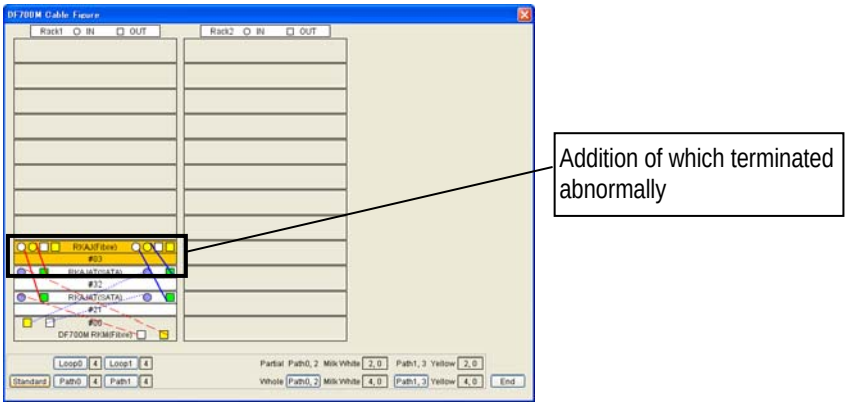
When the Additional Chassis are added, there are the offline (with the subsystem power turned off) addition and the online addition.
Perform the addition referring to "1.6.1 Procedure for adding the additional subsystem to the subsystem of rackmount model with U7 rack frame" (ADD 01-0490).

Copyright © 2005, 2006, Hitachi, Ltd.

1.3.1 Work immediately after abnormal termination

When an error occurred during the addition of the additional chassis, separate the additional chassis of which the addition is not completed due to including the failure suspect part by performing the following work.
Take recovery actions against the trouble after performing the following operations, and then make the addition again.
Be careful that the subsystem may go down if the existing system (‡1) and the chassis of which the addition is completed are separated.

NOTE : • Be sure to remove the ENC cables one by one with an interval for twenty seconds or more.
If the ENC cables are removed without leaving each interval for twenty seconds or more, the system may go down.
• If the AC Input Power Switch is turned off with the ENC cables indicated by the ACE tool connected, the subsystem may go down.



(1) Make sure of the additional subsystem addition of which terminated abnormally.
Make sure of the additional subsystems addition of which terminated abnormally according to one of the following messages displayed in the Information Message window of the Web as shown below.
- Unit ID# that the "I8040x (or I804HH) Unit ADD FAIL" message is displayed.
- Additional chassis that the "I8000x (or I800HH) Unit ADD start (Unit-x)" message is not displayed even five minutes or more passed after connecting the ENC cables.
- Additional chassis that the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message is not displayed after the addition.

(2) Construct the current subsystem configuration with the ACE tool of Storage Navigator Modular, and then display the ENC cable connection diagram. (Refer to Installation "1.6.2 Checking methods of device ID and ENC cable connection when mounting the newly introduced rack" (INST 01-0180).

‡1 : The existing subsystem is the basic chassis or the additional chassis that configures the subsystem under operation.
The additional chassis to be connected is connected to the existing subsystem.
The additional chassis that the addition is completed (the additional chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Select the additional disk array unit addition of which terminated abnormally in the ENC cable.

(4) Remove the ENC cables, which connect subsystems displayed in orange and blue in the ENC cable connection diagram and are displayed with red and blue solid lines in the diagram, one by one with an interval for twenty seconds or more (‡1).
At this time, remove the ENC cables of the ENC Unit/SENC Unit whose ALM LED (red) lights on as a priority.
In addition, for the additional chassis that the "I8040x (or I804HH) Unit ADD FAIL" message is not displayed, remove the ENC cables after checking that the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message is not displayed.

NOTE : • Be sure to remove the ENC cables one by one with an interval for twenty seconds or more.
If the ENC cables are removed without leaving each interval for twenty seconds or more, the system may go down.
• Never remove the ENC cables connecting the chassis of the unit ID# displayed in the message "I8020x (or I802HH) Unit ADD complete (Unit-x)" and the chassis of the unit ID# before it.
If removed, the subsystem may go down.
• For the additional chassis that the "I8040x (or I804HH) Unit ADD FAIL" message is not displayed, the recognition of the chassis may be completed (‡2) immediately before removing the ENC cables. In that case, the Loop blockade and the ENC blockade occur immediately after removing the ENC cables, so that perform the work with checking it.
Stop removing the ENC cables if they occur. The Loop blockade and the ENC blockade are recovered by inserting the ENC cables again.

(5) Turn off all the AC Input Power Switches of the added chassis indicated in orange after rechecking that the ENC cable of a red solid line and a blue solid line which is connecting the orange subsystem and the white subsystem was removed (‡1).

NOTE : • If the AC Input Power Switch is turned off with the ENC cables indicated by the ACE tool connected, the subsystem may go down.
• Never turn off the AC Input Power Switch of the additional chassis of the unit ID# displayed in the message "I8020x (or I802HH) Unit ADD complete (Unit-x)" because the subsystem goes down.

‡1 : When the subsystem goes down, be sure to perform the procedures (4) and (5) continuously, and then turn off the main switch and turn it on after one or more minutes have elapsed. In that case, do not turn off the battery switch of the Backup Battery Unit in front of the subsystem. If it is turned off, the user data lost may occur.

‡2 : Additional chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message.

Copyright © 2005, 2006, Hitachi, Ltd.

1.3.2 Device ID setting

The subsystem ID of the RKM/RKS/RKXS or the RKAJ to be connected to the RKH is set to # 0. Set the Device ID numbers of the additional subsystem in serial order starting from the RKAJ/RKAJAT/RKA connected next to the RKM/RKS/RKXS.

In the case of a configuration of one RKM+ RKAJs/RKAs + RKAJATs, set the device IDs of the RKAJ/RKA, the RKAJATs connected to the Path 0, and the RKAJATs connected to the Path 1 as #0x, #2x, and #3x respectively.
Set the "x" as an ascending serial number in each of the Path 0 and Path 1 without discrimination between the RKAJ/RKA and RKAJAT.

In the case of a configuration of one RKS+ RKAJs + RKAJATs, set the device IDs of the RKAJ, the RKAJATs connected to the Path 0, and the RKAJATs connected to the Path 1 as #0x, #2x, and #3x respectively.
Set the "x" as an ascending serial number in each of the Path 0 and Path 1 without discrimination between the RKAJ/RKAJAT and RKAJ/RKAJAT.

Set #2x for RKAJAT/RKAJATL of RKXS + RKAJAT/RKAJATL.
Set x in ascending order.

In the case of a configuration of one RKH + RKAJs/RKAs + RKAJATs, set the device IDs of the RKAJs/RKAs, the RKAJATs connected to the PATH #0, and the RKAJATs connected to the PATH #1 as #0x, #2x, and #3x respectively. Set the "x" as an ascending serial number in each of the PATH #0 and PATH #1 without discrimination between the RKAJ/RKA and RKAJAT.
Set the device IDs of the RKAJs/RKAs, the RKAJATs connected to the PATH #2, and the RKAJATs connected to the PATH #3 as #1x, #4x, and #5x respectively. Set the "x" as an ascending serial number in each of the PATH #2 and PATH # 3 without discrimination between the RKAJ/RKA and RKAJAT.

1.4 Adding Optional Components

1.4.1 Subsystems optional components for addition

(1) Optional components for addition

Component name	Model name	Specification	Requirements of addition	Condition of addition and number of item for referring to procedure	
				Power online (A host is in operation (*1).)	Power offline (with the subsystem power turned off)
Control Unit	DF-F700-F1JM	Array Control Unit for duplication (2port) In the RKM	• Install the Cache memory with a capacity same as that of the Cache memory of the installed Controller (#0 side).	Impossible	Possible "1.4.2 Adding a Control Unit" (ADD 01-0140)
	DF-F700-F1JS	Array Control Unit for duplication (1port) In the RKS			
	DF-F700-F1JXS	Array Control Unit for duplication (1port) In the RKXS			
Disk Drive(*2) (including Spare Disk)	DF-F700-AGF72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 10,000 min^{-1})	• Select from the Disk Drives shown on the left according to the intended total capacity of the subsystem. • The Spare Disk Drives can be set up to 15 in the whole subsystem (up to 30 in case of the RKH).	Varies depending on the disk array to be added. "1.4.3 Adding a Disk Drive" (ADD 01-0190)	Varies depending on) the disk array to be added. "1.4.3 Adding a Disk Drive" (ADD 01-0190)
	DF-F700-AGH72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 15,000 min^{-1})			
	DF-F700-AGF146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 10,000 min^{-1})			
	DF-F700-AGH146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 15,000 min^{-1})			
	DF-F700-AGF300	3.5-inch Disk Drive (287.6 G bytes) (Disk rotational speed : 10,000 min^{-1})			
	DF-F700-ATE250R (RKXS/RKAJAT)	3.5-inch Disk Drive (245.7 G bytes) (Disk rotational speed : 7,200 min^{-1})			
	DF-F700-ATE400R (RKXS/RKAJAT)	3.5-inch Disk Drive (393.4 G bytes) (Disk rotational speed : 7,200 min^{-1})			
	DF-F700-ATE500R (RKXS/RKAJAT)	3.5-inch Disk Drive (491.9 G bytes) (Disk rotational speed : 7,200 min^{-1})			
Cache Unit	DF-F700- C1GJ	Cache memory (1,024 M bytes)	• For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.	Impossible	Possible "1.4.4 Adding a Cache Unit" (ADD 01-0380)
	DF-F700-C2GJ (Excluding RKXS)	Cache memory (2,048 M bytes)			
	DF-F700-C512JX (RKXS special use)	Cache memory (512 M bytes)			
FC Interface Board	DF-F700-DJ4G2W (RKS/RKXS)	Independent two-port FC Interface Board (corresponding to 4 G bps) (including host connectors for 4G bps (2))	• Install the interface board after removing the dummy interface board from the Control Unit.	Impossible	Possible "1.4.6 Adding a FC Interface Board" (ADD 01-0420)
	DF-F700-DJ4G2H (RKH)	4G bps FC Interface Board (including host connectors for 4G bps (2))			
iSCSI Interface Board	DF-F700-DJSC2 (RKM/RKS/RKXS)	iSCSI Interface Board	–	Impossible	Possible "1.4.7 Adding an iSCSI Interface Board" (ADD 01-0430)
	DF-F700-DJSC2H (RKH)				

*1 : Data is exchanged between a host computer and the subsystem.
*2 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) NAS Unit/Adding optional components for NAS

Component name	Model name	Specification	Requirements of addition	Condition of addition and number of item for referring to procedure	
				Power online (A host is in operation (*1).)	Power offline (with the subsystem power turned off)
NAS Unit (RKNAS)	DF-700-RKNAS4G	Install the memory (DIMM) of 4Gbytes in the RKNAS.	• Connect it to the RKM. • The case of the dual Controller configuration only.	Impossible	Possible "1.4.8 Adding a NAS Unit" (ADD 01-0440)
	DF-700-RKNAS2G	Install the memory (DIMM) of 2Gbytes in the RKNAS.	• Connect it to the RKS or the RKXS. • The case of the dual Controller configuration only.	Impossible	Possible "1.4.8 Adding a NAS Unit" (ADD 01-0440)
NAS Interface Board	DF-F700-DJNAS (RKM/RKS/RKXS)	Interface Board (NAS)	• When connecting it to the RKNAS, install it in the basic subsystem.	Impossible	Possible "1.4.8 Adding a NAS Unit" (ADD 01-0440)
	DF-F700-DJNASH (RKH)				

*1 : Data is exchanged between a host computer and the subsystem.

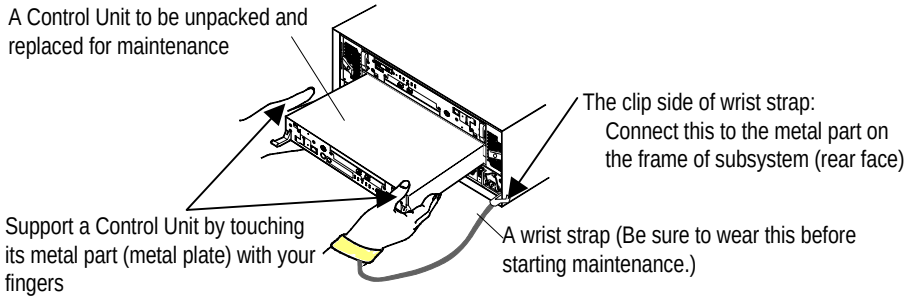
1.4.2 Adding a Control Unit

An addition of the Control Unit is done when duplicating the Control Unit.

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

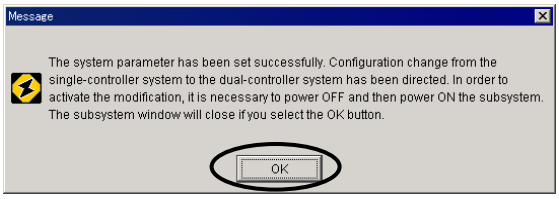
NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

(1) Turn off the main switch.
(2) Make sure that the PWR (POWER) LED (green) on the panel goes out.

NOTE : When the power has already been turned off, make sure that the cache is not in the cache backup mode. (Refer to Replacement, "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the cache is in the cache backup state, cancel the status.

(3) Make sure that the CACHE POWER LED (green) on the Controller is off.
When the CACHE POWER LED (green) is on, user data which has not written on the disk exists in the cache memory.
(4) Turn off the AC Power Unit Switch of the Power Unit (#0, #1).
(5) Remove the dummy (control Unit).
Loosen the fixing screws (right and left) of the dummy (Control Unit), slide the latches downward, and remove the dummy (Control Unit).
(6) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.
(7) Remove the dust cover from the cash slot of the Control Unit #1 to be added
(Insert the dust cover in the Cache slot in which the Cache memory is not installed).
(8) Install the Cache memory, which has the same capacity as that of the installed Controller#0, in the Controller#1 to be added by the set of two boards.
(9) When the Interface Board is installed in the Control Unit #0, install the Interface Board in the Control Unit #1 to be added, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places). At this time, insert the connector surely. Install the Interface Board making its sheet metal part face inside of the Control Unit.
Install the same type of the Interface Board as the Control Unit #0 in the Control Unit #1.
(10) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(11) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.



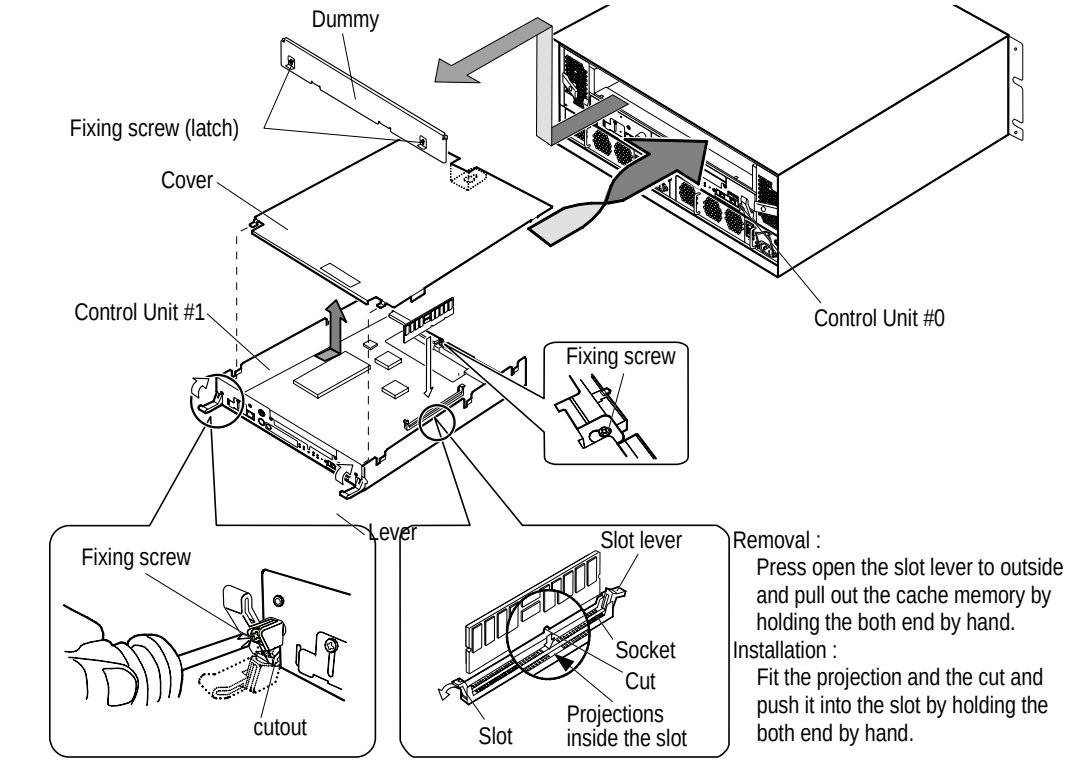
NOTE : • Do not catch an ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1.
Install the Control Unit #0 with the cover up and #1 with the cover down.

(12) Connect the interface cable, the LAN cable, and the ENC cable.

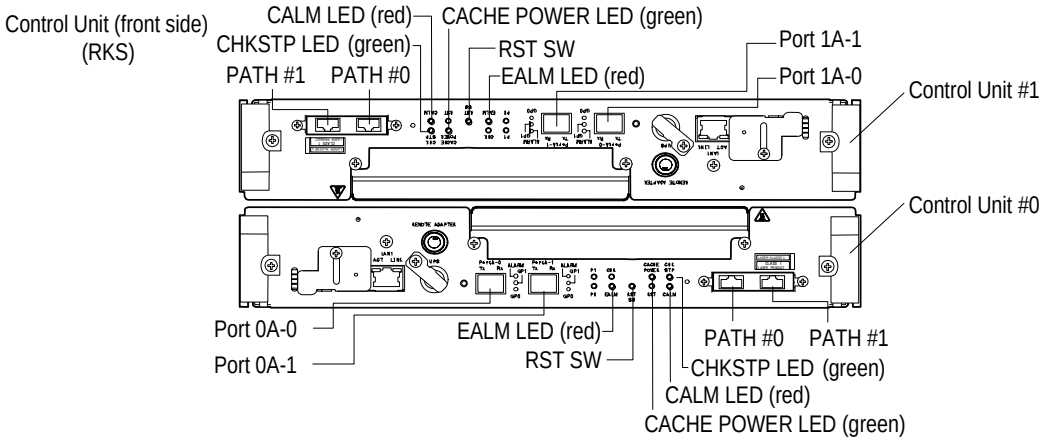
NOTE : • When connecting the Interface cable and the ENC cable, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
• When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

Copyright © 2005, 2006, Hitachi, Ltd.

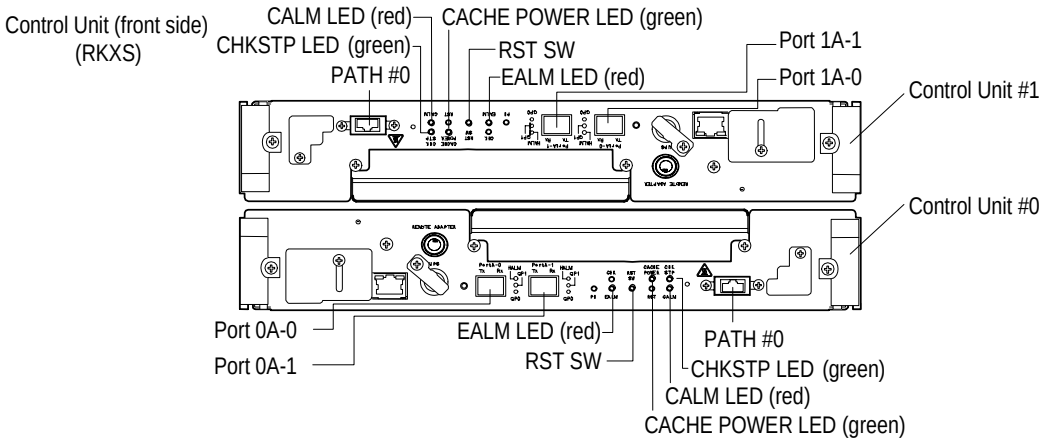
(13) Turn on the AC Power Unit Switch of the Power Unit.
(14) Turn on the main switch.
(15) Make sure that the RDY (READY) LED (green) on the front side of the subsystem comes on.
(16) Connect the PC to be connected with Storage Navigator Modular and the Control Unit #0 with a LAN cable. (Refer to System Parameter "1.1 Procedure for connecting Storage Navigator Modular with the subsystem" (SYSPR 01-0010).)
(17) Set the system starting attribute of Boot Option to the dual active mode to operate it by the dual system. (Refer to System Parameter "4.2 (1) Setting Boot Options" (SYSPR 04-0040).)
Besides, since the following message is displayed after the system parameters have been set, click the [OK] button.



(18) Turn off the main switch.
(19) Make sure that the PWR (POWER) LED (green) on the panel goes out.
(20) Turn on the main switch after waiting for one minute or longer.
(21) Make sure that the RDY (READY) LED (green) on the front side of the subsystem comes on.
(22) Connect the LAN cross cable to the LAN port for the maintenance of the Control Unit #1.
(23) Because the subsystem configuration was changed from the single Control Unit to the dual Control Unit, register the IP address of the Control Unit #1 in the array subsystem after deleting the target array subsystem in which the Storage Navigator Modular is registered. (Refer to System Parameter "1.1 Procedure for connecting Storage Navigator Modular with the subsystem" (SYSPR 01-0010).)
(24) Reset the configurations for the Control Unit #1.



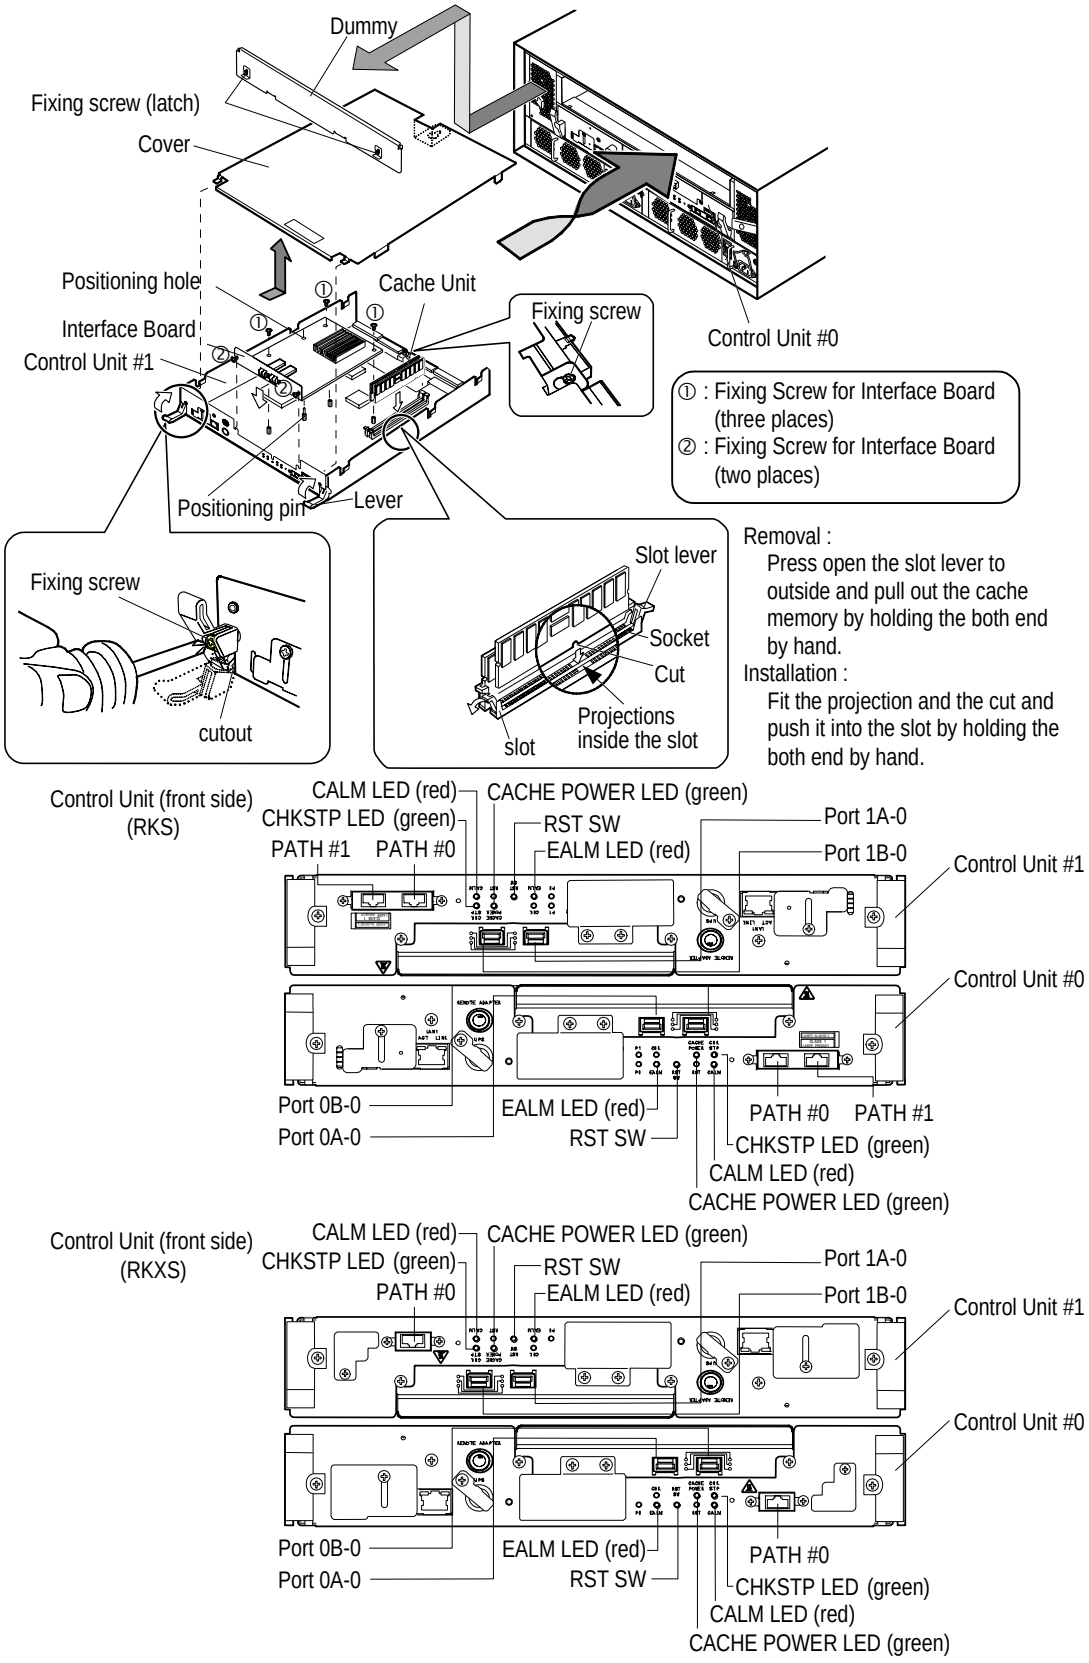
NOTE : A setup for the dual controller is necessary for the controller 1. (Refer to System Parameter "Chapter 4. Setting Configuration Information" (SYSPR 04-0000).)
When the cache is in the cache backup state, cancel the status.



(25) Turn off the main switch.
(26) Make sure that the PWR (POWER) LED (green) on the panel goes out.
(27) Remove the LAN cable connected to the Storage Navigator Modular from the Control Unit#0.
(28) Turn on the main switch.
(29) Make sure that the RDY (READY) LED (green) on the front side of the subsystem comes on.
(30) Check that the maintenance port IP address is set correctly.
When the maintenance port IP address is displayed as "0.0.0.0", set it.
Refer to System Parameter "4.2 (4) Setting of Maintenance LAN" (SYSPR 04-0100).

Copyright © 2005, 2006, Hitachi, Ltd.

Removal :
Press open the slot lever to outside and pull out the cache memory by holding the both end by hand.
Installation :
Fit the projection and the cut and push it into the slot by holding the both end by hand.



*1 : The figure shows the case where the FC Interface Board is not installed in the Control Unit of the RKS/RKXS.

1.4.3 Adding a Disk Drive

A procedure for adding/subtracting the Disk Drive varies depending on a location of the Disk Drive and a condition (whether the subsystem power is on or off).
Take care to use a procedure appropriate for the purpose because a use of an inappropriate procedure may cause an accident such as a loss of user data.

Table 1.4.1 Kinds of Disk Drive Addition and Subtraction

No.	Unit of addition/ subtraction	Component to be added/ subtracted	Addition for storage capacity expansion Addition of the disk array(s) or the Disk Drive(s) in order to expand a storage capacity		Replacement for storage capacity expansion Replacement with the Disk Drive(s) having larger capacity in order to expand a storage capacity	
			Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)	Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)
1	Disk Drive	RKM/RKS/RKXS #0 to 4 RKAJ corresponding to the unit ID #0 connected to the RKH #0 to 4	Possible Refer to "1.4.3 (2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0250)	Impossible –	Possible(*2) Refer to "1.4.3 (3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0290)	Impossible –
2		RKM/RKS/RKXS #5 to 14 RKAJ corresponding to the unit ID #0 connected to the RKH #5 to 14	Possible Refer to "1.4.3 (2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0250)	Possible Refer to "1.4.3 (2-2) Procedure for adding the Disk Drives offline (with the subsystem power turned off)" (ADD 01-0260)	Possible Refer to "1.4.3 (3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0290)	Possible Refer to "1.4.3 (3-2) Procedure for replacing the Disk Drive (in order to expand a storage capacity) while the subsystem power is offline (with the subsystem power turned off)" (ADD 01-0310)

*1 : Data is exchanged between a host computer and the subsystem.

*2 : When the Disk Drives are added additionally or by replacement in #0 to #4 of the RKM/RKS/RKXS or the Disk Drives of #0 to #4 of the first RKAJ connected to the RKH, be sure to check that the addition work is performed with the subsystem power turned on and the system copy is automatically started in the added Disk Drives and completed. The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive.
Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).
When the system copy is completed, "I141xy (or I141HH) System copy completed (Unit-x, HDU-y)" is displayed in the Information Message on WEB. (Refer to "Microprogram '3.2 Procedure for checking the status of system copy complete' (MICRO 03-0020)".)

*3 : If the RKAJ/RKAJAT is not mounted when adding any of the Disk Drives #0 to #3 to the RKAJ/RKAJAT, add it first.

(1) Before starting addition of Disk Drive

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

NOTE : • The Disk Drive is a precision machine. Never apply a shock or vibration to it.
• Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

(a) Locations and numbers of Disk Drives

The mounting position number of the Disk Drive is decided by the combination of the Disk Drive number set to the device number.

For details of the device ID setting, refer to Installation "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).

Set the subsystem identification switch for the RKAJ.

When the basic subsystem to be connected is the RKM/RKH, set it in the M side, and when it is the RKS, set it in the S side.

The Disk Drive number is #0 to #14 from the left sequentially seen sideways (for the floor model, it is #0 to #14 from the bottom).

The Disk Drive is not installed in RKH.

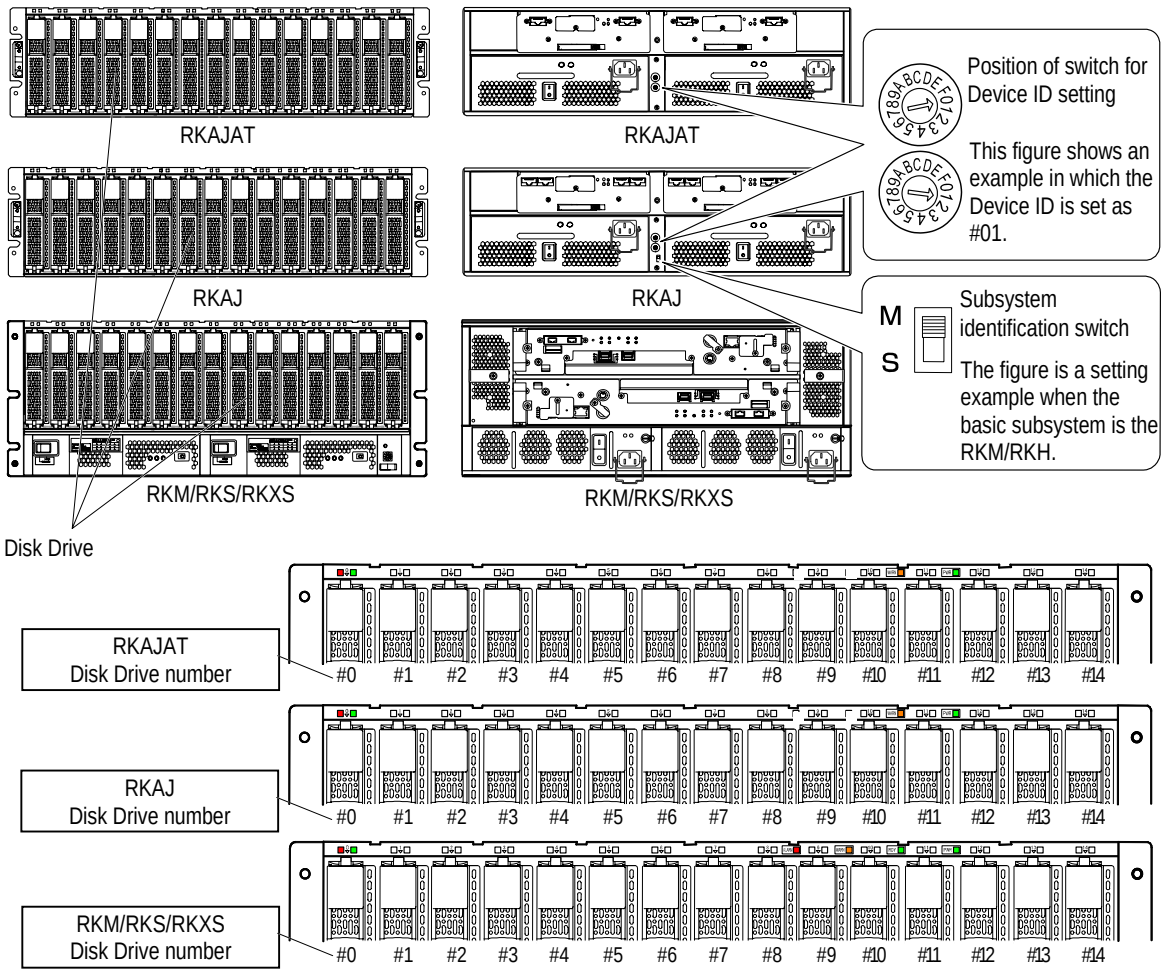

Figure 1.4.2 Disk Drive Mounting Location

Copyright © 2005, 2006, Hitachi, Ltd.

(b) If necessary number of vacant slots do not exist in the subsystem to which the Disk Drives are to be added. (Refer to "1.6 Adding the Additional Subsystem to the Rack Frame" (ADD 01-0490))
Arrange to mount two or more Disk Drives(‡1) on the added RKAJ/RKAJAT.
Set the Device ID number of the RKAJ/RKAJAT to be added.

(c) The Disk Drives for the Spare Disk Drives can be set up to 15 in one subsystem (up to 30 in case of the RKH) can be set in the optional positions.
Assign the Disk Drive, which has not been assigned to be a data disk, to be a Spare Disk.

(d) When adding the RKA or adding the Disk Drive to the RKA in the microprogram revision 0740/C or more, it is possible to treat the Disk Drive of the RKA as the target of the copy backless(‡2) if the customer/SE observes(‡3) either of the restrictions(‡4) on the operation shown below.

- The FC Disk Drive to be installed in the subsystem must be unified to the Disk Drive of the same rotational speed.
- The I/O performance and the Disk Drive restoration performance to the FC Disk Drive to be installed in the subsystem must be designed as the FC Disk Drive of 10,000 min^{-1} rotation.

When setting(‡5) this function, fully check that the customer/SE can strictly observe(‡3) the restrictions (‡4) on the operation shown below.

‡1 : The two of them must be installed in the slots Disk Drive #0 and Disk Drive #1.

‡2 : Refer to Theory "4.6. (3) Operation after replacing failed Disk Drive" (THEO 04-0240) for the details of the function.

‡3 : The customer/SE must observe the restrictions on the operation until the RAID Group configuration of the subsystem is reconstructed.

‡4 : If the customer/SE does not observe the restrictions on the operation, the following problems may occur.
If the FC Disk Drives of the different rotational speed are mixed in the subsystem, when the FC Disk Drive of 15,000 min^{-1} rotation is blocked, the FC Disk Drive of 10,000 min^{-1} rotation may be the Disk Drive which configures the RAID Group instead of the FC Disk Drive of 15,000 min^{-1} rotation.
If this condition occurs, the host I/O performance to the logical units which were configured only with 15,000 min^{-1} rotation in the RAID Group is deteriorated to the performance of the FC Disk Drive of 10,000 min^{-1} rotation.

Copyright © 2005, 2006, Hitachi, Ltd.

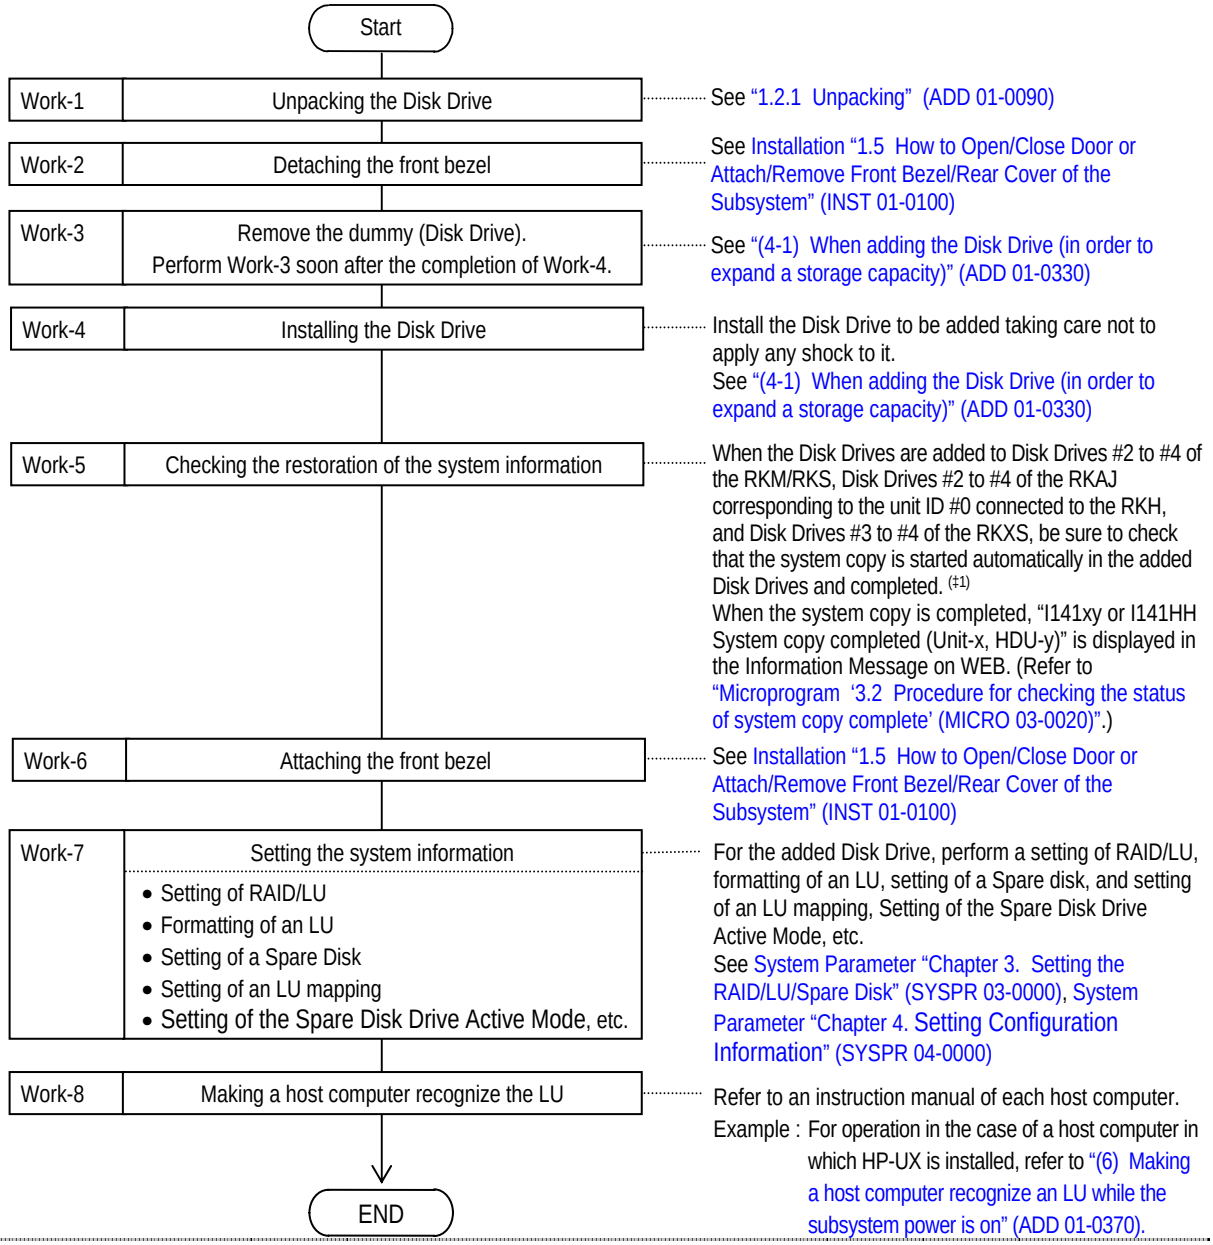
‡5 : Set it in (2-1)–Work 7, (2-2)–Work 9, (3-1)-Work 12 and (3-2)–Work 15.
This setting can be executed in the combination of the microprogram revision 0740/C or more and the Storage Navigator Modular Ver.4.05 or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for adding Disk Drive (in order to expand a storage capacity)

- A procedure for adding the Disk Drive to a vacant slot of the subsystem is shown below.
- When an addition of the additional subsystem is necessary because of insufficient vacant slots, add the additional subsystem first following the procedure explained in the item shown below. (Refer to "1.3 Mounting on Rack Frame" (ADD 01-0100).)
- When the Disk Drives are additionally added to the vacant slots of #2 to #4 of the RKM/RKS, #2 to #4 of the RKAJ corresponding to the unit ID #0 connected to the RKH and #3 to #4 of the RKXS, it cannot be performed with the subsystem power turned off.
  Perform the addition of the Disk Drives online (in order to expand the storage capacity) according to (2-1), and be sure to check that the system copy starts automatically to the added Disk Drives and it is completed. (‡1)
  When the system copy is completed, "I141xy (or I141HH) System copy completed (Unit-x, HDU-y)" is displayed in the Information Message on WEB. (Refer to "Microprogram '3.2 Procedure for checking the status of system copy complete' (MICRO 03-0020)".)
- It is recommended to backup data of all LUs to provide against an emergency because user data may be lost if a wrong operation is done.

The work for addition varies depending on whether the work is done while the power is turned on or off (with the subsystem power turned off).



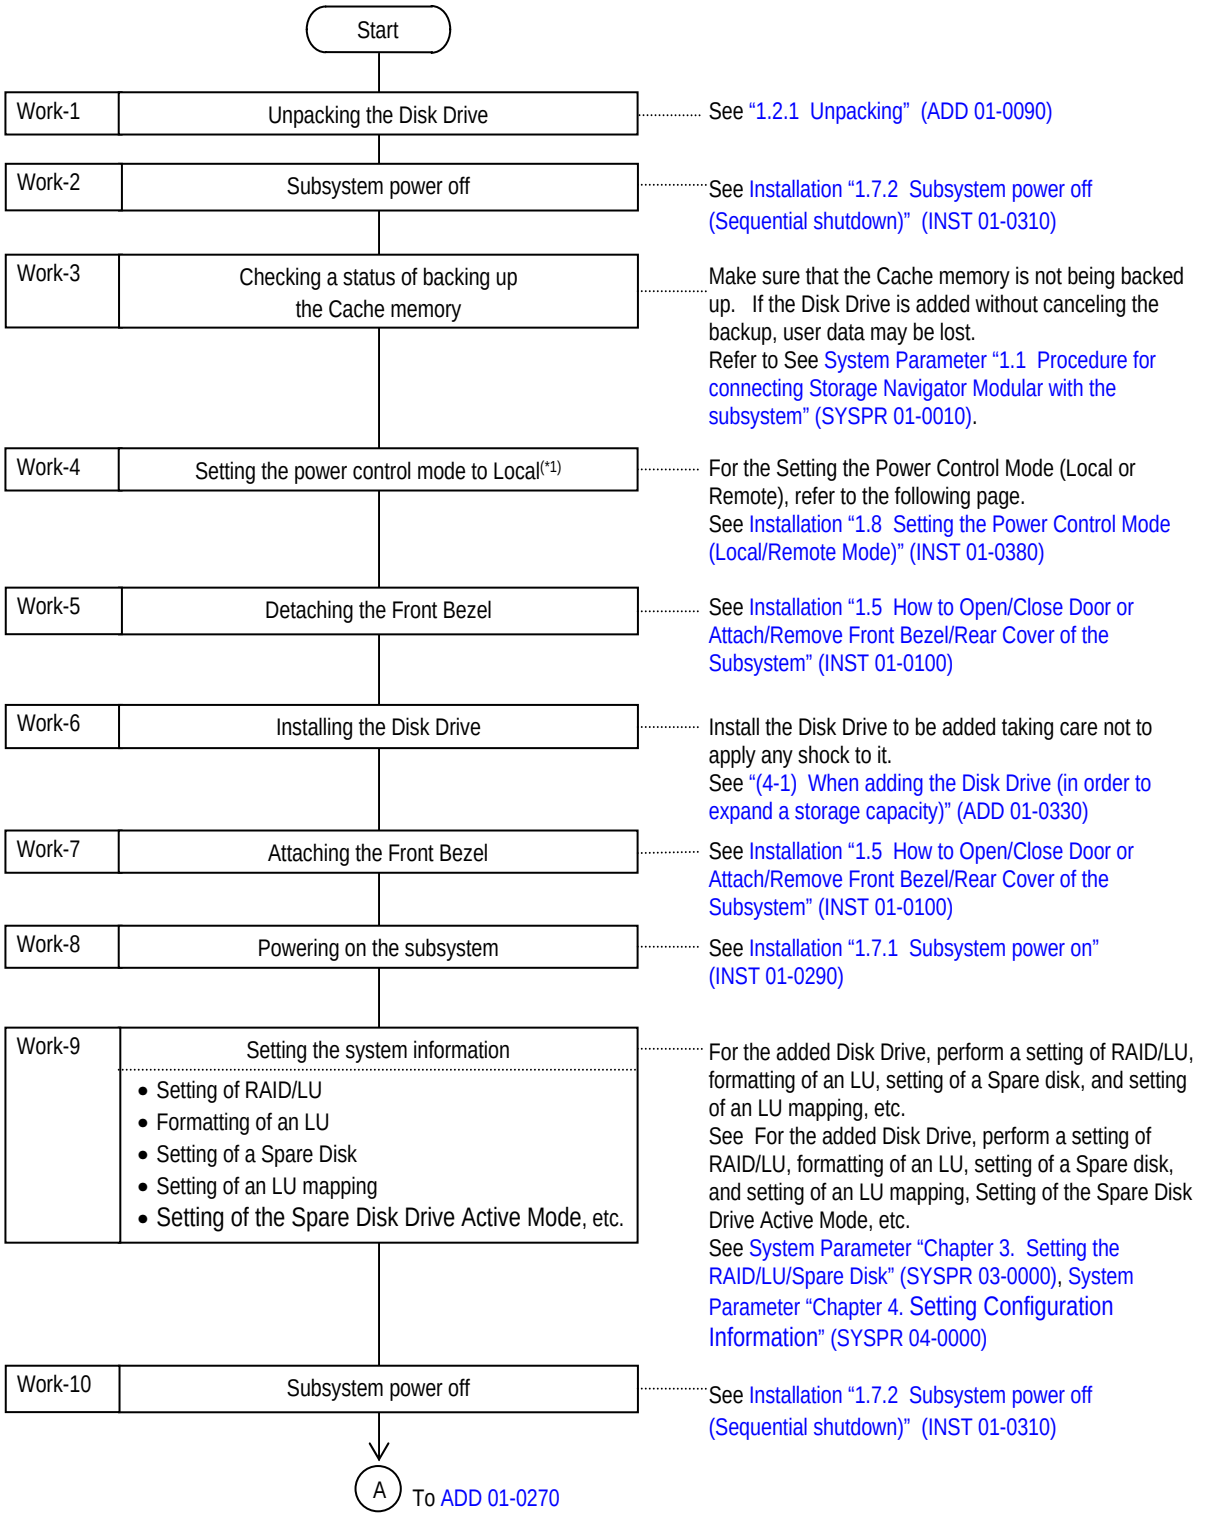
- Procedure for adding a Disk Drive while the power is turned online :
  See "(2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0250).
- Procedure for adding the Disk Drives offline (with the subsystem power turned off) :
  See "(2-2) Procedure for adding the Disk Drives offline (with the subsystem power turned off)" (ADD 01-0260).

Copyright © 2005, 2006, Hitachi, Ltd.

(2-1) Procedure for adding Disk Drive (in order to expand a storage capacity) while the subsystem power is online

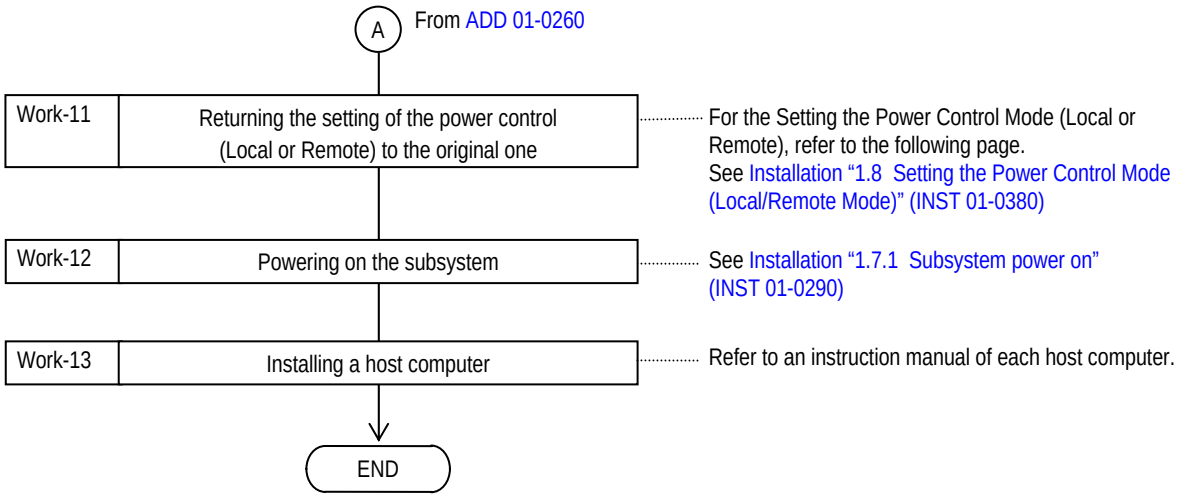
A procedure for adding the Disk Drive (in order to expand a storage capacity) without shutting down the subsystem is shown below.

NOTE : When adding the two or more Disk Drives in the installation of the Disk Drives (Work-4), checking the restoration of the system information (Work-5) for the each Disk Drive one by one, and then install the Disk Drives one by one.



‡1 : The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive.
Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).

Copyright © 2005, 2006, Hitachi, Ltd.



(2-2) Procedure for adding the Disk Drives offline (with the subsystem power turned off)

A procedure for adding the Disk Drive (in order to expand a storage capacity) after turning off the subsystem power is shown below.

*1 : When the subsystem power control works interlocking with the UPS, etc., make an adjustment so that the power is supplied to it.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, Hitachi, Ltd.

(3) Procedure for replacing Disk Drive (in order to expand a storage) capacity

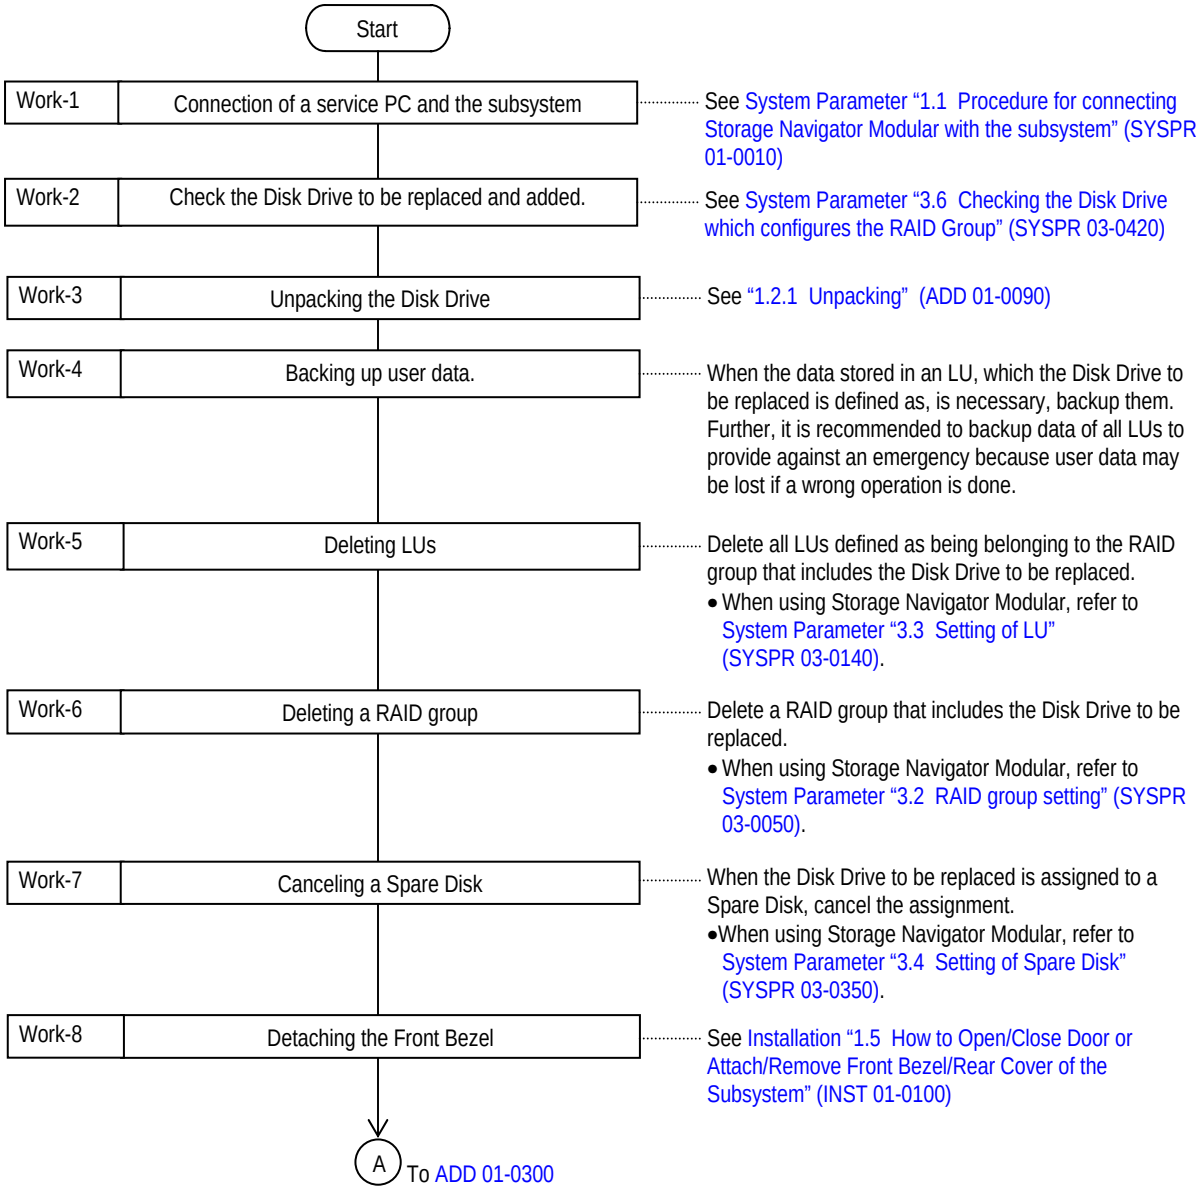
- A procedure for replacing the Disk Drive installed in the subsystem with the Disk Drive having a larger capacity is shown below.
- When replacing two or more Disk Drives, be sure to replace them one by one in order of location.
- When the Disk Drives #0 to #4 of the RKM/RKS/RKXS or the Disk Drives #0 to #4 of the RKAJ corresponding to the unit ID #0 connected to the RKH are added by replacement, it cannot be performed with the subsystem power turned off. Perform the replacement of the Disk Drives online (in order to expand the storage capacity) according to (2-1), and be sure to check that the system copy starts automatically to the added Disk Drives and it is completed(‡1).
  When the system copy is completed, "I141xy (or I141HH) System copy completed (Unit-x, HDU-y)" is displayed in the Information Message on WEB. (Refer to Microprogram, "3.2 Procedure for checking the status of system copy complete" (MICRO 03-0020).)
- It is recommended to backup data of all LUs to provide against an emergency because user data may be lost if a wrong operation is done.

The procedure for the replacement varies depending on whether the replacement is performed while the power is turned online or offline (with the subsystem power turned off).

- Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online .... "(3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online" (ADD 01-0290)
- Procedure for replacing the Disk Drive (in order to expand a storage capacity) while the subsystem power is offline (with the subsystem power turned off)..... "(3-2) Procedure for replacing the Disk Drive (in order to expand a storage capacity) while the subsystem power is offline (with the subsystem power turned off)" (ADD 01-0310)

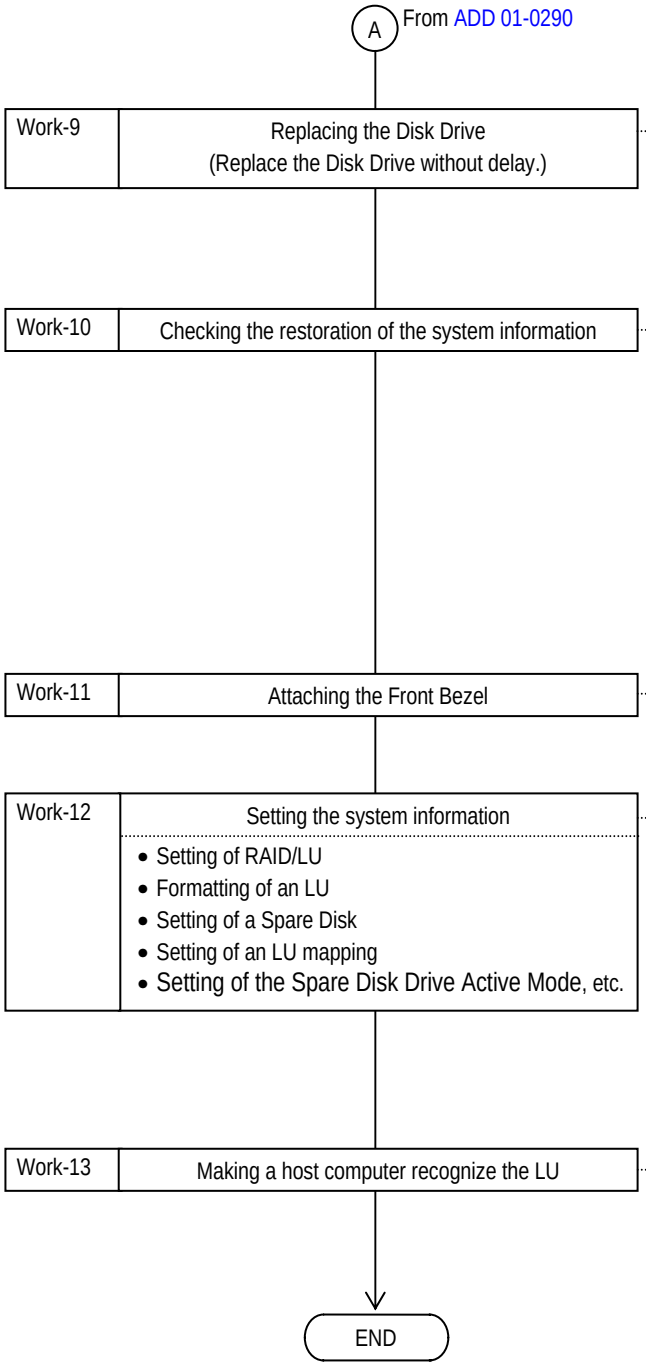
‡1 : The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive.
Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the

Copyright © 2005, 2006, Hitachi, Ltd.



system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).

Copyright © 2005, 2006, Hitachi, Ltd.

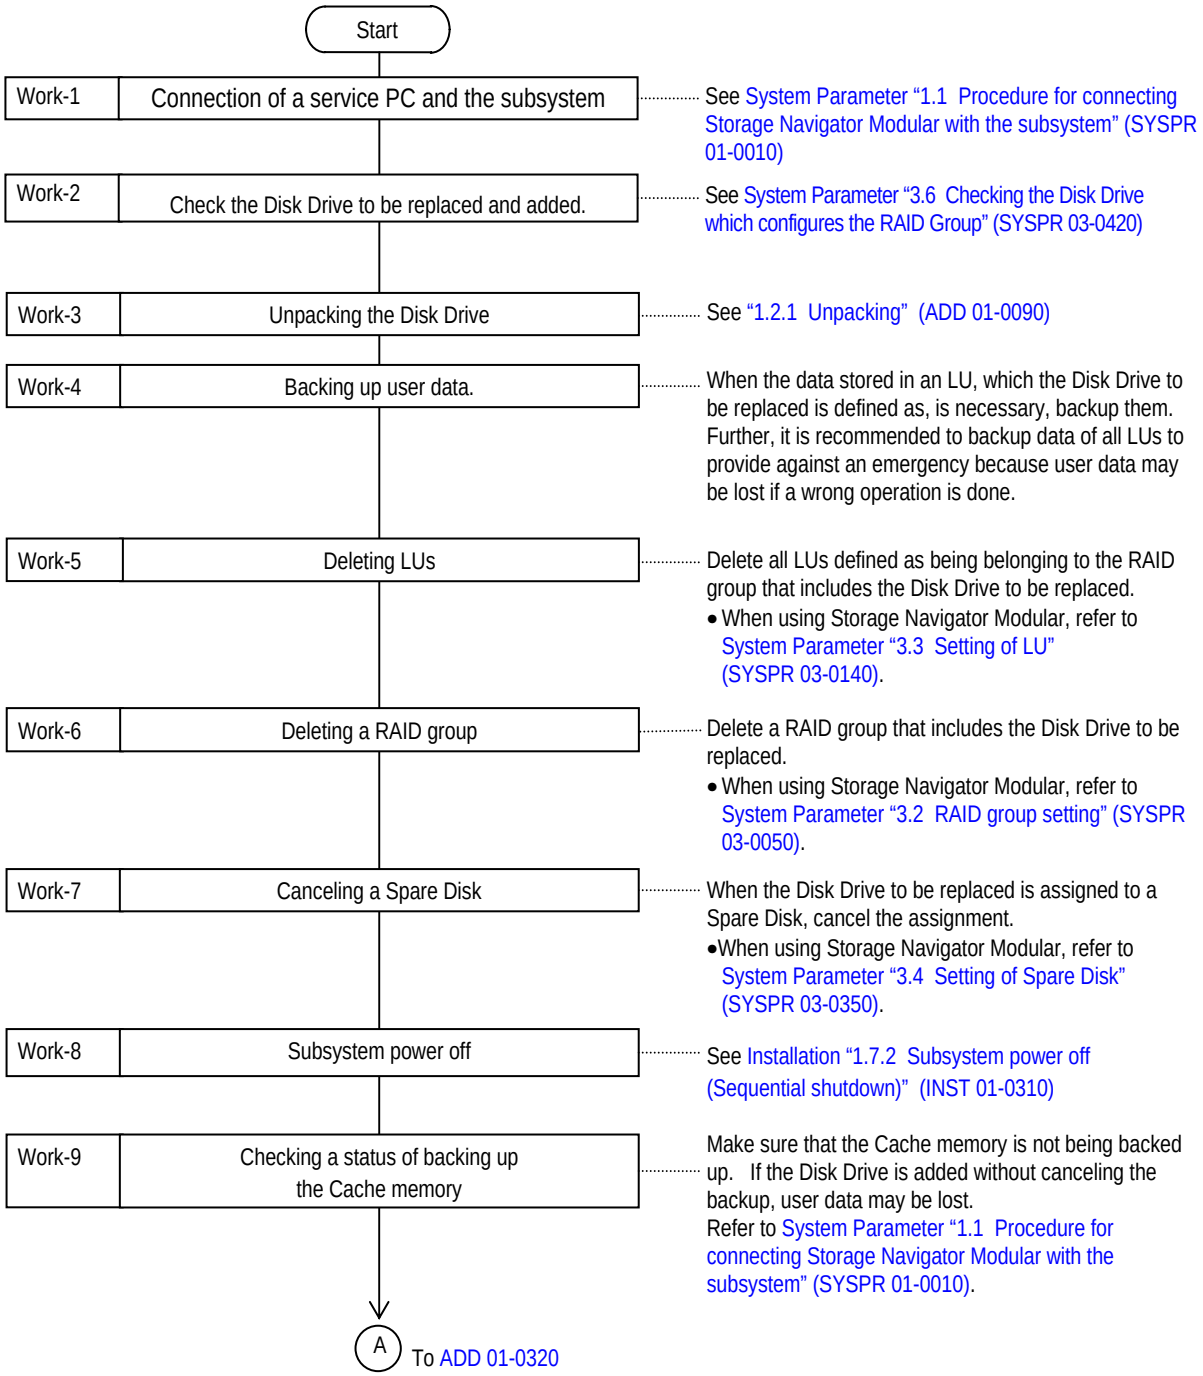


(3-1) Procedure for replacing Disk Drive (in order to expand a storage capacity) while the subsystem power is online

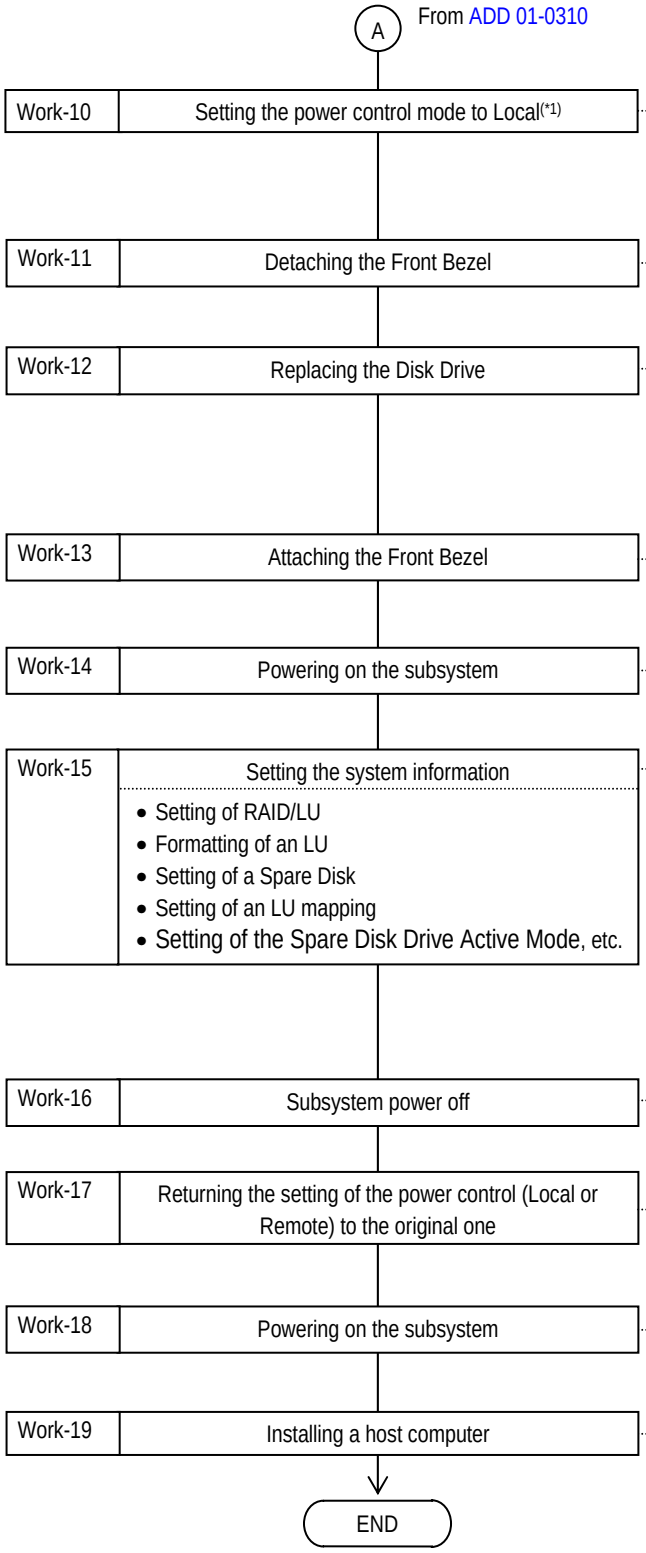
A procedure for replacing the Disk Drive (in order to expand a storage capacity) without shutting down the subsystem is shown below.

NOTE : When two or more Disk Drives are added by the replacement work of the Disk Drives on Work-7, it is necessary to check the restoration of the system information on Work-10 for each unit and install the Disk Drives one by one.

Copyright © 2005, 2006, Hitachi, Ltd.



‡1: The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive.
Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).



Copyright © 2005, 2006, Hitachi, Ltd.

(3-2) Procedure for replacing the Disk Drive (in order to expand a storage capacity) while the subsystem power is offline (with the subsystem power turned off)

A procedure for replacing the Disk Drive (in order to expand a storage capacity) after powering off the subsystem is shown below.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : When the subsystem power control works interlocking with the UPS, etc., make an adjustment so that the power is supplied to it.

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Installing/removing Disk Drive

When installing/removing the Disk Drive in the addition or subtraction of it, follow the procedure shown below.

- Procedure for adding a Disk Drive (RKM/RKAJ /RKS):
  See Item "(4-1) When adding the Disk Drive (in order to expand a storage capacity)" (ADD 01-0330).
- Procedure for replacing a (RKM/RKAJ /RKS):
  See Item "(4-2) When replacing the Disk Drive (in order to expand a storage capacity)" (ADD 01-0350).

(4-1) When adding the Disk Drive (in order to expand a storage capacity)

Perform the following operations (a) to (d) for each of the Disk Drives to be added (in order to expand a storage capacity) one by one.

(a) Pull the dummy (Disk Drive), and remove it.

There are two types of the dummies (Disk Drives), and the installation methods are different respectively.

- The dummy (Disk Drive) of which the external appearance is similar to the Disk Drive
  There is no label attached on the handle part.
  Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the dummy (disk drive) by pulling it.
- The dummy (Disk Drive) of which the external appearance is all black
  This is the dummy (Disk Drive) of the resin all-in-one molded piece (black) with no stopper and handle part.
  Pressing the latch (round dent) at the lower part of the dummy (Disk Drive), hold the upper part and pull it out, and then remove it.

Because the dummy (disk drive) that has been removed will be used when the added Disk Drive is de-installed, keep it in custody with its handle returned to its original state (locked by the stopper).

Keep the dummy (Disk Drive) similar to the Disk Drive in the status that the handle is returned to the original (the stopped is locked).

NOTE : Exteriors of the Disk Drive and dummy (Disk Drive) are similar to each other. Be careful not to install or remove a wrong one.
Disk Drive : The label to display the model name and the revision is attached on the handle part.

(b) Install the Disk Drive to be added taking care not to apply any shock to it (see Figure 1.4.4.1).

(i) Fit the Disk Drive in the guide rail of the RKAJAT and slide it in the direction shown by the arrow.

(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.

(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) When the Disk Drive has been added while the subsystem power is on, the ALARM LED on the Disk Drive will go out a little while after the Disk Drive has been inserted.
Make sure that the LED goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

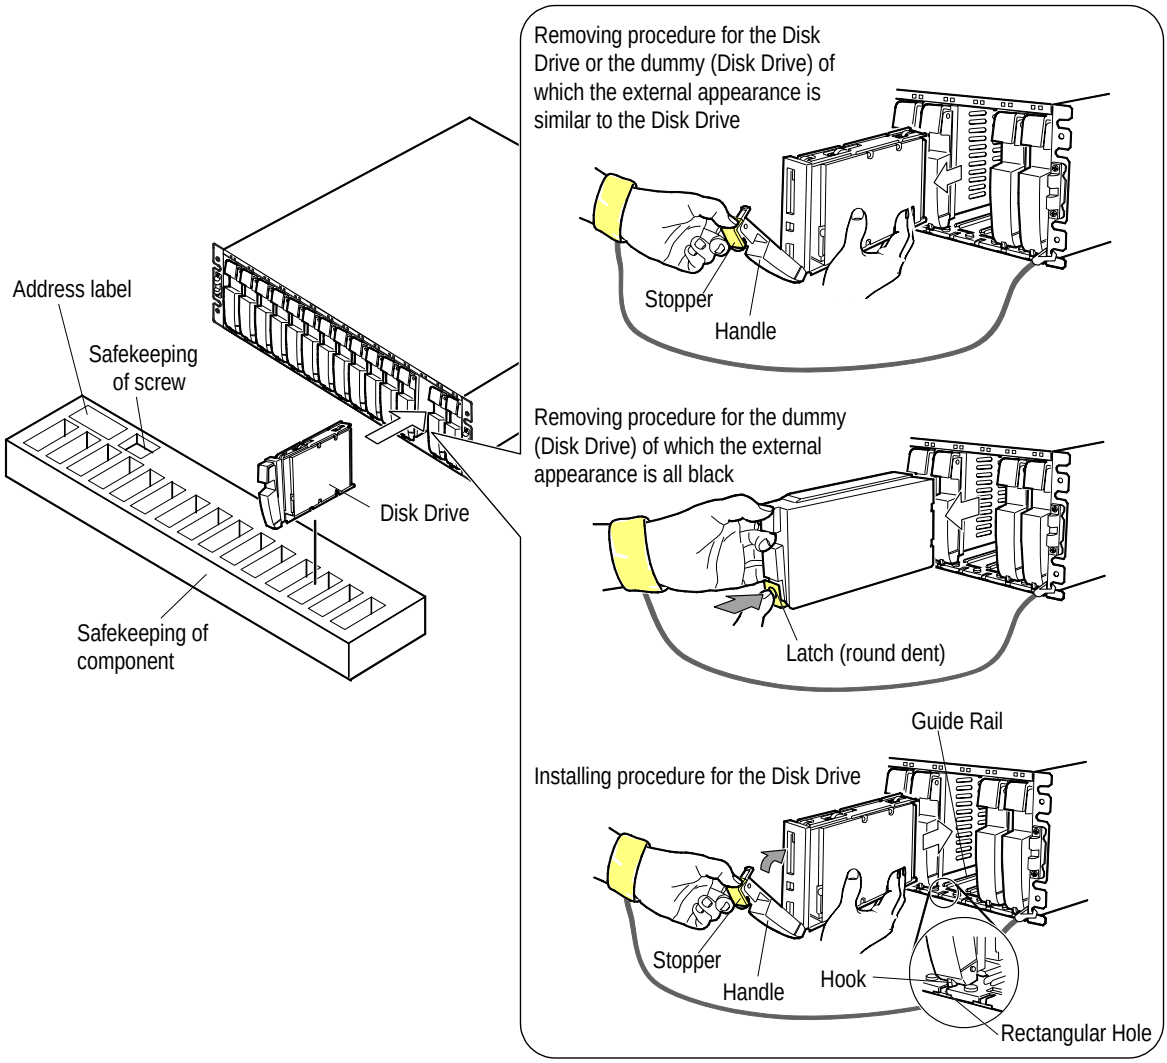


Figure 1.4.4.1 Removing the Dummy (Disk Drive) and Installing the Disk Drive

Copyright © 2005, 2006, Hitachi, Ltd.

(4-2) When replacing the Disk Drive (in order to expand a storage capacity)
Perform the following operations (a) and (d) for each of the slots, where the Disk Drive is to be replaced, one by one.

(a) Pull the stopper at the upper part of the Disk Drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive by pulling it out taking care not to apply a shock to it. (see Figure 1.4.4.2).
When using the removed Disk Drive for the purpose of addition to another disk array unit, keep it in custody with its handle returned to its original state (locked by the stopper) taking care not to apply a shock to it.

(b) Install the Disk Drive to be added taking care not to apply any shock to it (see Figure 1.4.4.2).
(i) Fit the Disk Drive in the guide rail of the RKAJAT and slide it in the direction shown by the arrow.
(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.
(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) When the Disk Drive has been added while the subsystem power is on, the ALARM LED on the Disk Drive will go out a little while after the Disk Drive has been inserted.
Make sure that the LED goes out.

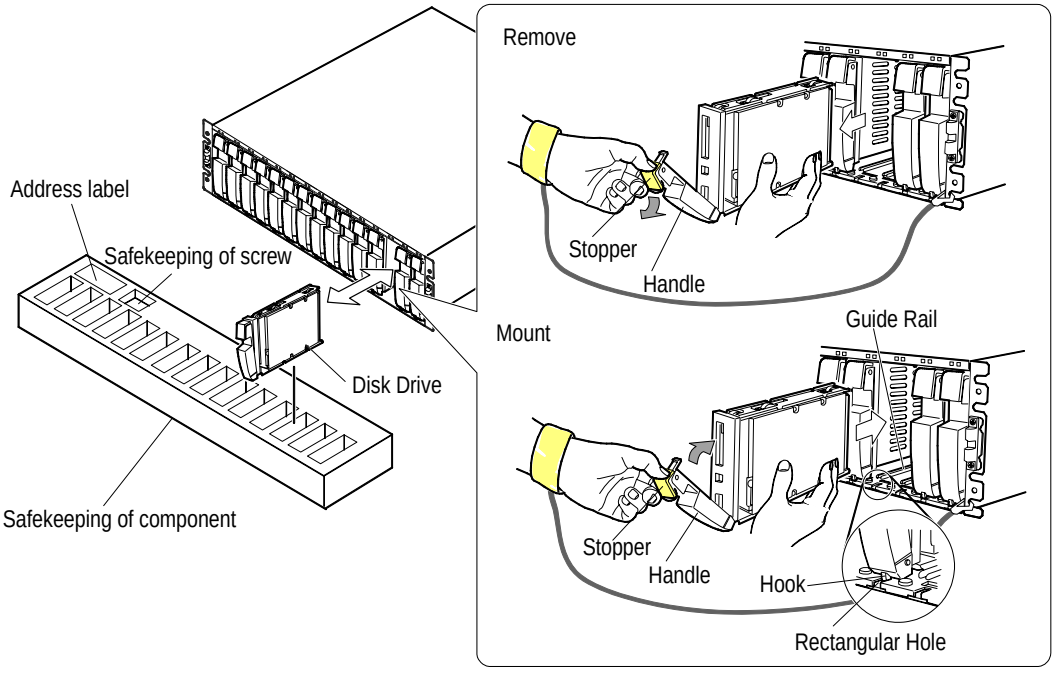

Figure 1.4.4.2 Operation of Mount/Remove the Disk Drive

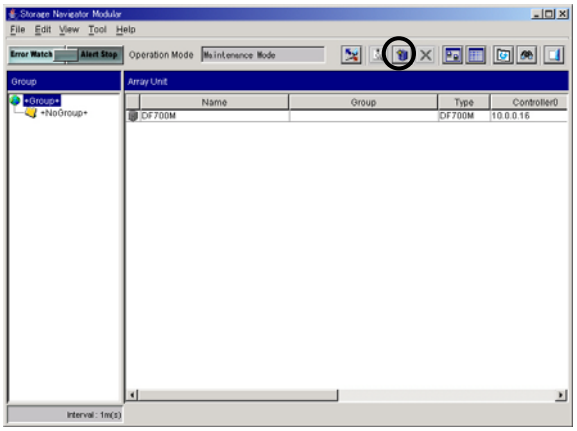


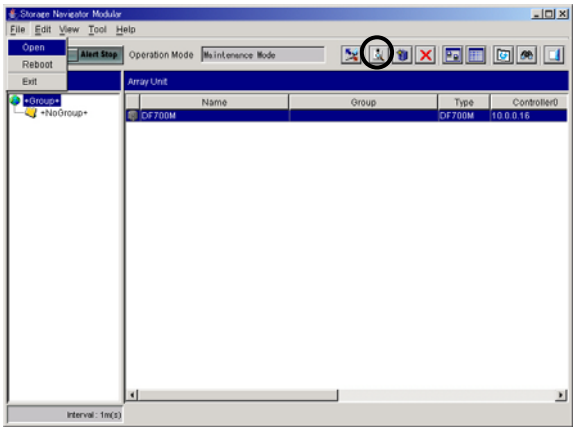
Copyright © 2005, Hitachi, Ltd.

(5) Restoring the system information

A restoration of the system information can be done by using either of the Storage Navigator Modular.

(5-1) Restoring the system information using Storage Navigator Modular

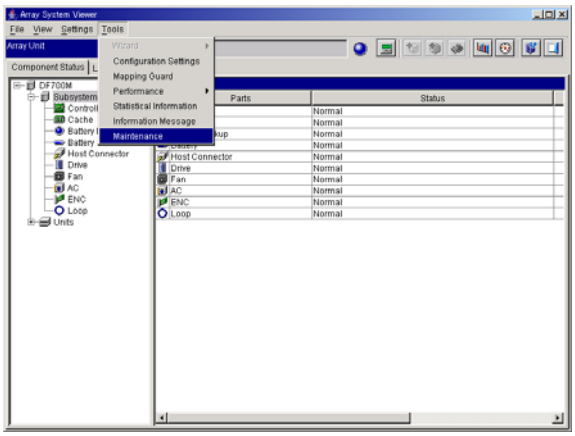
(a) Start Storage Navigator Modular, position the focus ([ ]) on the [Disk Array Subsystem Registration] ([ ]) on the tool bar by pressing the [Tab] key, and then press the [Ctrl], [Shift], and [E] keys at the same time.



Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

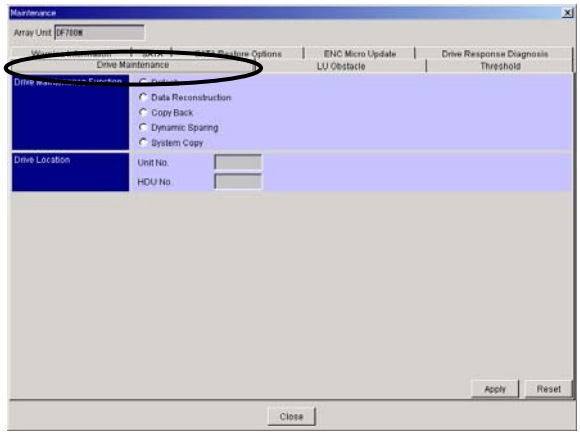
(b) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

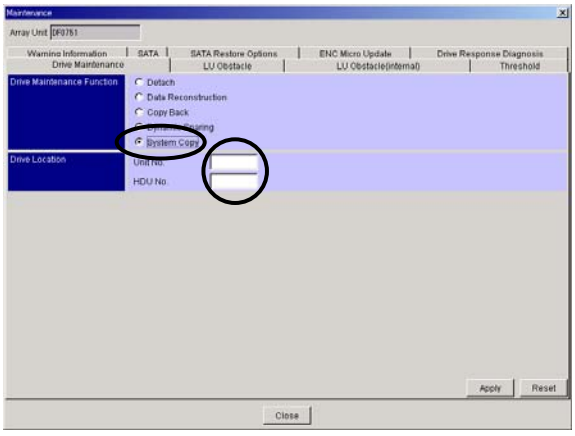


- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

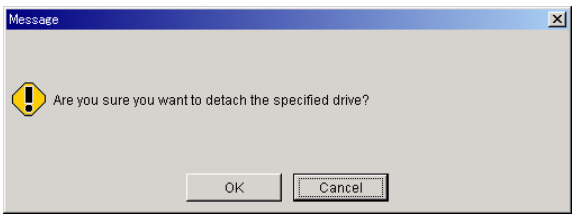


Copyright © 2005, Hitachi, Ltd.

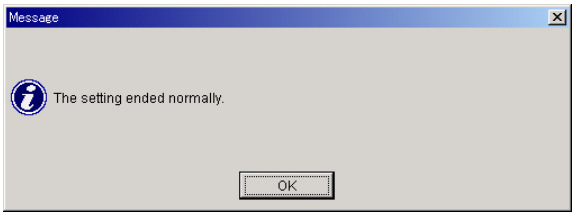


(c) Select [Tools] – [Maintenance] in the unit window.

(d) Click the [Drive Maintenance] tab.



(e) Select the [System Copy] and set the number of the Disk Drive that has been added.



(f) Click the [Apply] button.

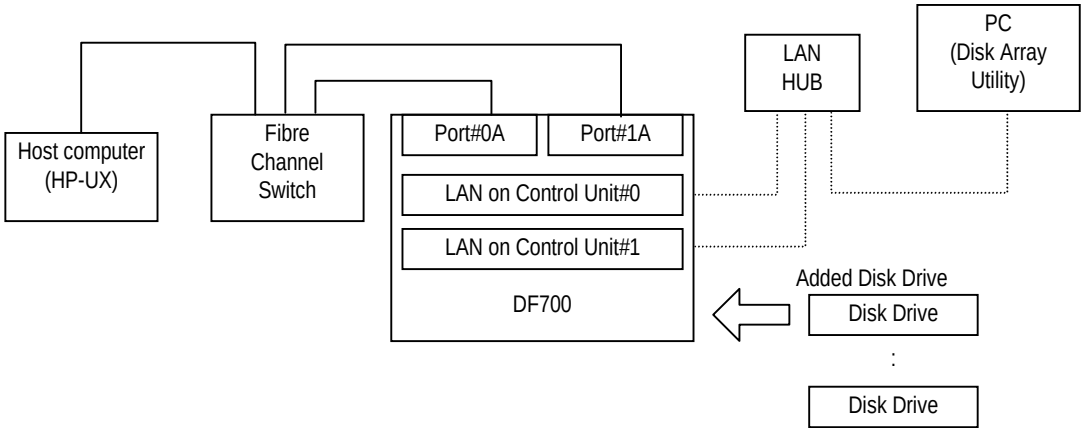
Copyright © 2005, Hitachi, Ltd.

(g) The confirmation window is display. Click the [OK] button.

(h) A window showing that the setting has been completed is displayed.
Press the [OK] button.

(i) When “System copy started (Unit-x, HDU-y)” and “System copy completed (Unit-x, HDU-y)” are displayed at the “Information Message” in the WEB window, the system copy has been completed.

Copyright © 2005, Hitachi, Ltd.



(6) Making a host computer recognize an LU while the subsystem power is on

< An example of the case of a host in which HP-UX is installed >

An example of the procedure to make the Disk Drive added while the subsystem power is on recognized by the host computer in which the HP-UX is installed is shown below.

(a) System configuration

LAN connect the PC, in which the Storage Navigator Modular is installed.

(b) Operation procedure

(i) Make sure that the host computer and the DF700 are in the Ready status. (I/Os host computer can be continued)

(ii) Install the Disk Drives to be added in the DF700.

(iii) Set a new RAID group for the installed Disk Drives.

(iv) Set (an) LU(s) newly for the RAID group which has been set in step (iii).

(v) Format the LU(s) which has been set in step (iv).

(vi) Issue the "ioscan -nfC disk" command from the host computer to verify that the DF700 has been recognized by the host computer. (However, the status of the newly added LU is displayed as NO-NW.)

(vii) Execute the "insf -e" command from the host to create a device file of the LU which has been newly added.

(viii) Issue the "ioscan -nfC disk" command from the host computer to verify that the DF700 has been recognized by the host computer. (The status of the newly added LU is displayed as CLAIMED.)

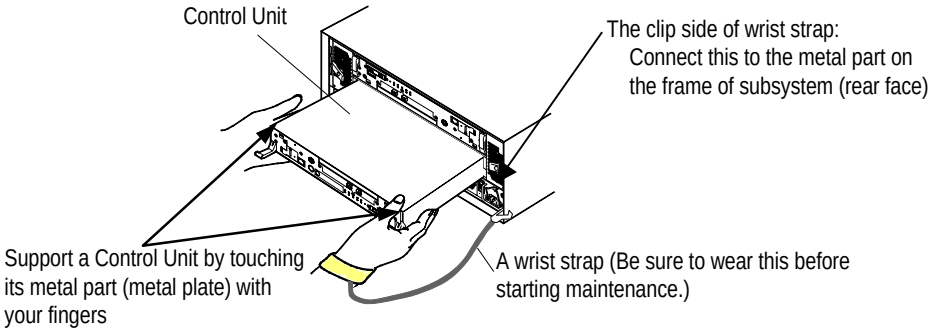
(ix) Execute a creation of a file system by creating the volume group and logical volume for the newly added LU from the host computer.

By operating as explained above, the LU(s) which has been newly created becomes able to be used by the host computer.

Copyright © 2005, Hitachi, Ltd.

1.4.4 Adding a Cache Unit

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.

Copyright © 2005, Hitachi, Ltd.

<Working Procedure>

(1) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(2) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(3) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(4) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(5) Remove the Control Unit by pulling it out toward you.

(6) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(7) Remove the Cache Unit.
Place the removed Cache Unit in the place where anti-static measures are taken.

Copyright © 2005, 2006, Hitachi, Ltd.

(8) Install the Cache Unit in the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Remove the dust cover when installing the Cache Unit.
• For the RKM, insert the Cache Units in the cache slots in regular order starting from the slot #0.
• In the case of the RKH, if the Cache memories are not installed in the slot #0 and the slot #1, the blockade of the Control Unit occurs.
Be sure to install the Cache memories in the slot #0 and the slot #1.
• Install the Cache Units by the set of two in the slot #0 and #1 and the slot #2 and #3.
• For the RKH, install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively, and make the capacity and the installation position of the Control Unit #0 and the Control Unit #1 the same.

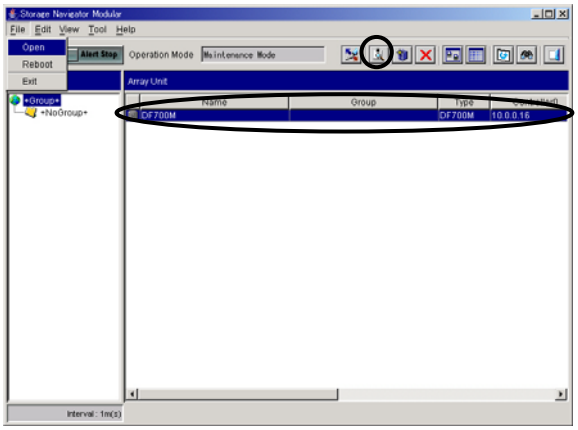
(9) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(10) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(11) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

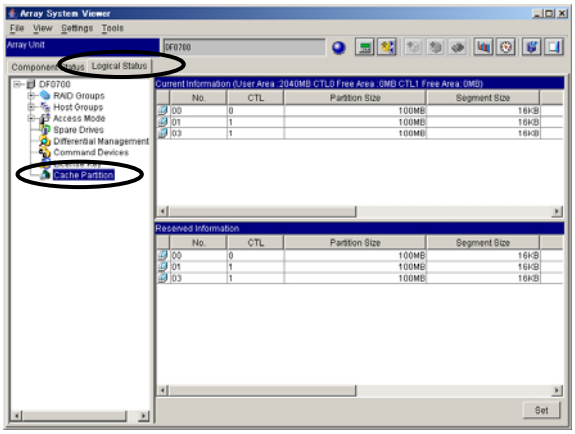
(12) Turn on the AC Power Unit Switch of the both Power Units.
(13) Turn on the main switch.
(14) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(15) Check that the READY LED (green) on the front of the Basic Chassis lights up. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).



‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

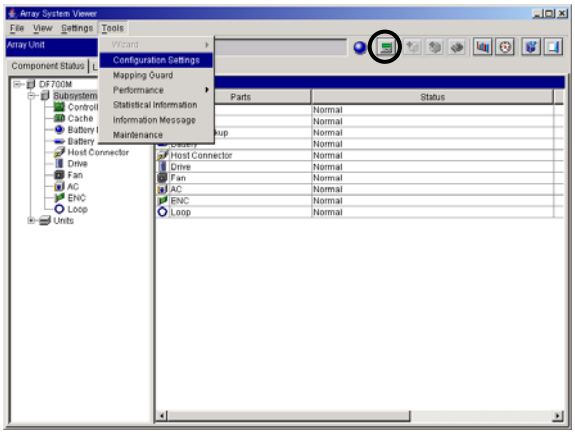
Copyright © 2005, 2006, Hitachi, Ltd.

When the priced option, Cache Partition Manager, is used, there is a possibility that you must have the customer/SE update the setting of the parameter of the priced option, Cache Partition Manager, after adding the Cache memory.
Check the status of the subsystem according to the following procedure.



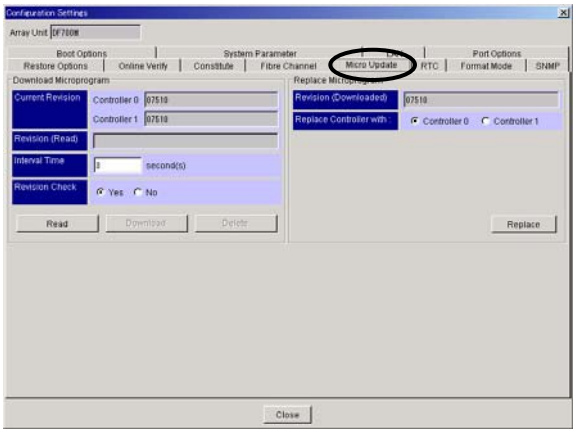
(16) Connect the LAN cross cable to the LAN connector for the maintenance of the subsystem (refer to Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000)).
(17) Connect Storage Navigator Modular.
(a) Be careful of the connection positions of the cables because the installation directions are different in the Control Unit #0 and #1.
Refer to System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050) for the changing method to the maintenance mode.
(b) Click the icon of the array subsystem that you want to set from the main window. There are the following three types of the selection methods.
• Select [File] - [Open].
• Double click the icon of the array subsystem that you want to set.
• Click the [: Open] button.

NOTE : Check whether the LAN port number is not changed when the main window is not displayed even if you click on the icon of the array subsystem (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)). Execute it again after using the changed LAN port number.

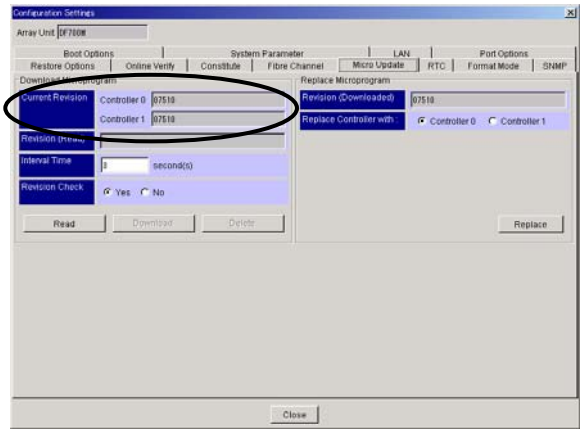


Copyright © 2005, 2006, Hitachi, Ltd.

(18) Click [Logical Status] in the unit window, and check that the icon of the priced option, Cache Partition Manager, is displayed (the priced option, Cache Partition Manager, is unlocked) in the tree view.
The addition work of the Cache memory is completed when the icon of the priced option, Cache Partition Manager, is not displayed in the tree view.
When the icon of the priced option, Cache Partition Manager, is displayed (the priced option, Cache Partition Manager, is unlocked) in the tree view, there is a possibility that you must update the setting of the parameter of the priced option, Cache Partition Manager, to use the Cache memory. Check whether it is necessary or not according to the following procedure.

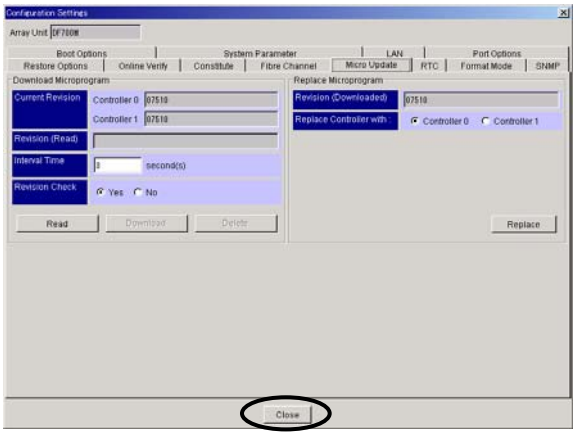


(19) Select [Tool] – [Configuration Setting] in the unit window, or click [: Configuration Setting].



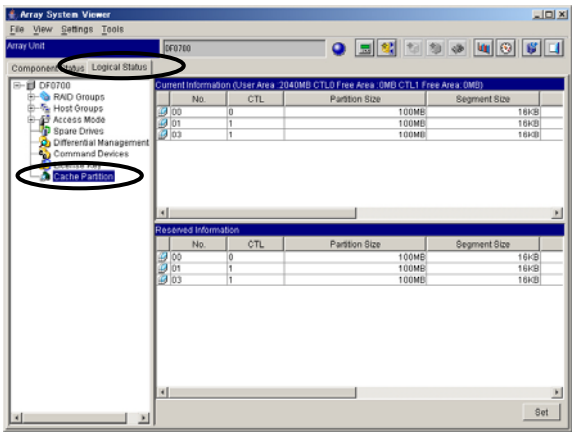
Copyright © 2005, 2006, Hitachi, Ltd.

(20) Click the [Micro Update] tab.

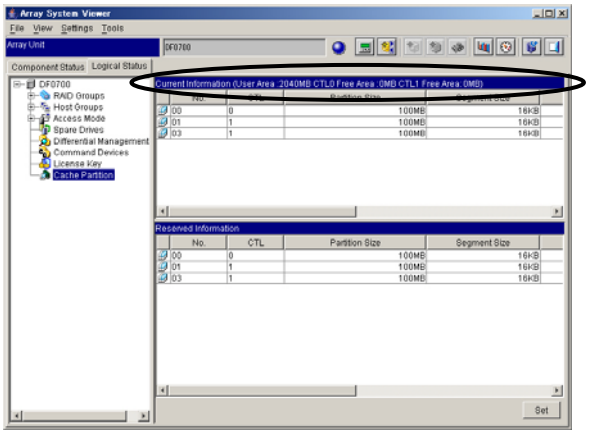


(21) Check [Current Revision] of [Download Microprogram].

- When the revision of the microprogram is 0770/A or less
  Request the customer/SE to update the setting of the parameter of the priced option, Cache Partition Manager.
  This is the end of the addition work of the Cache memory.
- When the revision of the microprogram is 0770/A or later
  Continue the confirmation work according to the following procedure.



(22) Click the [Close] button of the [Configuration Setting] window.



Copyright © 2005, 2006, Hitachi, Ltd.

(23) Click the [Logical Status] tab in the unit window, and then click the [Cache Partition] icon of the tree view.

(24) Check [Current Information] of the list view.

- When [CTL0 Free Capacity] and [CTL1 Free Capacity] are 0 M byte
  The size of the master partition is extended by adding the Cache memory.
  You have the customer/SE set the priced option, Cache Partition Manager, and then request the customer/SE to update the setting of the parameter if necessary.
  This is the end of the addition work of the Cache memory.
- When [CTL0 Free Capacity] and [CTL1 Free Capacity] are not 0 M byte
  This indicates that there is an unused area in the Cache memory.
  Although the Cache memory is added, the partition size is not extended because the partitioning functions (partition and size change) of the Cache memory are being used (‡1).
  Request the customer to update the setting of the parameter of the priced option, Cache Partition Manager.
  This is the end of the addition work of the Cache memory.

‡1 : • Even one sub-partition exists or it is reserved.
• The subsystem is the dual controller configuration, and there is even one different size among four sizes; the master partition 0 in [Current Information], the master partition 1, the master partition 0 in [Reservation Information] and the master partition 1.

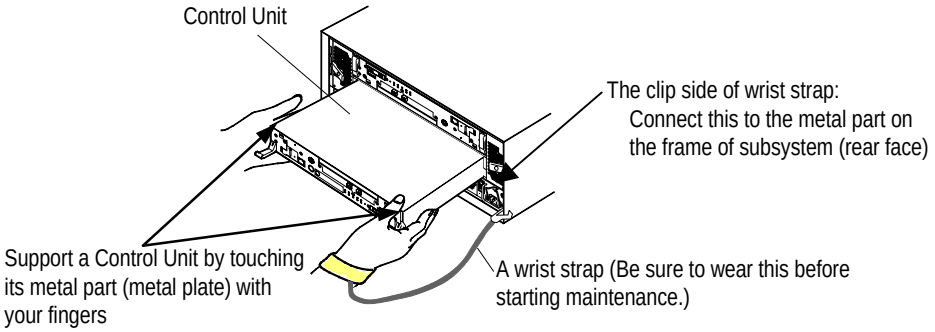
1.4.5 Adding a NAS Interface Board

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.
• Obtain the RKNAS when adding NAS Interface Board.

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Collect Simple Trace and Constitution Information (Port Information). (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(2) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(3) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(4) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.
(5) Remove the all cables connected to the Control Unit.

NOTE :
- When the cable cannot be removed easily, do not pull it by force. Besides, the cable can be damaged if it is bent upward or downward forcibly.
- When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(6) Remove the Control Unit by pulling it out toward you.
(7) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(8) Remove two host connectors for 2 G bps from the Control Unit.
- Pull it out after raising the lever for Type 1.
- Pull it out after pushing down the lever toward for Type 2.

After this, hand over the removed two host connectors for 2 G bps to the customer, and ask him/her to keep them carefully.

(9) Loosen the fixing screws ② (two places) of the Interface Board (or the dummy Interface Board) installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(10) Install the adding Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the Interface Board may become the inside of the Control Unit.

NOTE :
- Add the NAS Interface Board for RKH on #1 side. If interface #1 side is already used, move that board to the #0 side.
- Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1 (Refer to "Table 1.4.2 Installation position of the Interface Board" (ADD 01-0414)).

(11) Loosen the screws of the connector cover for the maintenance of the Control Unit and open it, and then attach the panel and fix it by tightening the screws.
It is not necessary to attach the panel for the RKH.
(12) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(13) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE :
- Do not catch a ENC cable, when the Control Unit for the inserted.
- The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(14) In the case of the dual control Unit composition, perform the procedure from (4) to (13) to the other Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(15) Connect the removed all cables to the Control Unit.

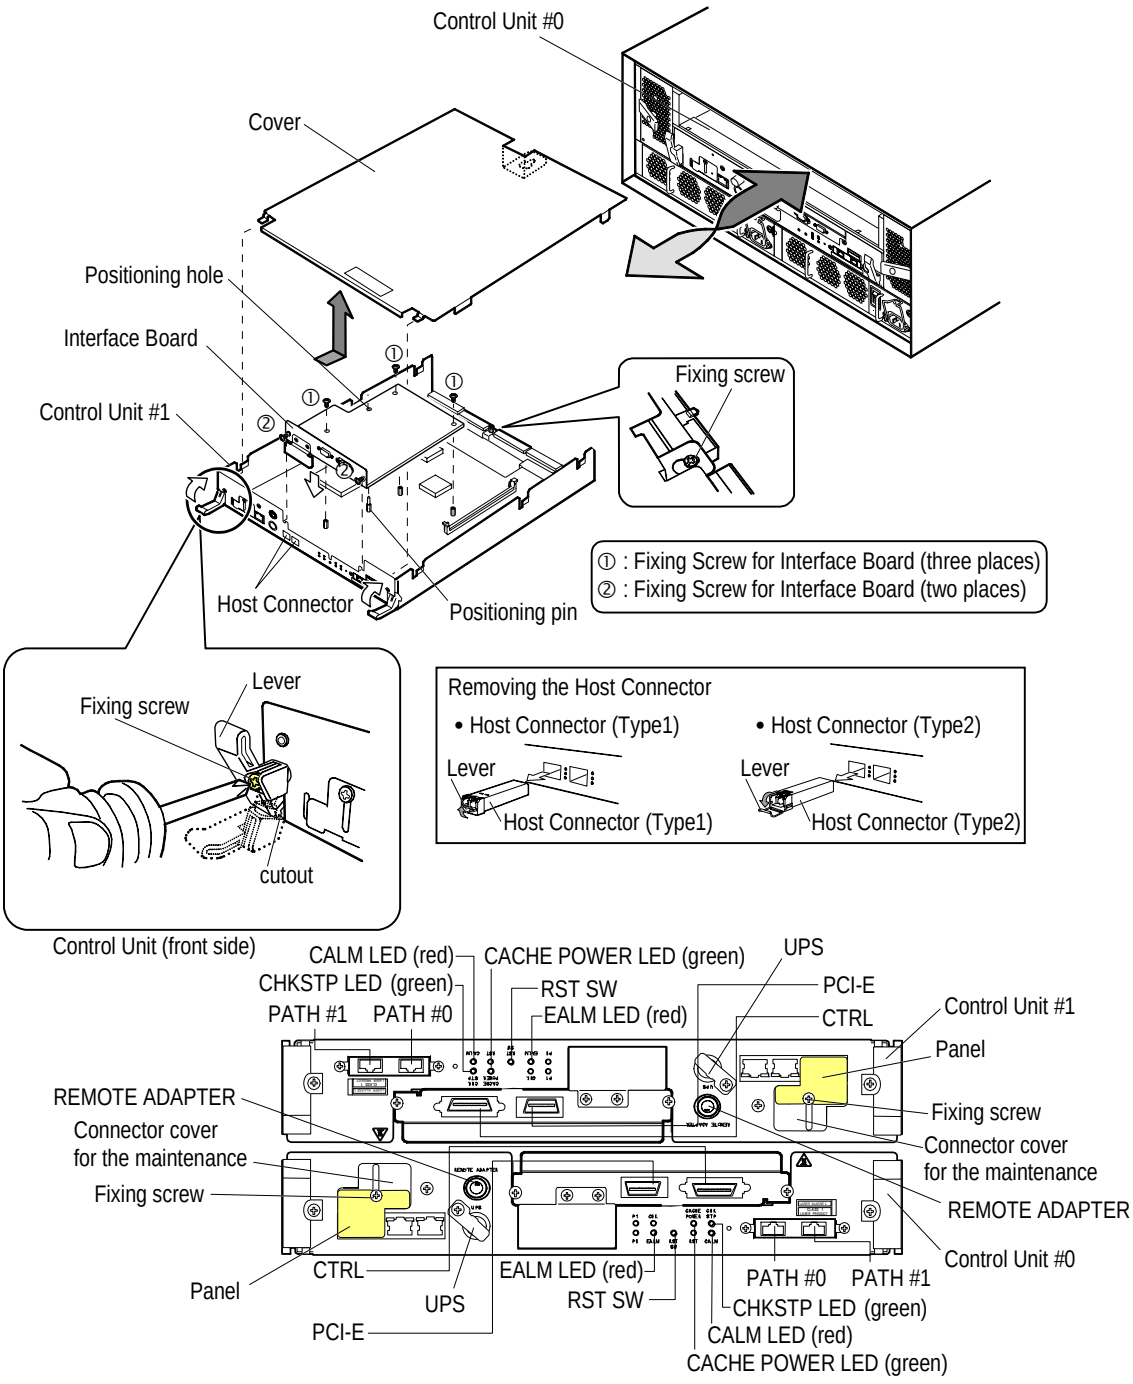
NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(16) Turn on all the AC Power Unit Switches of the RKNAS.

(17) Turn on the AC Power Unit Switch of the Power Unit on the Basic Chassis.

(18) Turn on the main switch.

(19) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).



(20) Check that the READY LED (green) on the front of the Basic Chassis lights up. The READY LED (green) on the front of the Basic Chassis may blink at high speed, for the maximum of 30 to 50 minutes (RKH: for the maximum of 40 to 60 minutes).

(21) Add the NAS Unit, and configure the system parameter (refer to "1.4.8 Adding a NAS Unit" (ADD 01-0440).)

(22) When moving the FC Interface Board from the interface #1 side to the #0 side because NAS Interface Board was removed, configure the host group and Fibre Channel port setting. (refer to System Parameter "Chapter 2 Setting Host Group/Targets" (SYSPR 02-0000), and System Parameter "4.2 (9) Setting of Fibre Channel" (SYSPR 04-0170).)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

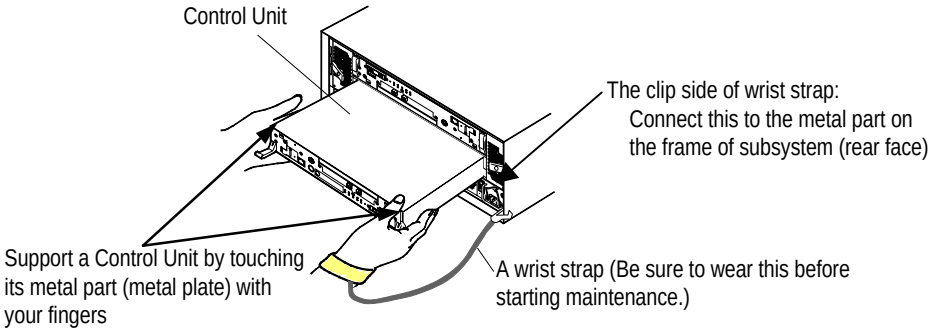
1.4.6 Adding a FC Interface Board

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and adding maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.

Copyright © 2005, Hitachi, Ltd.

(1) For the RSK/RKXS, if the Power Unit of the subsystem is turned off, turn it on (refer to Installation "1.7.1 Subsystem power on" (INST 01-0290)).
(2) Connect WEB for the RKS/RKXS (Refer to Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000)).
(3) Check that the microprogram version is 0726/A or more for the RKS/RKXS (Refer to WEB "2.2 Screen Outline" (WEB 02-0010)).
(4) If the microprogram version is less than 0726/A, perform the update installation of the microprogram whose version is 0726/A or more for the RKS/RKXS (Refer to Microprogram "Chapter 1 Installation of Microprogram" (MICRO 01-0000)).
(5) Collect Simple Trace and Constitution Information. (Refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(6) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(7) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(8) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(9) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(10) Remove the Control Unit by pulling it out toward you.

(11) Remove two host connectors for 2 G bps from the Control Unit.
• Pull it out after raising the lever for Type 1.
• Pull it out after pushing down the lever toward for Type 2.
After this, hand over the removed two host connectors for 2 G bps to the customer, and ask him/her to keep them carefully.

(12) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.

(13) Loosen the fixing screws ② (two places) of the Interface Board (or the dummy Interface Board) installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(14) Install the adding Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the Interface Board may become the inside of the Control Unit.

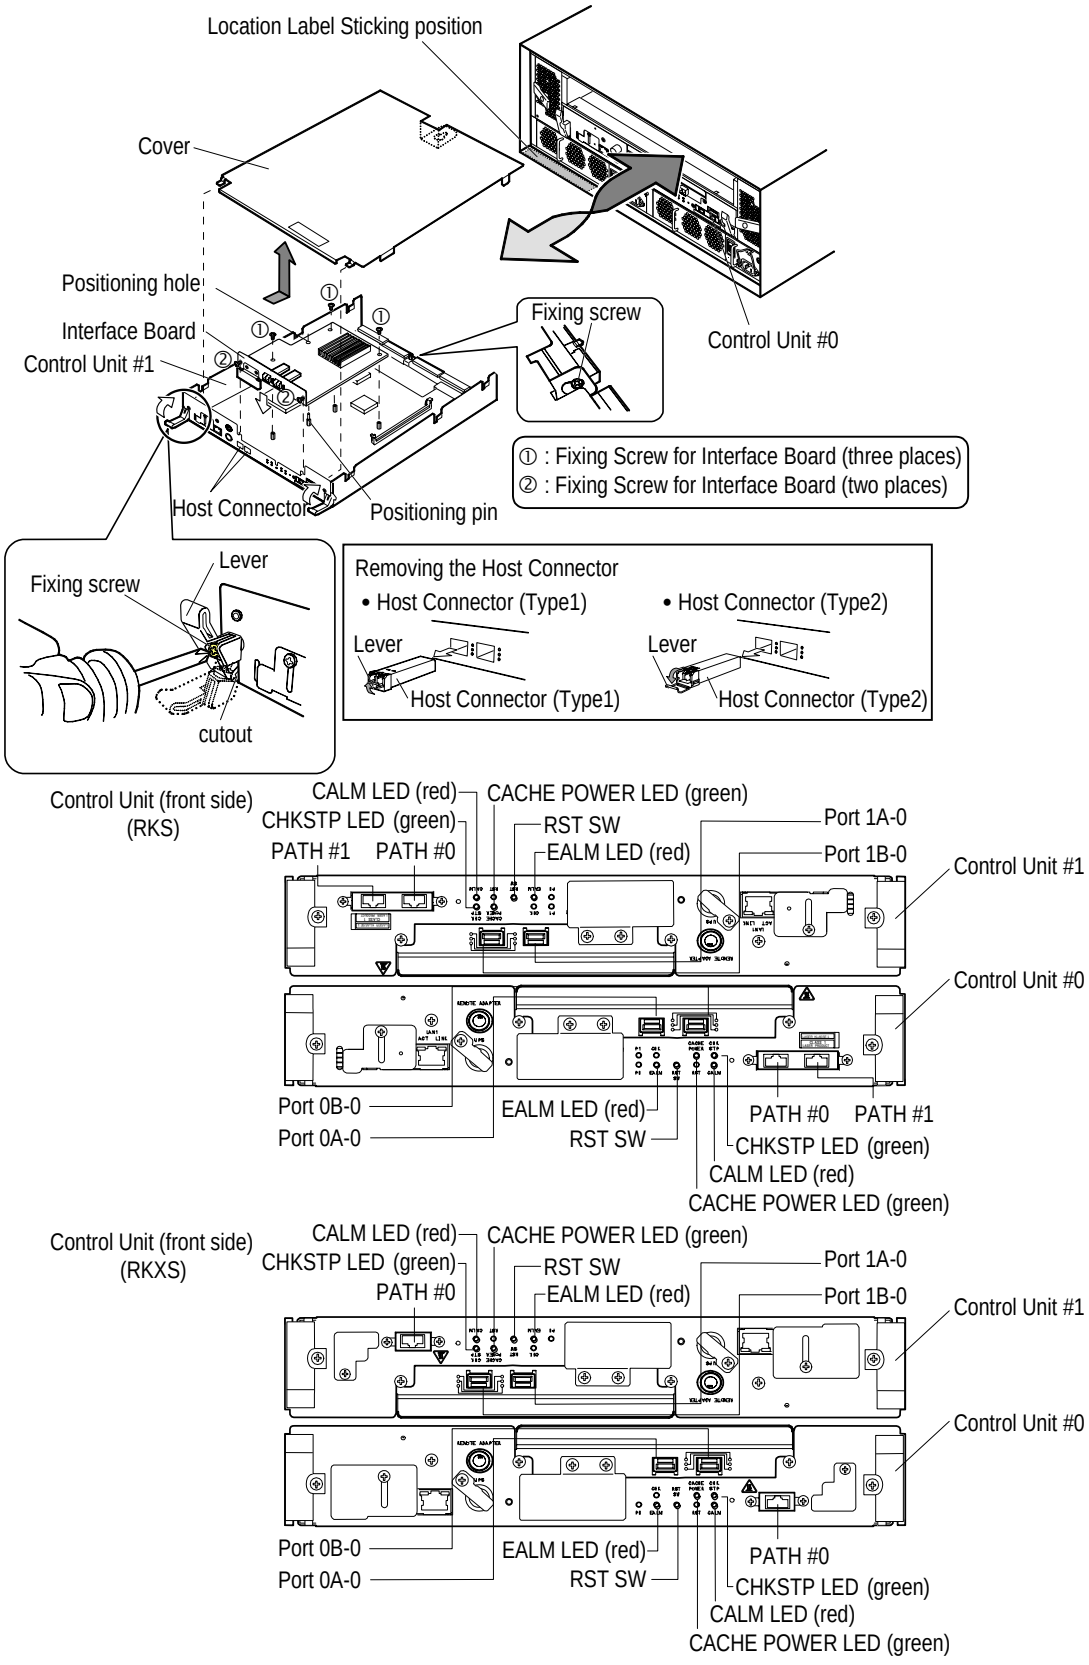
NOTE : Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1. (Refer to "Table 1.4.3 Installation position of the Interface Board" (ADD 01-0425).)

(15) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

Copyright © 2005, 2006, Hitachi, Ltd.

(16) Insert it into the position in the Control Unit with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.



(17) Stick the Location Label attached to the added interface board on the rear side of the subsystem.
(18) In the case of the dual control Unit composition, perform the procedure from (8) to (17) to the other Control Unit.
(19) Connect the removed all cables to the Control Unit.

NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(20) Turn on the AC Power Unit Switch of the both Power Units.
(21) Turn on the main switch.
(22) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(23) Check that the READY LED (green) on the front of the Basic Chassis lights up. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
(24) For the added FC Interface Board Port (Port 0B-0 and Port 1B-0 become usable for the RKS/RKXS), configure the host group and Fibre Channel port setting. (Refer to System Parameter “Chapter 2 Setting Host Group/Targets” (SYSPR 02-0000), and System Parameter “4.2 (9) Setting of Fibre Channel” (SYSPR 04-0170).)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

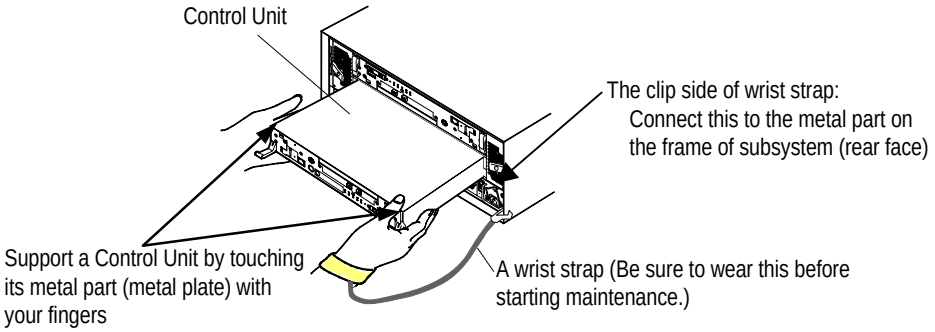
1.4.7 Adding an iSCSI Interface Board

CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE :
- For the RKH, only the Interface Board #0 can be installed as the iSCSI Interface Board.
- When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
- After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.

Copyright © 2005, 2006, Hitachi, Ltd.

(1) If the microprogram version is less than 0730/A, perform the update installation of the microprogram whose version is 0730/A or more for the RKS/RKXS. (Refer to Microprogram "Chapter 1 Installation of Microprogram" (MICRO 01-0000).)

(2) When the iSCSI Interface Board is added to the RKS, if the module revision of the Control Unit is E or less, replace it to the Control Unit whose module revision is F or more.
Check the module revision of the Control Unit with the Name Plate on the front side of the Control Unit.
When F of the REVISION on the Name Plate is not painted out, it is required to replace the Control Unit. Refer to Replacement "2.2.5 Replacing Control Unit" (REP 02-0390) for the replacement of the Control Unit.

(3) Collect Simple Trace and Constitution Information. (Refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(4) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(5) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(6) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(7) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(8) Remove the Control Unit by pulling it out toward you.
(9) Remove two host connectors for 2 G bps from the Control Unit.
• Pull it out after raising the lever for Type 1.
• Pull it out after pushing down the lever toward for Type 2.
After this, hand over the removed two host connectors for 2 G bps to the customer, and ask him/her to keep them carefully.
(10) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(11) Loosen the fixing screws ② (two places) of the Interface Board (or the dummy Interface Board) installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(12) Install the adding Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the Interface Board may become the inside of the Control Unit.

NOTE : • Add the iSCSI Interface Board for the RKH on the interface #0 side.
If necessary, remove the Interface Board installed on the #0 side and install it on the #1 side.
• Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1. (Refer to "Table 1.4.4 Installation position of the Interface Board" (ADD 01-0435).)

(13) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

Copyright © 2005, 2006, Hitachi, Ltd.

(14) Insert it into the position in the Control Unit with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(15) Connect the iSCSI Interface cables to the adding Interface Board.
Stick the Location Label attached to the added interface board on the rear side of the subsystem.

(16) In the case of the dual control Unit composition, perform the procedure from (6) to (15) to the other Control Unit.

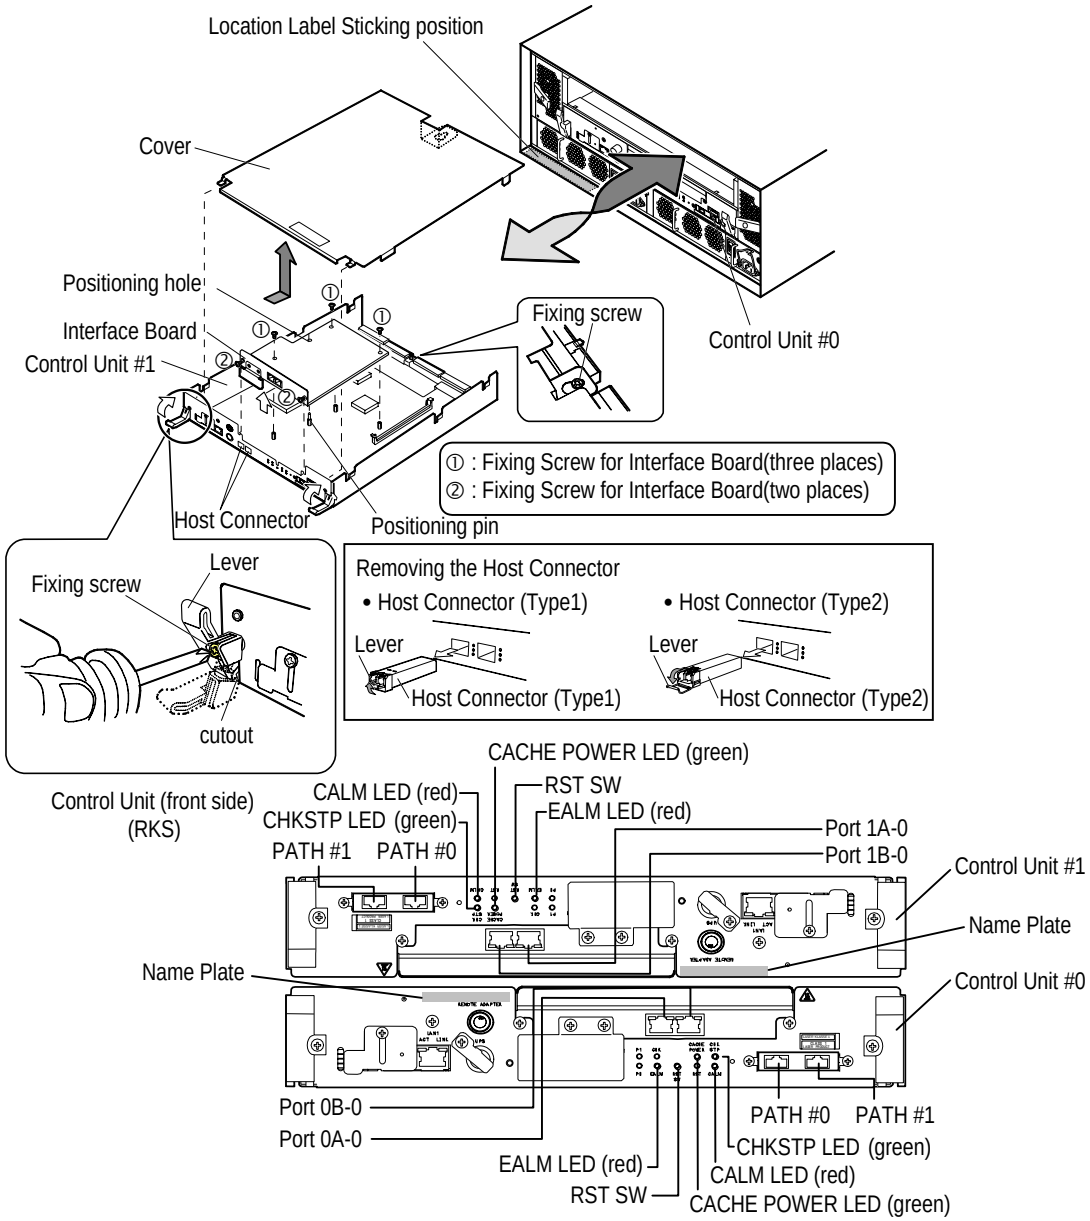
(17) Connect the removed all cables to the Control Unit.

NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(18) Turn on the AC Power Unit Switch of the both Power Units.

(19) Turn on the main switch.

(20) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).



(21) Check that the READY LED (green) on the front of the Basic Chassis lights up. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).

(22) For the added iSCSI Interface Board Port, Configure the host group and iSCSI port setting. (Refer to System Parameter “Chapter 2 Setting Host Group/Targets” (SYSPR 02-0000), and System Parameter “4.2 (10) Setting of iSCSI” (SYSPR 04-0191).)

(23) When moving the FC Interface Board from the interface #1 side to the #0 side because iSCSI Interface Board was removed, configure the host group and Fibre Channel port setting. (Refer to System Parameter “Chapter 2 Setting Host Group/Targets” (SYSPR 02-0000), and System Parameter “4.2 (9) Setting of Fibre Channel” (SYSPR 04-0170).)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The figure shows the case where the iSCSI Interface Board is installed in the Control Unit of the RKS.

Figure 1.4.8 Adding an iSCSI Interface Board

1.4.8 Adding a NAS Unit

NOTE : The data of the old disk array subsystem cannot be used in the NAS system.

NOTE : The addition of the NAS Unit cannot be performed in the disk array subsystem in which the Account Authentication is unlocked. When operating the NAS system, it is required to lock the Account Authentication.

(1) Install the interface board for the NAS
Refer to "1.4.5 Adding a NAS interface Board" (ADD 01-0400) and install the Interface Board for the NAS.

(2) Install the NAS Unit
Refer to Installation "3.4.8 Installing the RKNAS" (INST 03-0601) and install the NAS Unit.

NOTE : Remove all of the installed basic chassis and the additional chassis from the rack, and install it so that the NAS Unit becomes the bottom of the rack.

(3) Connect the cables for the NAS
Refer to Installation "3.4.14 Connecting the cables for RKNAS" (INST 03-0740) to Installation "3.4.17 Connecting the power cables for NAS" (INST 03-0770) and connect the cables for the NAS.

(4) Turn on the AC Power Unit Switch of the both Power Units.

(5) Turn on the main switch.

(6) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).

(7) Check that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
If this occurs, refer to Information Message screen on WEB, and check that "IA1S0x NNC NAS OS not found (NNC-x)" is displayed. (Refer to WEB "2.5 Information Message" (WEB 02-0120).)

(8) Setting the System Parameter
(a) Setting the RAID/LU/spare disk for the NAS system LU
See System Parameter "Chapter 3 Setting the RAID/LU/Spare Disk" (SYSPR 03-0000)
(b) Setting the command device indispensable as the system LU of the NAS
See System Parameter "3.8 Setting the command device indispensable as the system LU of the NAS" (SYSPR 03-0520)
(c) Allocation of the NAS system LU
See System Parameter "3.7 Allocation of the system LU/user LU of the NAS" (SYSPR 03-0440)
(d) Setting the RAID/LU/spare disk for the NAS user LU

1.5 Adding Other Optional Devices

1.5.1 Other optional additional devices

Component name	Model name	Specification	Requirements of addition	Condition of addition and number of item for referring to procedure	
				Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)
PDB (UPDU7)	DF-F700-UPDU7	For U7	Additional PDB for U7 rack frame	Possible "1.5.2 Mounting a PDB (UPDU7)" (ADD 01-0460)	Possible "1.5.2 Mounting a PDB (UPDU7)" (ADD 01-0460)

*1 : Data is exchanged between a host computer and the subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

1.5.2 Mounting a PDB (UPDU7)

(1) Height of Required Space in Rack Frame

The height of the space required for mounting the PDB on the rack frame is one unit of the EIA standard.

(2) Optional Parts for Mounting (Model Name : DF-F700-UPDU7)

NOTE : The current capacity for a PDB is limited to up to 20 amperes. When mounting the subsystem, connect them avoiding applying the current of more than 20 amperes to a PDB. (RKH one unit : 2.6 A, RKM one unit : 4.2 A, RKS one unit : 4.0 A, RKXS one unit : 3.0 A, RKAJ one unit : 2.6 A, RKAJAT one unit : 2.4 A, RKNAS one unit : 2.0 A)
Up to four subsystems in total combining 0 to 1 RKHs/RKMs/RKSs/RKXSs and 0 to 4 RKAJs/RKAJATs can be connected to a single PDB.
Up to four RKHs/RKMs/RKSs/RKXSs can be connected to a single PDB.

The optional parts and their quantities required to mount the one PDB are shown below.

Table 1.5.1 Composition of DF-F700-UPDU7 (per set)

No.	Product name	Parts No.	Quantity	Comment	Remarks
1	PDB	—	1	Adding rack frame in PDB	—
2	Power cable	3259166-A	1	L6-30P 4.5 m	—
3	Support metal bracket	32663121-1	2	U7 rack frame	For U7 rack
4	RAC NUT (Fastener)	5510146-1	5	U7 rack frame rack frame (2 spare is included)	—
5	LL Washer	2051001-513	5	U7 rack frame (2 spare is included)	For U7 rack
6	Socket bolt (M5 × 20)	BS520	5	U7 rack frame (2 spare is included)	For U7 rack
7	Bind screw (M5 × 10)	SB510	5	For securing the PDB (2 spare is included)	—
8	Name plate	3243319-232	1	Already affixed to PDB	—
9	Cable holder	3230194-1	1	Adding PDB	—
10	Socket bolt (M4 × 30)	BS430	3	For securing the cable holder	—
11	Plate holder	5519109-1	1	Adding PDB	—
12	Socket bolt (M4 × 8)	BS408	2	For securing the plate holder	—

(3) Tool Required

- Phillips screwdriver (No.1, No.2)
- Allen wrench (No.4)
- Allen wrench (No.5)

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Installing UPDU7 in U7 Rack Frame

Install the PDB making it face the rear of the rack frame.

NOTE : When adding PDB, mount PDB in two-part set due to the duplicated power supply.

(a) Attach the fasteners (four places) to the positions in the rear of the U7 rack frame where the rack accommodating the UPDU7 components is to be mounted.

(b) Attach the support metal brackets to the positions where the Fasteners are attached in Step (a), and fix the brackets with socket bolts of M5×20 size (two places per bracket).

(c) PDB components onto the rack frame, engaging the front holes of the rack with those of the support metal brackets attached in Step (b). Then, fix the rack with binding screws of M5×10 size (four places).

(d) Add another two-part set of PDB in the same way.

(e) Route and connect cables, observing the rules provided in Installation "1.1 (3) Note on cable routing" (INST 01-0010).

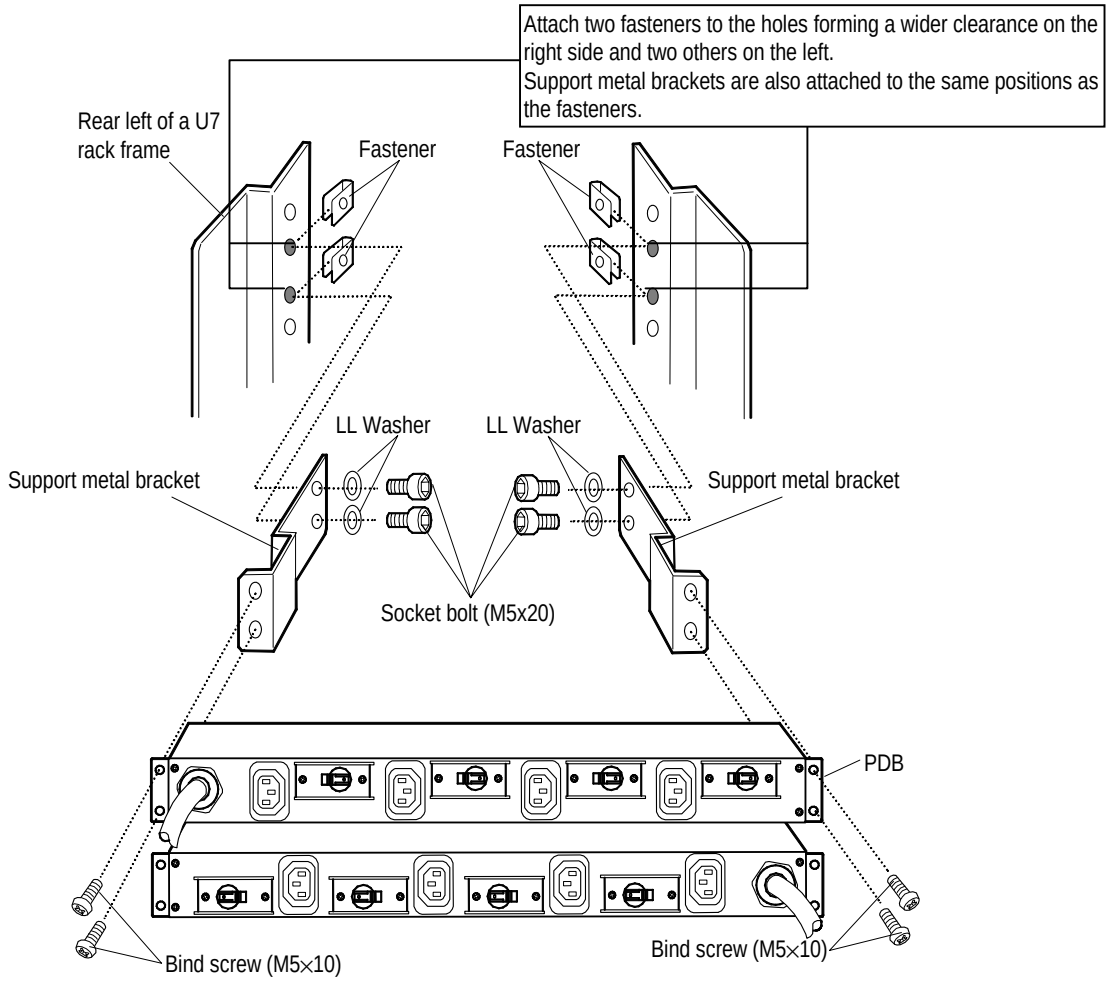

Figure 1.5.1 Installing the PDB (UPDU7)

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Installing the power Cable (Added PDB append parts) and cable holder.

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : Make sure that conductors shall be provided with 30 A over current protection in accordance with Article 240 of the National Electrical Code, ANSI/NFPA 70, and the Canadian Electrical Code, Part 1, CSA C22.1, Section 14.

(a) Open the rear door. (See Installation "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)
(b) Make sure that the power supply switches of the PDBs are turned off.
(c) Remove the cable holder (adding PDB).
(d) Put out the power cables of PDBs through the Cable passing opening at the bottom of the Rack.
(e) Fasten the power cables to the rack frame by attaching the cable holders (adding PDB) with the hexagon socket head bolt M4×30.
(f) Make sure that the connecter is securely fixed after the assembly work.

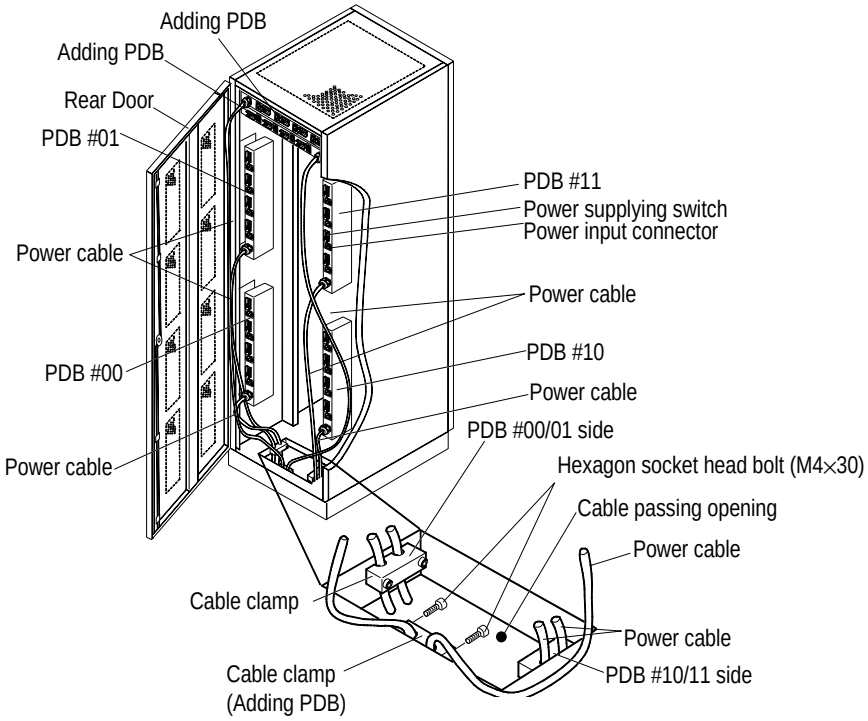

Figure 1.5.2 Installing the PDB (UPDU7)

1.6 Adding the Additional Subsystem to the Rack Frame

In the case of adding Disk Drives to a subsystem of the rackmount model, the additional subsystem must be added when vacant slots for the Disk Drives to be added are insufficient in the existing subsystem (‡1).
The procedure for adding the Additional Chassis to the U7 rack frame online or offline (with the subsystem power turned off)(‡2) is shown.
When mounting the additional subsystem on the rack frame, installation of as many rack rail kits (DF-F700-URHT7) as the additional subsystem to be added are required.
When the decoration panels/filler panels of the rack frame are attached, it is necessary to remove the panels at the installation positions.

1.6.1 Procedure for adding the additional subsystem to the subsystem of rackmount model with U7 rack frame

(1) Prerequisites

Before starting the addition, make sure that the following requirements are satisfied. If not, an abnormal termination of the addition or a system down may be caused.

(a) The addition must be done only when any WARNING (WARN) LED (orange) on the subsystem is off. If any WARNING (WARN) LED (orange) on the subsystem is on, take an action to make the LED lighting up or blinking. (Refer to Troubleshooting "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000).)

(b) Do not perform the recognition (‡2) operation of the additional chassis during the execution of the format command (it is not the LU format from the Storage Navigator Modular) from the host computer. When the format was executed from the host computer, add the additional chassis after the format is completed.

(c) Do not make the addition work when the READY LED (green) on the front of the Basic Chassis is blinking at high speed. Perform the addition work after checking that the READY LED (green) on the front of the Basic Chassis lights up after waiting for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of RKH).

(d) When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the addition work. While this WARNING LED (orange) is blinking at high speed, the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Perform the addition work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up in the maximum of 30 to 85 minutes.

‡1 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

‡2 : The expression "with the subsystem power on" described here means a state in which the power of the disk array subsystem is turned on. (System operation with a host is no concern of it.)

Copyright © 2005, 2006, Hitachi, Ltd.

(e) When adding DF600-RKA/RKAJAT/RKAJATL, understand the specification of the Power Unit/weight, etc. in the manual of DF600, and perform the installation and the addition work safely.

(f) When RKA/RKAJAT/RKAJATL of the DF600 is connected, the version of the ENC/SENC firmware should be the following. Also, the purchase of the addition support kit of the DF-F700-K1BUP is indispensable.

(i) In the case of RKA

- SH firmware: 1A or more

(ii) In the case of RKAJAT/RKAJATL

- SR firmware: 5.75 B or more
- H8S firmware: 02-02-07 or more

Perform the version check and the update of the firmware beforehand, referring to "Procedure for Offline ENC/SENC Firmware Download" of the DF600.

(g) When adding the RKA, check that the microprogram revision is 0720/A or more. When the microprogram revision is less than 0720/A, add the RKA after performing the update installation of the most recent microprogram of 0720/A or more (Refer to Microprogram "Chapter 1 Installation of Microprogram" (MICRO 01-0000)).

(2) Restrictions

Observe the following restrictions strictly. There is fear of the abnormal termination of the addition or the subsystem down.

(a) The part replacement cannot be performed during the recognition(‡1) of the additional chassis ((5) - Work 9).

(b) Do not execute the format command (it is not the LU format from the Storage Navigator Modular) from the host computer during the recognition(‡1) operation of the additional chassis ((5) - Work 9).

‡1 : The recognition indicates that the Control Unit of the existing RKM/RKS/RKXS/RKH recognizes the Additional Chassis (the "I8020x (or I802HH) Unit Add complete (Unit-x) message is displayed).

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Specifications

(a) At least the following components must have been installed in the additional subsystem to beaded.

- Two Disk Drives (a combination of the Disk Drives #0 and #1)
- Two ENC Units/SENC Units (Standard installation, four ENC cables (ENC Unit), two ENC cables (SENC Unit) are included.)
- Two Power Units (AC) (additional subsystem)'s (Standard installation)

For five or more Disk Drives, add the remaining Disk Drives after completing the recognition of all additional subsystems (Refer to "1.6.3 Verifying the additional subsystem" (ADD 01-0770)).

(b) Be sure to connect one to two ENC cables(‡1) per ENC Unit/SENC Unit between the RKM/RKS/RKH and the Additional Chassis, the RKXS and the RKAJAT, and the Additional Chassis and the Additional Chassis.

(c) Restriction of number of the additional subsystems allowed to be added is that the total number of the subsystems must not exceed the allowable maximum after the addition.
The RKM can be connected to the additional subsystem and up to 15 units can be installed including the RKM.
The RKS can be connected to the additional subsystem and up to 7 units can be installed including the RKM.
The RKXS can be connected to the RKAJAT/RKAJATL and up to 7 units can be installed including the RKXS.
The RKH can be connected to 30 additional subsystems at the maximum.
However, the RKH must connect the RKAJ as the chassis of the unit ID #0 for sure in any configuration (the maximum connection number only with the RKAJ/RKA is 30, and when the RKAJAT is connected with the maximum connection number, it is 28 for the RKAJAT and two for the RKAJ/RKA).

(d) Final arrangement of the Disk Drives to be added
It is required to check which slots to arrange the Disk Drives beforehand in the addition of the Additional Chassis according with the addition of the Disk Drives.
Decide the arrangement of the Disk Drives according to the next priority order (this is not the order of the additional installation of the Disk Drives).

① Disk Drives #0 and #1 of the Additional Chassis to be added (Installation is indispensable.)
② Disk Drives #2 and #3 of the Additional Chassis to be added
③ Vacant slots of the Disk Drives of the existing chassis (‡2)
④ Disk Drives #4 to #14 of the Additional Chassis to be added

‡1 : Two ENC cables are used between the Control Unit of the RKH and the ENC Unit of the RKAJ/RKA, the Control Unit of the RKM and the ENC Unit of the RKAJ/RKA, the Control Unit of the RKS and the ENC Unit of the RKAJ, and the ENC Unit of the RKAJ/RKA and the ENC Unit of the RKAJ/RKA, and one ENC cable is used between the Control Unit of the RKM and the SENC Unit of the RKAJAT, the Control Unit of the RKS and the SENC Unit of the RKAJAT, the Control Unit of the RKXS and the SENC Unit of the RKAJAT, the ENC Unit of the RKAJ and the SENC Unit of the RKAJAT, and the SENC Unit of the RKAJAT and the SENC Unit of the RKAJAT.

‡2 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) The number of the installed Disk Drives of the Additional Chassis when making the subsystem recognize the Additional Chassis with the subsystem power turned on
Install the Disk Drives #0 to #3 only in the Additional Chassis to be added when making the subsystem recognize the Additional Chassis with the subsystem power turned on. When the number of the Disk Drives to be installed finally in one Additional Chassis is less than four, be sure to install the Disk Drives in the Disk Drives #0 and #1.
- When the number of the Disk Drives is two, install two of them in the Disk Drives #0 and #1.
- When the number of the Disk Drives is three, install three of them in the Disk Drive #0 to #2.
- When the number of the Disk Drives is four, install four of them in the Disk Drive #0 to #3.

If five or more Disk Drives are finally installed in one Additional Chassis, install four Disk Drives of #0 to #3 when making the subsystem recognize the Additional Chassis. Add the remaining Disk Drives of #4 to #14 after completing the recognition of the Additional Chassis (refer to "1.6.3 Verifying the additional subsystem" (ADD 01-0770)).

(f) Install them after all the additional subsystem have been recognized(‡1) ((5)-Work-9), connect the ENC cables between the existing subsystem (‡2) and the additional subsystem to be connected to the subsystem for the each loop one by one. (Refer to "1.6.2 Recognition and connection of the additional subsystem" (ADD 01-0570).)

(g) When failures occur in both of the existing subsystem (‡2) and the additional subsystem while the operation to make the additional subsystem recognized(‡1) ((5)-Work-9) is being done, take a recovery action against the failure of the existing subsystem preferentially after the additional subsystem has been recognized(‡1).
After that, take a recovery action against the failure of the additional subsystem, and then resume the operation.

(h) When the Additional Chassis is added with the subsystem power turned on in the subsystem of the dual controller configuration, complete the addition work by making the existing chassis (‡2) recognize the Additional Chasses one by one, and then perform the addition work of the next Additional Chassis. (Refer to "(5) Procedure for adding the Additional Chassis with the subsystem power turned on" (ADD 01-0530).)

(i) When adding the Additional Chassis with the subsystem power turned off, install all the Disk Drives to be added in the chassis, connect between all the chassis with the ENC cables, and turn on the subsystem power. (Refer to "(6) Procedure for adding the Additional Chassis in the status that the subsystem power is turned off" (ADD 01-0550).)

(j) Types of Additional Chassis
- The Additional Chassis to be added to the RKXS must be only the RKAJAT.
- There should be no RKA in the Additional Chassis to be added to the RKS.
- The chassis of unit ID #0 of the RKH must be the RKAJ.

‡1 : The recognition indicates that the Control Unit of the existing RKM/RKS/RKXS/RKH recognizes the Additional Chassis (the "I8020x (or I802HH) Unit Add complete (Unit-x) message is displayed).

‡2 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

Copyright © 2006, Hitachi, Ltd.

(k) Last chassis of the existing subsystem(‡2)
- When adding the RKAJ/RKA to the RKM/RKS, the last chassis of the existing subsystem(‡1) should not be the RKAJAT in odd numbers.
- When adding the RKAJ/RKA to (PATH #0 and PATH #1) of the RKH, the last chassis of (PATH #0 and PATH #1) of the existing subsystem(‡1) should not be the RKAJAT in odd numbers.
- When adding the RKAJ/RKA to (PATH #2 and PATH #3) of the RKH, the last chassis of (PATH #2 and PATH #3) of the existing subsystem(‡1) should not be the RKAJAT in odd numbers.
- The chassis of the unit ID#0 of the RKH can only connect the RKAJ.

(l) When adding the optional component with the subsystem power on, the operation replacing dummy Disk Drive with Disk Drive has to be finished within 10 minutes.

(m) When adding the RKA, install the Disk Drives whose capacity is 71.3 Gbytes or more.

(n) Do not add the optional parts while the array subsystem is being started.
When the array subsystem is being started, add the optional parts after the array subsystem becomes the Ready status.

(o) When adding the RKA or adding the Disk Drive to the RKA in the microprogram revision 0740/C or more, it is possible to treat the Disk Drive of the RKA as the target of the copy backless (‡3) if the customer/SE observes (‡4) either of the restrictions (‡5) on the operation shown below.
- The FC Disk Drive to be installed in the subsystem must be unified to the Disk Drive of the same rotational speed.
- The I/O performance and the Disk Drive restoration performance to the FC Disk Drive to be installed in the subsystem must be designed as the FC Disk Drive of 10,000 min^{-1} rotation.

When setting(‡6) this function, fully check that the customer/SE can strictly observe (‡4) the restrictions(‡5) on the operation shown below.

---

‡1 : The recognition indicates that the Control Unit of the existing RKM/RKS/RKXS/RKH recognizes the Additional Chassis (the "I8020x (or I802HH) Unit Add complete (Unit-x) message is displayed).

‡2 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

‡3 : Refer to Theory "4.6. (3) Operation after replacing failed Disk Drive" (THEO 04-0240) for the details of the function.

‡4 : The customer/SE must observe the restrictions on the operation until the RAID Group configuration of the subsystem is reconstructed.

‡5 : If the customer/SE does not observe the restrictions on the operation, the following problems may occur.
If the FC Disk Drives of the different rotational speed are mixed in the subsystem, when the FC Disk Drive of 15,000 min^{-1} rotation is blocked, the FC Disk Drive of 10,000 min^{-1} rotation may be the Disk Drive which configures the RAID Group instead of the FC Disk Drive of 15,000 min^{-1} rotation.
If this condition occurs, the host I/O performance to the logical units which were configured only with 15,000 min^{-1} rotation in the RAID Group is deteriorated to the performance of the FC Disk Drive of 10,000 min^{-1} rotation.

‡6 : Set it in (5)–Work 11 and (6)–Work 15.
This setting can be executed in the combination of the microprogram revision 0740/C or more and the Storage Navigator Modular Ver.4.05 or more.

Copyright © 2006, Hitachi, Ltd.

(p) When the priced option, Power Saving, is used in the array subsystem, "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is displayed in Information Message on WEB, the WARNING LED (orange) on the front of the Basic Chassis lights up or blinks, and the array subsystem may become the Warning status while adding the Additional Chassis.
When "IZYR00 Automatic ENC microprogram download completed successfully" is displayed in Information Message on WEB in the following procedure, the message code "W0GM00" disappears from Warning Information on WEB, "I54C00 Power Saving function became possible to work without the limit by SENC" is displayed in Information Massage on WEB, the WARNING LED (orange) on the front of the Basic Chassis goes out, and the subsystem Warning of the array subsystem recovers.

(4) Procedure for adding the Additional Chassis
The procedure for adding the Addition Chassis has two types; one is the procedure to perform it with the subsystem power turned off, and the other is the procedure to perform it with the subsystem power turned on.
Perform the isolation of the work procedure referring to Table 1.6.1.

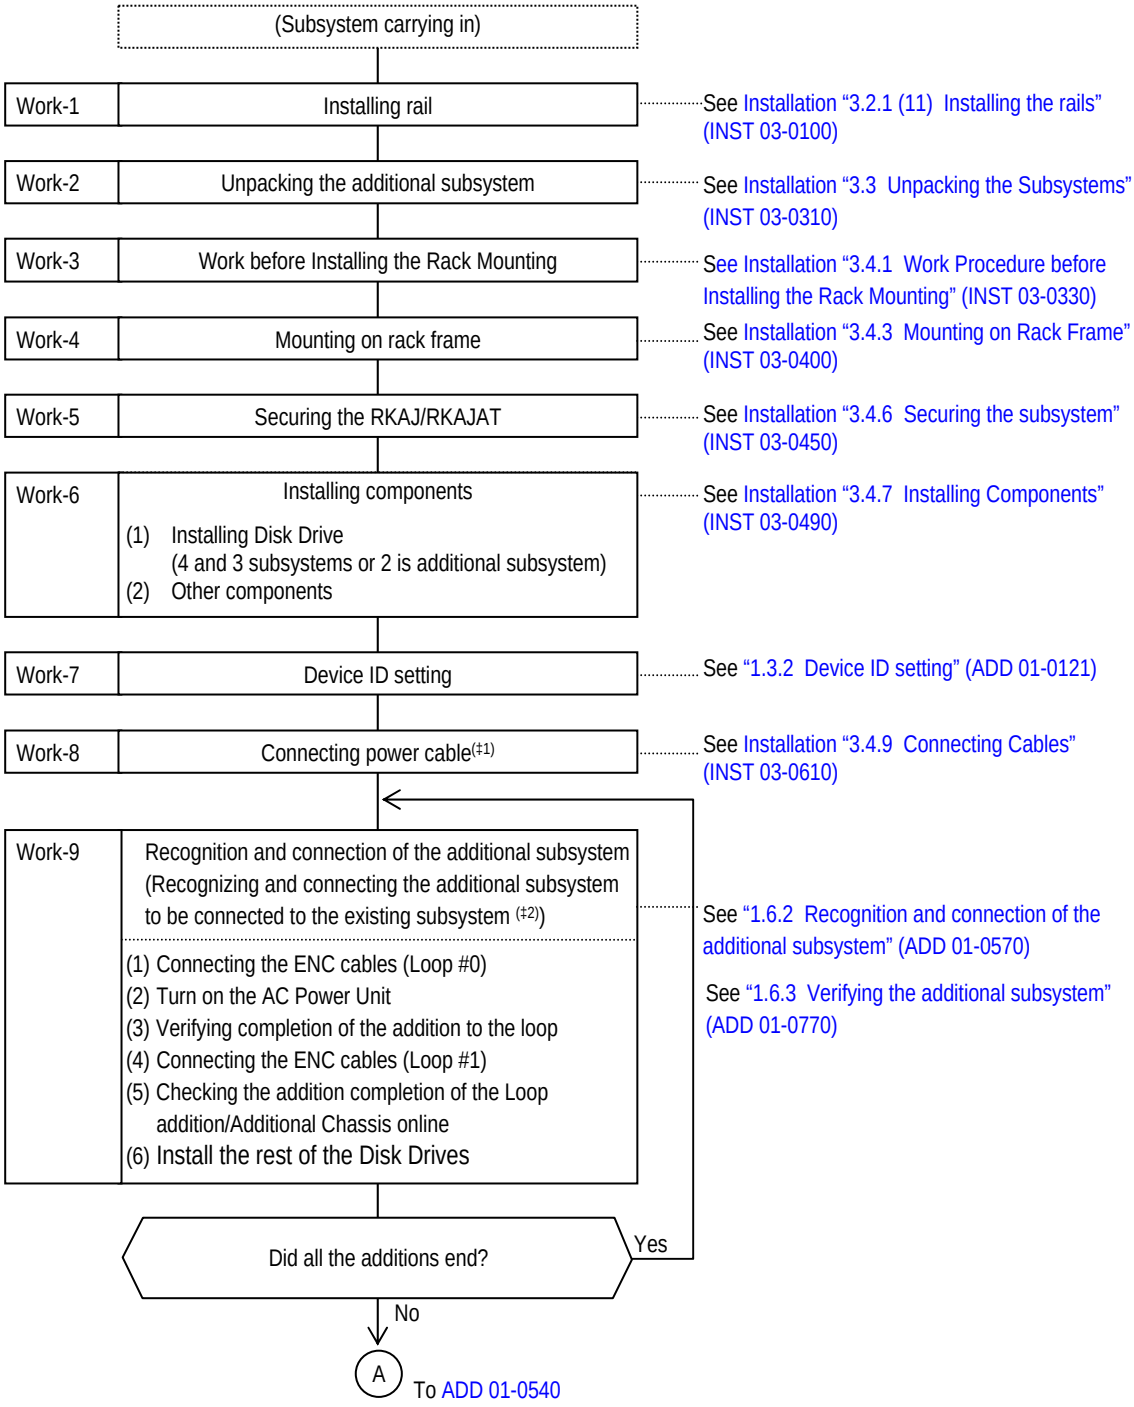

Table 1.6.1 Isolation of the Procedure for Adding the Additional Chassis

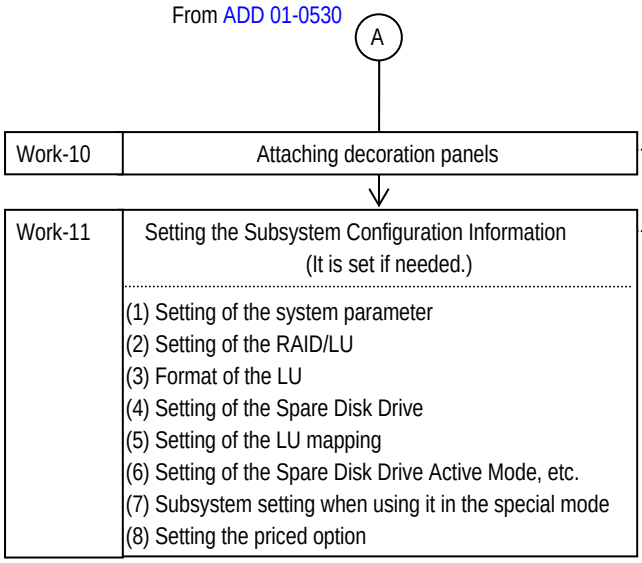
Power Status of the Subsystem in the Addition Work	Controller Configuration	Reference Place of the Procedure for the Addition Work
ON	Single	Cannot be operated
	Dual	"(5) Procedure for adding the Additional Chassis with the subsystem power turned on" (ADD 01-0530)
OFF	Single	"(6) Procedure for adding the Additional Chassis in the status that the subsystem power is turned off" (ADD 01-0550)
	Dual	

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Procedure for adding the Additional Chassis with the subsystem power turned on



The addition work can be performed only at the time of the dual controller configuration with the subsystem power turned on. Check the following work, and then work on it.

‡1 : When using the UPS for the exclusive use, install and connect the UPS referring to the UPS manual.

‡2 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

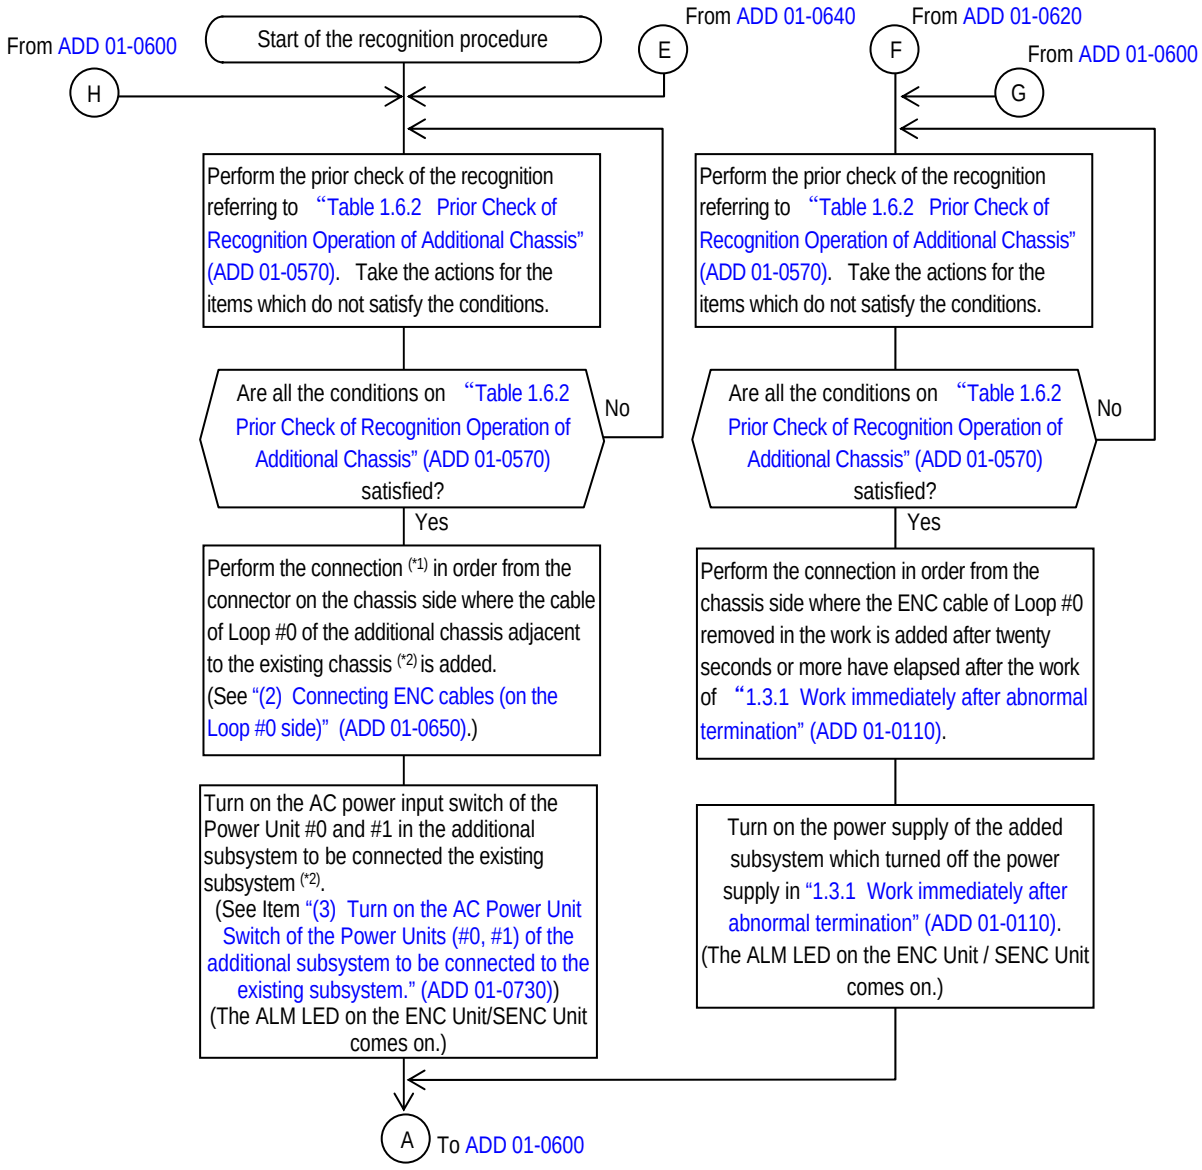
1.6.2 Recognition and connection of the additional subsystem

Satisfy the following conditions to recognize the additional chassis.

Table 1.6.2 Prior Check of the Recognition Operation of the Additional Chassis

No.	Item to be checked	Matter to be checked	Actions to be taken when the conditions on the left were not satisfied	Check result
1	Disk Drive	The Disk Drives #0 to #3 must be installed in the additional subsystem to be added.	Install the Disk Drives #0 to #3 in the Additional Chassis to be added. When two Disk Drives are installed in the Additional Chassis finally, install the Disk Drives #0 and #1, and when three Disk Drives, install the Disk Drives #0, #1 and #2.	
		When less than four Disk Drives are to be added, the Disk Drives #0 and #1 must be installed in the additional subsystem.	Remove the Disk Drives from #4 to 14. Add the Disk Drives #4 to 14 after completing the recognition of the Additional Chassis according to the procedure for the addition work.	
2	ENC Unit/SENC Unit	The two units must be installed in the additional subsystem to be added.	Check that it is installed at the time of the shipment.	
3	Power Unit	The two units must be installed in the additional subsystem to be added.		
4	Fan Assembly (RKA)	The two units must be installed in the additional subsystem to be added.		
5	WARNING (WARN) LED of the Basic Chassis	No WARNING (WARN) LED on the front of the Basic Chassis must be lighting up or blinking.	Perform the maintenance referring to the Information Message on WEB and according to the message displayed. Check that the WARNING LED on the front of the Basic Chassis was turned off after completing the maintenance work.	
6	Information Message on WEB	The message, which says that the maintenance is necessary, should not be displayed.	Perform the maintenance according the message displayed. Check that the message, which says that the maintenance is not completed, is not displayed after completing the maintenance work.	
7	Mainframe of WEB	Subsystem Status is Ready, and there should be no abnormality in the status of the replacement part.	Perform the maintenance referring to the Information Message on WEB and according to the message displayed. Check that the Subsystem Status is Ready and there is no abnormality in the status of the replacement part.	
8	READY LED on the front of the basic chassis	The READY LED on the front of the basic chassis should light up.	• Because the automatic download of the ENC/SENC firmware is operating, check that the WANING LED (orange) on the front of the Basic Chassis goes out in the maximum of 30 to 50 minutes (the maximum of 40 to 60 minutes in case of the RKH), the READY LED (green) lights up, and "IZYR00 Automatic ENC microprogram download completed successfully" is displayed in the Information Message on WEB. • After the READY LED on the front of the Basic Chassis lights up, recheck that the message, which says that the maintenance is necessary, is not displayed referring to the Information Message on WEB. • When the READY LED on the Basic Chassis continues blinking, collect the simple trace, and contact the Technical Support Center.	

Copyright © 2005, 2006, Hitachi, Ltd.

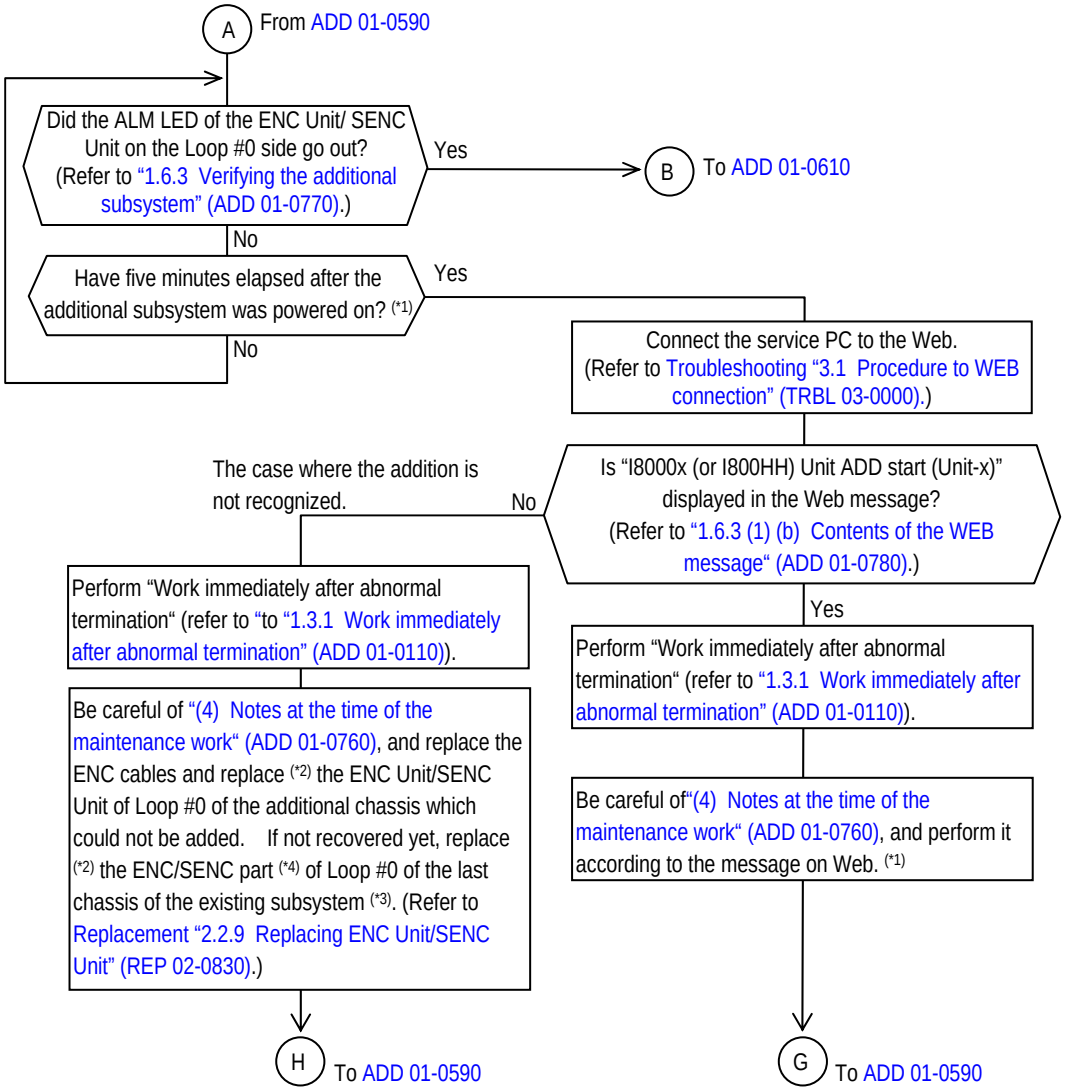


No.	Item to be checked	Matter to be checked	Actions to be taken when the conditions on the left were not satisfied	Check result
9	Device ID	The device ID must be set correctly (Refer to "1.3.2 Device ID setting" (ADD 01-0121).)	Set the device ID after checking the correct device ID with the ACE tool.	
10	Subsystem identification switch (RKAJ)	The subsystem identification switch must be set correctly. (Refer to Installation "3.4.7 (1-3) Setting the subsystem identification switch" (INST 03-0521).)	Set the subsystem recognition switch to "M" when the Basic Chassis is the RKH/RKM and to "S" when it is the RKS.	
11	Other maintenance works	No other maintenance work must be in progress.	Complete all the maintenance work in progress.	

When the conditions above are satisfied, perform the work according to "(1) Procedure for making the additional subsystem recognized" (ADD 01-0590).

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for making the additional subsystem recognized

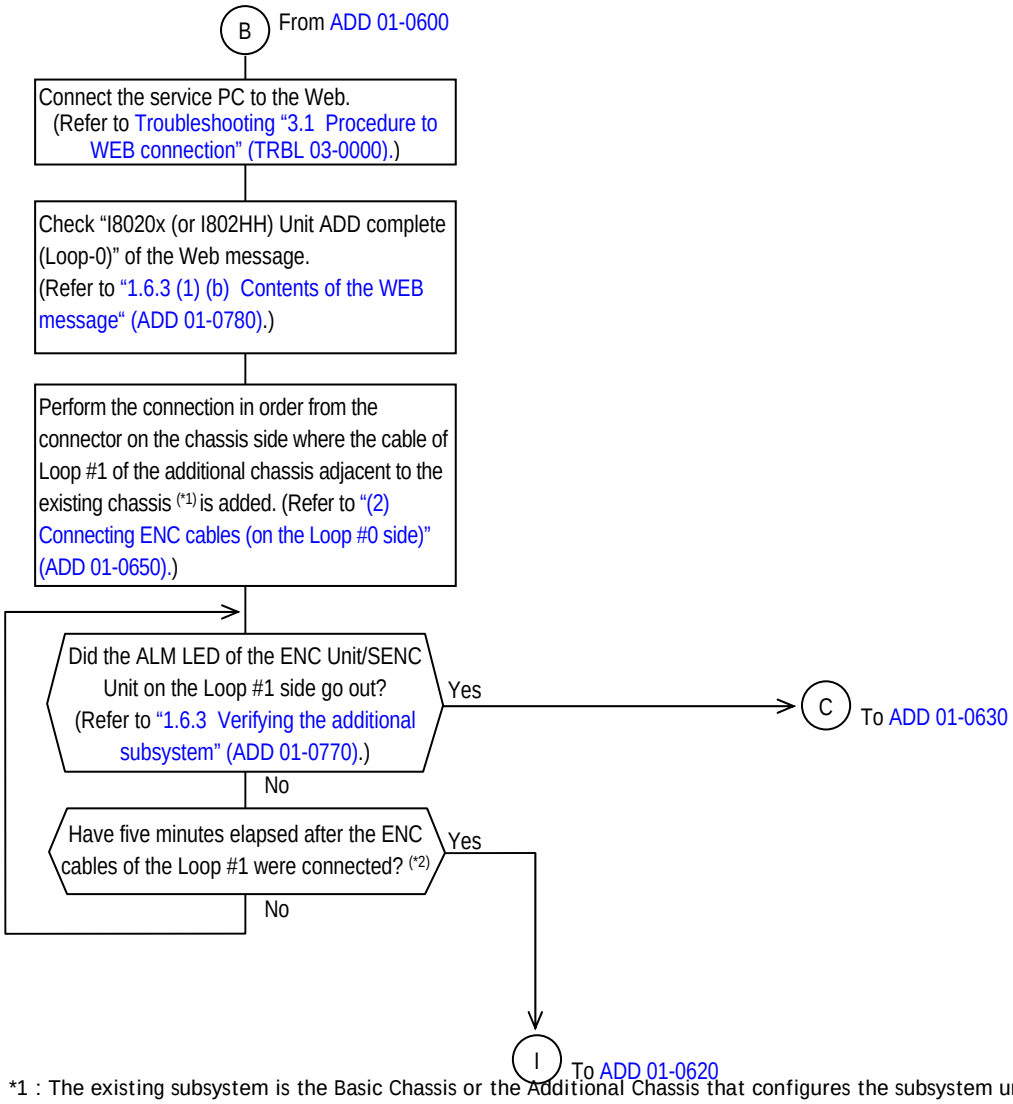


Perform the additional subsystem recognition operation following the flowchart below. Perform the recognition operation for the Additional Chassis to be connected to the existing subsystems one by one starting from the Additional Chassis nearest to the Basic Chassis. The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

*1 : The recognition operation is possible even when mistaking the connection of the ENC cables and executing it from Loop #1. However, in this case, perform the recognition operation by reading 0 as 1 and 1 as 0 on the Loop #0 and Loop #1 sides and ENC Unit/SENC Unit #0 and #1 sides of the work procedure.

*2 : The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

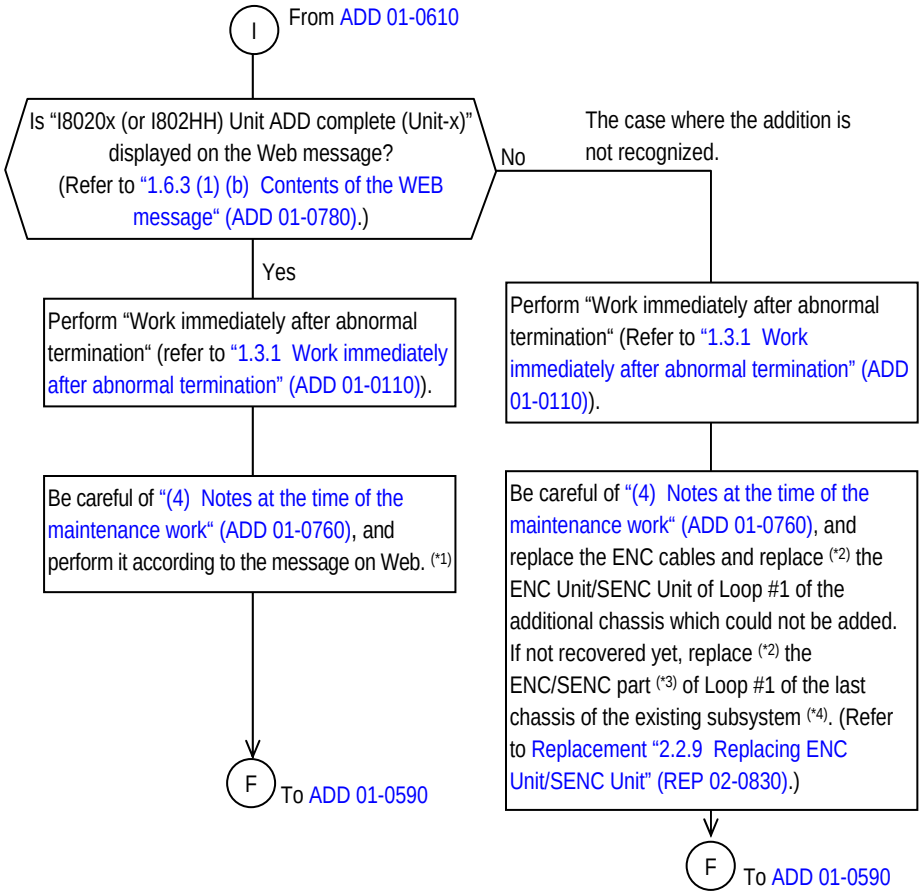


*1 : When the Disk Drives other than #0 to 3 are installed and the recognition operation is started at the time of the Additional Chassis recognition, the message "I80E00 Unit ADD warning [HDU number over]" is output in the "Information message" window on the WEB window. When this message is output, the addition process may not be completed within the specified time (five minutes). However, even if this message is displayed, do not pull out the Disk Drives during the Additional Chassis recognition. There is fear of the abnormal termination of the addition or the subsystem down.

*2 : Perform the addition of the Additional Chassis again from the beginning by replacing the ENC Unit/SENC Unit #0 of the Additional Chassis which could not be added and the ENC cables connected to the ENC/SENC Unit #0. Even if the same phenomenon still occurs, replace the ENC/SENC part of the last chassis of the existing subsystem, and perform the addition of the Additional Chassis again from the beginning.

*3 The existing subsystem is the Basic Chassis or the Additional Chassis that configures the subsystem under operation. The Additional Chassis to be connected is connected to the existing subsystem. The Additional Chassis that the addition is completed (the Additional Chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

*4 : It indicates the Control Unit #0 when the existing last subsystem is the Basic Chassis and indicates ENC Unit/SENC Unit #0 when it is the Additional Chassis.



Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

*2 : When the priced option, Power Saving, is used in the array subsystem, "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is displayed in Warning Information on WEB, the WARNING LED (orange) on the front of the Basic Chassis lights up or blinks, and the array subsystem may become the Warning status.
When "IZYR00 Automatic ENC microprogram download completed successfully" is displayed in Information Message on WEB in the following procedure, the message code "W0GM00" disappears from Warning Information on WEB, "I54C00 Power Saving function became possible to work without the limit by SENC" is displayed in Information Massage on WEB, the WARNING LED (orange) on the front of the Basic Chassis goes out, and the subsystem Warning of the array subsystem recovers.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Connecting ENC cables (on the Loop #0 side)

Perform the recognition operation for the Adding Chassis to be connected to the existing subsystems one by one starting from the Adding Chassis nearest to the Basic Chassis.

When adding the Additional Chassis online, it is required to connect the ENC Unit/SENC Unit on the Loop #0 (ENC #0) side of the Additional Chassis to be added and the output connector of FC-AL (RKM/RKS/RKXS/RKH/RKAJ/RKAJAT/RKA) in the last chassis of the existing subsystem with the ENC cables.(‡1)

Do not connect the ENC cables of the both loops Loop #0 and Loop #1 at a time.
Otherwise, the subsystem may go down.
Connect the ENC cables of the Loop #1 after verifying the completion of the addition to the Loop #0.

Use the ENC cable (1 meter) in the DF-F700-K1BUP when connecting RKA/RKAJAT/RKAJATL(‡2) of the DF600 to the existing subsystem.

(a) Seeing the ENC cables to be connected to the existing subsystems

See the required connections using the ACE Tool.

For the operation method of ACE Tool, refer to Installation "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).

Refer to "<Example of connection>" (ADD 01-0740).

(i) Change the color of the displays of all the adding subsystems to orange by selecting them while the Ctrl key is pressed.
Cables connected to the subsystems displayed in a color changed to white are the ENC cables to be connected to the existing subsystems.

(ii) In the case of the RKAJAT/RKAJATL(‡2), also see the details of the paths because the milk white or yellow Mini-Binders are to be attached to the ENC cables.
Attach the milk white Mini-Binders to the ENC cables of the PATH #0 and the yellow Mini-Binders to those of the PATH #1.

‡1 : Keep the ENC cables carefully to provide for the case where they are needed.

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) See the details of the Loops using the ACE Tool.
When the ACE Tool is used, the Loop #0 is displayed with red or green lines and the Loop #1, with blue or pink lines.
You can highlight the display of the Loop #0 by clicking the [Loop 0] button.

NOTE : • Be sure to connect the ENC cable from the chassis to be added.
If it is connected from the existing subsystem, the loop failure occurs.
- For the single Control Unit configuration, connect the Loop #0 (ENC Unit #0/SENC Unit #0) side only, and do not connect the Loop #1 (ENC Unit #1/SENC Unit #1) side.
When the multiple additional subsystem are mounted, however, connect the ENC Unit #1/SENC Unit #1 as well as the ENC Unit #0/SENC Unit #0 among the additional subsystem by the ENC cables.
- When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
- For the RKA, the ENC cables are connected to the two paths, the PATH #0 side (or the PATH #2 side) and the PATH #1 side (or the PATH #3 side) of the ENC Unit #0 side (Loop #0), and the two path, the PATH #0 side (or the PATH #2 side) and the PATH #1 side (or the PATH #3 side) of the ENC Unit #1 side (Loop #1) (total of four).
The ENC Unit connector and the ENC cable connected to it have the same color indication.
Be careful to keep the color of PATH #0 and PATH #2 same in milky white and PATH #1 and PATH #3 in yellow.
For the RKAJAT, the ENC cables are connected to the one path, the PATH #0 side (or any of the PATH #1 side, PATH #2 side and PATH #3 side) of the SENC Unit #0 (Loop #0), and the one path, the PATH #0 side (or any of the PATH #1 side, PATH #2 side and PATH #3 side) of the SENC Unit #1 (Loop #1) (total of two).
- The IN and OUT connectors of the SENC Unit of the RKAJAT/RKAJATL(‡1) have indications by means of blue and green labels respectively.

‡1 : RKAJATL can be only connected to RKXS.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Attach the milk white or yellow Mini-Binders to the ENC cables
Cut off an excess portion of the cable after the Mini-Binders are attached.

NOTE : • Do not tighten the Mini-Binders too much.
• Take care not to damage the ENC cable when cutting the Mini-Binder.

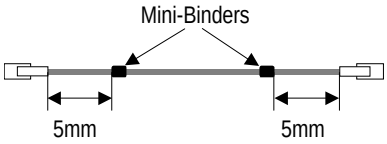

Figure 1.6.1 Positions for attaching Mini-Binders

(c) Remove the rubber cap(‡1) of the output connector of the existing final subsystem FC-AL.
(d) Make connections on the Loop #0 side as directed by the ACE Tool
(see the Loop #0 in "Figure 1.6.6 Connecting ENC Cables of the Existing Subsystem (RKAJ) and the Additional Subsystems (one RKAJ)" (ADD 01-0690) - "Figure 1.6.10 Connecting ENC Cables of the Existing Subsystem (RKAJATL) and the Additional Subsystems (four RKAJATLs)" (ADD 01-0720).
Connect the ENC Unit/SENC Unit on the Loop #0 side of the added RKAJ/RKAJAT/RKA connecting to the existing subsystem and the FC-AL output connector on the Loop #0 side of the existing subsystem with the ENC cable.

NOTE : The connection on the Loop #1 side is not performed here because it is connected after the connection on the Loop #0 side is completed.

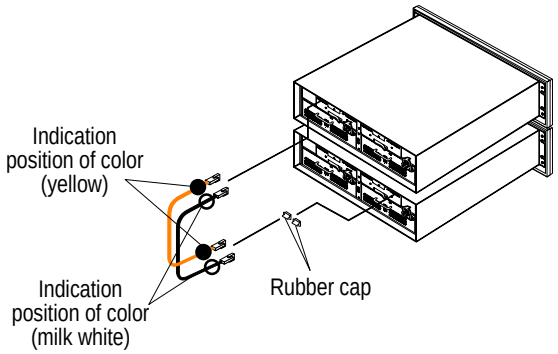

Figure 1.6.2 ENC Cable and Rubber cap

‡1 : Keep unused cables carefully to prepare for an occasion to use them.

Copyright © 2005, 2006, Hitachi, Ltd.

<Example of connection>

- Before the addition
  Configuration of RKM + Two RKAJs
- At the time of completing the final addition
  Configuration of RKM + Two RKAJs + Two RKAJATs + Two RKAJs + Five RKAJATs

Refer to Figure 1.6.12 Example of ENC Cable Connections Directed by ACE Tool.
When the additional chassis to be added is selected, the color on the selected subsystem changes from gray to orange.
The ENC cables connected to the subsystems displayed in a color changed from gray to white are the ENC cables that are to be connected to the existing subsystems (‡1).
Check the recognition of the adding subsystems to be connected to the existing subsystems(‡1) one by one starting from the adding subsystem nearest to the basic subsystem.
Connect the ENC cable on the Loop #1 side after the addition concerning the Loop #0 is completed.

(i) The first recognition : Fibre #02 (RKAJ) and SATA #23 (RKAJAT)
(ii) The second recognition : Fibre #02 (RKAJ) and SATA #34 (RKAJAT)

NOTE : • Do not connect the ENC cables of the Loops #0 and #1 at the same time because the subsystem may go down otherwise.
- When the ACE Tool is used, the Loop #0 is displayed with red lines and the Loop #1, with blue lines.
- The additional chassis that the addition is completed becomes the existing subsystem (*1).
  For example, when adding the RKAJAT of the second chassis after adding the two RKM+RKAs, read the RKAJAT that the addition is already completed as the existing subsystem (*1).

‡1 : The existing subsystem is the basic chassis or the additional chassis that configures the subsystem under operation. The additional chassis to be connected is connected to the existing subsystem. The additional chassis that the addition is completed (the additional chassis of the unit ID# displayed in the "I8020x (or I802HH) Unit ADD complete (Unit-x)" message) becomes the existing subsystem.

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Notes at the time of the maintenance work

When a failure occurs during the recognition of the Additional Chassis, and the maintenance work is performed to recover it, be careful of the following items.

(a) When a failure occurs in the existing subsystem or the Additional Chassis to be added during the Additional Chassis recognition

Because the maintenance work affects the Additional Chassis recognition process, remove the Additional Chassis which failed the addition from the existing subsystem by performing "1.3.1 Work immediately after abnormal termination" (ADD 01-0110), and then perform the maintenance referring to the Information Message on WEB.

If the maintenance work of the failure recovery is performed during the Additional Chassis recognition, there is fear of the abnormal termination of the addition or the subsystem down.

(b) When a failure occurs in the Additional Chassis and the existing subsystem at the same time during the Additional Chassis recognition

After performing "1.3.1 Work immediately after abnormal termination" (ADD 01-0110), fist of all, perform the maintenance of the Additional Chassis giving priority to the existing subsystem, and then restart the Additional Chassis recognition operation again from the beginning.

(c) When the subsystem went down during the Additional Chassis recognition

Perform "1.3.1 Work immediately after abnormal termination" (ADD 01-0110), perform the maintenance work according the Information Message on WEB, restart the subsystem in the configuration of the existing subsystem before the addition, and then restart the addition from the beginning.

When the subsystem goes down even after retrying the addition, perform the addition after the subsystem went down (offline addition (with the subsystem power turned off)), and then restart the subsystem.

(d) When a Loop failure occurs during the Additional Chassis recognition (when the blocked part is not specified)

Perform "1.3.1 Work immediately after abnormal termination" (ADD 01-0110), and recover the Loop failure by pulling out the ENC cables corresponding to the blocked Loop of the Additional Chassis that the addition failed.

If the Loop failure is still not recovered, it may be recovered by performing the dummy replacement(‡1) for the ENC Unit/SENC Unit of the existing last subsystem of the Loop concerned. The ENC/SENC blockade occurs when pulling out the ENC Unit/SENC Unit, but the ENC/SENC blockade and the Loop failure are both recovered by inserting the ENC Unit/SENC Unit.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.

1.6.3 Verifying the additional subsystem

(1) Checking the addition completion of the Additional Chassis

(1-1) Verifying completion of the addition to the loop

(a) Procedure for verifying completion of the addition to the loop

When the ALM LED (red) on the ENC Unit/SENC Unit to which the ENC cables have been connected and the WARNING (WARN) LED (orange) of the additional subsystem are off, the addition to the loop has been completed normally.

(The ALM LED (red) on the ENC Unit/SENC Unit of the Additional Chassis which is not adjacent to the existing subsystem is not a problem in the lighting status at this time. In the process of completing the Loop addition of each Additional Chassis, the ALM LED (red) on the ENC Unit/SENC Unit installed in the Additional Chassis will be turned off.)

Incidentally, the completion of the addition to the loop or a message output when a trouble occurs can be checked in the "Information Message" window that is one of the WEB windows.

Chapter 2. Subtracting Optional Components

2.1 Before Starting Subtraction of Optional Components

If you make a mistake in operation during a subtraction of the optional component, it is feared that user data in the subsystem is lost. Therefore, perform the following before starting the subtraction of the optional component to provide against an unexpected accident.

(1) Backup user data.
Backup user data in the subsystem by the operation on the host computer side.

(2) The work to subtraction an optional component varies depending on the component and a location where the component is to be installed. Besides, perform the addition after making sure whether the work must be done with the subsystem power on or off.
- An subtraction with the subsystem power on :
  A status in which the subsystem power is turned on irrespective of whether the system (host computer) is turned on or off.
- An subtraction with the subsystem power off :
  A status in which the subsystem power is turned on irrespective of whether the system (host computer) is turned on or off.

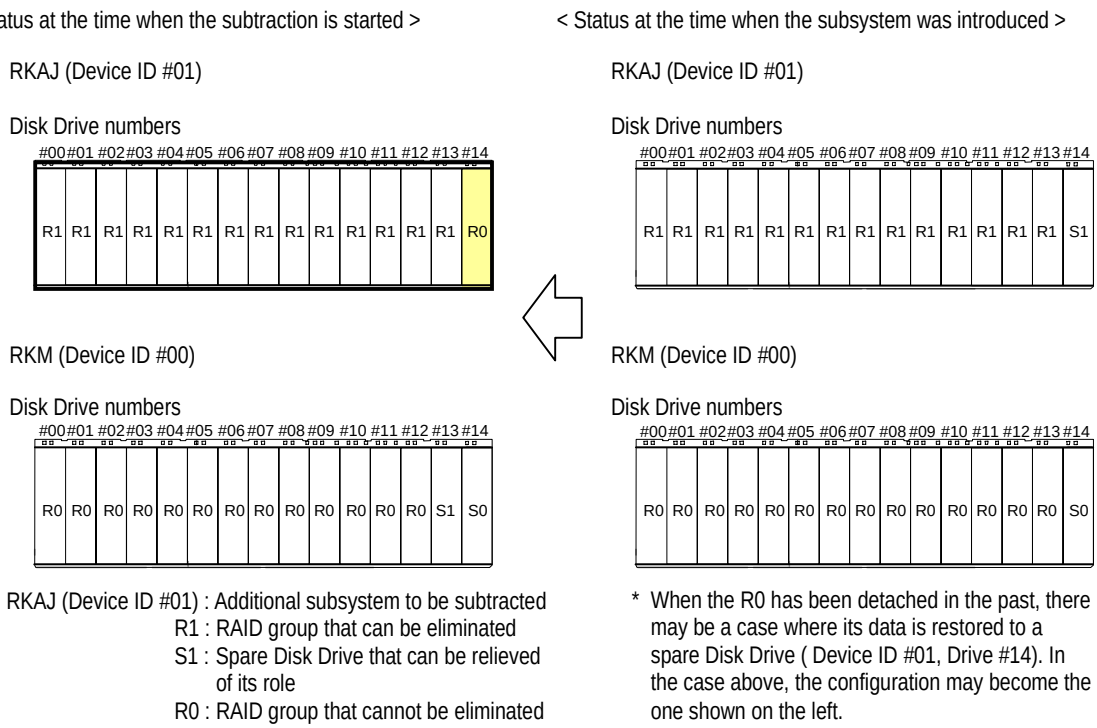
(3) When subtraction the optional component, it is required to change the settings of the subsystem using a service PC connected via a LAN. Make the following preparations before starting the addition of the optional component.
- Prepare a PC in which Storage Navigator Modular is installed. The PC must be used in the LAN environment.
- Ask the customer whether the subsystem is operable via a LAN. If not, obtain customer's permission to operate the subsystem via a LAN.

(4) Promote mutual understanding with the user about the possibility of a system down in order to minimize damage caused by failures.

(5) Be sure to install a dummy Control Unit and a dummy Disk Drive in a vacant slot because dummy Control Unit and dummy Disk Drive are required for adjusting the cooling air flow. When subtracting the optional component with the subsystem power on, the operation replacing Disk Drive with dummy Disk Drive has to be finished within 10 minutes.

(6) When the Spare Disk Drive Active Mode(‡1) is set as variable or it was set as variable in the past, the RAID Group configuration and the Spare Disk Drive configuration may be different from the configuration at the time of the introduction depending on the occurrence conditions of the Disk Drive failures after the installation.
When "Applying No Copy Back Mode on All the Units" of [Configuration Settings] – [Restore Option] is set as enable or it was set to enable in the past, it is possible that the FC Disk Drives of 15,000 min^{-1} rotation and 10,000 min^{-1} rotation are mixed in the RAID Group in the microprogram revision 0740/C or more.
Check if the configuration examples conform to that described in "2.1.1 Preparatory works for subtraction" (ADD 02-0010) before starting the subtraction. When the conformity is confirmed, execute the procedure for the preparation.

(7) Do not subtract the parts while the array subsystem is being started.
When the array subsystem is being started, subtract the parts after the array subsystem becomes the Ready status.



‡1 : For details of the spare Disk Drive operation mode, refer to System Parameter "(6) Setting of Restore Options" (SYSPR 04-0120) and "Theory "4.6 (3) Operation after replacing failed Disk Drive" (THEO 04-0240).

Copyright © 2005, 2006, Hitachi, Ltd.

2.1.1 Preparatory works for subtraction

When the Spare Disk Drive Active Mode is set as variable or it was set as variable in the past, the RAID Group configuration or the Spare Disk Drive configuration may be different from the configuration at the time of the introduction.
The Configuration examples concerned are shown in the following Items (1) to (4).
When they conform to these configuration examples, execute the following works before starting the subtraction.
Also, if the RAID group configuration of the Additional Chassis to be subtracted was changed from that at the time when the subsystem was introduced, restore the additional chassis to be subtracted to the configuration at the time when the subsystem was introduced, and then execute the subtraction work.

(1) When the additional subsystem to be de-installed has a Disk Drive that composes a RAID group unable to be eliminated

RKAJ (Device ID #01) : Additional subsystem to be subtracted
R1 : RAID group that can be eliminated
S1 : Spare Disk Drive that can be relieved of its role
R0 : RAID group that cannot be eliminated
S0 : Spare Disk Drive that cannot be relieved of its role

* When the R0 has been detached in the past, there may be a case where its data is restored to a spare Disk Drive (Device ID #01, Drive #14). In the case above, the configuration may become the one shown on the left.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Make sure that the model names of Disk Drive (Device ID #01, Drive #14) and the spare Disk Drive (Device ID #00, Drive #13) are the same(‡1).
You can make sure of it by checking the "Product ID" and "Capacity" of the Disk Drive shown when you select the Component Status tab of Storage Navigator Modular. (For the details, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

(b) Output the text file of the "RAID group/Logical unit" in the configuration copy information. (For the details, refer to System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

(c) Relieve spare Disk Drives other than the S1of their roles. (For the details, refer to System Parameter "[Procedure ④-C]Deleting Spare Disk" (SYSPR 03-0380).)

(d) Execute the dynamic sparing for the Disk Drive (Device ID #01, Drive #14). (For the details, refer to Troubleshooting "10.2.7 Drive Maintenance" (TRBL 10-0330).)

(e) Make sure that the Disk Drive (Device ID #00, Drive #13) becomes a data Disk Drive that is a component of the R0 and the Disk Drive (Device ID #01, Drive #14) becomes a detached Disk Drive(‡2) as a spare Disk Drive after the dynamic sparing is completed(‡3).
You can make sure of it by checking the "Type" and "Status" of the Disk Drive shown when you select the Component Status tab of Storage Navigator Modular. (For the details, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

(f) Reset the spare Disk Drive that was relieved of its role in Step (c) referring to the text file that was output in Step (b). (For the details, refer to System Parameter "3.4 [Procedure ④-B]Setting Spare Disk" (SYSPR 03-0360).)
However, the Disk Drive (Device ID #00, Drive #13) cannot be set as a spare Disk Drive.

(g) Make sure that there is no other Disk Drive, which composes a RAID group that cannot be eliminated, than the additional unit to be de-installed. If such a Disk Drive exists, repeat the works again from Step (c).

(h) Output the text file of the "RAID group/Logical unit" in the configuration copy information again. (For the details, refer to System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

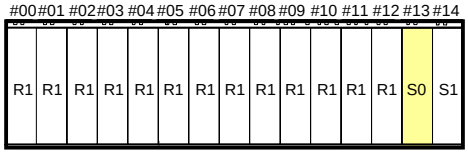
(i) Make sure that the current settings of the RAID groups and spare disks are correct and neither more not less by comparing the text file that was output in Step (b) with that output in Step (h). At this time roles of the Disk Drives (Device ID #00, Drive #13 and Device ID #01, Drive #14) as a data Disk Drive and spare Disk Drive are reversed.

---

‡1 : When "Spare Drive" of [Configuration Settings] – [Restore Options] of the Storage Navigator Modular is variable (default value) and "Applying No Copy Back Mode on All the Units" is enabled in the microprogram revision 0740/C or more, the Spare Disk Drive (S1) of the device ID #00 and the Disk Drive number #13 may not be the same model name as the Disk Drive of the device ID #01 and the Disk Drive number #14. The Spare Disk Drive (S1) of the device ID #00 and the Disk Drive number #13 may be the same model name as the Disk Drive of the device ID #01 and the Disk Drive number #14 or the Disk Drive whose the rotational speed differs and the capacity is the same as the Disk Drive of the device ID #01 and the Disk Diver number #14.

‡2 : The Disk Drive (Device ID #01, Drive #14) is detached. However, do not replace it because the detachment does not mean a trouble.

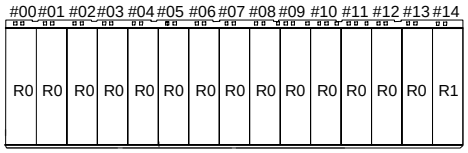
‡3 : It takes a while to complete the dynamic sparing. For the standard time required, refer to "Table 2.2.2 Standard Time Required for the Correction copy or Copy back" in Replacement "(4) Confirming completion of data recovery or copy back" (REP 02-0230).



Copyright © 2005, 2006, Hitachi, Ltd.

(2) When the additional subsystem to be de-installed has a Spare Disk Drive that cannot be relieved of its role

< Status at the time when the subtraction is started >



RKAJ (Device ID #01)

Disk Drive numbers

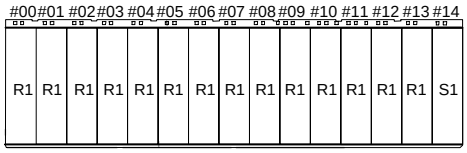
RKM (Device ID #00)

Disk Drive numbers

RKAJ (Device ID #01) : Additional subsystem to be subtracted

R1 : RAID group that can be eliminated

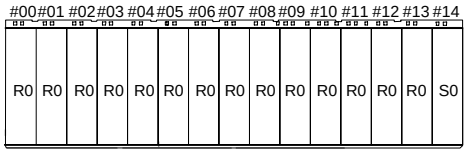
S1 : Spare Disk Drive that can be relieved of its role



R0 : RAID group that cannot be eliminated

S0 : Spare Disk Drive that cannot be relieved of its role

< Status at the time when the subsystem was introduced >



RKAJ (Device ID #01)

Disk Drive numbers

RKM (Device ID #00)

Disk Drive numbers

* When the R0 has been detached in the past, there may be a case where its data is restored to a spare Disk Drive (Device ID #01, Drive #14). In the case above, the configuration may become the one shown on the left.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Make sure that the model names of Disk Drive (Device ID #01, Drive #14) and the Spare Disk Drive (Device ID #00, Drive #13) are the same(‡1).
You can make sure of it by checking the "Product ID" and "Capacity" of the Disk Drive shown when you select the Component Status tab of Storage Navigator Modular. (For the details, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

(b) Output the text file of the "RAID group/Logical unit" in the configuration copy information. (For the details, refer to System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

(c) Relieve Spare Disk Drives other than the S1of their roles. (For the details, refer to System Parameter "[Procedure ④-C]Deleting Spare Disk" (SYSPR 03-0380).)

(d) Execute the dynamic sparing for the Disk Drive (Device ID #01, Drive #14). (For the details, refer to Troubleshooting "10.2.7 Drive Maintenance" (TRBL 10-0330).)

(e) Make sure that the Disk Drive (Device ID #00, Drive #13) becomes a data Disk Drive that is a component of the R0 and the Disk Drive (Device ID #01, Drive #14) becomes a detached Disk Drive(‡2) as a Spare Disk Drive after the dynamic sparing is completed(‡3).
You can make sure of it by checking the "Type" and "Status" of the Disk Drive shown when you select the Component Status tab of Storage Navigator Modular. (For the details, refer to System Parameter "3.5 Checking the status of Disk Drive" (SYSPR 03-0400).)

(f) Reset the Spare Disk Drive that was relieved of its role in Step (c) referring to the text file that was output in Step (b). (For the details, refer to System Parameter "3.4 [Procedure ④-B]Setting Spare Disk" (SYSPR 03-0360).)
However, the Disk Drive (Device ID #00, Drive #13) cannot be set as a Spare Disk Drive.

(g) Make sure that there is no other Disk Drive, which composes a RAID group that cannot be eliminated, than the additional unit to be de-installed. If such a Disk Drive exists, make a dummy replacement(‡4) of the Spare Disk Drive (Device ID #00, Drive #14) that was detached and repeat the works from Step (c) after making sure that the Disk Drive was recovered from the detachment(‡5).

(h) Output the text file of the "RAID group/Logical unit" in the configuration copy information again. (For the details, refer to System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

(i) Make sure that the current settings of the RAID groups and Spare Disk Drives are correct and neither more not less by comparing the text file that was output in Step (b) with that output in Step (h). At this time roles of the Disk Drives (Device ID #00, Drive #13 and Device ID #01, Drive #14) as a data Disk Drive and Spare Disk Drive are reversed.

---

‡1 : When "Spare Drive" of [Configuration Settings] – [Restore Options] of the Storage Navigator Modular is variable (default value) and "Applying No Copy Back Mode on All the Units" is enabled in the microprogram revision 0740/C or more, the Spare Disk Drive (S0) of the device ID #01 and the Disk Drive number #13 may not be the same model name as the Disk Drive of the device ID #00 and the Disk Drive number #14. The Spare Disk Drive (S0) of the device ID #01 and the Disk Drive number #13 may be the same model name as the Disk Drive of the device ID #00 and the Disk Drive number #14 or the Disk Drive whose the rotational speed differs and the capacity is the same as the Disk Drive of the device ID #00 and the Disk Diver number #14.

‡2 : The Disk Drive (Device ID #01, Drive #14) is detached. However, do not replace it because the detachment does not mean a trouble.

‡3 : It takes a while to complete the dynamic sparing. For the standard time required, refer to "Table 2.2.2 Standard Time Required for the Correction copy or Copy back" in Replacement "(4) Confirming completion of data recovery or copy back" (REP 02-0230).

‡4 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

‡5 : "I009xy (or I009HH) Spare HDU recovered (x: Unit number, y: HDU number)" is displayed in the Information Message of the Web and the ALARM LED (red) on the Disk Drive concerned goes out.

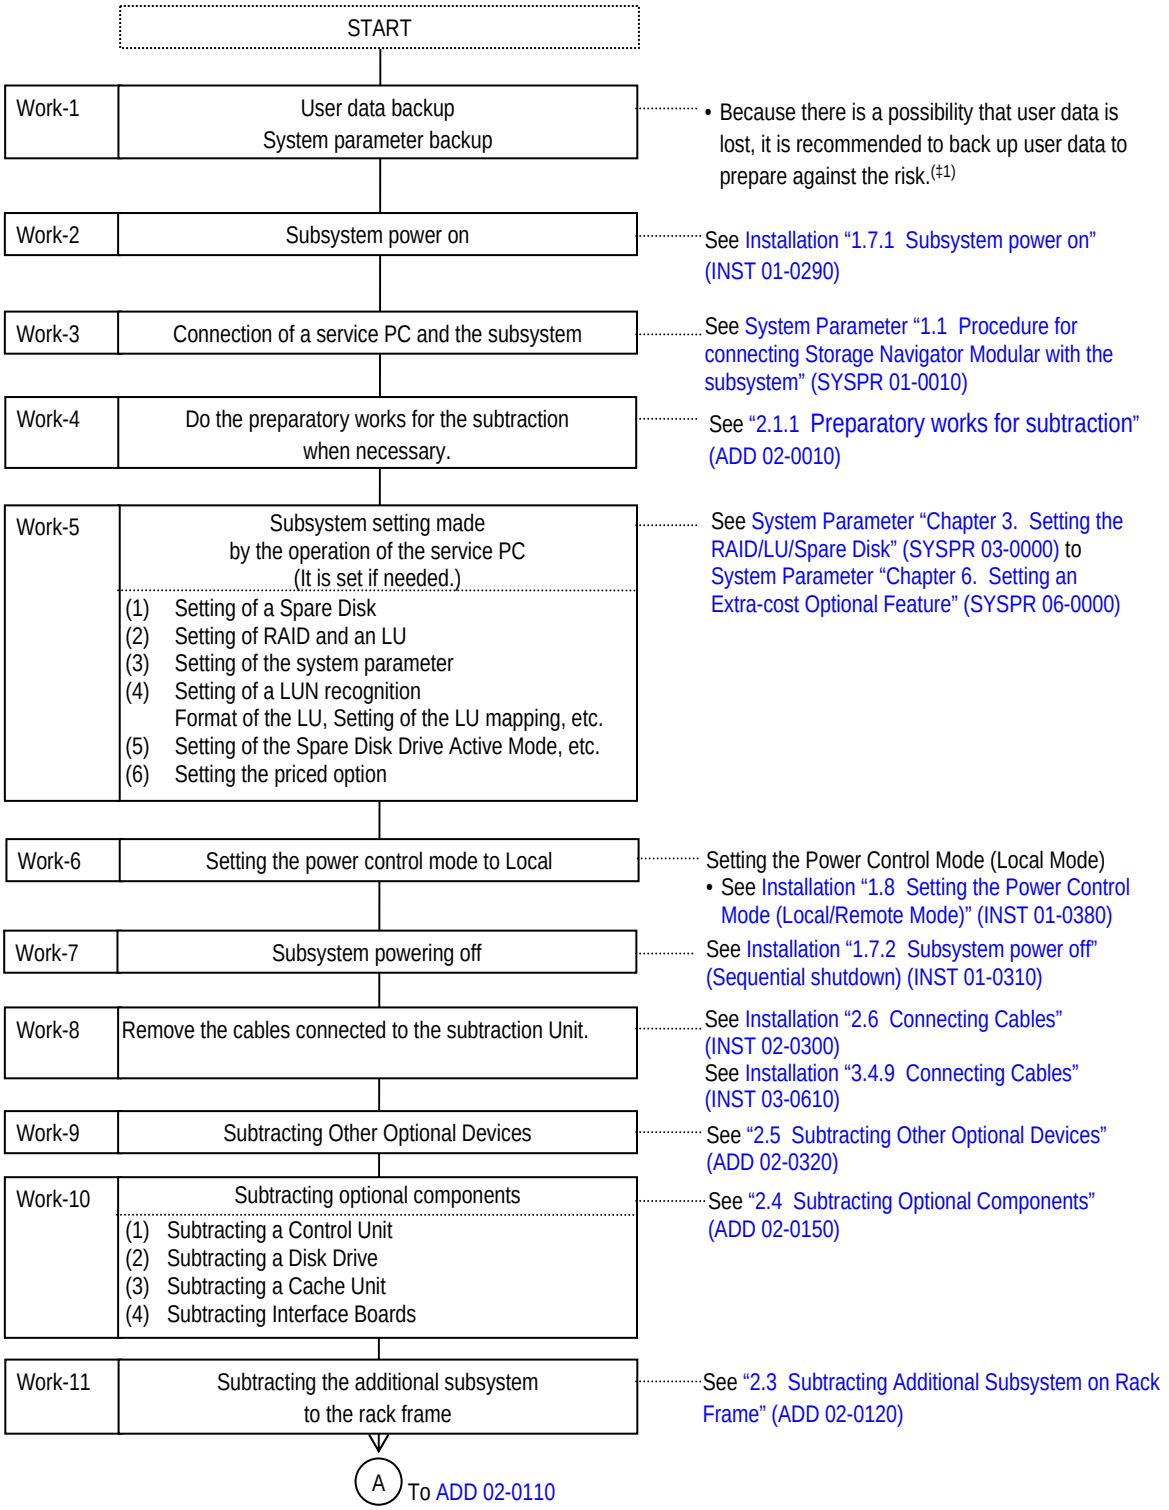
2.2 Procedures for Subtracting Optional Components

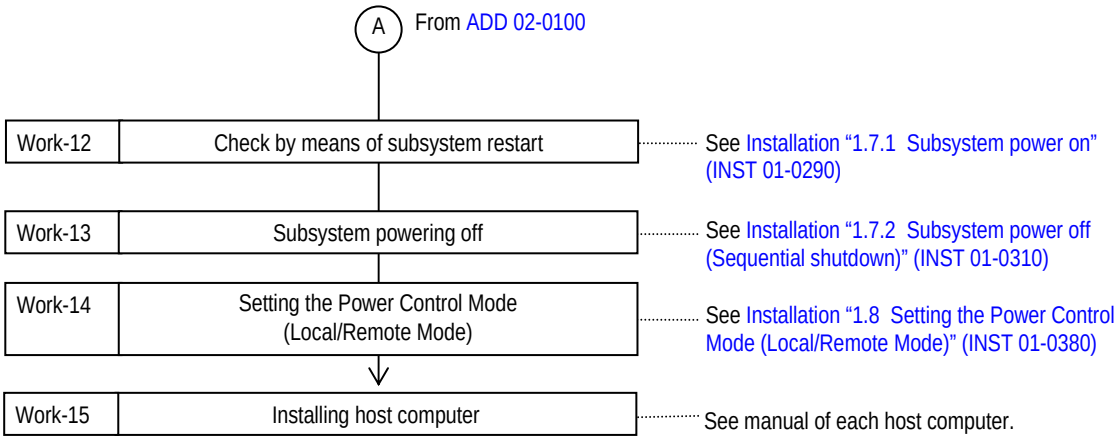
(1) Procedure for subtracting an optional component while the subsystem power online

NOTE : For safety use, always close the front bezel after the operation.



‡1 : Service personnel must check if a customer has backed up user data. If the customer does not perform the backup, start the work after getting customer's permission.

Copyright © 2005, 2006, Hitachi, Ltd.



(2) Procedure for the offline subtraction (with the subsystem power turned off)

NOTE : • For safety use, always close the front bezel after the operation.
• For the see Installation "1.7 Power On/Off Procedure" (INST 01-0290).

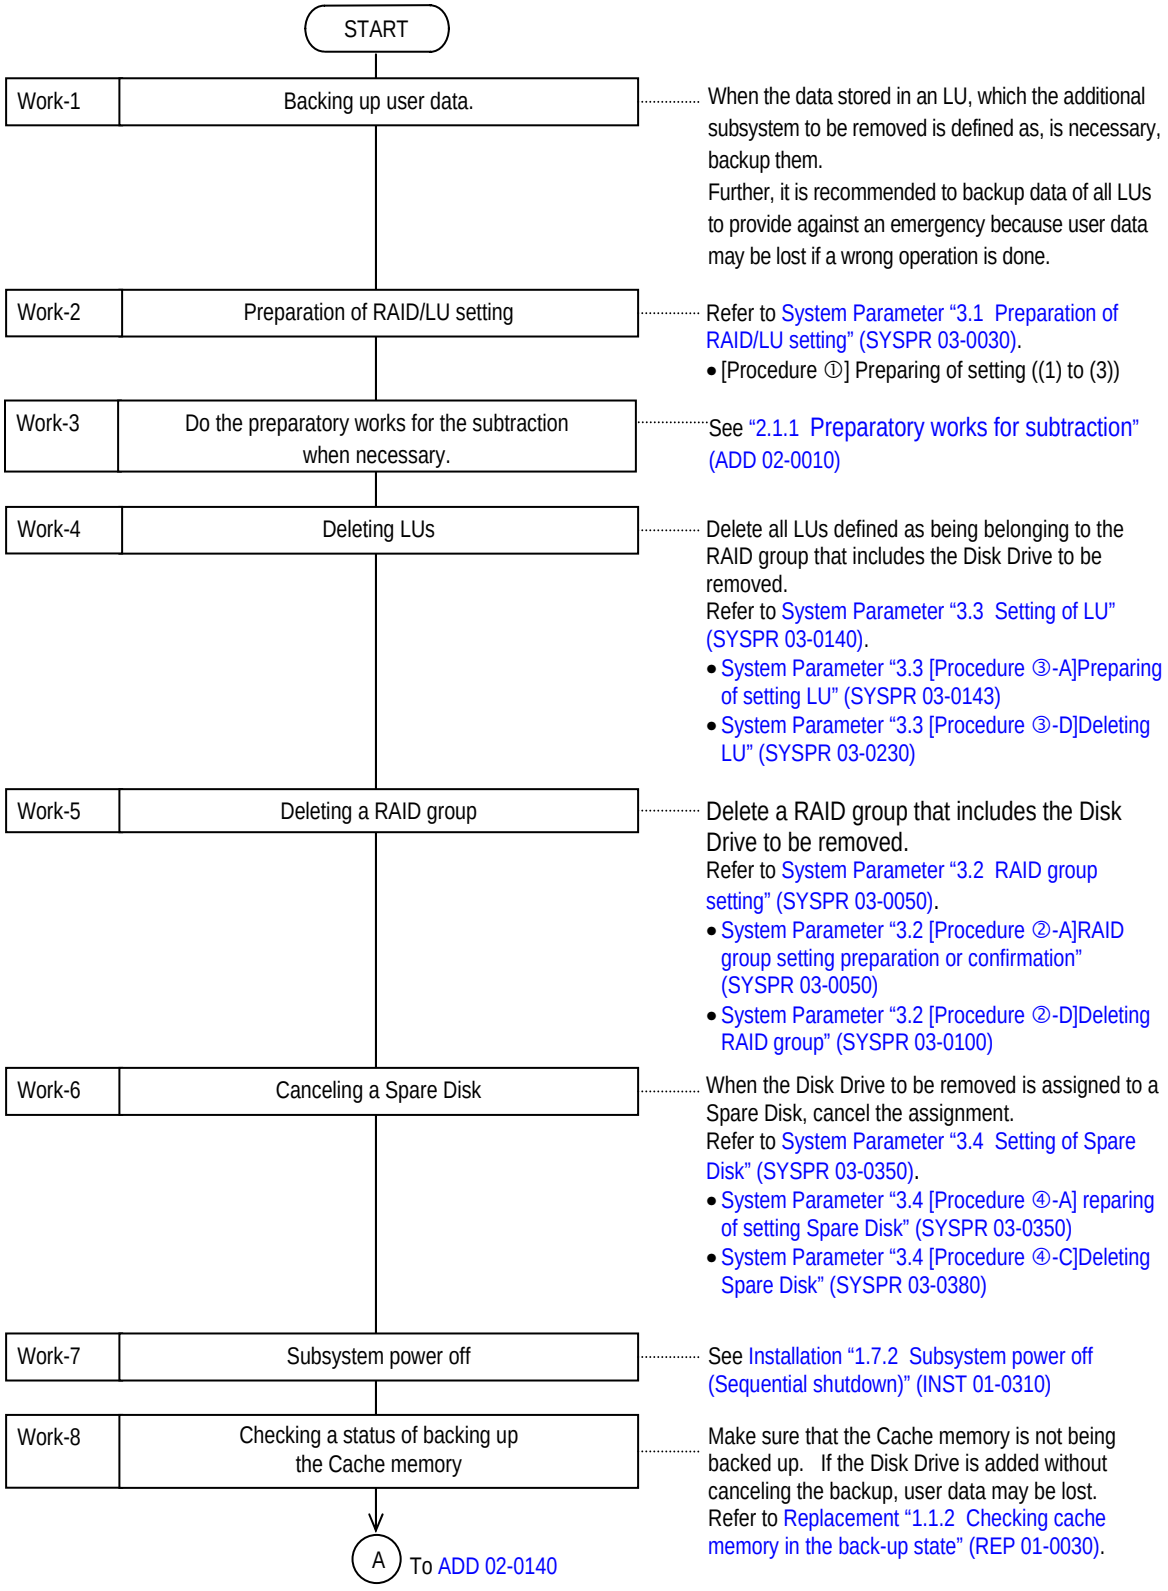
‡1 : Service personnel must check if a customer has backed up user data. If the customer does not perform the backup, start the work after getting customer's permission.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, 2006, Hitachi, Ltd.

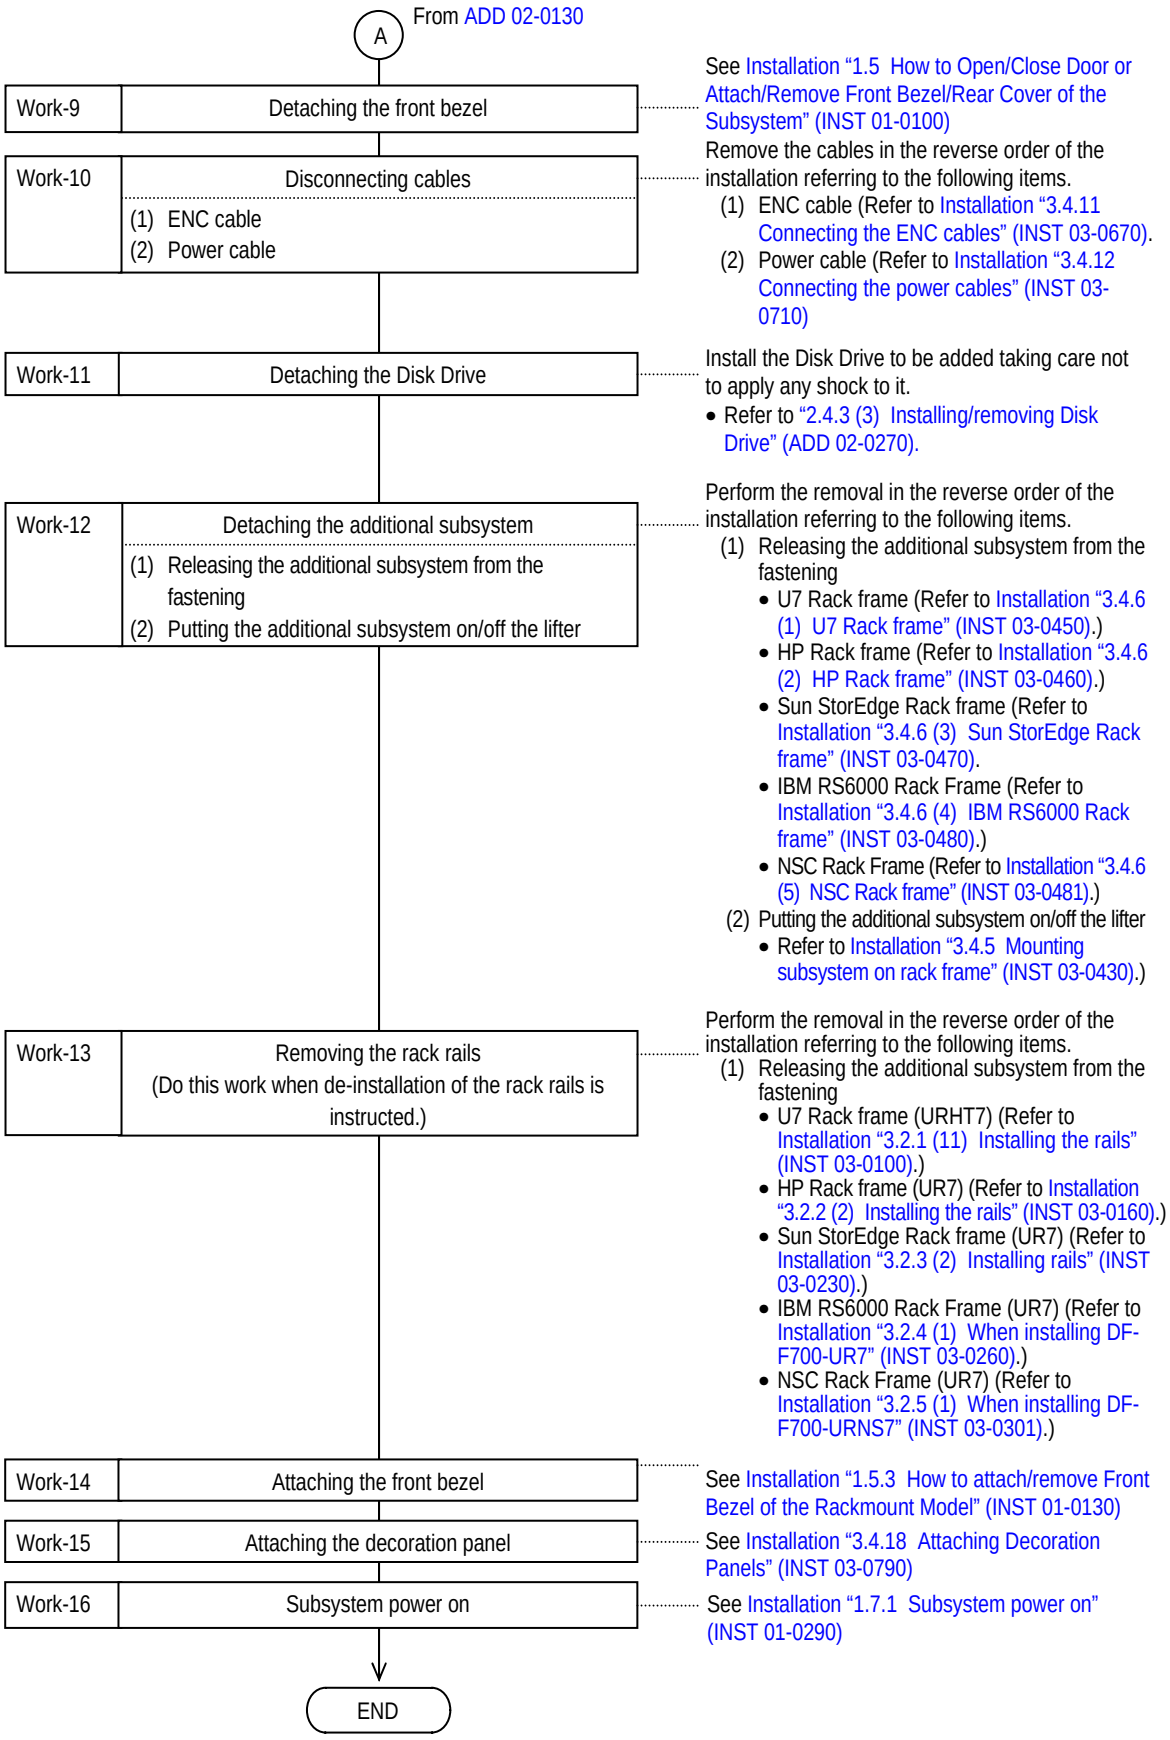
2.3 Subtracting Additional Subsystem on Rack Frame

Select a procedure from the following and execute it.



No.	Model	Power status during the subtraction	Restriction	Subtraction Process section
1	Rackmount model	Subtraction with the power turned on	–	Impossible(*1)
2		Subtraction with the power turned off	1. Remove the Disk Drive. 2. When the Additional Chassis are subtracted offline (with the subsystem power turned off), only the last Additional Chassis of the configuration can be subtracted. While configuring additional subsystem, the additional subsystem cannot be removed. 3. Turn off the AC Power Unit Switch of the subsystem. 4. Subtract the additional subsystem in the opposite procedure of the operation of adding the additional subsystem to the rack frame.	Refer to "1.6 Adding the Additional Subsystem to the Rack Frame (In the case of the connection to the RKM)" (ADD 01-0490)

*1 : Additional subsystem cannot be removed while the subsystem power is on. Be sure to perform it offline (with the subsystem power turned off).
When removing additional subsystem with subsystem power turned online, system may go down since the subsystem recognizes that a failure occurs in the removed additional subsystem.



Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for subtracting the Additional Chassis offline (with the subsystem power turned off)

A procedure for subtracting the RKAJ/RKAJAT after powering off the subsystem is shown below.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, Hitachi, Ltd.

2.4 Subtracting Optional Components

2.4.1 Subsystems optional components for subtraction

(1) Subtracting optional components

Component name	Model name	Specification	Requirements of subtraction	Condition of subtraction and number of item for referring to procedure	
				Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)
Control Unit	DF-F700-F1JM	Array Controller (2port) for duplication. For RKM	–	Impossible	Possible "2.4.2 Subtracting a Control Unit" (ADD 02-0160)
	DF-F700-F1JS	Array Controller (1port) for duplication. For RKS			
	DF-F700-F1JXS	Array Controller (1port) for duplication. For RKXS			
Disk Drive(*2) (including Spare Disk)	DF-F700-AGF72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 10,000 min^{-1})	–	Varies depending on the disk array to be subtraction. "2.4.3 (2) (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Varies depending on) the disk array to be subtraction. "2.4.3 (2) (2-2) Procedure for subtracting Disk Drive while the subsystem power is offline (with the subsystem power turned off)" (ADD 02-0250)
	DF-F700-AGH72	3.5-inch Disk Drive (71.3 G bytes) (Disk rotational speed : 15,000 min-1)			
	DF-F700-AGF146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 10,000 min-1)			
	DF-F700-AGH146	3.5-inch Disk Drive (143.3 G bytes) (Disk rotational speed : 15,000 min-1)			
	DF-F700-AGF300	3.5-inch Disk Drive (287.6 G bytes) (Disk rotational speed : 10,000 min-1)			
	DF-F700-ATE250R (RKXS/RKAJAT)	3.5-inch Disk Drive (245.7 G bytes) (Disk rotational speed : 7,200 min-1)			
	DF-F700-ATE400R (RKXS/RKAJAT)	3.5-inch Disk Drive (393.4 G bytes) (Disk rotational speed : 7,200 min-1)			
	DF-F700-ATE500R (RKXS/RKAJAT)	3.5-inch Disk Drive (491.9 G bytes) (Disk rotational speed : 7,200 min-1)			
Cache Unit	DF-F700-C1GJ	Cache memory (1,024 M bytes)	• For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.	Impossible	Possible "2.4.4 Subtracting a Cache Unit" (ADD 02-0280)
	DF-F700-C2GJ (Excluding RKXS)	Cache memory (2,048 M bytes)			
	DF-F700-C512JX (RKXS special use)	Cache memory (512 M bytes)			
FC Interface Board	DF-F700-DJ4G2H (RKH)	4G bps FC Interface Board (including host connectors for 4G bps (2))	–	Impossible	Possible "2.4.6 Subtracting a FC Interface Board" (ADD 02-0440)
iSCSI Interface Board	DF-F700-DJSC2 (RKM/RKS/RKXS)	iSCSI Interface Board	–	Impossible	Possible "2.4.7 Subtracting an iSCSI Interface Board" (ADD 02-0480)
	DF-F700-DJSC2H (RKH)				

*1 : Data is exchanged between a host computer and the subsystem.

*2 : These values of storage capacity are calculated as 1 G bytes = 1,00,000,000 bytes.
This definition is different from that (1 k bytes = 1,024 bytes) shown on PCs you are using.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) NAS Unit/Subtracting optional components

Component name	Model name	Specification	Requirements of subtraction	Condition of subtraction and number of item for referring to procedure	
				Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)
NAS Unit (RKNAS)	DF-700-RKNAS4G	Install the Memory (DIMM) of 4Gbytes in the RKNAS.	–	Impossible	Possible "2.4.8 Subtracting a NAS Unit" (ADD 02-0540)
	DF-700-RKNAS2G	Install the Memory (DIMM) of 2Gbytes in the RKNAS.			
NAS Interface Board	DF-F700-DJNAS (RKM/RKS/RKXS)	NAS Interface Board	–	Impossible	Possible "2.4.5 Subtracting a NAS Interface Board" (ADD 02-0390)
	DF-F700-DJNASH (RKH)				

*1 : Data is exchanged between a host computer and the subsystem.

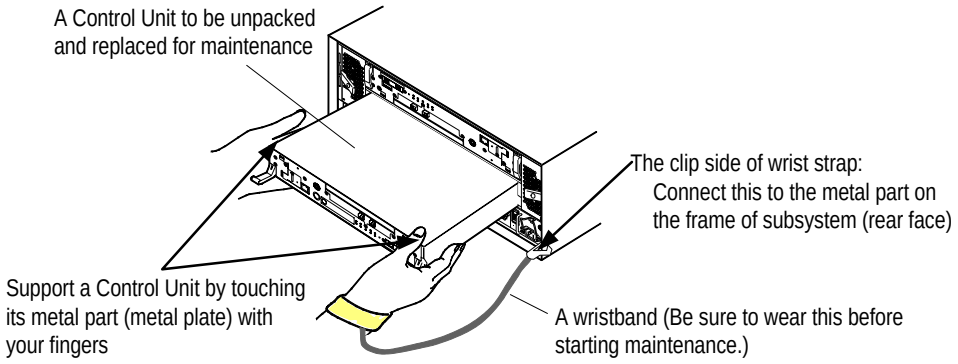
2.4.2 Subtracting a Control Unit

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

(1) Subtracting Process for the Control Unit

Select a procedure from the following and execute it.

No.	Model	Power status during the subtraction	Restriction	Subtraction Process section
1	RKM/RKS/ RKXS	Subtraction with the power turned on	–	Impossible
2		Subtraction with the power turned off	The case of the dual Controller configuration only	Refer to "2.4.2 (2) Procedure for subtraction with the power turned off" (ADD 02-0180)

Copyright © 2005, Hitachi, Ltd.

(2) Procedure of subtraction for the Control Unit

(a) Connect the PC to be connected with Storage Navigator Modular and the Control Unit #0 with a LAN cable. (System Parameter "1.1 Procedure for connecting Storage Navigator Modular with the subsystem" (SYSPR 01-0010))

(b) Set the system starting attribute of Boot Option to the single mode to operate it by the single system (refer to System Parameter "4.2 (1) Setting Boot Options" (SYSPR 04-0040)).

(c) Turn off the main switch.

(d) Make sure that the PWR (POWER) LED (green) on the panel goes out.

NOTE : When the power has already been turned off, make sure that the cache is not in the cache backup mode. (Refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the cache is in the cache backup state, make the Subtracting after canceling the mode.

(e) Make sure that the CACHE POWER LED (green) on the Control Unit is off.

NOTE : When the CACHE POWER LED (green) is on, user data which has not written on the disk exists in the cache memory.

(f) Turn off the AC Power Unit Switch of the Power Unit.

(g) Remove the Fibre Channel cable, LAN, ENC cable, and RS232C cables connected to the Control Unit #1.

NOTE : • Connect only the Loop #0 (ENC Unit #0) side to make the single Control Unit configuration. The Loop #1 (ENC Unit #1) side is not connected.
When two or more additional subsystem are connected, however, both cables in ENC Unit #0 and ENC Unit #1 should be connected for the additional subsystem.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(h) Remove the Control Unit #1.
Loosen the screws (right and left) which are fixing the levers of the Control Unit #1, push down the levers forward, and pull out the Control Unit.

(i) Install the dummy (control Unit).
Install the dummy (Control Unit) by fitting its right and left claws to the cutouts of the basic subsystem, slide the latches upward, and tighten the fixing screws (right and left).

NOTE : Do not catch a ENC cable, when the Control Unit for the inserted.

(j) Turn on the AC Power Unit Switch of the Power Unit.

(k) Turn on the main switch.

(l) Make sure that the RDY (READY) LED (green) on the front side of the subsystem comes on.

(m) Check that the maintenance port IP address is set correctly.
When the maintenance port IP address is displayed as "0.0.0.0", set it.
Refer to System Parameter "4.2 (4) Setting of Maintenance LAN" (SYSPR 04-0100).

2.4.3 Subtracting a Disk Drive

A procedure for subtracting the Disk Drive varies depending on a location of the Disk Drive and a condition (whether the subsystem power is online or offline (with the subsystem power turned off)). Take care to use a procedure appropriate for the purpose because a use of an inappropriate procedure may cause an accident such as a loss of user data.

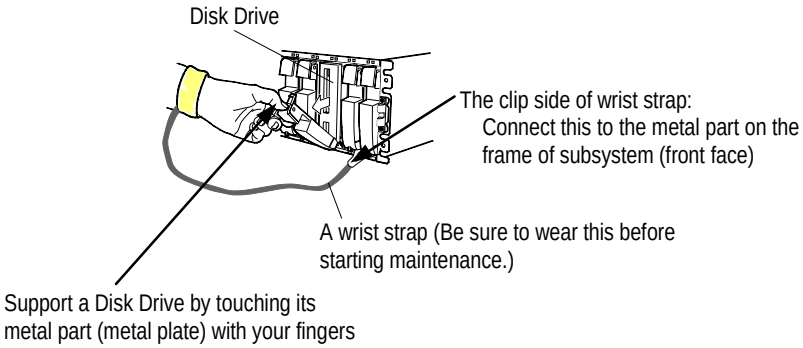
Table 2.4.1 Kinds of Disk Drive Subtraction

No.	Unit of addition/ subtraction	Component to be added/ subtracted	Subtraction	
			Removal of the Disk Drive(s) which is not used (from which a setting of a RAID group has been deleted)	
			Power online (A host is in operation (*1).)	Power offline (with the subsystem power turned off)
1	Disk Drive	RKM/RKS/RKXS #0 to 4 RKAJ corresponding to the unit ID #0 connected to the RKH #0 to 4	Impossible (*2) –	Impossible(*2) –
2		RKM/RKS/RKXS #5 to14 RKAJ corresponding to the unit ID #0 connected to the RKH #5 to 14	Possible Refer to "2.4.3 (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Possible Refer to "2.4.3 (2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)" (ADD 02-0250)
3		RKAJ #0 to 3 (Excluding the RKAJ corresponding to the unit ID #0 connected to the RKH)	Possible(*3) Refer to "2.4.3 (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Impossible(*3) Refer to "2.4.3 (2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)" (ADD 02-0250)
4		RKAJ #4 to 14 (Excluding the RKAJ corresponding to the unit ID #0 connected to the RKH)	Possible Refer to "2.4.3 (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Possible Refer to "2.4.3 (2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)" (ADD 02-0250)
5		RKAJAT #0 to 3	Possible(*2) Refer to "2.4.3 (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Possible(*2) Refer to "2.4.3 (2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)" (ADD 02-0250)
6		RKAJAT #4 to 14	Possible Refer to "2.4.3 (2-1) Procedure for subtracting Disk Drive while the subsystem power is online" (ADD 02-0230)	Possible Refer to "2.4.3 (2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)" (ADD 02-0250)

*1 : Data is exchanged between a host computer and the subsystem.

*2 : The Disk Drives #0 to #4 of the RKM/RKS/RKXS cannot be decreased because the microprogram is stored in them. The Disk Drives #0 to #4 of the RKAJ corresponding to the unit ID #0 connected to the RKH cannot be decreased because the microprogram is stored in them.

*3 : Since the Disk Drives #0 to #3 of the RKAJ/RKAJAT are used for monitoring the RKAJ/RKAJAT , be sure to decrease them so that either set of the two Disk Drives, #0 and #1 or #2 and #3, is left. (Excluding the RKAJ corresponding to the unit ID #0 connected to the RKH)
All of the Disk Drives #0 to #3 cannot be removed from the RKAJ/RKAJAT at the middle of a configuration. (Excluding the RKAJ corresponding to the unit ID #0 connected to the RKH)
When you want to subtract all the Disk Drives of #0 to #3 in the RKAJ/RKAJAT of the last configuration, subtract the whole RKAJ/RKAJAT offline (with the subsystem power turned off). (Excluding the RKAJ corresponding to the unit ID #0 connected to the RKH)



Copyright © 2005, 2006, Hitachi, Ltd.

(1) Before starting subtraction of Disk Drive

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you remove a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

(a) Locations and numbers of Disk Drives

The mounting position number of the disk drive is decided by the combination of the disk drive number set to the device number (device ID).

Set #0 for the device ID of RKM/RKS/RKXS and set the device ID of RKAJ/RKAJAT as follows.

Set #0x for the device ID of RKAJ.

Set the device ID of RKAJAT to be connected to RKXS to 2x.

There is no device ID for the RKH.

NOTE : Set x in ascending order in PATH #0 and #1 without the distinction of RKAJ/RKAJAT.

For details of the device ID setting, refer to Installation "1.6 Device ID Setting and ENC Cable Connection" (INST 01-0160).

Set the subsystem identification switch for the RKAJ.

When the basic subsystem to be connected is the RKM, set it in the M side, and when it is the RKS, set it in the S side.

The disk drive number is #0 to #14 from the left sequentially seen sideways (for the floor model, it is #0 to #14 from the bottom).

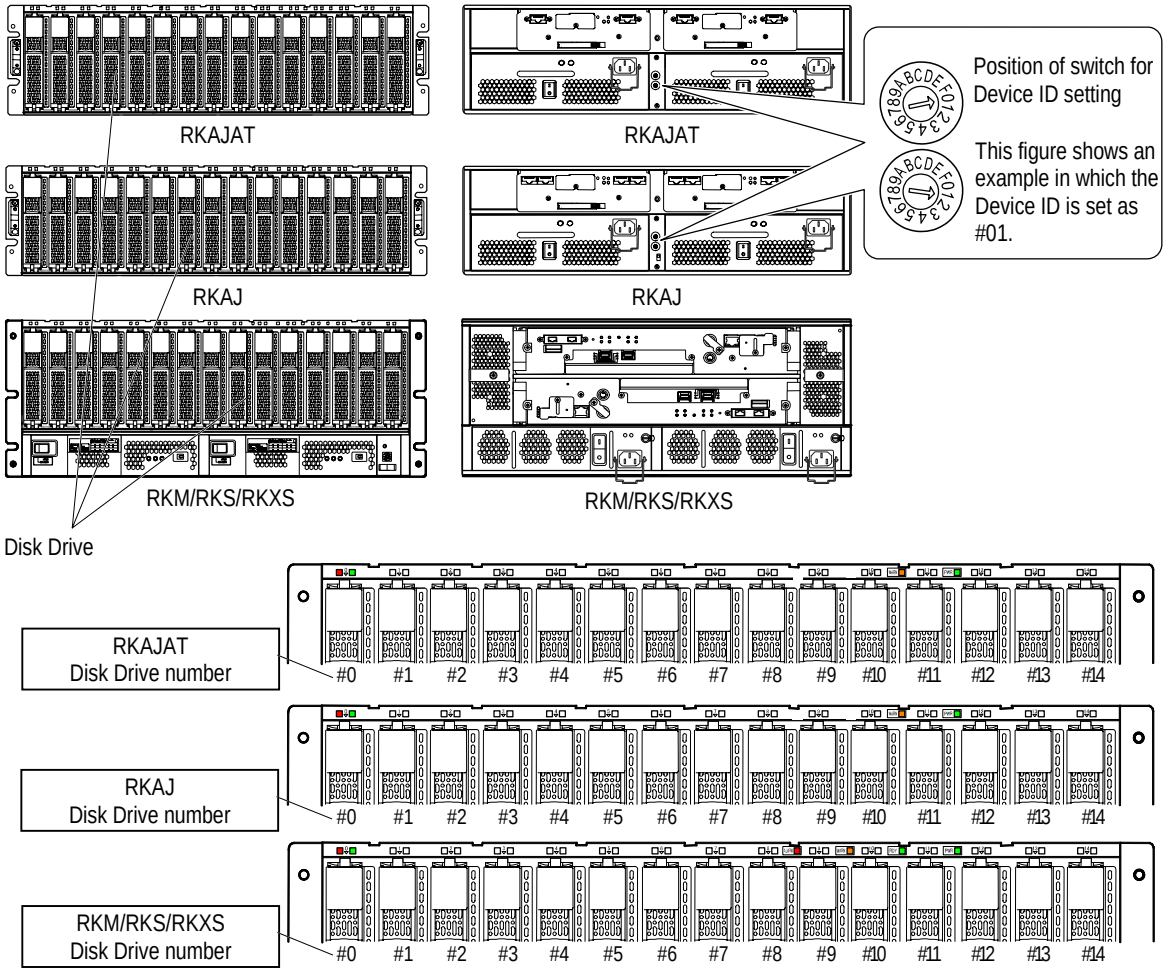


Figure 2.4.2 Disk Drive Mounting Location

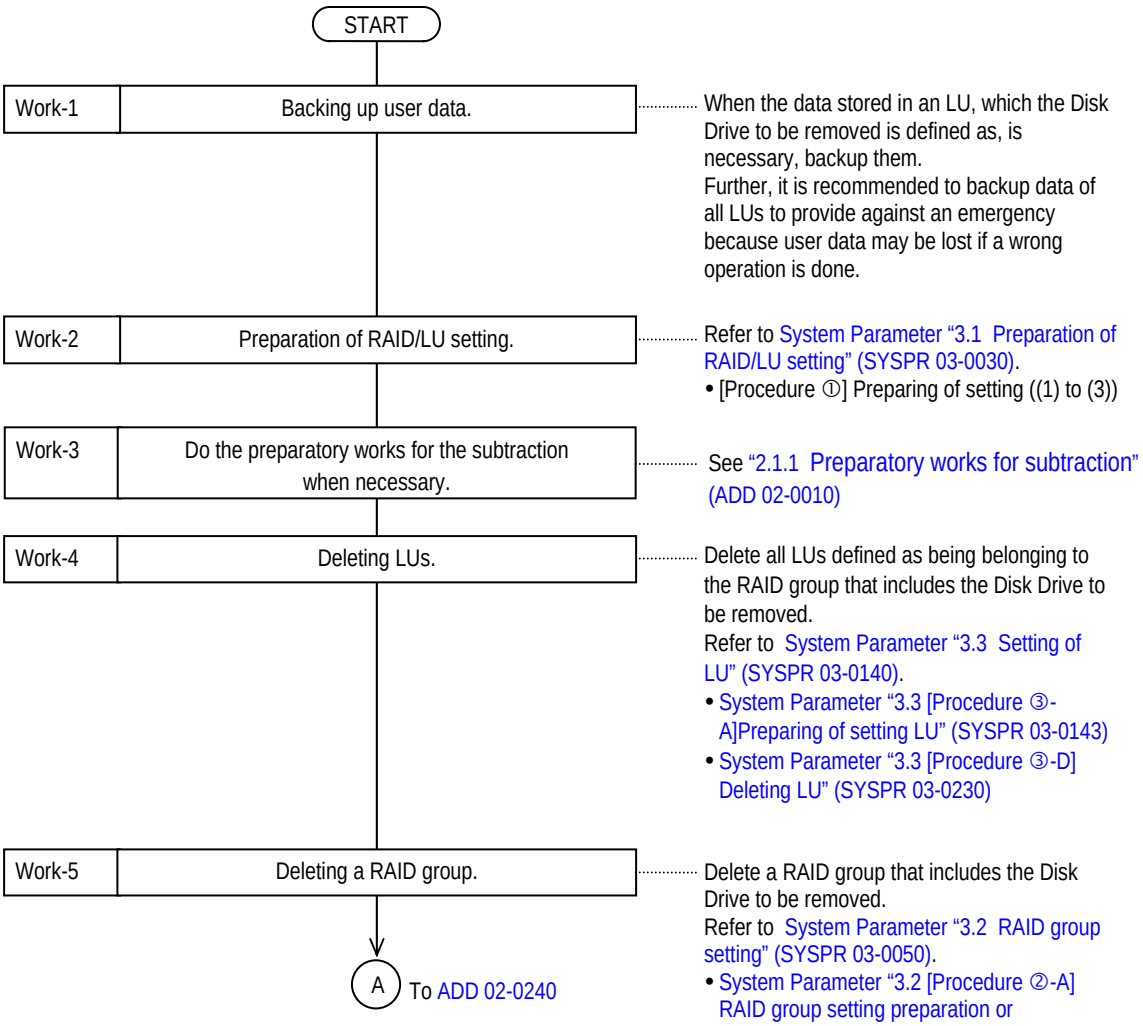
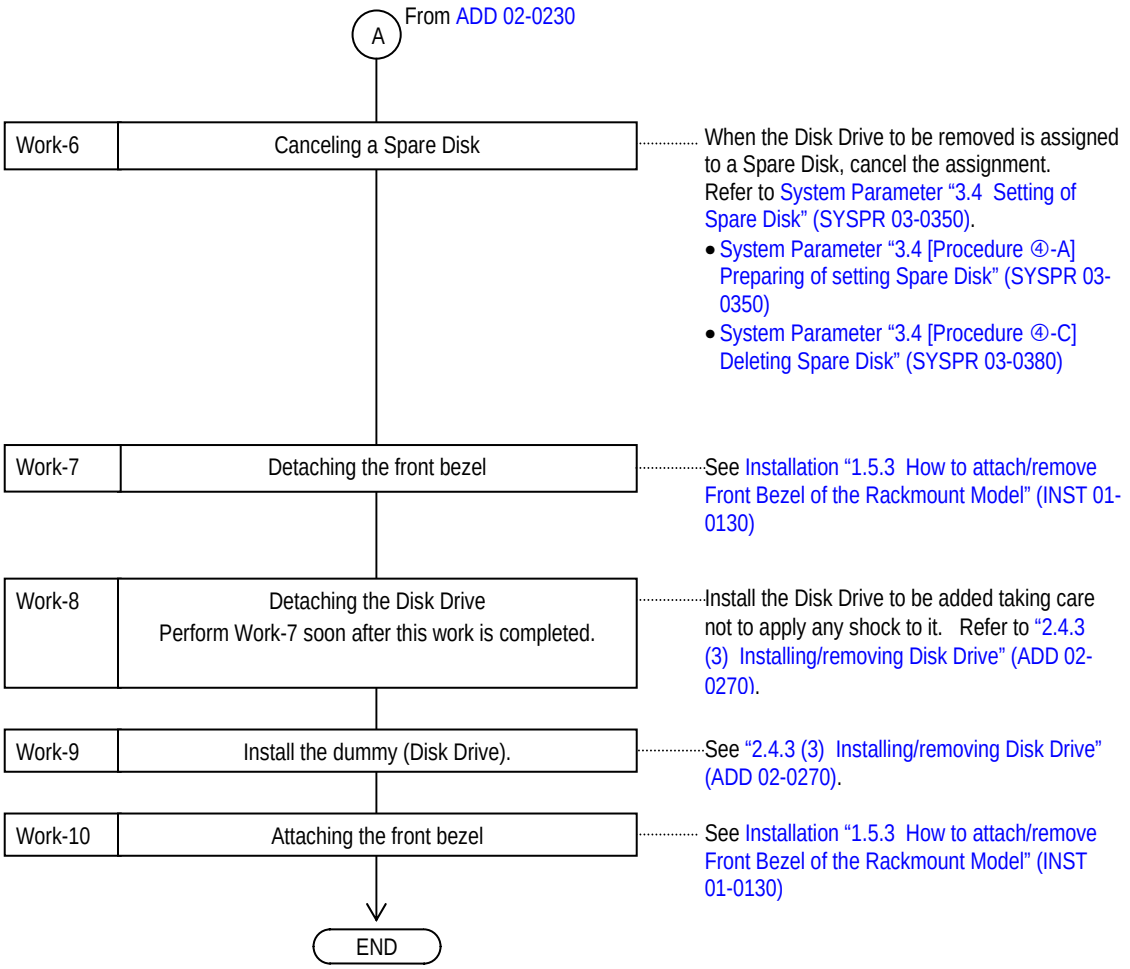


Copyright © 2005, 2006, Hitachi, Ltd.

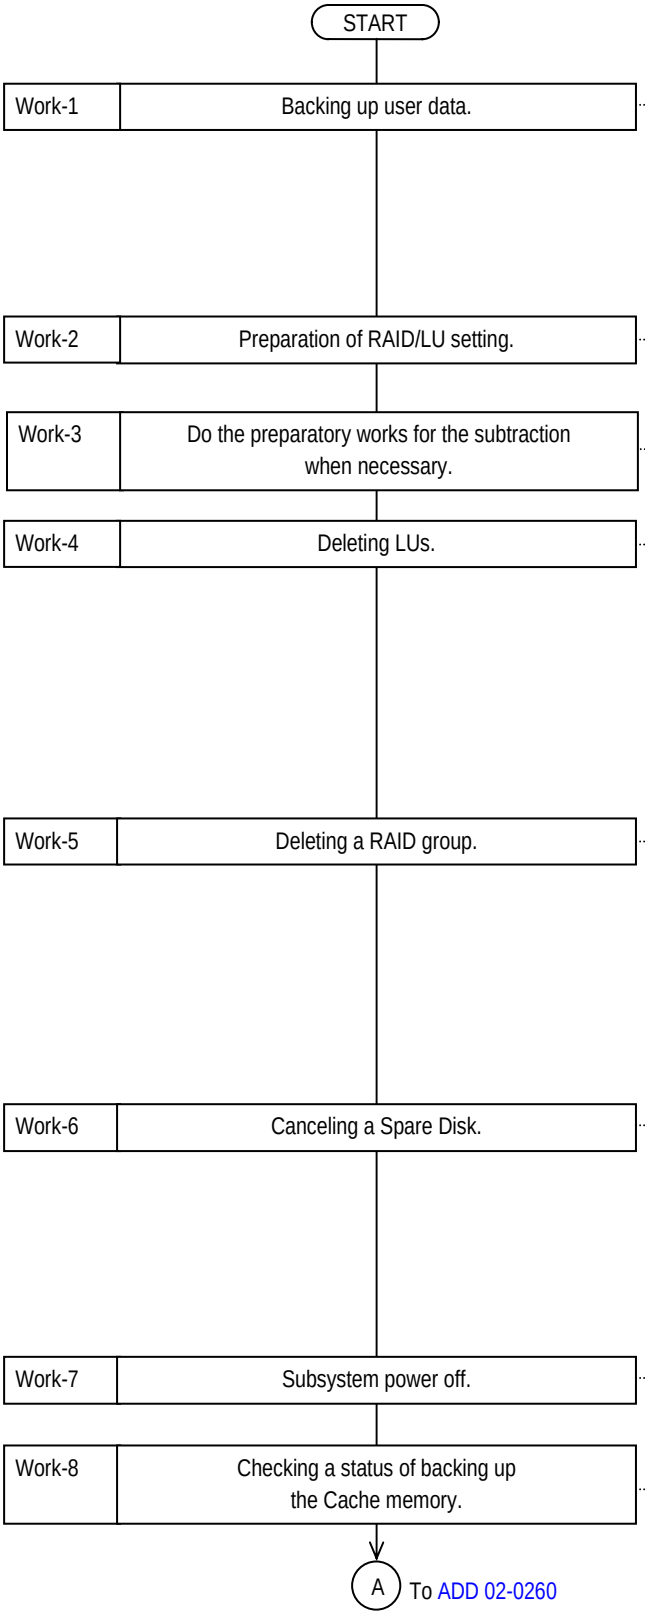
(2) Procedure for subtracting Disk Drive



- A procedure for subtracting the Disk Drive installed in the subsystem is shown below.
- Any of the Disk Drives #0 to #4 of the RKM/RKS/RKXS cannot be subtracted.
- To remove all of the Disk Drives #0 and #1 of the RKAJ/RKAJAT, it is required to remove them together with the RKAJ/RKAJAT in which they are installed.
- It is recommended to backup data of all LUs to provide against an emergency because user data may be lost if a wrong operation is done.

(2-1) Procedure for subtracting Disk Drive while the subsystem power is online

A procedure for subtracting the Disk Drive without shutting down the subsystem is shown below.



Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, Hitachi, Ltd.

(2-2) Procedure for subtracting the Disk Drives offline (with the subsystem power turned off)

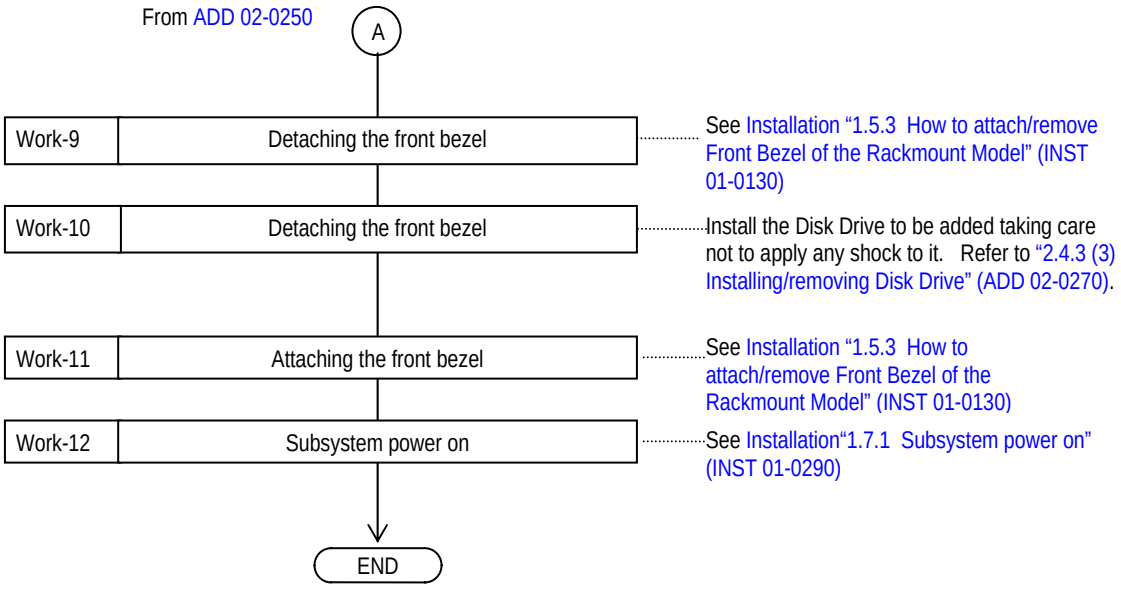
A procedure for subtracting the Disk Drive after powering off the subsystem is shown below.

When the data stored in an LU, which the Disk Drive to be removed is defined as, is necessary, backup them.
Further, it is recommended to backup data of all LUs to provide against an emergency because user data may be lost if a wrong operation is done.

Refer to System Parameter "3.1 Preparation of RAID/LU setting" (SYSPR 03-0030).
- [Procedure ①] Preparing of setting ((1) to (3))

See "2.1.1 Preparatory works for subtraction" (ADD 02-0010)

Delete all LUs defined as being belonging to the RAID group that includes the Disk Drive to be removed.
Refer to System Parameter "3.3 Setting of LU" (SYSPR 03-0140).
- System Parameter "3.3 [Procedure ③-A]Preparing of setting LU" (SYSPR 03-0143)
- System Parameter "3.3 [Procedure ③-D] Deleting LU" (SYSPR 03-0230)



Delete a RAID group that includes the Disk Drive to be removed.
Refer to System Parameter "3.2 RAID group setting" (SYSPR 03-0050).
- System Parameter "3.2 [Procedure ②-A] RAID group setting preparation or confirmation" (SYSPR 03-0050)
- System Parameter "3.2 [Procedure ②-D] Deleting RAID group" (SYSPR 03-0100)

When the Disk Drive to be removed is assigned to a Spare Disk, cancel the assignment.
Refer to System Parameter "3.4 Setting of Spare Disk" (SYSPR 03-0350).
- System Parameter "3.4 [Procedure ④-A] Preparing of setting Spare Disk" (SYSPR 03-0350)
- System Parameter "3.4 [Procedure ④-C] Deleting Spare Disk" (SYSPR 03-0380)

See Installation "1.7.2 Subsystem power off (Sequential shutdown)" (INST 01-0310)

Make sure that the Cache memory is not being backed up. If the Disk Drive is added without canceling the backup, user data may be lost.
Refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, Hitachi, Ltd.

(3) Installing/removing Disk Drive

When installing or removing a Disk Drive in the work for decreasing the number of Disk Drives, follow the procedure explained below.

Perform the following operations (a) and (b) for each of the slots, where the Disk Drive is to be replaced, one by one.

(a) Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive by pulling it out taking care not to apply a shock to it. (see Figure 2.4.3).

When using the removed Disk Drive for the purpose of addition to another disk array unit, keep it in custody with its handle returned to its original state (locked by the stopper) taking care not to apply a shock to it.

(b) Install the dummy (Disk Drive) in the slot from which the Disk Drive has been removed.

Be sure to insert the dummy (Disk Drive) in the vacant slot because it is necessary to regulate a cooling air flow inside the disk array.

There are two types of the dummies (Disk Drives), and the installation methods are different respectively.

- The dummy (Disk Drive) of which the external appearance is similar to the Disk Drive

  There is no label attached on the handle part.

  (i) Fit the Disk Drive in the guide rail of the RKAJAT and slide it in the direction shown by the arrow.

  (ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the disk array unit.

  (iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

- The dummy (Disk Drive) of which the external appearance is all black

  This is the dummy (Disk Drive) of the resin all-in-one molded piece (black) with no stopper and handle part.

  Insert it into the slot slowly so that the latch (round dent) part of the dummy (Disk Drive) comes to the lower side.

NOTE : Exteriors of the Disk Drive and dummy (Disk Drive) are similar to each other. Be careful not to install or remove a wrong one.

Disk Drive : The label to display the model name and the revision is attached on the handle part.

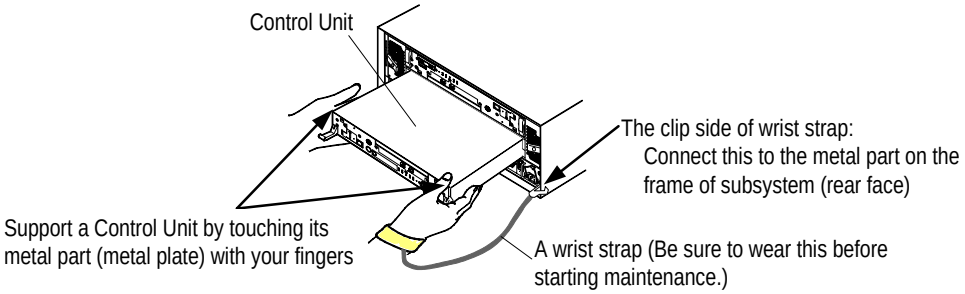
2.4.4 Subtracting a Cache Unit

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

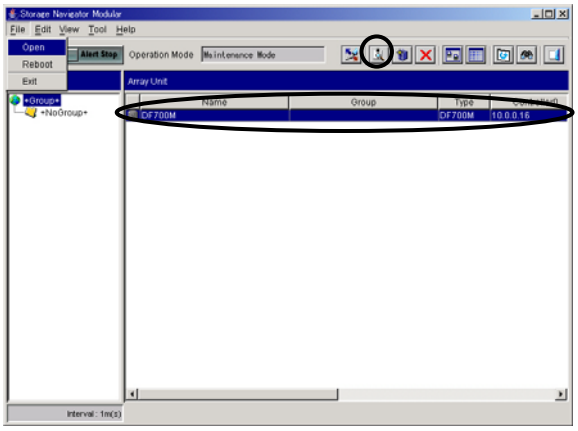
NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, Hitachi, Ltd.

<Working Procedure>

When the priced option, Cache Partition Manager, is used, there is a possibility that the Cache memory cannot be subtracted or the setting of the parameter of the priced option, Cache Partition Manager, is updated when subtracting the Cache memory.
There is a procedure to check the status of the subsystem before subtracting the Cache memory.

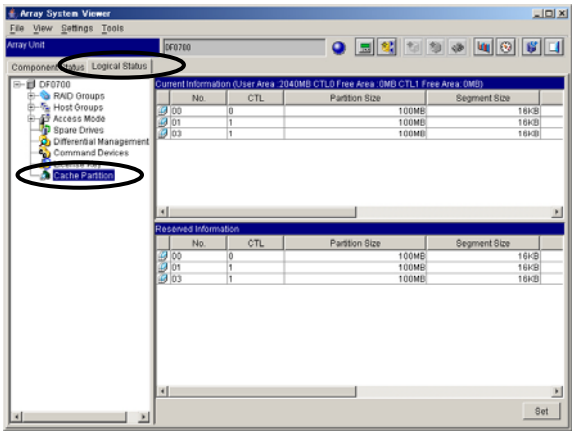
(1) Connect the LAN cross cable to the LAN connector for the maintenance of the subsystem (refer to Troubleshooting "3.1 Procedure to WEB connection" (TRBL 03-0000)).



(2) Connect Storage Navigator Modular.

(a) Be careful of the connection positions of the cables because the installation directions are different in the Control Unit #0 and #1.
Refer to System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050) for the changing method to the maintenance mode.

(b) Click the icon of the array subsystem that you want to set from the main window. There are the following three types of the selection methods.

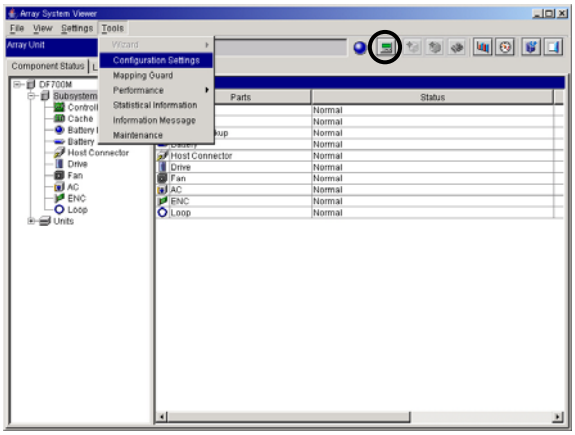


- Select [File] - [Open].
- Double click the icon of the array subsystem that you want to set.
- Click the [: Open] button.

NOTE : Check whether the LAN port number is not changed when the main window is not displayed even if you click on the icon of the array subsystem (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).
Execute it again after using the changed LAN port number.

Copyright © 2005, 2006, Hitachi, Ltd.

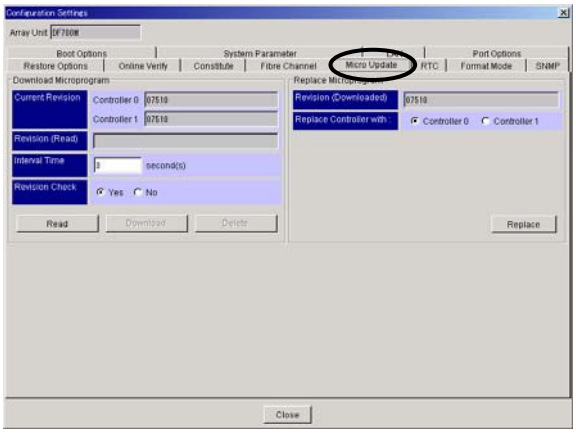
(3) When the icon of the priced option, Cache Partition Manager, is displayed in the tree view, there is a possibility that the Cache memory cannot be subtracted. In this case, check whether the Cache memory can be subtracted according to the following procedure.
When the icon of the priced option, Cache Partition Manager, is not displayed in the tree view, go to Procedure (11).



(4) Check the subsystem that subtracts the Cache memory.

- The Cache memory of WMS100 cannot be subtracted to 512 M bytes per Control Unit in the status that the priced option, Cache Partition Manager, is enabled.
- The Cache memory of AMS500 cannot be subtracted to 1G bytes per Control Unit in the status that the priced option, Cache Partition Manager, is enabled.

Check with the customer/SE whether to subtract the Cache memory after locking (‡1) the priced option, Cache Partition Manager, or to stop the subtraction work of the Cache memory.
When subtracting the Cache memory after locking (‡1) the priced option, Cache Partition Manager, go to Procedure (11) after the customer/SE locks the priced option, Cache Partition Manager.



(5) Select [Tool] – [Configuration Setting] in the unit window, or click [: Configuration Setting].

‡1 :Request the customer/SE for the lock of the priced option, Cache Partition Manager.

Copyright © 2005, 2006, Hitachi, Ltd.

(6) Click the [Micro Update] tab.

(7) Check [Current Revision] of [Download Microprogram].

- When the revision of the microprogram is 0770/A or less

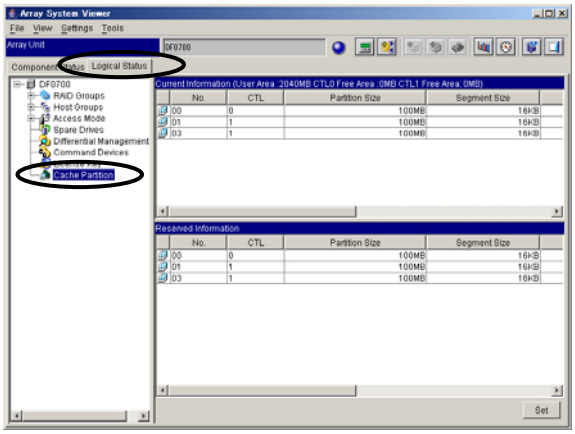
  The Cache memory cannot be subtracted in the status that the priced option, Cache Partition Manager, is enabled.

  In that case, check with the customer whether to make the priced option, Cache Partition Manager, disabled (‡1) once and then return it to be enabled and set the parameter of the priced option, Cache Partition Manager, again (‡2) or to stop the subtraction work of the Cache memory.

  When subtracting the Cache memory after making the priced option, Cache Partition Manager, disabled, go to Procedure (11) after the customer/SE makes the priced option, Cache Partition Manager, disabled (‡1).

- When the revision of the microprogram is 0770/A or later

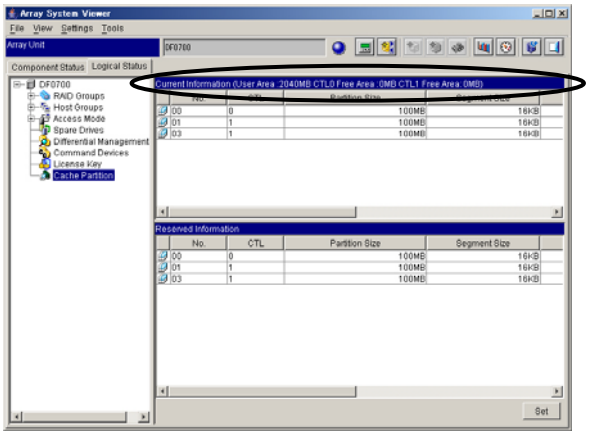
  Continue the confirmation work according to the following procedure to check whether the subtraction of the Cache memory is possible.



‡1 :Request the customer/SE for the lock of the priced option, Cache Partition Manager.
‡2 :Request the customer/SE for the validation and the parameter setting of the priced option, Cache Partition Manager.

Copyright © 2005, 2006, Hitachi, Ltd.

(8) Click the [Close] button of the [Configuration Setting] window.



(9) Click the [Logical Status] tab in the unit window, and then click the [Cache Partition] icon of the tree view.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) Check [Current Information] and [Reservation Information] in the list view.
(a) The partition No.02 to No.31 are listed in [Current Information] or [Reservation Information] (‡1).
(b) The subsystem is the dual controller configuration, and there is even one different size among four sizes; the size of the partition No.00 and the size of the partition No.01 in [Current Information] and the partition No.00 and the partition No.01 in [Reservation Information] (‡2).

When either (a) or (b) is applied, the Cache memory cannot be subtracted in the status that the priced option, Cache Partition Manager, is enabled.
Check with the customer whether to make the priced option, Cache Partition Manager, disabled (‡3) once and then return it to be enabled and set the parameter of the priced option, Cache Partition Manager, again (‡4) or to stop the subtraction work of the Cache memory.
When subtracting the Cache memory after making the priced option, Cache Partition Manager, disabled, go to Procedure (11) after the customer/SE makes the priced option, Cache Partition Manager, disabled (‡3).
When neither (a) nor (b) is applied, go to Procedure (11) and subtract the Cache memory.

‡1 : The partition No.02 to No.31 are called sub-partition. This indicates that the sub-partition is added or reserved for the addition by the partitioning function of the Cache memory.
‡2 : This indicates that the partition size is changed or the change of the partition size is reserved by the partitioning function of the Cache memory.
‡3 : Request the customer/SE for the lock of the priced option, Cache Partition Manager.
‡4 : Request the customer/SE for the validation and the parameter setting of the priced option, Cache Partition Manager.

Copyright © 2005, 2006, Hitachi, Ltd.

(11) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : When the subsystem power has already been turned off, make sure that the cache memory is not being backed up. (Refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
If the cache memory is being backed up, execute Step (b) and the following steps after canceling the backing up.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(12) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(13) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.
(14) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(15) Remove the Control Unit by pulling it out toward you.
(16) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(17) Remove the Cache Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

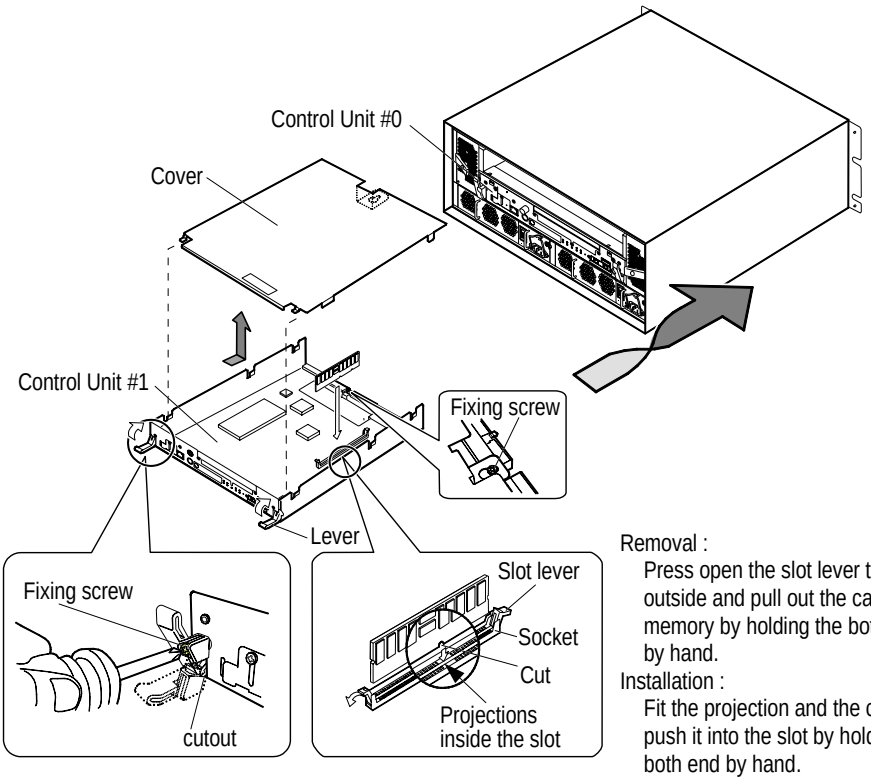
Copyright © 2006, Hitachi, Ltd.

(18) Install the subtracted Cache Unit in the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• If the Cache memory is not installed in slot #0 for RKM, the Control Unit blockade is caused. Be sure to install the Cache memory in slot #0.
• For the RKM, insert the Cache Units in the cache slots in regular order starting from the slot #0.
• In the case of the RKH, if the Cache memories are not installed in the slot #0 and the slot #1, the blockade of the Control Unit occurs.
Be sure to install the Cache memories in the slot #0 and the slot #1.
• Install the Cache Units by the set of two in the slot #0 and #1 and the slot #2 and #3.
• For the RKH, install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively, and make the capacity and the installation position of the Control Unit #0 and the Control Unit #1 the same.

(19) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(20) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch an ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.



(21) Connect the removed all cables to the Control Unit.

NOTE : • When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(22) Turn on the AC Power Unit Switch of the both Power Units .
(23) Turn on the main switch.
(24) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1). The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(25) Check that the READY LED (green) or the WARNING LED (orange) on the front of the Basic Chassis lights up. The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

Copyright © 2006, Hitachi, Ltd.

Removal :
Press open the slot lever to outside and pull out the cache memory by holding the both end by hand.
Installation :
Fit the projection and the cut and push it into the slot by holding the both end by hand.

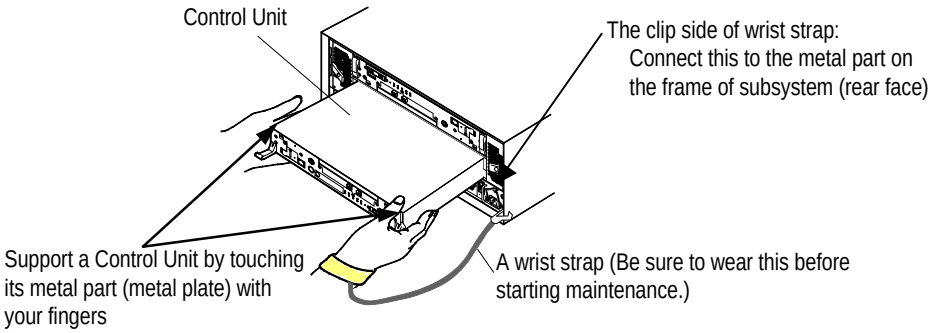
2.4.5 Subtracting a NAS Interface Board

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the Additional Chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.

Copyright © 2006, Hitachi, Ltd.

(1) Collect Simple Trace and Constitution Information. (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(2) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(3) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(4) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(5) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(6) Remove the Control Unit by pulling it out toward you.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2006, Hitachi, Ltd.

(7) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(8) Loosen the fixing screws ② (two places) of the NAS Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the NAS Interface Board upwards and remove it from the Control Unit.

NOTE : • Place the removed Interface Board in the place where anti-static measures are taken.
• Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1 (Refer to "Table 2.4.2 Installation position of the Interface Board" (ADD 02-0430)).

(9) When the 4 G bps interface is used, install the 4 G bps FC Interface Board (RKH: DF700-DJ4G2H, RKM: DF700-DJ4G2, RKS/RKXS: DF700-DJ4G2W) fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the 4 G bps FC Interface Board (RKH: DF700-DJ4G2H, RKM: DF700-DJ4G2, RKS/RKXS: DF700-DJ4G2W) may become the inside of the Control Unit.
Go to Procedure (12).
(10) When the 2Gbps interface is used, install the dummy Interface Board and fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the dummy Interface Board may become the inside of the Control Unit.
(11) Install the two host connectors for 2 G bps (for the RKS/RKXS), which were removed when the NAS Interface Board was added, in the Control Units respectively.
(12) Loosen the screws of the connector cover for the maintenance of the Control Unit and remove the Panel attached when the NAS Interface Board was added.
Hand over the removed Panel to the customer, and ask him/her to keep it carefully.
(13) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(14) Insert it into the position in the Control Unit with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch an ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(15) In the case of the dual control Unit composition, perform the procedure from (4) to (14) to the other Control Unit.
(16) Remove the NAS Unit. (Refer to "2.4.8 Subtracting a NAS Unit" (ADD 02-0540).)
(17) Connect the removed all cables to the Control Unit.

NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Copyright © 2006, Hitachi, Ltd.

(18) Turn on the AC Power Unit Switch of the both Power Units.
(19) Turn on the main switch.
(20) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(21) Check that the READY LED (green) or the WARNING LED (orange) on the front of the Basic Chassis lights up. The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
(22) When installing the FC Interface Board after Subtracting the NAS Interface Board, configure the host group and Fibre Channel port setting. (refer to System Parameter "Chapter 2 Setting Host Group/Targets" (SYSPR 02-0000), and System Parameter "4.2 (9) Setting of Fibre Channel" (SYSPR 04-0170).)

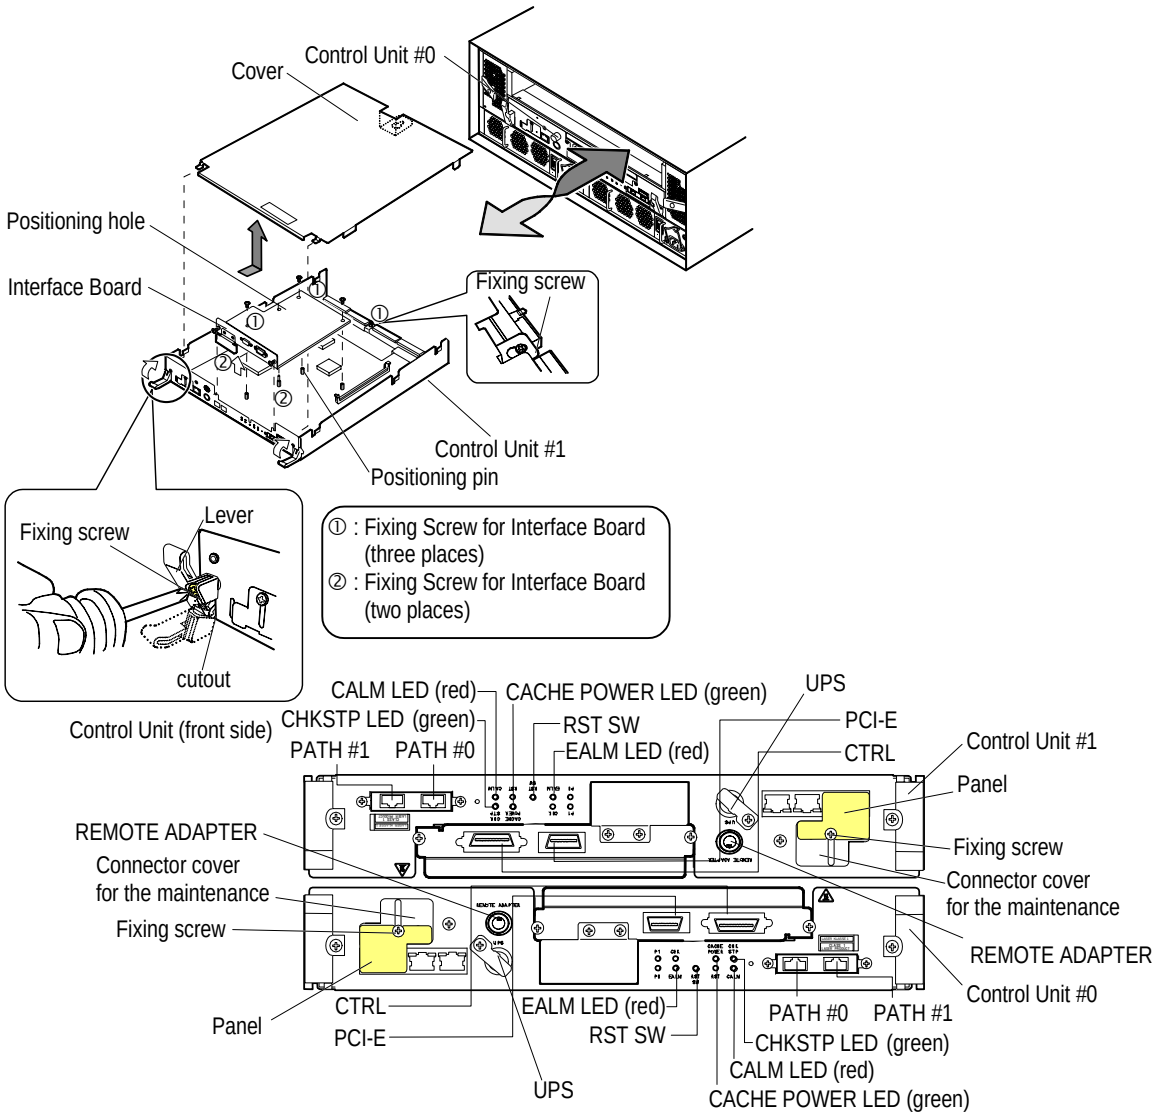


Figure 2.4.5 Subtracting NAS Interface Board

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

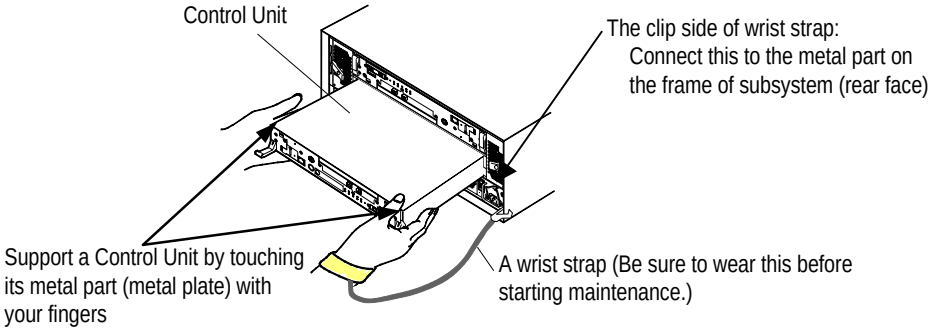
2.4.6 Subtracting a FC Interface Board

This work is for the RKH only.

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and adding maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • Do the works for the Control Unit #0 and #1.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations.

Copyright © 2006, Hitachi, Ltd.

(1) Collect Simple Trace and Constitution Information. (refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.

- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(2) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(3) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(4) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(5) Remove the all cables connected to the Control Unit.

NOTE :
- When the cable cannot be removed easily, do not pull it by force. Besides, the cable can be damaged if it is bent upward or downward forcibly.
- When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2006, Hitachi, Ltd.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(6) Remove the Control Unit by pulling it out toward you.
(7) Loosen the two fixing screws for the cover at the back of the cover, and remove it.
(8) Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit.

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(9) Install the dummy Interface Board and fix it by tightening the fixing screws ② (two places). At this time, install it so that the sheet metal part of the dummy Interface may become the inside of the Control Unit.
(10) Attach the cover, and tighten the fixing screw for the cover at the back of the cover.
(11) Insert it into the position in the Control Unit with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(12) Perform the procedure from (4) to (11) to the other Control Unit.
(13) Connect the removed all cables to the Control Unit.

NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(14) Turn on the AC Power Unit Switch of the both Power Units.
(15) Turn on the main switch.
(16) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(17) Check that the READY LED (green) on the front of the Basic Chassis lights up. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
(18) For the added FC Interface Board Port, configure the host group and Fibre Channel port setting. (Refer to System Parameter "Chapter 2 Setting Host Group/Targets" (SYSPR 02-0000), and System Parameter "4.2 (9) Setting of Fibre Channel" (SYSPR 04-0170).)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

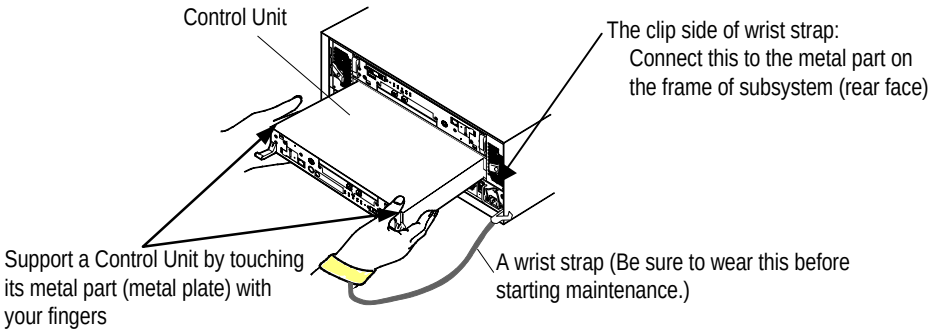
2.4.7 Subtracting an iSCSI Interface Board

CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the Additional Chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

NOTE : • When the subsystem operates in the dual controller configuration, do the works for the both Control Units. In the case of the single controller configuration, do the work for the Control Unit #0 only.
• After the work is completed, be sure to return the Control Units #0 and #1 to their original locations. In the case of the single controller configuration, return the Control Unit to a location of the Control Unit #0.

(1) Collect Simple Trace and Constitution Information. (Refer to Troublelshooting "7.3 Collecting simple trace" (TRBL 07-0040) and System Parameter "4.2 (8) Setting of Constitute" (SYSPR 04-0150).)

NOTE : When the installation position of the Interface Board is changed (‡1) or when the Interface Board of the different type is installed in the position where the Interface Board is currently installed, the following configuration information of the interface is all cleared. Be sure to perform the collection of the simple trace and the acquisition of the configuration information to back up the configuration information before the change.
- Host Group Information / Target Information
- Host Group Option / Target Option
- Mapping Information
- Fibre Channel Information Port Setting Information/ NAS Connection Information/iSCSI port setting information
- CHAP security information (iSCSI)

(2) Turn off the main switch.
Make sure that the POWER LED (Green) on the Front Bezel go off. If you cannot turn off the power, troubleshoot the failure by connecting to the Web.

NOTE : If the power has already been turned off, check that Cache memory is not in the back-up state. (To check for the back-up state, refer to Replacement "1.1.2 Checking cache memory in the back-up state" (REP 01-0030).)
When the Cache is in the backup status, cancel the status.

In this case, check that the CACHE POWER LED (Green) on Control Unit is extinguished.

NOTE : If the CACHE POWER LED (Green) is lit, it may be that some of the Cache Unit data has not been written into the disk. In this case, removing the Control Unit may cause a loss of user data.

(3) Turn off the AC Power Unit Switch of the both Power Units.

NOTE : It is possible that the recovery is not made normally if the replacement is done without turning off the AC Power Unit Switch.

(4) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(5) Remove the all cables connected to the Control Unit.

NOTE : • When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.
- When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

‡1 : Even if the installed Interface Board is changed to the uninstalled, the configuration information is maintained in the subsystem.

Copyright © 2006, Hitachi, Ltd.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(6) Remove the Control Unit by pulling it out toward you.
(7) Loosen the fixing screw (two fixing screws for the RKH) for the cover at the back of the cover, slide the cover (do not slide it for the RKH) in the direction shown by the arrow (⟶), and remove it.
(8) Loosen the fixing screws ② (two places) of the iSCSI Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the iSCSI Interface Board upwards and remove it from the Control Unit.

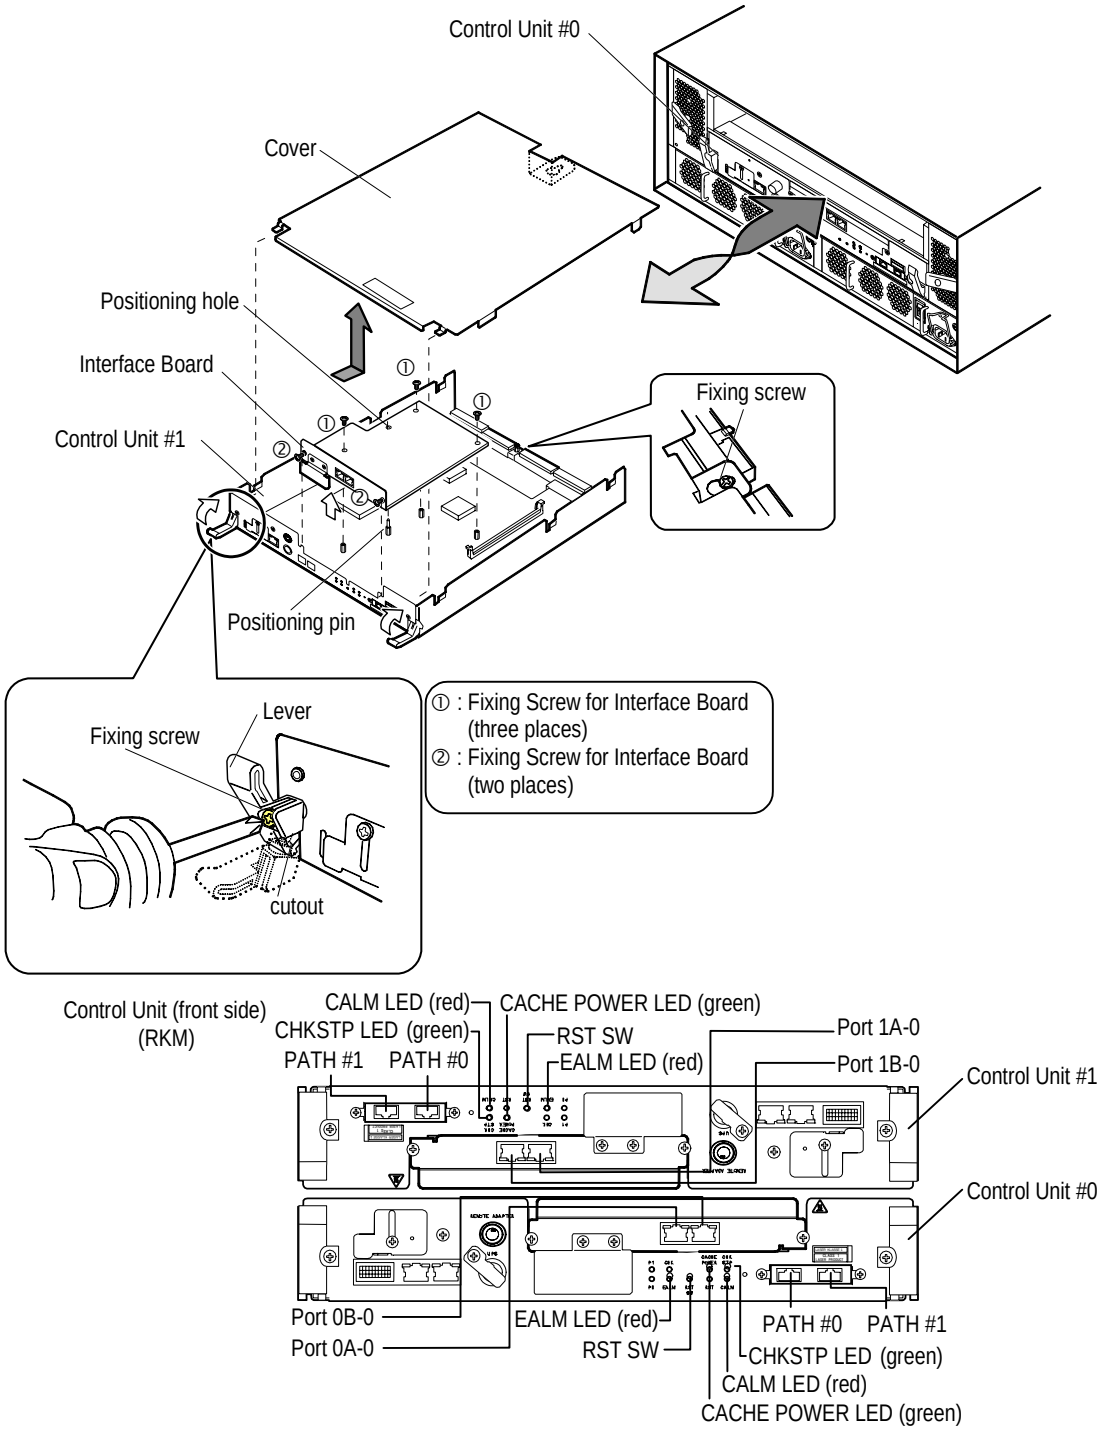
NOTE : • Place the removed Interface Board in the place where anti-static measures are taken.
• When subtracting the iSCSI Interface Board for the RKH on the interface #0 side, remove the FC Interface Board installed on the #1 side and install it on the #0 side.
• Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1 (Refer to "Table 2.4.3 Installation position of the Interface Board" (ADD 02-0530)).

(9) When the 4 G bps interface is used, install the 4 G bps FC Interface Board (RKM: HT-F4064-DJ4G2, RKS/RKXS: HT-F4064-DJ4G2W, RKH: HT-F4064-DJ4G2H) fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the 4 G bps FC Interface Board (RKM: HT-F4064-DJ4G2, RKS/RKXS: HT-F4064-DJ4G2W, RKH: HT-F4064-DJ4G2H) may become the inside of the Control Unit.
Go to Procedure (11).
(10) When the 2Gbps interface is used, install the dummy Interface Board and fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the dummy Interface Board may become the inside of the Control Unit.
(11) Install the two host connectors for 2 G bps (for the RKS/RKXS), which were removed when the iSCSI Interface Board was added, in the Control Units respectively.
(12) Slide the cover (do not slide it for the RKH) in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

Copyright © 2006, Hitachi, Ltd.

(13) Insert it into the position in the Control Unit with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch an ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.



(14) In the case of the dual control Unit composition, perform the procedure from (4) to (13) to the other Control Unit.
(15) Connect the removed all cables to the Control Unit.

NOTE : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(16) Turn on the AC Power Unit Switch of the both Power Units.
(17) Turn on the main switch.
(18) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out(‡1).
The WARNING LED (orange) may blink at high speed (for the maximum of 30 to 85 minutes).
(19) Check that the READY LED (green) or the WARNING LED (orange) on the front of the Basic Chassis lights up. The READY LED (green) may blink at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH).
(20) When moving the FC Interface Board from the interface #1 side to the #0 side or replacing the FC Interface Board after subtracting the iSCSI Interface Board, configure the host group and Fibre Channel port setting. (Refer to System Parameter “Chapter 2 Setting Host Group/Targets” (SYSPR 02-0000), and System Parameter “4.2 (9) Setting of Fibre Channel” (SYSPR 04-0170).)

‡1 : When it is blinking at low speed, perform the maintenance according to the recovery method of the message referring to the Information Message on WEB. If the subsystem is in the WARNING status when the Information Message on WEB was referred to, the WARNING LED (orange) on the front of the Basic Chassis lights up, and if the subsystem is not in the WARNING status, the WARNING LED (orange) goes out.

2.5 Subtracting Other Optional Devices

2.5.1 Other optional subtraction devices

Component name	Model name	Specification	Requirements of subtraction	Condition of subtraction and number of item for referring to procedure	
				Power online (A host is in operation(*1).)	Power offline (with the subsystem power turned off)
PDB (UPDU7)	DF-F700-UPDU7	For U7	Additional PDB for U7 rack frame	Possible Refer to "2.5.2 Subtracting a PDB (UPDU7)" (ADD 02-0560)	Possible Refer to "2.5.2 Subtracting a PDB (UPDU7)" (ADD 02-0560)

*1 : Data is exchanged between a host computer and the subsystem.

Copyright © 2006, Hitachi, Ltd.

2.5.2 Subtracting a PDB (UPDU7)

(1) Subtracting Process for the PDB (UPDU7)

Select a procedure from the following and execute it.

No.	Model	Power status during the subtraction	Restriction	Subtraction Process section
1	Rackmount model	Subtraction with the power turned on	• This is the dedicated rack for the U4/U7 rack frame. • Only the PDB whose all the outlets for output to which the power cable plugs are not connected can be subtracted.	Refer to "2.5.2 (2) Procedure for subtraction" (ADD 02-0560)
2		Subtraction with the power turned off		

(2) Procedure for subtraction

(a) Make sure that the power cable plugs are not connected to all the outlets for output on the PDB to be subtracted.

(b) Disconnect the power cable, which is connected to the PDB to be de-installed to supply power to it, by pulling its power feeder plug for safety.

(c) Remove the PDB to be subtracted from the rack frame.

Remove the PDB in the opposite procedure of the installing operation referring to "1.5.2 Mounting a PDB (UPDU7)" (ADD 01-0460).

Keep the subtracted components as the occasion demands.

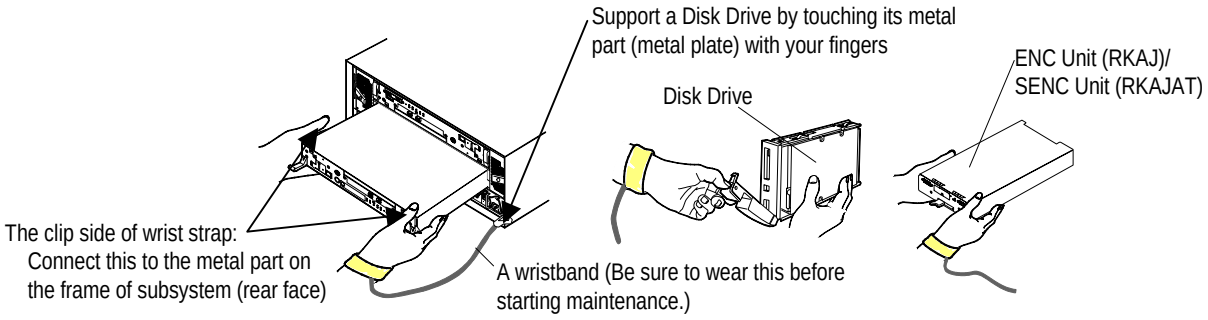
Chapter 3. Relocation/Removal Work

3.1 Before Starting Relocation/Removal Work



Take notice of the following when performing a installation work for the subsystem.
When moving or removing a subsystem, take care of the following matters.

(1) Note on installing and removing parts
Generally, each part is equipped with high-precision components. Remove and install the part gently so as not to give it any shock.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

Be sure to wear the wristband, connect its lead wire to the subsystem enclosure before starting the work, and do not remove them until the work is completed.
When installing a Disk Drive, Control Unit or ENC Unit/SENC Unit, hold it with your hand wearing the wristband having fingers contact metallic portions on the sides of the part.

Copyright © 2005, Hitachi, Ltd.

(2) Note on cable routing

(a) Handling of cables on the floor

- Protect cables which cannot be accommodated by the subsystem and thus laid on the floor or cables which cross a passage with cable protecting, etc.
- Do not make inter-device cables apart from the floor but lay them on the floor.

(b) Handling of under-floor cables when the subsystem is installed on the free access floor.

- Give excess lengths to cables routed under the floor so that they can easily be laid on the slab. Do not make them to be hung dangling.

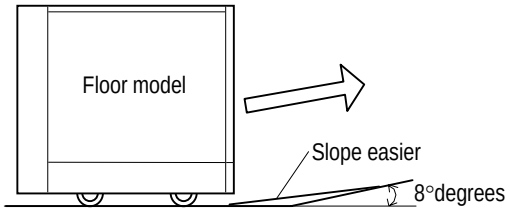
(c) How to route cables

- Give adequate margin of length to cables to withstand earthquakes, etc.
- Route cables giving them excess lengths lest they should disturb replacement of part to be done for maintenance.
- Make power cable and power cable apart each other. When they have to be positioned close each other, do not make them run in parallel but make them cross each other.
- When using cable protecting duct, be careful not to damage or break cables by catching them.

(d) Be sure to insert or pull out a cable connector holding it with your hand. If you pull a cable, a trouble may be caused.

(e) When bending the FC I/F cable and RC (ENC) cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(3) Note on restarting



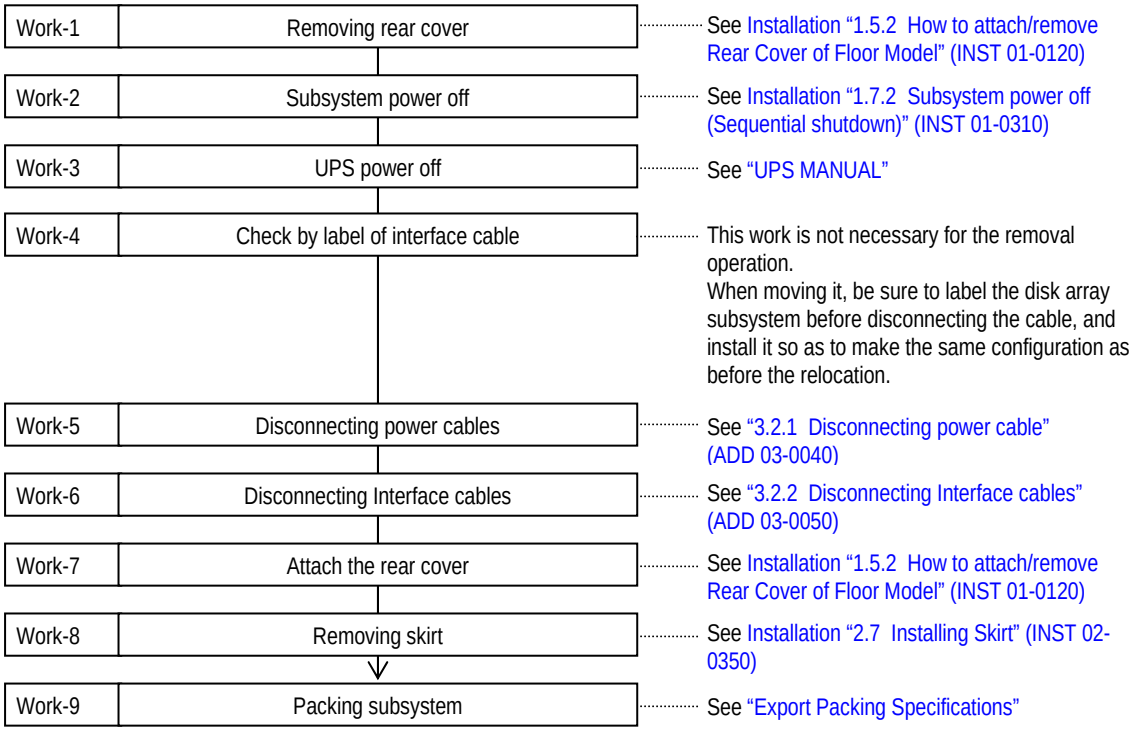
When restarting the subsystem, turn on the main switch after waiting more than one minute after the main switch is turned off (after the POWER LED goes out).

(4) Note on completing a maintenance work

Close all the external covers when a maintenance work is completed.
It is required to make all the external covers closed to operate the subsystem properly.
(Be sure to close all the external covers during operation because it is indispensable to maintain the performance of the subsystem including prevention of adverse effects caused by radio frequency energy.)

(5) Note on moving the Floor Model

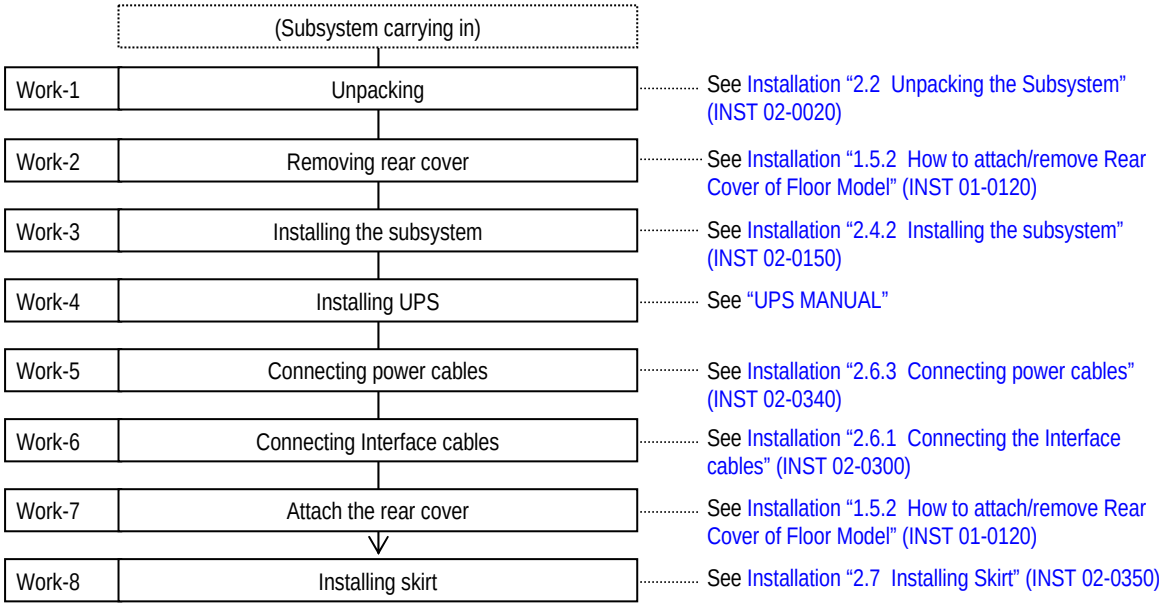
The allowable maximum inclination angle at the end of the slope for the Floor Model is eight degrees.
When moving the Floor Model through a slope steeper than the above or across a level difference of the floor, use a gangway, etc. to make the slope easier.



Copyright © 2005, Hitachi, Ltd.

3.2 Procedure for Relocating or Removing Floor Model

(1) Procedure for relocation from where the subsystem is currently installed



Before performing the relocation from where the subsystem is currently installed, make sure of work items to be done shown below.

Copyright © 2005, Hitachi, Ltd.

(2) Procedure for installation at a place from where the subsystem is moved

Before performing installation at a place where the subsystem is moved to, make sure of work items to be done shown below.

Copyright © 2005, Hitachi, Ltd.

3.2.1 Disconnecting power cable

(1) Disconnecting the power cable of Power Unit

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the Power Unit a little, and then perform the cable removal again.

(a) Make sure that AC power input switches (breakers) on the Power Unit have been all turned off.
(b) Remove the power cable to the power outlet.
(c) Remove the power cables.

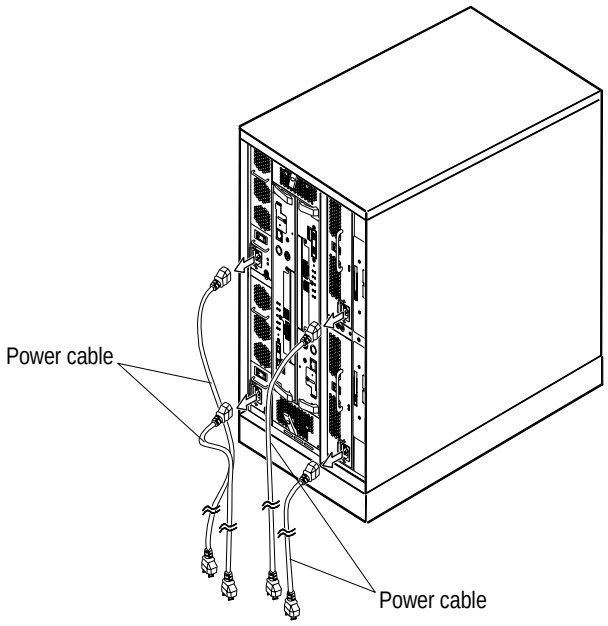


Figure 3.2.1 Disconnecting Power Cable

Copyright © 2005, Hitachi, Ltd.

3.2.2 Disconnecting Interface cables

(1) Disconnecting Fibre Channel Interface cables

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Remove the Interface cable to the Control Unit.
(b) Remove the Interface cable to the Clamp (Fibre).

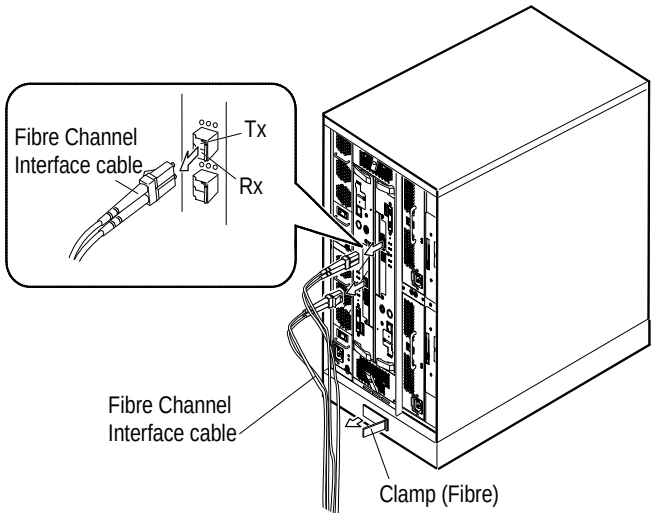

Figure 3.2.2 Disconnecting Fibre Channel Interface Cable

(2) Disconnecting iSCSI Interface cables

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Remove the Interface cable to the Control Unit.
(b) Remove the Interface cable to the Clamp.

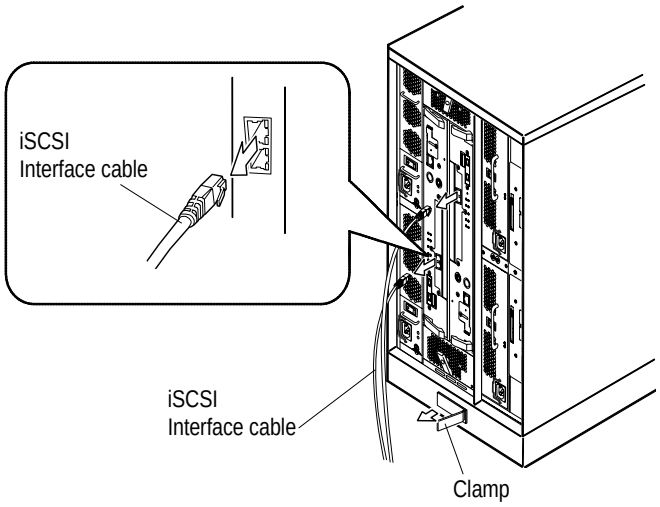

Figure 3.2.3 Disconnecting iSCSI Interface Cable

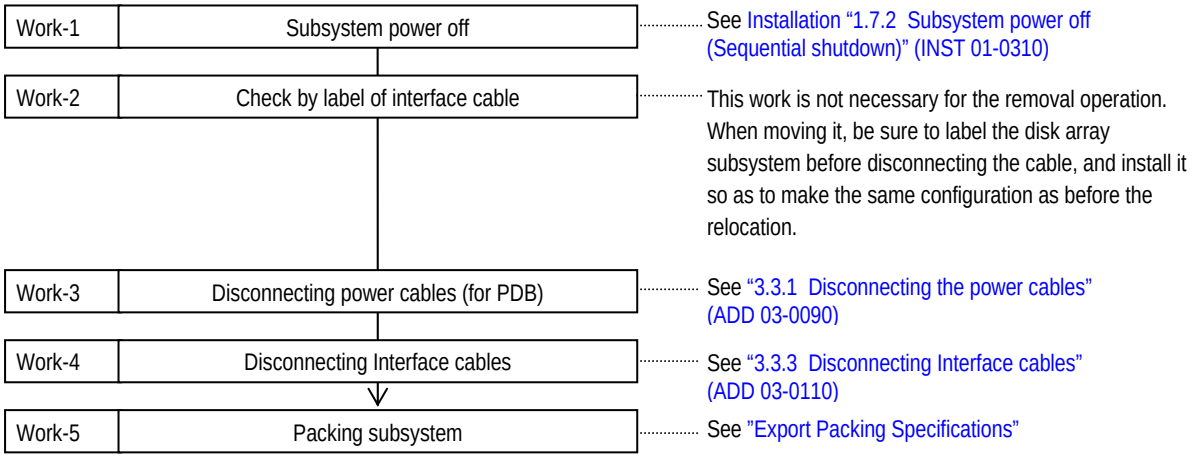
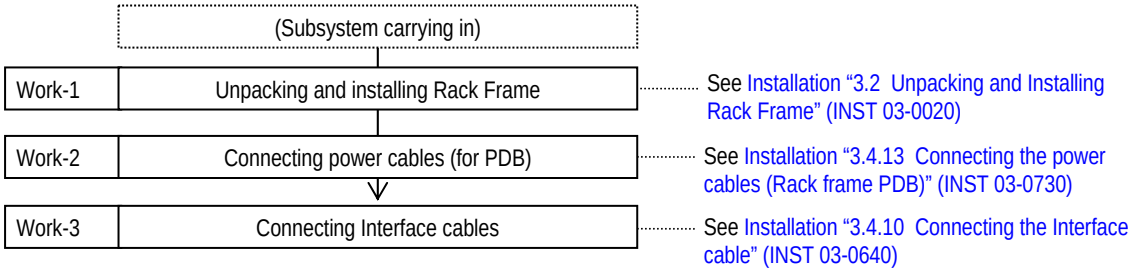


Copyright © 2005, Hitachi, Ltd.

3.3 Procedure for Relocating or Removing Rackmount Model

(1) When moving the subsystem together with a rack frame

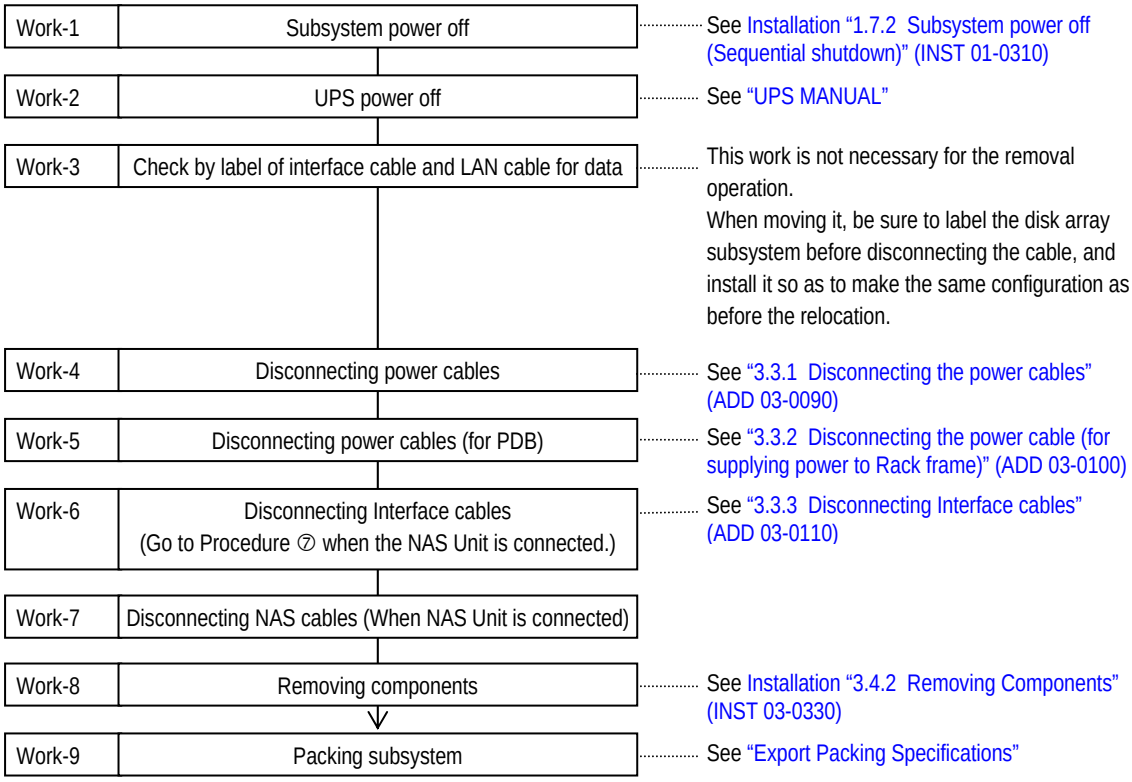


(a) Procedure for removal from where the subsystem is currently installed

Before performing the removal from where the subsystem is currently installed, make sure of work items to be done shown below.

(b) Procedure for installation at a place from where the subsystem is moved

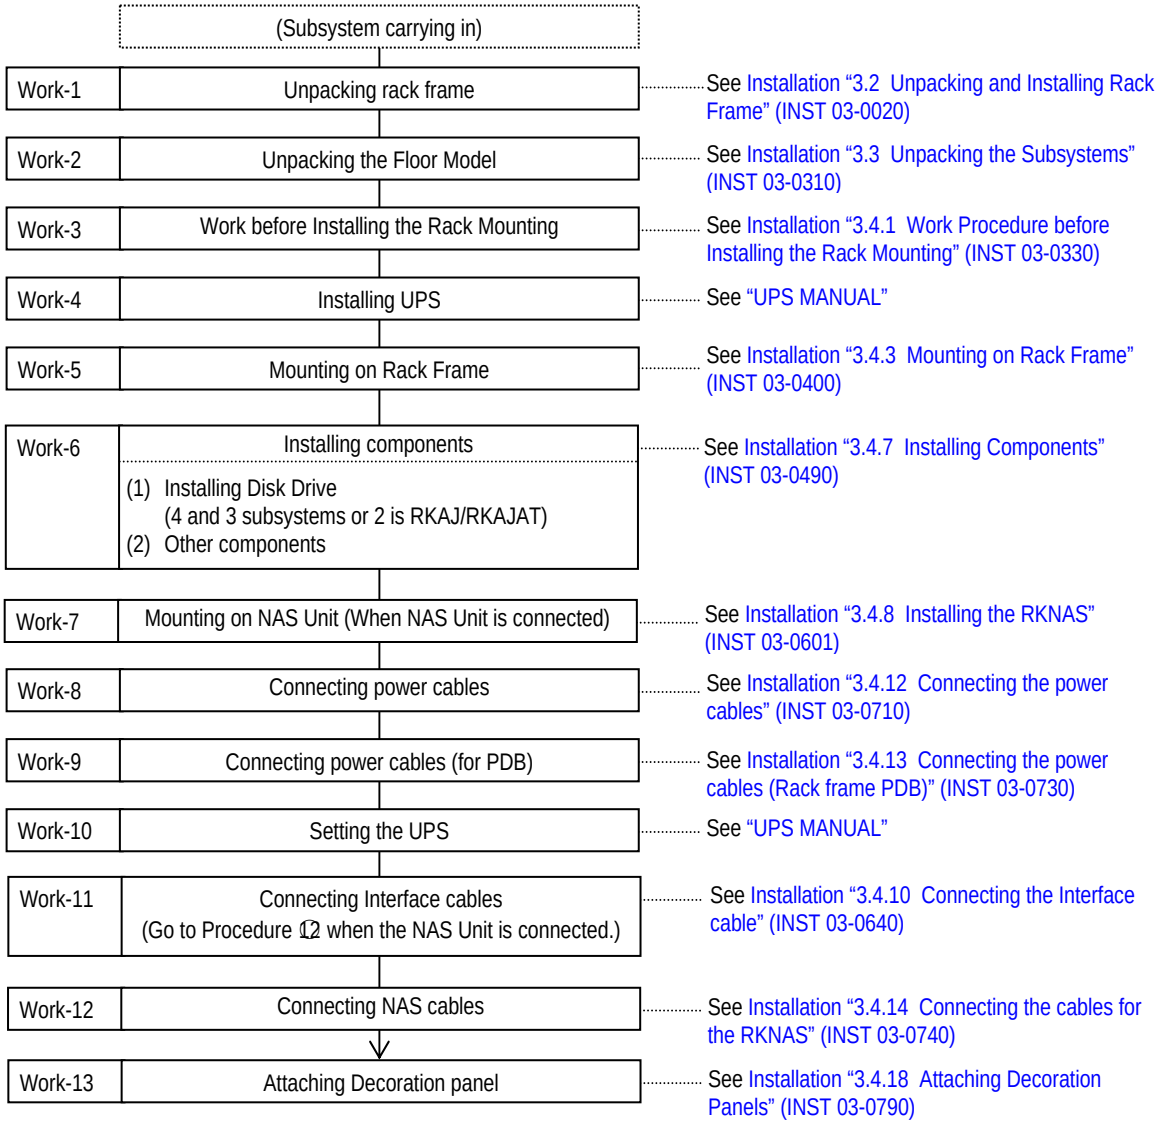
Before performing installation at a place where the subsystem is moved to, make sure of work items to be done shown below.



Copyright © 2005, Hitachi, Ltd.

(2) When moving the subsystem together with removing of parts

(a) Procedure for removal from where the subsystem is currently installed



Before performing the removal from where the subsystem is currently installed, make sure of work items to be done shown below.

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Procedure for installation at a place from where the subsystem is moved

Before performing installation at a place where the subsystem is moved to, make sure of work items to be done shown below.

3.3.1 Disconnecting the power cables

(1) Disconnecting the power cable of Power Unit

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Disconnect the power cable connected to the PDB.
(b) In the case of the RKAJ/RKAJAT, pass Repeat Binders through the cleats removed to the right and left stoppers and fasten the power cable with the Binders.
(c) Disconnect the power cable connected to the Power Unit.

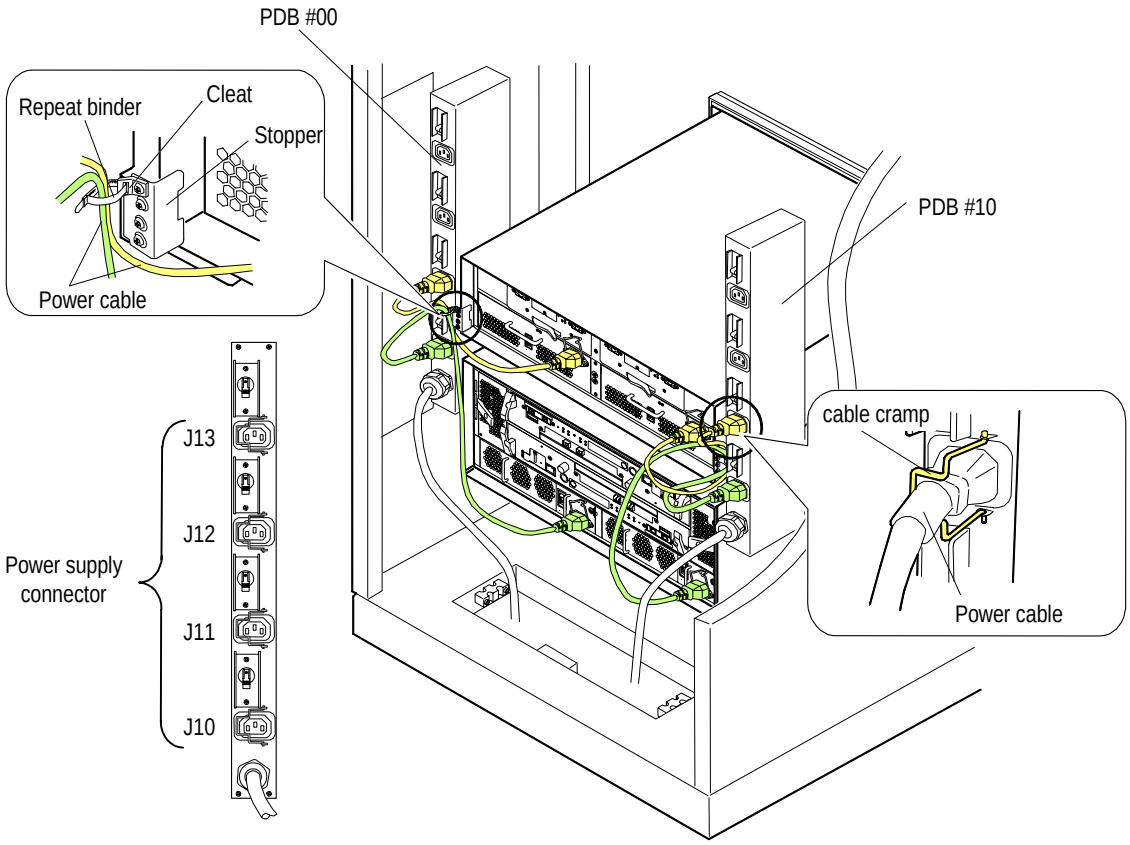

Figure 3.3.1 Disconnecting Power Cables

Copyright © 2005, Hitachi, Ltd.

3.3.2 Disconnecting the power cable (for supplying power to Rack frame)

(1) Open the rear door. (See Installation "1.5.4 How to open/close the Rear Door of U7 rack frame" (INST 01-0150).)
(2) Remove the cable holders from the rack frame by removing the hexagon socket head. (three places)
(3) Disconnecting the power cable to the consent.
(4) Disconnecting the power cable to the Power input connector.
(5) Return all the removed cable holders as they were before.
(6) Close the rear door.

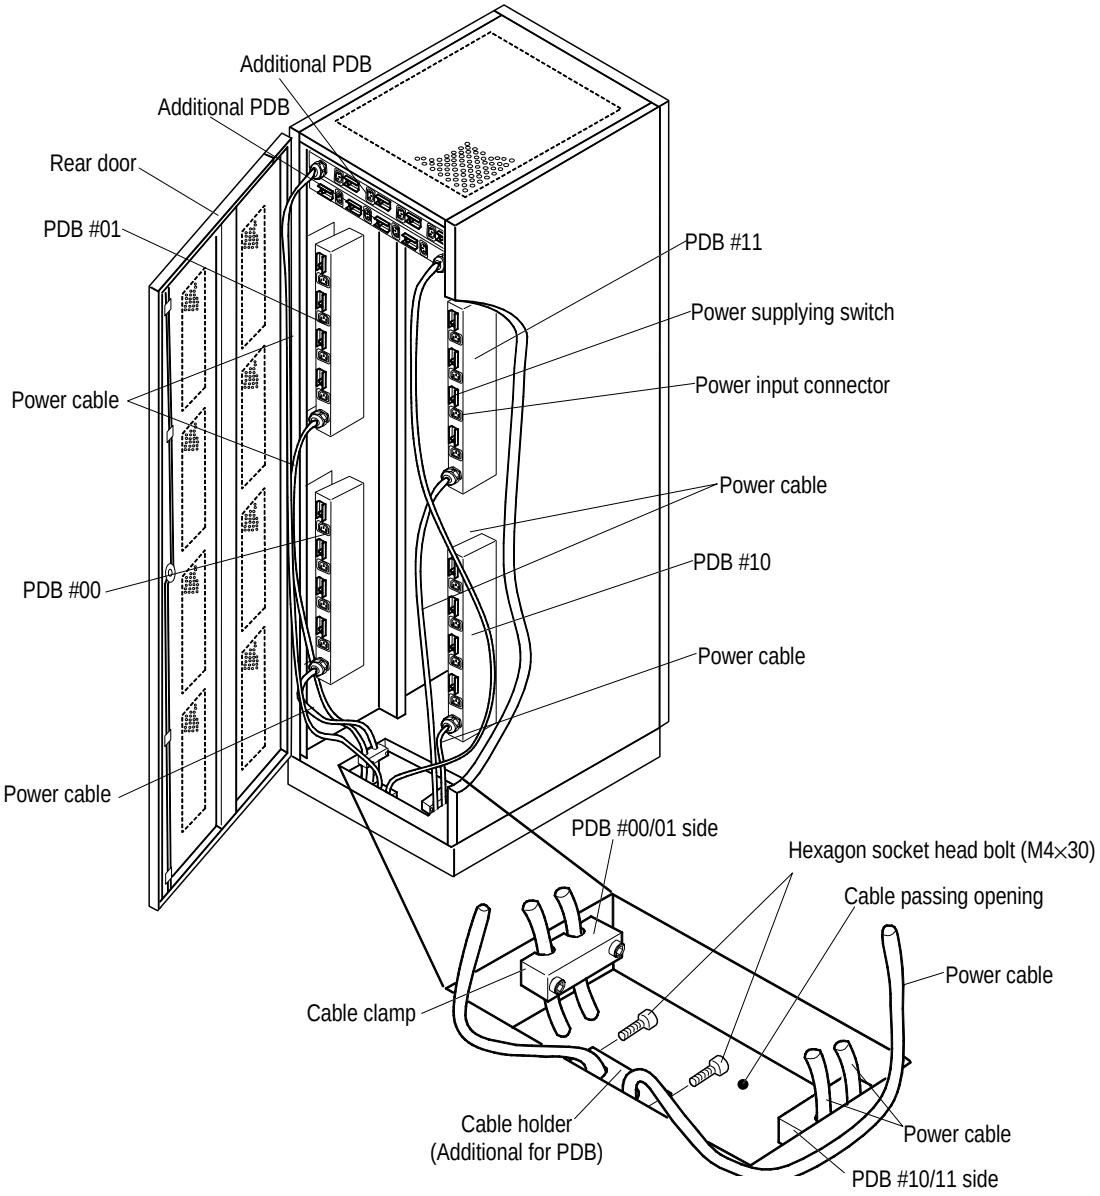

Figure 3.3.2 Disconnecting Power Cables

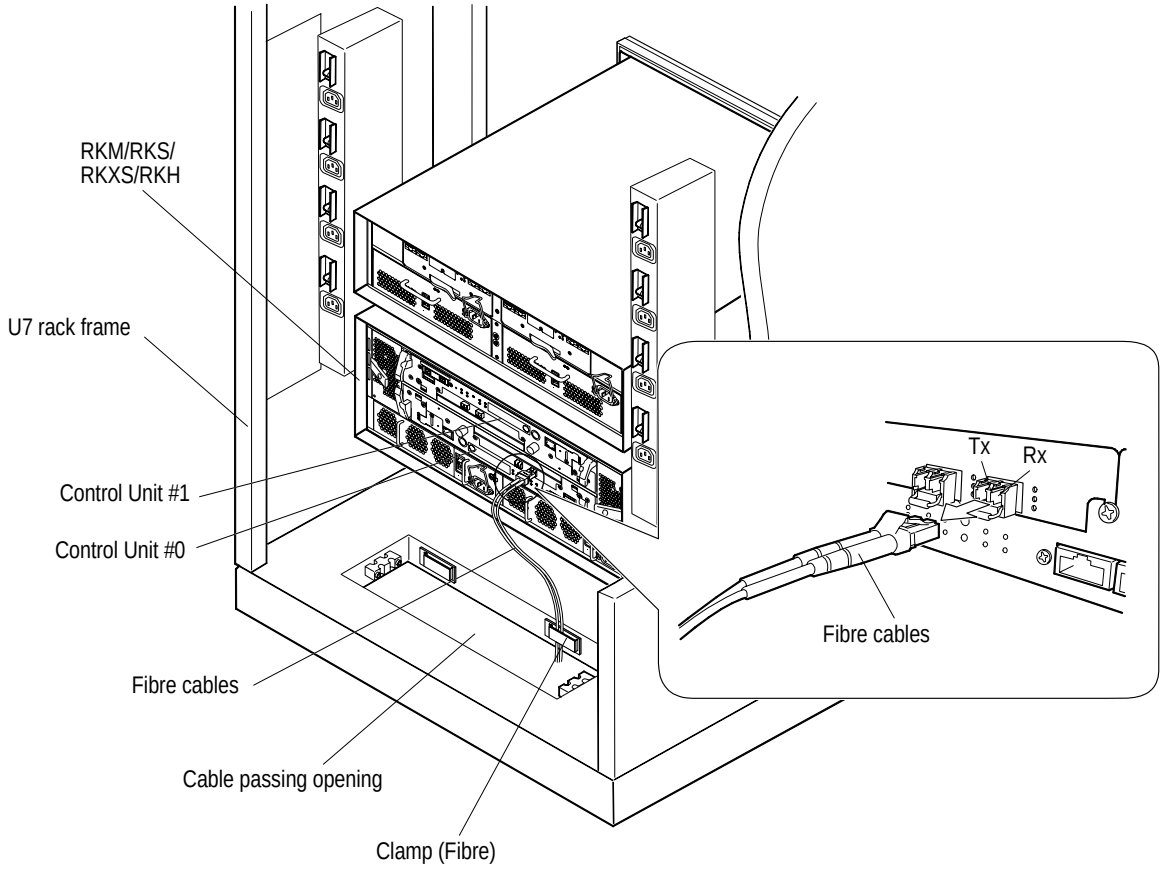

Copyright © 2005, Hitachi, Ltd.

3.3.3 Disconnecting Interface cables

(1) Disconnecting the Fibre Channel Interface cable

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Disconnecting the Fibre Channel Interface cable to the clamp
(b) Disconnect the Fibre Channel Interface cable connected to the Control Unit.

*1 : The figure shows the RKM.

Chapter 1. Flowchart for troubleshooting

This chapter contains information on troubleshooting to be used when failures occur in the unit. Illustrations in this section show cases of the rackmount model. They are the same for the floor model.

The following is the flow of troubleshooting to be used when a failure occurs in the unit.

Failure call accepting

When a failure is detected by SNMP Agent Support Function. Refer to "10.1 Trouble Analysis by SNMP Agent Support Function" (TRBL 10-0000).

When a failure is detected by Storage Navigator Modular. Refer to "10.2 Trouble Analysis by Storage Navigator Modular" (TRBL 10-0080).

When a P.P. failure is detected.
Refer to "Chapter 9. Data Collection when a Failure Occurs in Program Product (P.P.)" (TRBL 09-0000).

Refer to "ASSIST-PC Manual" when a failure of the failure monitoring program was detected.

When the sense code concerning the subsystem was reported to the log in the host computer. Refer Message "Chapter 9. Failure Analysis by Sense Data" (MSG 09-0000).

When an LU subordinate to the specific path of the disk array subsystem cannot be recognized by the host computer. Refer to "Chapter 5. Procedure for Investigating Disk Array Subsystem Regarding Fibre Channel Failure" (TRBL 05-0000).

When it cannot access the LU under the control of the NAS system from the NAS client PC.
Refer to "Chapter 11 Procedure for Determining Failure of Network Side n NAS System" (TRBL 11-0000).

When the LU under the specific PATH of the disk array subsystem cannot be recognized from the host computer which has the iSCSI interface.
Refer to "Chapter 12 Procedure for the iSCSI System Failure Determination on the Disk Array Subsystem Side" (TRBL 12-0000).

When an error message is displayed during an operation of the Web. Refer to Message "Chapter 7. Web Error Messages" (MSG 07-0000).

When an error message is displayed during an operation of the Storage Navigator Modular.
Refer to Message "Chapter 8. Storage Navigator Modular Error Messages" (MSG 08-0000).

- When a failure is detected from the subsystem (through a beep of a buzzer or a lighting of the ALARM LED, etc.)
- When a host computer detects a subsystem failure
- When a subsystem failure is detected from WEB

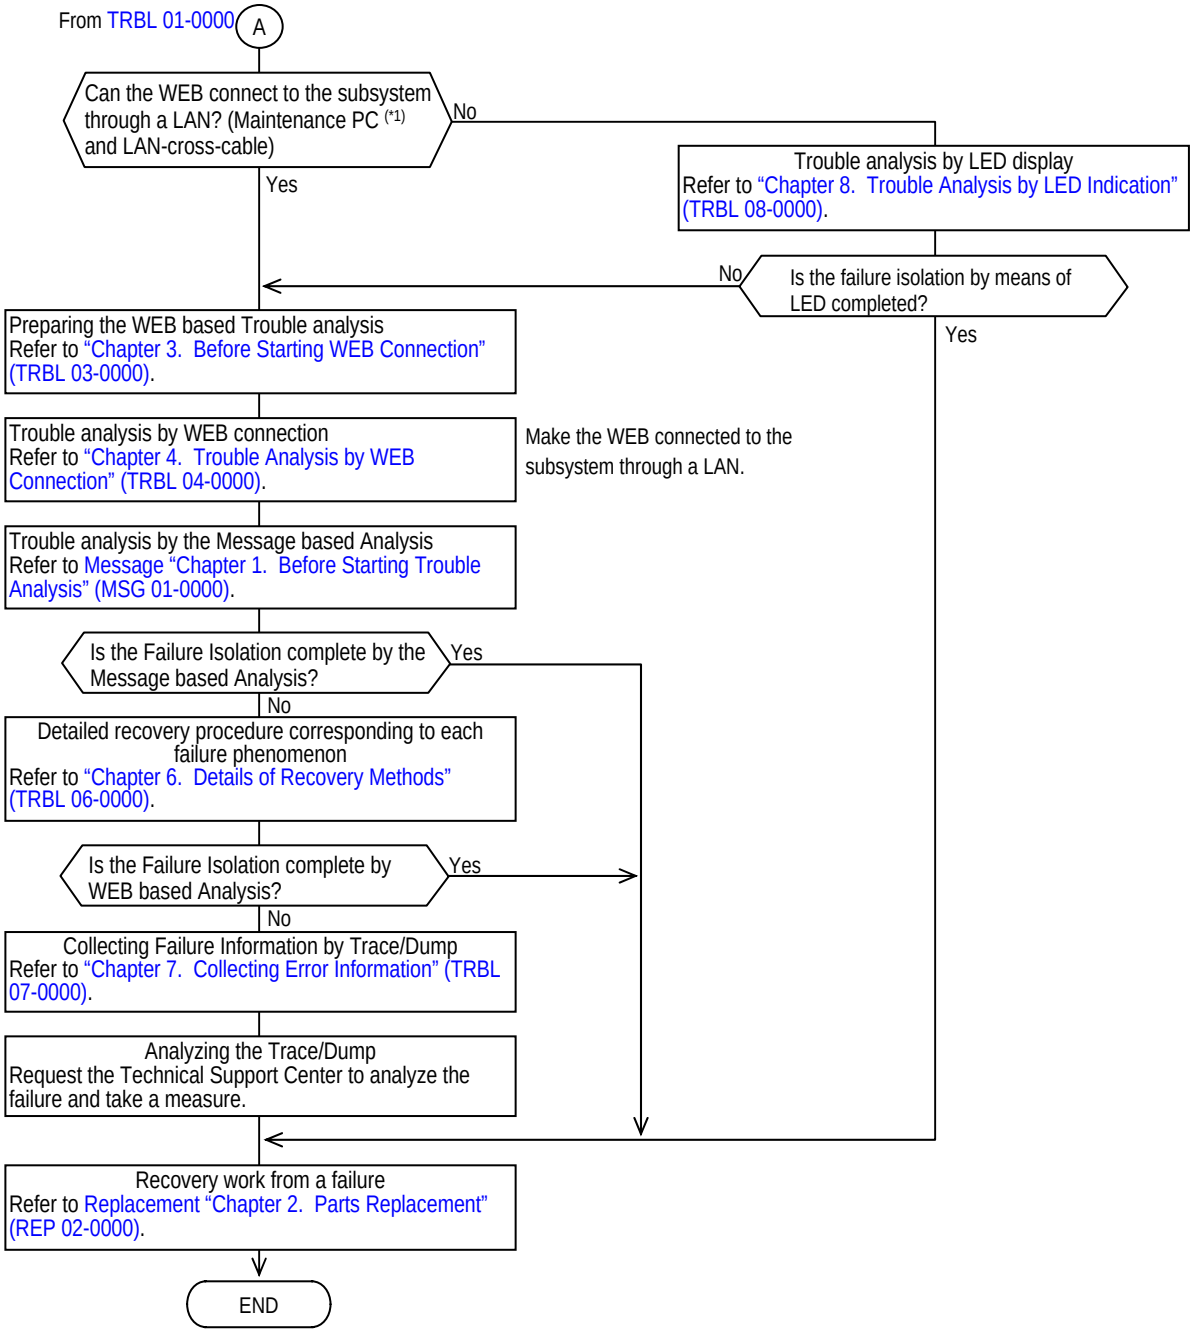
follow the following flow.

To TRBL 01-0010

NOTE : Order of Components replacement when two or more failures occurred
When failures occurred in two or more components, replace the corresponding components in the following order.
Be sure to follow this order, or it may repeat the failure.
When failures occur in the two or more RKAJ(s)/RKAJAT(s)/RKA(s), replace the RKAJ/RKAJAT/RKA by N of the subsystem ID# xN is small.
In the case where the RKAJATs are installed, perform the replacement taking notice of the subsystem ID number.
When failures occurs in two or more RKAJs, replace the RKAJs, in ascending order of the device ID numbers. Perform the following part replacement after verifying that the failed part has been recovered normally (for a Disk Drive, after verifying that a recovery has been started).
However, when two or more failures of the NAS Unit related parts (DIMM, PS, Fan) occur, replace the failure parts at the same time.

1. Backup Battery Unit (RKM/RKS/RKXS/RKH)
2. Power Unit (RKM/RKS/RKXS/RKH)
3. Power Unit (RKAJ/RKAJAT/RKA)
4. Fan Assembly (RKM/RKS/RKXS/RKH)
5. Control Unit (RKM/RKS/RKXS/RKH)
6. FC Interface Board/NAS Interface Board/iSCSI Interface Board
7. SENC Unit (RKAJAT/RKA)
8. Disk Drive (RKM/RKS/RKXS)
9. ENC Unit (RKM/RKS/RKXS)
10. Host Connector (RKM/RKS/RKXS/RKH)
11. NAS Unit (RKNAS)
12. NAS Unit related parts (DIMM, PS, Fan)
13. Host connector (for RKNAS)

The following two types of Basic Chassis exist in the SANRISE AMS1000.



- DF-700-RKH (abbr.: RKH)
- DF-700-RKHE (abbr.: RKHE)

The Control Unit of the RKH and the Control Unit of the RKHE cannot be mixed in this Basic Chassis.
This manual does not describe the RKHE except for the following differences.
When the RKHE is used, it becomes the same procedure as the RKH.
Therefore, read the RKH as the RKHE excluding the part described in parallel and use it.

Differences between the RKH and the RKHE

Chassis Name	Installed Control Unit Model Name	Processor (Control CPU)	Control Memory (L2 Cache Memory)
RKH	DF-F700-F1JH	POWER PC 7447A (1.4GHz)	512 K bytes
RKHE	DF-F700-F2JH	POWER PC 7448 (1.7GHz)	1 M bytes

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Check the requirements for the service PC at the time of NAS Unit connection.
Refer to DF700 NAS SOFTWARE Maintenance Manual "2.5.2 Service PC" (NAS 02-0100) and "8.1 Construction of Service PC" (NAS 08-0000).

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 2. Before Maintenance Work

2.1 Precautions

(1) Note on restarting

When restarting the subsystem, turn on the main switch after waiting more than one minute after the main switch is turned off (after the POWER LED goes out).

If the array subsystem used for a remote side of TrueCopy remote replication/TrueCopy Extended Distance restarts in the status that TrueCopy remote replication/TrueCopy Extended Distance is enabled, the following phenomena occur.

- The paths of TrueCopy remote replication/TrueCopy Extended Distance are both blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair changes to PSUE.

If the array subsystem is restarted unavoidably, restart it after the status of the pair of TrueCopy remote replication/TrueCopy Extended Distance is changed to PSUS.

If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops.

When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

NOTE : When Power Saving of the priced option is used, if you restart the subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the subsystem starts.
Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then restart the subsystem.
If the spin-down fails, execute the spin-down again.

(2) Notes while the array subsystem is being started

Because the status where the array subsystem is being started is in the middle of the transition to the status of the subsystem power turned on (Ready status) from the status of the subsystem power turned off, do not perform the following work while the array subsystem is being started.

- Isolating the Fibre system failure in the disk array subsystem side
- Trouble analysis by LED indication
- Isolating the network system failure in the NAS system
- Isolating the iSCSI system failure in the disk array subsystem side
- Part replacement
- Data collection when a failure occurs in Program Product (P.P.)
- Troubleshooting of the failure of the failure monitoring program
- Troubleshooting of the WEB error message

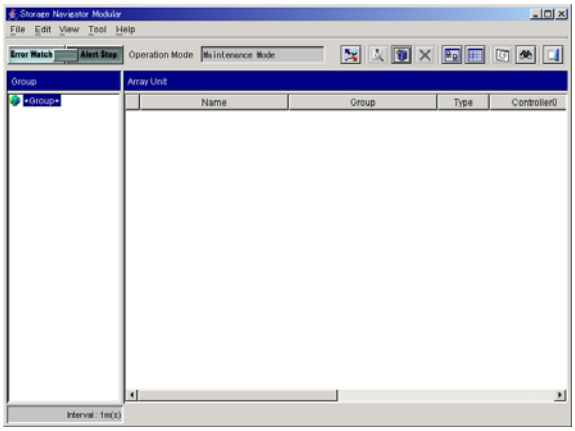
Copyright © 2005, 2006, Hitachi, Ltd.

Also, the setting function or the reference function using the Storage Navigator Modular cannot be executed to the array subsystem which is being started.

Copyright © 2005, 2006, Hitachi, Ltd.

2.2 Confirming and setting RTC (Real Time Clock)

RTC (Real Time Clock) is a built-in clock in the Controller. It is used to record the time information of messages and trace/dump when an error occurred. Even if the RTC is out of order, the host system may not be affected. However, the time information of messages and trace/dump is not correct. Accordingly, the failure analysis with synchronizing to the host may be affected.



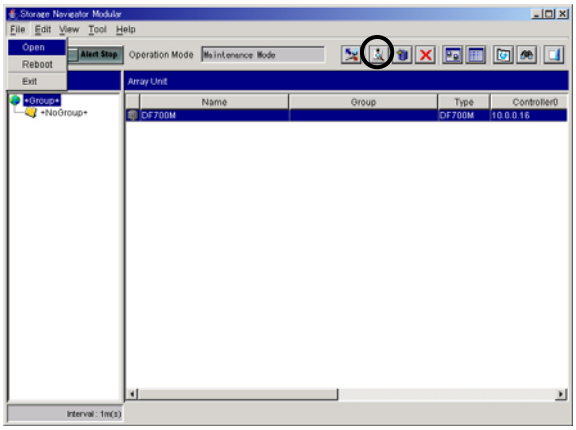
In the following cases, check the RTC and reset it if it varies.

- When the controller was replaced while the subsystem power was turned off.
- When there is something wrong with the time on messages, traces and dump.

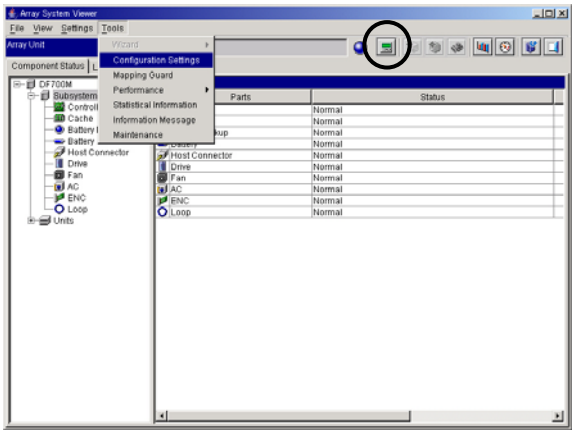
Set the time on the Japanese Standard Time basis

If you wish to use Storage Navigator Modular to set the RTC, please refer to the System Parameter "1.1 Procedure for connecting Storage Navigator Modular with the subsystem" (SYSPR 01-0010).
The setting of RTC can be made without rebooting the array unit.

(1) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time. Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



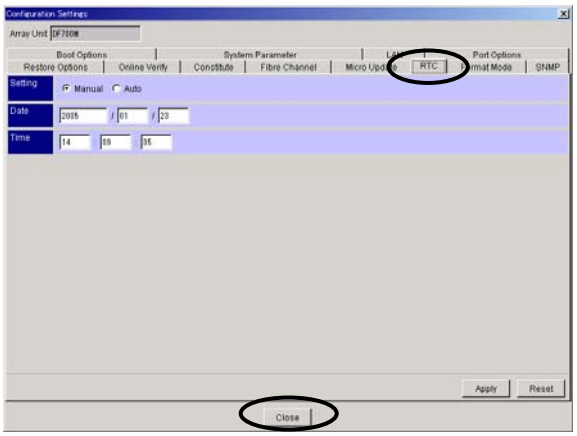
(2) Click the DF700 icon for setting parameters in the main window.



NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

Copyright © 2005, Hitachi, Ltd.

(3) Click the icon of an array unit on the Main window, and then select the [File] – [Open]. Or, click the [ : Open]button in the tool bar.



(4) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

Copyright © 2005, Hitachi, Ltd.

(5) Click the [RTC] tab.

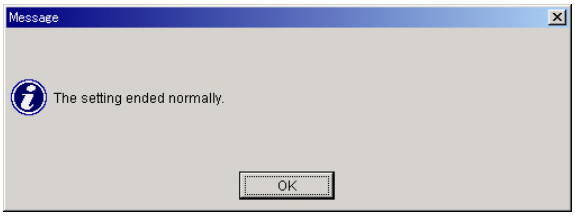
(6) Set the RTC.

Setting : Select Manual or Auto.

Manual : Sets the date and time.

Auto : Sets the time of the PC or Server/Workstation executing the Storage Navigator Modular.

Date : Displays date.



Time : Displays time.

(7) Click the [Apply] button.

(8) The confirmation window is display. Click the [OK] button.

(9) A message appears, stating that the setting is complete. Click the [OK] button.

2.3 Indications and their Functions

(1) Indication positions and their functions of RKM

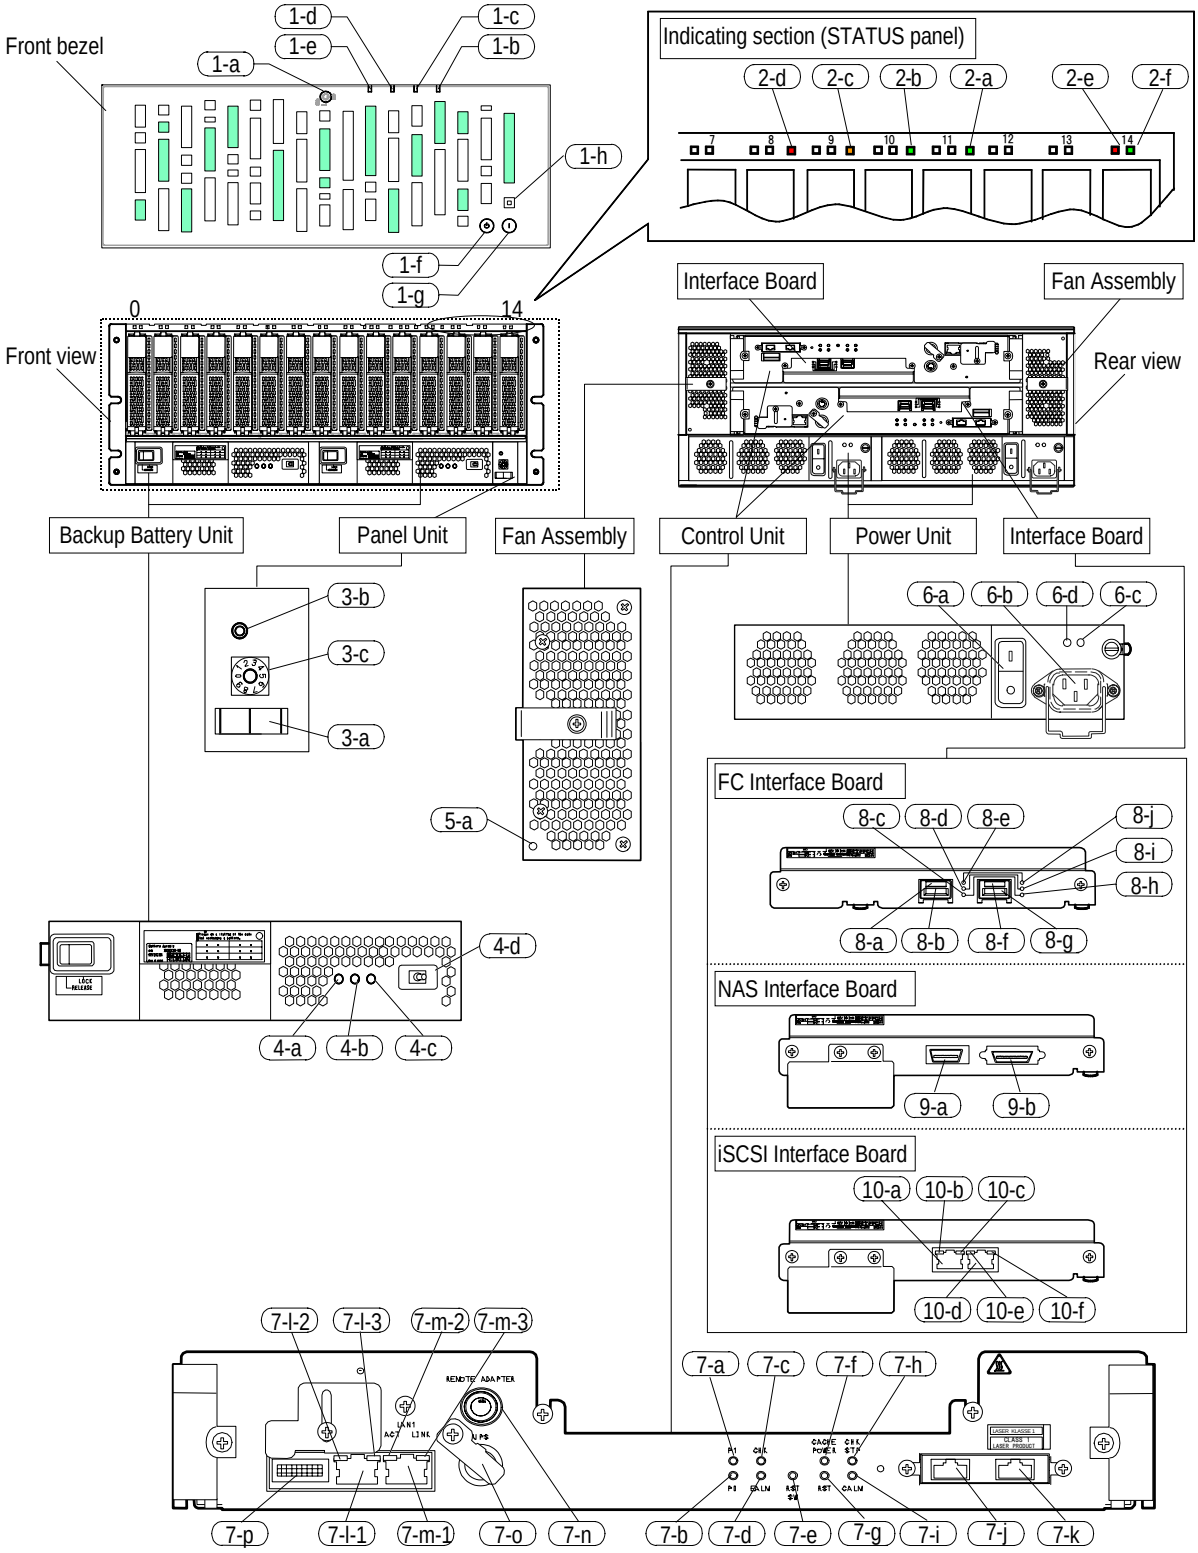

Figure 2.3.1 Indication Locations of Functional Components

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.3.1 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	KEY	Key	—	Locks the front bezel.
1-b		POWER	LED	Green	Indicates that the power supply is supplied to the subsystem.
1-c		READY	LED	Green	Lighting Indicates that the subsystem can be operated. Blinking High-speed blinking : Indicates that the automatic download of the ENC/SENC firmware is being executed in the dual controller configuration. Low-speed blinking : Indicates that the download processing of the ENC/SENC firmware is completed online.
1-d		WARNING	LED	Orange	Lighting Indicates that a failure, which allows the subsystem to operate, occurred. Blinking High-speed blinking : Indicates that the most recent revision maintenance function of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Low-speed blinking : Indicates that a failure, which does not stop operation occurred in unit (It must be detected with WEB).
1-e		ALARM	LED	Red	Lighting Indicates that a failure, which does not allow the subsystem to operate, occurred. Blinking Low-speed blinking : Indicates that a serious failure occurred while power on.
1-f		Main switch (OFF)	Switch	—	OFF : Presses off the power.
1-g		Main switch (ON)	Switch	—	ON : Presses on the power.
1-h		BUZZER OFF SW	Switch	—	Pressing of this switch while the buzzer sounds stops the beep. (*1)
2-a	STATUS Panel (RKM)	PWR (POWER)	LED	Green	Indicates that the power supply is supplied to the subsystem.
2-b		RDY (READY)	LED	Green	Lighting Indicates that the subsystem can be operated. Blinking High-speed blinking : Indicates that the automatic download of the ENC/SENC firmware is being executed in the dual controller configuration. Low-speed blinking : Indicates that the download processing of the ENC/SENC firmware is completed online.
2-c		WARN (WARNING)	LED	Orange	Lighting Indicates that a failure, which allows the subsystem to operate, occurred. Blinking High-speed blinking : Indicates that the most recent revision maintenance function of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Low-speed blinking : Indicates that a failure, which allows the subsystem to operate, occurred. (It must be detected with WEB).

*1 : In case of a serious failure of hardware (Electrical surges of both power supplies and so on), the buzzer does not stop even if you push the button to call attention. In this case, perform the appropriate recovery procedure depending on each cause.

No.	Section	Name		Classification	Color	Function
7-a	Control Unit	P1		LED	Green	Indicates that the link status of the FC-AL (loop 1 side) is normal.
7-b		P0		LED	Green	Indicates that the link status of the FC-AL (loop 0 side) is normal.
7-c		CHK (CHECK)		LED	Red	Shows error factors by means of a number of times of blinking. Once : Drive +5 V voltage is abnormal. Twice : Drive +12 V voltage is abnormal. Five times : Battery is abnormal. Six times : Voltage on the Controller is abnormal. (Reset of the Controller is not canceled.) Seven times : BS12V voltage is abnormal. Nine times : Fans are abnormal. The following blinking is fast because ENC microprogram detects CUDG error. Once : SRAM error. Twice : ENC hard error. Three times : Microprogram error in flash memory. Not blinking : BOOT section error of ENC microprogram, RAM error, or ENC hard configuration error.
7-d		EALM		LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC in the Control Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)
7-e		RST SW		Switch	—	Used to perform a Full Dump.
7-f		CACHE POWER		LED	Green	You can check whether the Cache memory is being backed up through indication of this LED. This LED is effective when the AC Power Unit Switch is turned on On : Indicates that the cache is being backed up. (The power is supplied from the battery to the Cache memory.) Off : The Cache memory is not backed up.
7-g		RST		LED	Orange	Indicates that the Controller is being reset. • During power-on reset • During reset for doing a dump • During reset for a reboot at the time of a microprogram down load • The DC-DC converter or the reset circuit on the Control Unit fails.
7-h		CHKSTP		LED	Red	A failure occurred at Controller and it became not operational.
7-i		CALM		LED	Red	• Indicates that a failure which makes in the Controller unable to operate occurred in it. • Does not light up when the Control Unit is in the reset status.
7-j		PATH0		Connector	—	Connection connector for ENC cable (PATH 0 side).
7-k		PATH1		Connector	—	Connection connector for ENC cable (PATH 1 side).
7-l-1		LAN0	LAN0	Connector	—	Connects the LAN0 cable. (For maintenance)
7-l-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 0.
7-l-2			LINK	LED	Green	Indicates that the link status of the LAN 0 is normal.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name		Classification	Color	Function
7 m-1	Control Unit	LAN1	LAN1	Connector	—	Connects the LAN1 cable. (For User Management)
7-m-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 1.
7-m-3			LINK	LED	Green	Indicates that the link status of the LAN 1 is normal.
7-n		Connector for connecting the Remote adapter (J8)		Connector	—	Used to connect the Remote adapter.
7-o		Connector for connecting the UPS interlocking cable (J5)		Connector	—	Used to connect the UPS for the DF700.
7-p		Jumper Connector		Connector	—	There are two cases where the numbers of pins are 8 and 20 respectively depending on the revision of the PCB. (The switch has nothing to do with maintenance because it is used for evaluation.)
8-a	FC Interface Board	Port 0A-0/ Port 1A-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-b			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-c			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-d			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-e			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0 is in trouble.
8-f		Port 0B-0/ Port 1B-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-g			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-h			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-I			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-j			HALM	LED	Red	Lights when the Port 0B-0/Port 1B-0 is in trouble.
9-a	NAS Interface Board	PCI-E		Connector	—	Connection connector for PCI-Express cable
9-b		CTRL		Connector	—	Connection connector for CTRL cable
10-a	iSCSI Interface Board	Port A	iSCSI	Connector	—	Connects the iSCSI cable (Port A side). (For maintenance)
10-b			Active	LED	Yellow	Indicates that data is being transferred via a Port A side.
10-c			Link	LED	Green	Indicates that the link status of the Port A side is normal.
10-d		Port B	iSCSI	Connector	—	Connects the iSCSI cable (Port B side). (For User Management)
10-e			Active	LED	Yellow	Indicates that data is being transferred via a Port B side.
10-f			Link	LED	Green	Indicates that the link status of the Port B side is normal.

No.	Section	Name		Classification	Color	Function
7-n	Control Unit	Connector for connecting the Remote adapter (J8)		Connector	—	Used to connect the Remote adapter.
7-o		Connector for connecting the UPS interlocking cable (J5)		Connector	—	Used to connect the UPS for the DF700.
7-p		Voltage Check Connector		Connector	—	There are two cases where the numbers of pins are 8 and 20 respectively depending on the revision of the PCB. (The switch has nothing to do with maintenance because it is used for evaluation.)
7-q-1		Port 0A-0/ Port 1A-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
7-q-2			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
7-q-3			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
7-q-4			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
7-q-5			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0 is in trouble.
7-r-1		Port 0A-1/ Port 1A-1	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-1/Port 1A-1 side.
7-r-2			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-1/Port 1A-1 side.
7-r-3			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-1/Port 1A-1 side.
7-r-4			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-1/Port 1A-1 side.
7-r-5			HALM	LED	Red	Lights when the Port 0A-1/Port 1A-1 is in trouble.
8-a	FC Interface Board	Port 0A-0/ Port 1A-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-b			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-c			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-d			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-e			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0 is in trouble.
8-f		Port 0B-0/ Port 1B-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-g			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-h			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-I			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-j			HALM	LED	Red	Lights when the Port 0B-0/Port 1B-0 is in trouble.
9-a	NAS Interface Board	PCI-E		Connector	—	Connection connector for PCI-Express cable
9-b		CTRL		Connector	—	Connection connector for CTRL cable
10-a	iSCSI Interface Board	Port A	iSCSI	Connector	—	Connects the iSCSI cable (Port A side). (For maintenance)
10-b			Active	LED	Yellow	Indicates that data is being transferred via a Port A side.
10-c			Link	LED	Green	Indicates that the link status of the Port A side is normal.
10-d		Port B	iSCSI	Connector	—	Connects the iSCSI cable (Port B side). (For User Management)
10-e			Active	LED	Yellow	Indicates that data is being transferred via a Port B side.
10-f			Link	LED	Green	Indicates that the link status of the Port B side is normal.

Table 2.3.3 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	KEY	Key	—	Locks the front bezel.
1-b		POWER	LED	Green	Indicates that the power supply is supplied to the subsystem.
1-c		READY	LED	Green	Lighting Indicates that the subsystem can be operated. Blinking High-speed blinking : Indicates that the automatic download of the ENC/SENC firmware is being executed in the dual controller configuration. Low-speed blinking : Indicates that the download processing of the ENC/SENC firmware is completed online.
1-d		WARNING	LED	Orange	Lighting Indicates that a failure, which allows the subsystem to operate, occurred. Blinking High-speed blinking : Indicates that the most recent revision maintenance function of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Low-speed blinking : Indicates that a failure, which does not stop operation occurred in unit (It must be detected with WEB).
1-e		ALARM	LED	Red	Lighting Indicates that a failure, which does not allow the subsystem to operate, occurred. Blinking Low-speed blinking : Indicates that a serious failure occurred while power on.
1-f		Main switch (OFF)	Switch	—	OFF : Presses off the power.
1-g		Main switch (ON)	Switch	—	ON : Presses on the power.
1-h		BUZZER OFF SW	Switch	—	Pressing of this switch while the buzzer sounds stops the beep. (*1)
2-a	STATUS Panel (RKXS)	PWR (POWER)	LED	Green	Indicates that the power supply is supplied to the subsystem.
2-b		RDY (READY)	LED	Green	Lighting Indicates that the subsystem can be operated. Blinking High-speed blinking : Indicates that the automatic download of the ENC/SENC firmware is being executed in the dual controller configuration. Low-speed blinking : Indicates that the download processing of the ENC/SENC firmware is completed online.
2-c		WARN (WARNING)	LED	Orange	Lighting Indicates that a failure, which allows the subsystem to operate, occurred. Blinking High-speed blinking : Indicates that the most recent revision maintenance function of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. Low-speed blinking : Indicates that a failure, which allows the subsystem to operate, occurred. (It must be detected with WEB).

*1 : In case of a serious failure of hardware (Electrical surges of both power supplies and so on), the buzzer does not stop even if you push the button to call attention. In this case, perform the appropriate recovery procedure depending on each cause.

No.	Section	Name		Classification	Color	Function
7-a	Control Unit	P0		LED	Green	Indicates that the link status of the FC-AL (loop 0 side) is normal.
7-b		CHK (CHECK)		LED	Red	Shows error factors by means of a number of times of blinking. Five times : BATTERY is abnormal. Six times : Voltage on the Controller is abnormal. (Reset of the Controller is not canceled.) Seven times : BS12V voltage is abnormal. Eight times : ENC part FAN monitoring circuit is abnormal. Nine times : Fans are abnormal. The following blinking is fast because ENC microprogram detects CUDG error. On : RAM error detected by ENC microprogram. ENC hard configuration error. Twice : ENC hard error. Five times : CUDG error detected by ENC microprogram (BOOT section). Six times : Significant surface error in ENC FLASH. Seven times : SUM check error in ENC FLASH.
7-c		EALM		LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC in the Control Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)
7-d		RST SW		Switch	—	Used to perform a Full Dump.
7-e		CACHE POWER		LED	Green	You can check whether the Cache memory is being backed up through indication of this LED. This LED is effective when the AC Power Unit Switch is turned on On : Indicates that the cache is being backed up. (The power is supplied from the battery to the Cache memory.) Off : The Cache memory is not backed up.
7-f		RST		LED	Orange	Indicates that the Controller is being reset. • During power-on reset • During reset for doing a dump • During reset for a reboot at the time of a microprogram down load • The DC-DC converter or the reset circuit on the Control Unit fails.
7-g		CHKSTP		LED	Red	A failure occurred at Controller and it became not operational.
7-h		CALM		LED	Red	• Indicates that a failure which makes in the Controller unable to operate occurred in it. • Does not light up when the Control Unit is in the reset status.
7-i		PATH0		Connector	—	Connection connector for ENC cable (PATH 0 side).
7-j-1		LAN0	LAN0	Connector	—	Connects the LAN0 cable. (For maintenance)
7-j-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 0.
7-j-2			LINK	LED	Green	Indicates that the link status of the LAN 0 is normal.
7-k-1		LAN1	LAN1	Connector	—	Connects the LAN1 cable. (For User Management)
7-k-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 1.
7-k-3			LINK	LED	Green	Indicates that the link status of the LAN 1 is normal.

7-l	Control Unit	Connector for connecting the Remote adapter (J8)		Connector	—	Used to connect the Remote adapter.
7-m		Connector for connecting the UPS interlocking cable (J5)		Connector	—	Used to connect the UPS for the DF700.
7-n		Voltage Check Connector		Connector	—	There are two cases where the numbers of pins are 8 and 20 respectively depending on the revision of the PCB. (The switch has nothing to do with maintenance because it is used for evaluation.)
7-o-1		Port 0A-0/ Port 1A-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
7-o-2			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
7-o-3			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
7-o-4			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
7-o-5			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0 is in trouble.
7-p-1		Port 0A-1/ Port 1A-1	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-1/Port 1A-1 side.
7-p-2			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-1/Port 1A-1 side.
7-p-3			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-1/Port 1A-1 side.
7-p-4			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-1/Port 1A-1 side.
7-p-5			HALM	LED	Red	Lights when the Port 0A-1/Port 1A-1 is in trouble.
8-a	FC Interface Board	Port 0A-0/ Port 1A-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-b			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0 side.
8-c			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-d			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0 side.
8-e			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0 is in trouble.
8-f		Port 0B-0/ Port 1B-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-g			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0 side.
8-h			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-l			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0 side.
8-j			HALM	LED	Red	Lights when the Port 0B-0/Port 1B-0 is in trouble.
9-a	NAS Interface Board	PCI-E		Connector	—	Connection connector for PCI-Express cable
9-b		CTRL		Connector	—	Connection connector for CTRL cable
10-a	iSCSI Interface Board	Port A	iSCSI	Connector	—	Connects the iSCSI cable (Port A side). (For maintenance)
10-b			Active	LED	Yellow	Indicates that data is being transferred via a Port A side.
10-c			Link	LED	Green	Indicates that the link status of the Port A side is normal.
10-d		Port B	iSCSI	Connector	—	Connects the iSCSI cable (Port B side). (For User Management)
10-e			Active	LED	Yellow	Indicates that data is being transferred via a Port B side.
10-f			Link	LED	Green	Indicates that the link status of the Port B side is normal.

No.	Section	Name	Classification	Color	Function
7-a	Control Unit	P0	LED	Green	Indicates that the link status of the FC-AL (loop 0 side) is normal.
7-b		P1	LED	Green	Indicates that the link status of the FC-AL (loop 1 side) is normal.
7-c		P2	LED	Green	Indicates that the link status of the FC-AL (loop 2 side) is normal.
7-d		P3	LED	Green	Indicates that the link status of the FC-AL (loop 3 side) is normal.
7-e		CHK (CHECK)	LED	Red	Shows error factors by means of a number of times of blinking. Once : Drive +5 V voltage is abnormal. Twice : Drive +12 V voltage is abnormal. Five times : Battery is abnormal. Six times : Voltage on the Controller is abnormal. (Reset of the Controller is not canceled.) Seven times : BS12V voltage is abnormal. Nine times : Fans are abnormal. The following blinking is fast because ENC microprogram detects CUDG error. Once : SRAM error. Twice : ENC hard error. Three times : Microprogram error in flash memory. Not blinking : BOOT section error of ENC microprogram, RAM error, or ENC hard configuration error.
7-f		EALM	LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC in the Control Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)
7-g		RST SW	Switch	—	Used to perform a Full Dump.
7-h		CACHE POWER	LED	Green	You can check whether the Cache memory is being backed up through indication of this LED. This LED is effective when the AC Power Unit Switch is turned on On : Indicates that the cache is being backed up. (The power is supplied from the battery to the Cache memory.) Off : The Cache memory is not backed up.
7-i		RST	LED	Orange	Indicates that the Controller is being reset. • During power-on reset • During reset for doing a dump • During reset for a reboot at the time of a microprogram down load • The DC-DC converter or the reset circuit on the Control Unit fails.
7-j		CHKSTP	LED	Red	A failure occurred at Controller and it became not operational.
7-k		CALM	LED	Red	• Indicates that a failure which makes in the Controller unable to operate occurred in it. • Does not light up when the Control Unit is in the reset status.
7-l		PATH0	Connector	—	Connection connector for ENC cable (PATH 0 side).
7-m		PATH1	Connector	—	Connection connector for ENC cable (PATH 1 side).
7-n		PATH2	Connector	—	Connection connector for ENC cable (PATH 2 side).
7-o		PATH3	Connector	—	Connection connector for ENC cable (PATH 3 side).

No.	Section	Name		Classification	Color	Function
7-p-1	Control Unit	LAN0	LAN0	Connector	—	Connects the LAN0 cable. (For maintenance)
7-p-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 0.
7-p-3			LINK	LED	Green	Indicates that the link status of the LAN 0 is normal.
7-q-1		LAN1	LAN1	Connector	—	Connects the LAN1 cable. (For User Management)
7-q-2			ACT	LED	Yellow	Indicates that data is being transferred via a LAN 1.
7-q-3			LINK	LED	Green	Indicates that the link status of the LAN 1 is normal.
7-r		Connector for connecting the Remote adapter (J8)		Connector	—	Used to connect the Remote adapter.
7-s		Connector for connecting the UPS interlocking cable (J5)		Connector	—	Used to connect the UPS for the DF700.
7-t		Voltage Check Connector		Connector	—	Voltage Check Connector of 16 pins. (The switch has nothing to do with maintenance because it is used for evaluation.)
8-a	FC Interface Board	Port 0A-0/ Port 1A-0/ Port 0C-0/ Port 1C-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0/Port 0C-0/Port 1C-0 side.
8-b			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0A-0/Port 1A-0/Port 0C-0/Port 1C-0 side.
8-c			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0/Port 0C-0/Port 1C-0 side.
8-d			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0A-0/Port 1A-0/Port 0C-0/Port 1C-0side.
8-e			HALM	LED	Red	Lights when the Port 0A-0/Port 1A-0/Port 0C-0/Port 1C-0 is in trouble.
8-f		Port 0B-0/ Port 1B-0/ Port 0D-0/ Port 1D-0	Tx	Connector	—	Connector on the signal output side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0/Port 0D-0/Port 1D-0 side.
8-g			Rx	Connector	—	Connector on the signal input side to connect the Fibre Channel interface cable in the Port 0B-0/Port 1B-0/Port 0D-0/Port 1D-0 side.
8-h			GP1	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0/Port 0D-0/Port 1D-0 side.
8-I			GP0	LED	Green	Shows status of the standard Interface Board mounted on the Controller in the Port 0B-0/Port 1B-0/Port 0D-0/Port 1D-0 side.
8-j			HALM	LED	Red	Lights when the Port 0B-0/Port 1B-0/Port 0D-0/Port 1D-0 is in trouble.
9-a	NAS Interface Board	PCI-E		Connector	—	Connection connector for PCI-Express cable
9-b		CTRL		Connector	—	Connection connector for CTRL cable
10-a	iSCSI Interface Board	Port A	iSCSI	Connector	—	Connects the iSCSI cable (Port A side). (For maintenance)
10-b			Active	LED	Yellow	Indicates that data is being transferred via a Port A side.
10-c			Link	LED	Green	Indicates that the link status of the Port A side is normal.
10-d		Port B	iSCSI	Connector	—	Connects the iSCSI cable (Port B side). (For User Management)
10-e			Active	LED	Yellow	Indicates that data is being transferred via a Port B side.
10-f			Link	LED	Green	Indicates that the link status of the Port B side is normal.

(5) Indication positions and their functions of RKAJ

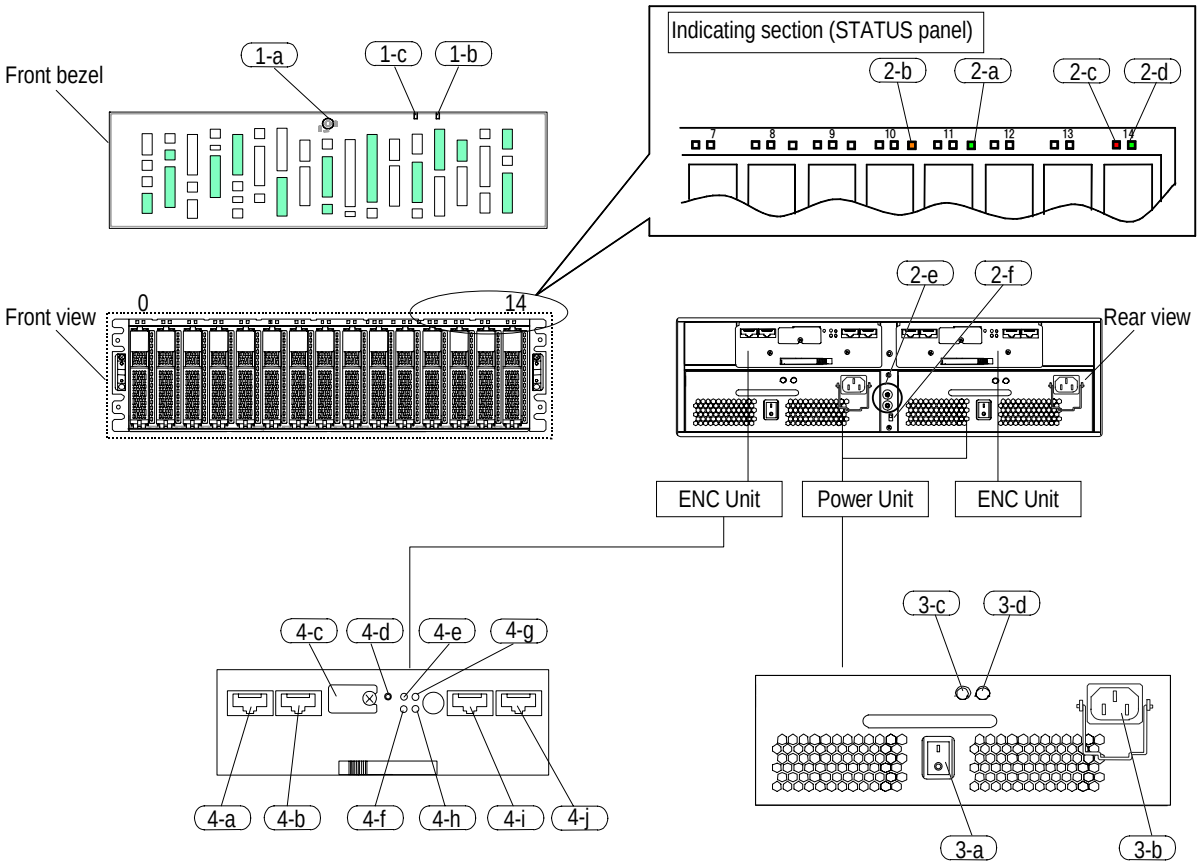

Figure 2.3.4 Indication Locations of Functional Components

Copyright © 2006, Hitachi, Ltd.

Table 2.3.4 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	KEY	Key	—	Locks the front bezel.
1-b		POWER	LED	Green	Indicates that the power supply is supplied to RKAJ.
1-c		WARNING	LED	Orange	Indicates that a failure, which allows RKAJ to operate, occurred.
2-a	STATUS Panel (RKAJ)	PWR (POWER)	LED	Green	Indicates that the power is supplied to the RKAJ/RKAJAT.
2-b		WARN (WARNING)	LED	Orange	Indicates that a failure which allows the RKAJ/RKAJAT operation occurred.
2-c		ALARM	LED	Red	Indicates that a failure which makes the unable to operate occurred.
2-d		ACTIVE	LED	Green	No. / LED status / Meaning 1 / Blinking / Shows that the Disk Drive is being accessed. 2 / On / Spin up state. 3 / Off / Spin down state.
2-e		Device ID	Switch	—	Sets the device ID (*1) of the RKAJ/RKAJAT.
2-f		Subsystem identification	Switch	—	Sets the basic subsystem to be connected. M : RKH/RKM S : RKS
3-a	Power Unit	AC Power Unit Switch	Switch	—	Controls the power applied to the subsystem. | : Power on ○: Power off
3-b		Receptor (J1)	Connector	—	Connector on the subsystem side to connect the power cable.
3-c		READY	LED	Green	Shows the operation state of the Power Unit. On : Normal operation Off : Abnormal operation or out of operation
3-d		ALARM	LED	Red	Lights when the Power Unit is in trouble.
4-a	ENC Unit	PATH0 (IN side)	Connector	—	Connection (for input) connector for ENC cable (PATH0 side).
4-b		PATH1 (IN side)	Connector	—	Connection connector (for input) for ENC cable (PATH1 side).
4-c		Jumper Connector (J30 : RKAJ)	Connector	—	Type : Four pins (The switch has nothing to do with maintenance because it is used for evaluation.)
4-d		SW	Switch	—	Not used (The switch has nothing to do with maintenance because it is used for evaluation.)
4-e		P1	LED	Green	Indicates that the link status of the FC-AL (loop 1 side) is normal.
4-f		P0	LED	Green	Indicates that the link status of the FC-AL (loop 0 side) is normal.
4-g		CHK	LED	Red	ENC Unit It indicates error factors by means of number of times of blinking. Low-speed blinking: Once : Logic +5 V voltage is abnormal. Twice : Logic +12 V voltage is abnormal. Six times : Logic + 2.5V voltage of the ENC Unit is abnormal. CUDG error detected by ENC microprogram. Lighting: CUDG error detected by ENC microprogram (BOOT section) RAM error detected by ENC microprogram ENC hard configuration error High-speed blinking: Once : SRAM error. Twice : CUDG error in ENC hard. Three times : Microprogram error in flash memory.

*1 : When the basic chassis is the RKM/RKS, the device ID #0 is fixedly assigned to the RKM/RKS.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name		Classification	Color	Function
4-h	ENC Unit	ALM		LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)
4-i		PATH0	(OUT side)	Connector	—	Connection connector (for output) for ENC cable (PATH 0 side).
4-j		PATH1		Connector	—	Connection connector (for output) for ENC cable (PATH 1 side).

Copyright © 2005, Hitachi, Ltd.

(6) Indication positions and their functions of RKAJAT/RKAJATL

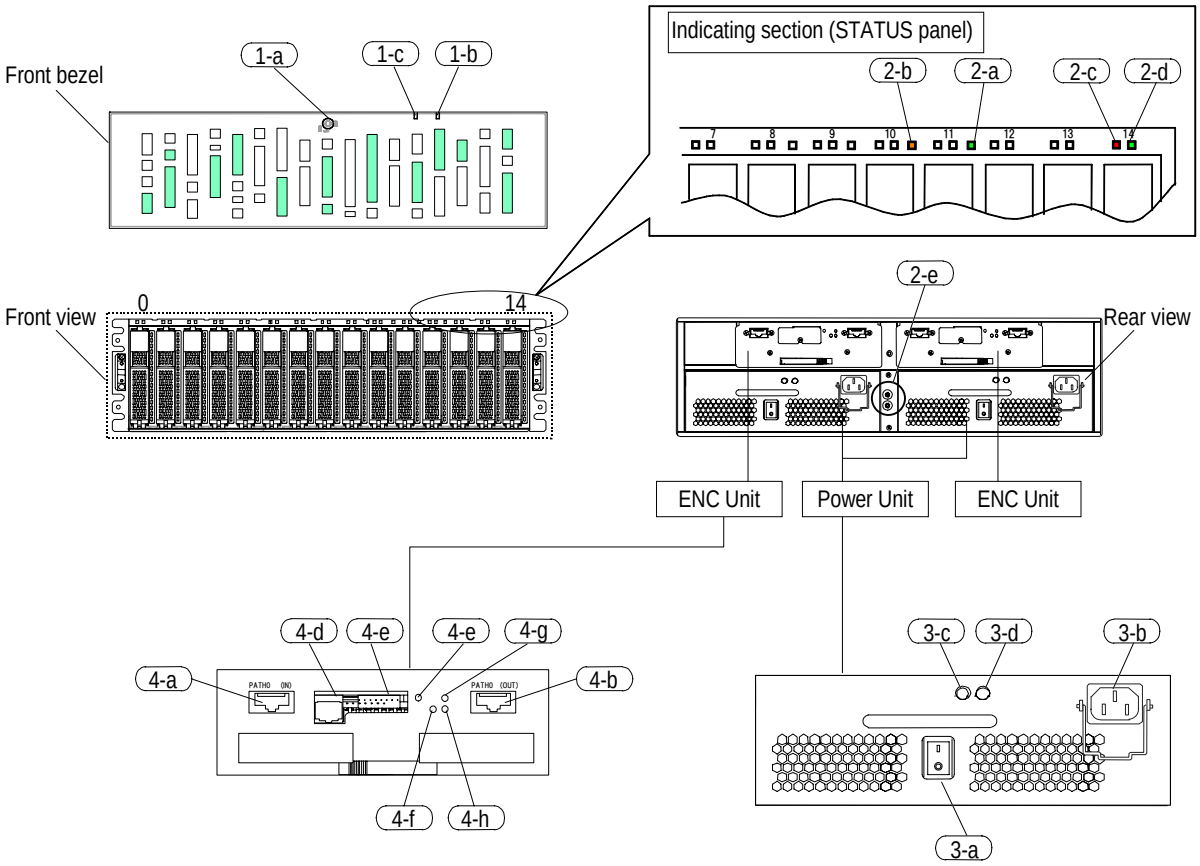

Figure 2.3.5 Indication Locations of Functional Components

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.3.5 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	KEY	Key	—	Locks the front bezel.
1-b		POWER	LED	Green	Indicates that the power supply is supplied to RKAJAT/RKAJATL(*1).
1-c		WARNING	LED	Orange	Indicates that a failure, which allows RKAJAT/RKAJATL(*1) to operate, occurred.
2-a	STATUS Panel (RKAJAT/ RKAJATL(*1))	PWR (POWER)	LED	Green	Indicates that the power is supplied to the RKAJ/RKAJAT/ RKAJATL(*1).
2-b		WARN (WARNING)	LED	Orange	Indicates that a failure which allows the RKAJ/RKAJAT/ RKAJATL(*1) operation occurred.
2-c		ALARM	LED	Red	Indicates that a failure which makes the unable to operate occurred.
2-d		ACTIVE	LED	Green	No. 1: LED status Blinking: Shows that the Disk Drive is being accessed. No. 2: LED status On: Spin up state. No. 3: LED status Off: Spin down state.
2-e		Device ID	Switch	—	Sets the device ID (*2) of the RKAJ/RKAJAT/RKAJATL(*1).
2-f			Switch	—	M : RKM S : RKS
3-a	Power Unit	AC Power Unit Switch	Switch	—	Controls the power applied to the subsystem. | : Power on ○: Power off
3-b		Receptor (J1)	Connector	—	Connector on the subsystem side to connect the power cable.
3-c		READY	LED	Green	Shows the operation state of the Power Unit. On : Normal operation Off : Abnormal operation or out of operation
3-d		ALARM	LED	Red	Lights when the Power Unit is in trouble.
4-a	SENC Unit	PATH0 (IN side)	Connector	—	Connection (for input) connector for ENC cable (PATH0 side).
4-b		PATH1 (IN side)	Connector	—	Connection connector (for input) for ENC cable (PATH1 side).
4-c		Voltage Check Connector	Connector	—	Not used (The switch has nothing to do with maintenance because it is used for evaluation.)
4-d		Connector for connecting a processor	Connector	—	To be used when connecting the console cable of a processor. (For setup before shipment)
4-e		SW	Switch	—	Not used (The switch has nothing to do with maintenance because it is used for evaluation.)
4-f		P1	LED	Green	Indicates that the link status of the FC-AL (loop 1 side) is normal.

*1 : RKAJATL can be only connected to RKXS.

*2 : When the basic chassis is the RKM/RKS, the device ID #0 is fixedly assigned to the RKM/RKS.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name	Classification	Color	Function
4-g	SENC Unit	CHK	LED	Red	SENC Unit (RKAJAT) The CHK LED (Red) lights on (for about 10 seconds) while the CUDG is being executed. Also, it indicates error factors in the subsystem by the number of times of blinking. Low-speed blinking: Twice : CUDG error in SENC Eight times : Fan selector circuit error. Lighting: CUDG error in BOOT section of SENC High-speed blinking: Five times : Fixed data error in flash memory. Six times : Significant surface error in flash memory Seven times : SUM check error in flash memory
4-h		ALM	LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)

*1 : RKAJATL can be only connected to RKXS.

Table 2.3.6 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	KEY	Key	—	Locks the front bezel.
1-b		POWER	LED	Green	Indicates that the power supply is supplied to RKA.
1-c		WARNING	LED	Orange	Indicates that a failure, which allows RKA to operate, occurred.
2-a	STATUS Panel (RKA)	PWR (POWER)	LED	Green	Indicates that the power is supplied to the RKA.
2-b		WARN (WARNING)	LED	Orange	Indicates that a failure which allows the RKA operation occurred.
2-c		FAIL	LED	Red	Indicates that a failure which makes the unable to operate occurred.
2-d		ACTIVE	LED	Green	No. / LED status / Meaning 1 / Blinking / Shows that the Disk Drive is being accessed. 2 / On / Spin up state. 3 / Off / Spin down state.
2-e		Device ID	Switch	—	Sets the device ID (*1) of the RKA.
3-a	Power Unit	AC Power Unit Switch	Switch	—	Controls the power applied to the subsystem. | : Power on ○: Power off
3-b		Receptor (J1)	Connector	—	Connector on the subsystem side to connect the power cable.
3-c		READY	LED	Green	Shows the operation state of the Power Unit. On : Normal operation Off : Abnormal operation or out of operation
3-d		ALARM	LED	Red	Lights when the Power Unit is in trouble.
4-a	Fan Assembly	ALM	LED	Red	Shows the state of the Fan Assembly On : Abnormal Off : Normal
5-a	ENC Unit	PATH0 (IN side)	Connector	—	Connection (for input) connector for ENC cable (PATH0 side).
5-b		PATH1	Connector	—	Connection connector (for input) for ENC cable (PATH1 side).
5-c		Voltage Check Connector	Connector	—	Not used (The switch has nothing to do with maintenance because it is used for evaluation.)
5-d		SW	Switch	—	Not used (The switch has nothing to do with maintenance because it is used for evaluation.)
5-e		P1	LED	Green	Indicates that the link status of the FC-AL (loop 1 side) is normal.
5-f		P0	LED	Green	Indicates that the link status of the FC-AL (loop 0 side) is normal.

*1 : "0" is used for the subsystem in default.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name		Classification	Color	Function
5-g	ENC Unit	CHK		LED	Red	ENC Unit It indicates error factors by means of number of times of blinking. Low-speed blinking: Once : Logic +5 V voltage is abnormal. Twice : Drive +12 V voltage is abnormal. Seven times : BS 1.8 V, BS 3.3 V, or BS 12 V voltage is abnormal. Eight times : Two or more fans in both fan units (#0, #1) rotates abnormally. CUDG error detected by ENC microprogram. Lighting: CUDG error detected by ENC microprogram (BOOT section) RAM error detected by ENC microprogram ENC hard configuration error High-speed blinking: Once : SRAM error. Twice : CUDG error in ENC hard. Three times : Microprogram error in flash memory.
5-h	ENC Unit / SENC Unit	ALM		LED	Red	Indicates error factors by means of lighting or blinking. Lighting Indicates that a failure, which makes the ENC Unit /SENC Unit unable to operate, occurred. Blinking Normal blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. High-speed blinking (CHK LED is on) : An exceptional process error detected by the ENC microprogram. (stack over) Normal blinking (CHK LED is off) : Indicates that FLASH write is performed during the ENC microprogram download. (It is not in the abnormal status.)
5-I		PATH0	(OUT side)	Connector	—	Connection connector (for output) for ENC cable (PATH0 side).
5-j		PATH1		Connector	—	Connection connector (for output) for ENC cable (PATH1 side).

(8) Indication positions and their functions of RKNAS

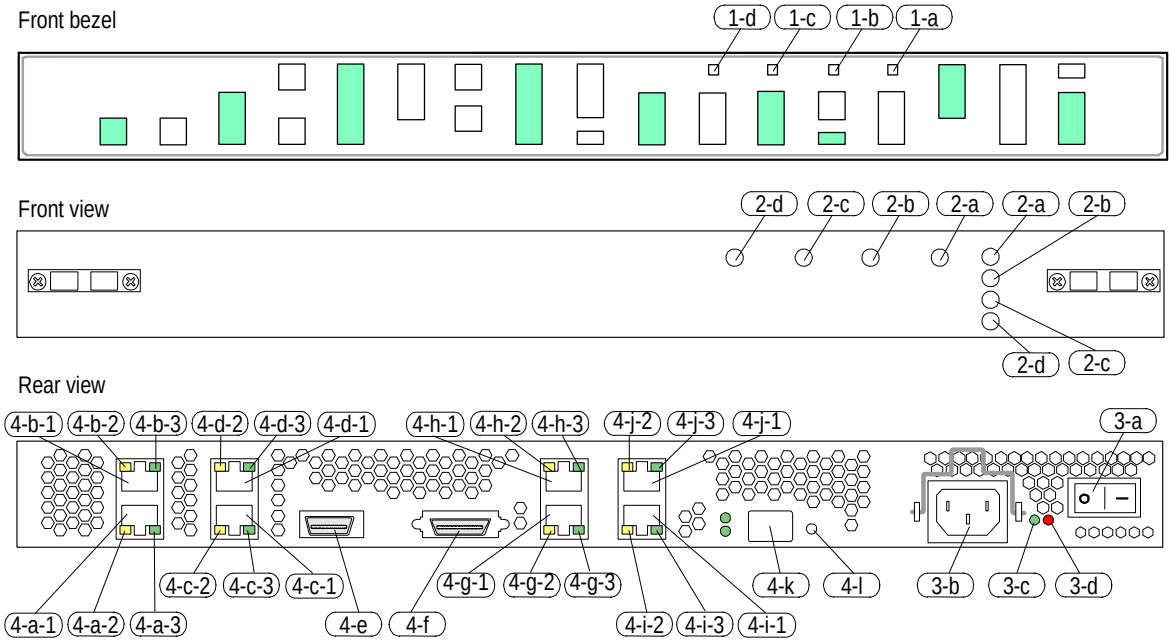

Figure 2.3.7 Indication Locations of Functional Components

Table 2.3.7 Functions of Indications

No.	Section	Name	Classification	Color	Function
1-a	Front Bezel	POWER	LED	Green	Indicates that the power supply is supplied to RKNAS.
1-b		READY	LED	Green	Indicates that the RKNAS can be operated. (*1)
1-c		WARNING	LED	Orange	Indicates that a failure, which allows RKNAS to operate, occurred.
1-d		ALARM	LED	Red	Indicates that a failure, which cannot be operated, occurs in the RKNAS.
2-a	STATUS Panel (RKANAS)	POWER	LED	Green	Indicates that the power is supplied to the RKNAS.
2-b		READY	LED	Green	Indicates that the RKNAS can be operated. (*1)
2-c		WARNING	LED	Orange	Indicates that a failure, which allows RKNAS to operate, occurred.
2-d		ALARM	LED	Red	Indicates that a failure, which cannot be operated, occurs in the RKNAS.
3-a	Power Unit	AC Power Unit Switch	Switch	—	Controls the power applied to the RKNAS. | : Power on O: Power off
3-b		Receptor (J1)	Connector	—	Connector on the subsystem side to connect the power cable.
3-c		READY	LED	Green	Shows the operation state of the Power Unit. On : Normal operation Off : Abnormal operation or out of operation
3-d		ALARM	LED	Red	Lights when the Power Unit is in trouble.

*1 : There is the case that READY LED of RKNAS illuminates, and cannot access from a host computer. A NAS system accepts access from a host computer only in case of "ACTIVE" NAS OS Condition. (Refer to "4.2 (d) NNC (NAS Unit)" (TRBL 04-0090).)

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name		Classification	Color	Function
4-a-1	RKNAS (Rear view)	gbe4	gbe4	Connector	—	A connector for connecting the gbe4 side cable
4-a-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the gbe4. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-a-3			10/100/1000	LED	Green/ Yellow	Indicates the transfer speed of the gbe4. Off: 10M Green : 100M Yellow : 1000M
4-b-1		gbe3	gbe3	Connector	—	Connects the gbe3 cable.
4-b-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the gbe3. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-b-3			10/100/1000	LED	Green/ Yellow	Indicates the transfer speed of the gbe3. Off : 10M Green : 100M Yellow : 1000M
4-c-1		gbe2	gbe2	Connector	—	Connects the gbe2 cable.
4-c-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the gbe2. Green: Indicates that it is in the link status. Yellow: Indicates that it is in the data transfer.
4-c-3			10/100/1000	LED	Green/ Yellow	Indicates the transfer speed of the gbe2. Off : 10M Green : 100M Yellow : 1000M
4-d-1		gbe1	gbe1	Connector	—	Connects the gbe1 cable.
4-d-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the gbe1. Green: Indicates that it is in the link status. Yellow: Indicates that it is in the data transfer.
4-d-3			10/100/1000	LED	Green/ Yellow	Indicates the transfer speed of the gbe1. Off : 10M Green : 100M Yellow : 1000M
4-e		PCI-E		Connector	—	A connector for connecting the PCI-Express cable
4-f		CTRL		Connector	—	A connector for connecting the CTRL cable
4-g-1		mng1 (MAN LAN)	mng1 (MAN LAN)	Connector	—	A connector for connecting the LAN cable for the user control
4-g-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the LAN for the control. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-g-3			10/100/1000	LED	Green/ Yellow	Indicates the transfer speed of the LAN for the control. Off : 10M Green : 100M Yellow : 1000M

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Section	Name		Classification	Color	Function
4-h-1	RKNAS (Rear view)	Other NNC (NAS)	LAN	Connector	—	At the time of the cluster configuration A connector for connecting the LAN cable to the other RKNAS
4-h-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of another LAN. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-h-3			10/100	LED	Green	Indicates the transfer speed of another LAN. Off : 10M Green : 100M
4-i-1		Disk ARRAY	LAN	Connector	—	A connector for connecting it to the maintenance LAN port of the Control Unit. (For maintenance)
4-i-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of another LAN. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-i-3			10/100	LED	Green	Indicates the transfer speed of another LAN. Off : 10M Green : 100M
4-j-1		mtp1 (MNT PC)	mtp1 (MNT PC)	Connector	—	A connector for connecting the LAN for the maintenance
4-j-2			LINK/ACT	LED	Green/ Yellow	Indicates that it is in the link status/data transfer of the LAN for the maintenance. Green : Indicates that it is in the link status. Yellow : Indicates that it is in the data transfer.
4-j-3			10/100	LED	Green	Indicates the transfer speed of the LAN for the maintenance. Off : 10M, Green : 100M
4-k		FC PORT		Connector	—	A connector for connecting the backup subsystem
4-l		RESET SW		Switch	—	Is used to reset the RKNAS.

Copyright © 2005, 2006, Hitachi, Ltd.

.

Chapter 3. Before Starting WEB Connection

3.1 Procedure to WEB connection

(1) Points to be confirmed before connecting WEB

Unless the subsystem is activated, the subsystem cannot be connected to WEB.
Confirming the following LEDs before connecting to WEB.

• Confirming the power status (POWER LED).

Check if the POWER LED on the Front Bezel lights up.
If the Power LED does not light up, see "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000).

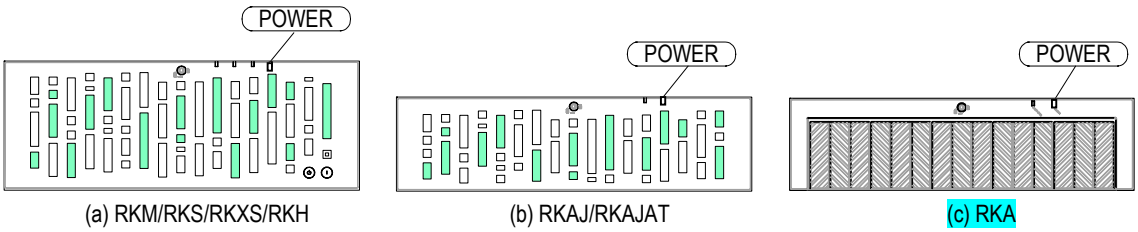

Figure 3.1.1 Locations and Name of LED

• Confirming the CHKSTP LED of the Control Unit

Check if the CHKSTP LED on the Control Unit lights up.
If CHKSTP LED is on, replace Control Unit of which CHKSP LED is on. Refer to Replacement "2.2.5 Replacing Control Unit" (REP 02-0390) for replacing a Control Unit.

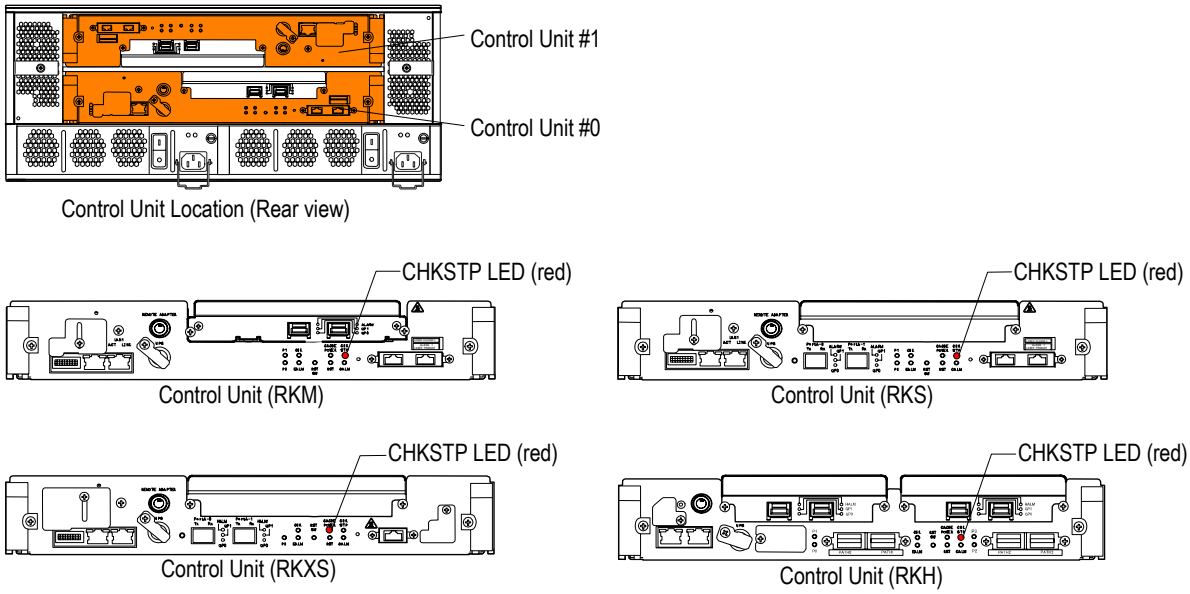

Figure 3.1.2 Locations and Name of LED

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Preparation of maintenance terminal to be used

Table 3.1.1 Decision and Preparation of Maintenance Terminal

Item	Customer's environment	Maintenance terminal used	Preparation	Connection procedure reference destination
1	Using LAN connectors for maintenance of the Control Unit	Connect the portable Maintenance PC via a LAN.	• PC for maintenance(*1) • LAN cross cable	"3.1 (4) Procedure to connect portable maintenance PC to WEB" (TRBL 03-0010).

*1 : Refer to "3.3 Note on WEB connecting" (TRBL 03-0060) for recommended PC.

(3) Control Unit to be connection

If a system has a dual Control Unit, connect to either Control Unit to connect to the WEB. First, connect to Control Unit#0.

If Control Unit #0 is blocked, however, information after the blockage of Control Unit #0 is referenced on only Control Unit #1 side. Accordingly, if Control Unit #0 is blocked, connect to Control Unit #1.

(4) Procedure to connect portable maintenance PC to WEB

(a) Remove the cover on the Control Unit. Connect the LAN-Connecter for maintenance and the LAN-Connecter of Maintenance PC with a LAN-cross-cable.

At the time of the RKNAS connection, remove the cover of the LAN connector for the maintenance in the RKNAS (rear side), and connect the LAN connector for the maintenance and the LAN connector of the Maintenance PC.

NOTE : At the time of the NAS connection, connect it to the LAN connector for the maintenance of the NAS Unit. In such case, check that the AC Input Power of the NAS Unit is turned on. If it is turned off, turn on the AC Input Power of the NAS Unit. (Refer to Installation "1.7 Power On/Off Procedure" (INST 01-0290).)

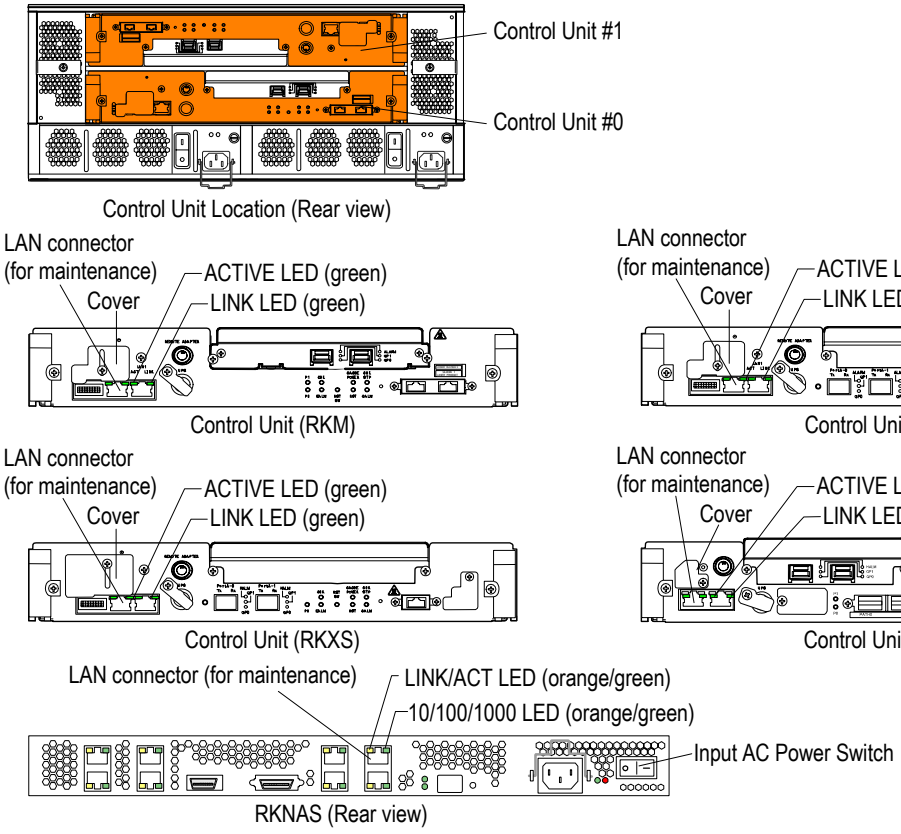

Figure 3.1.3 LAN Connector Position

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Start up the maintenance PC.

(c) Change the IP address of the network parameter for the maintenance PC.
For the maintenance PC, set the IP address shown in No. 1 in Table 3.1.2 below.
When it cannot be connected, specify the connectable value and perform the WEB connection by setting the values of No.2 to No.5 in order.
If not connected yet, refer to "3.4 Procedure for specifying maintenance port IP address" (TRBL 03-0100).

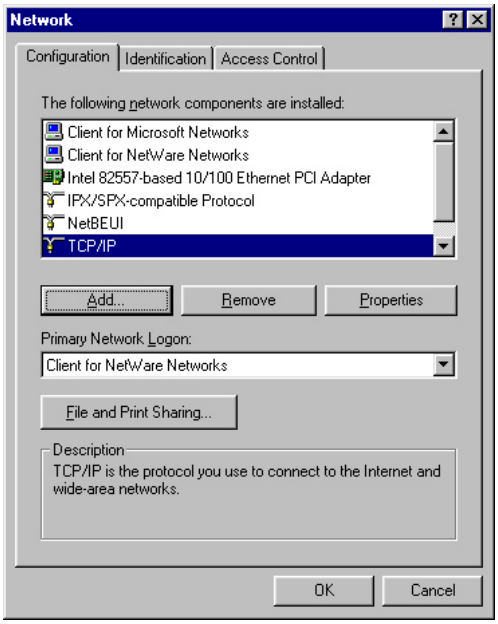
Table 3.1.2 Operational Environment

No.	Subsystem (LAN port for maintenance)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 0.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL 0: 192.168.233.16 CTL 1: 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL 0: 172.23.211.16 CTL 1:172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL 0: 10.197.181.16 CTL 1:10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0

• Manual change of the network parameter of the Maintenance port
When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.
Therefore, the LAN port for the maintenance when performing the WEB connection is set as any value of No.1 to No.5 in Table 3.1.2 on the work other than the installation of the subsystem at the time of the shipment.

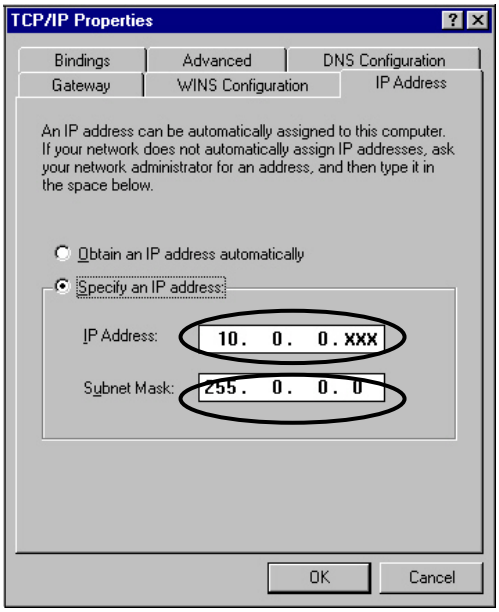
NOTE : However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
If this is the case, set network address other than maintenance port in the LAN device which is connected via the Gateway in the extension of the User management port, or set maintenance port other than the network address of LAN device which is connected via the Gateway. (Refer to System Parameter "4.2 (4) Setting Maintenance of LAN"(SYSPR 04-0100).)

Copyright © 2005, 2006, Hitachi, Ltd.



(5) Setting method of IP Address on Windows 95

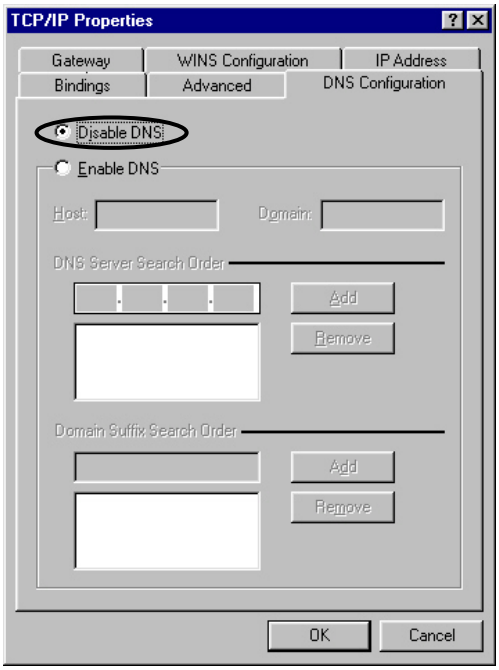
The procedure for setting an IP Address of the PC in Windows 95 is shown below.



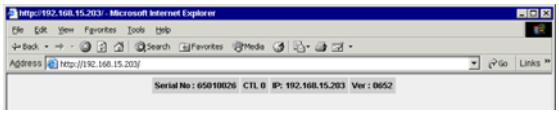
Also in Windows 98, Widows 2000 and Windows XP, the IP Address of the PC can be set by the similar operation.

(a) Select [Start]-[Set]-[Control Panel]-[Network].

(b) Select [Configuration]-[The following network components are installed]-[TCP/IP] and click the [Properties] button to open [TCP/IP].



(c) Select [TCP/IP Properties]-[IP Address]-[Specify an IP address] and set the [IP Address] and press the [OK] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(d) Set the TCP/IP to "Disable DNS" because the connection takes a long time when the TCP/IP of the network is set to the condition in which the DNS is used.
For the setting procedure, refer to the instruction manual of the PC to be used.

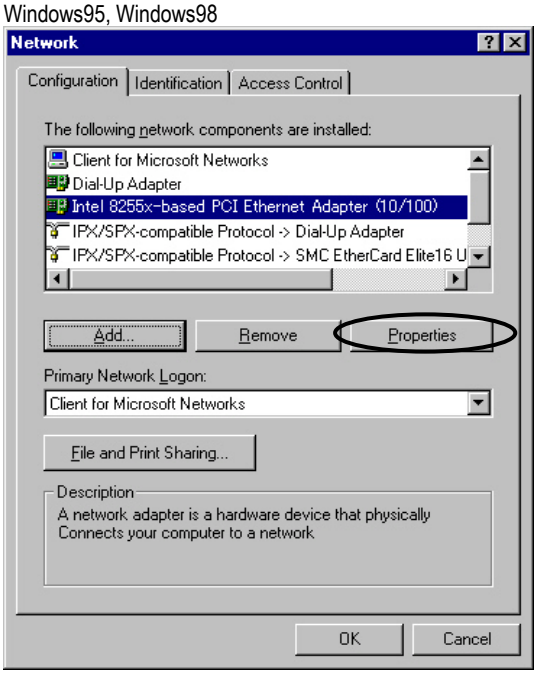
(e) When confirming message appears whether to reboot the Maintenance PC, press [OK].
(f) The maintenance PC is rebooted and the changed IP Address and Subnet Mask become effective.
(g) Start up the Browser. Enter the URL window with the IP address of maintenance port to which the maintenance PC is connected. When WEB screen appears, the connection is complete.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

(h) Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used.
To make sure the setting, refer to the instruction manual of the browser to be used.
If you cannot connect, the negotiation of Maintenance PC may be changed.
Refer to "(6) Procedure for setting negotiation" (TRBL 03-0041), and set negotiation of Maintenance PC to auto negotiation.

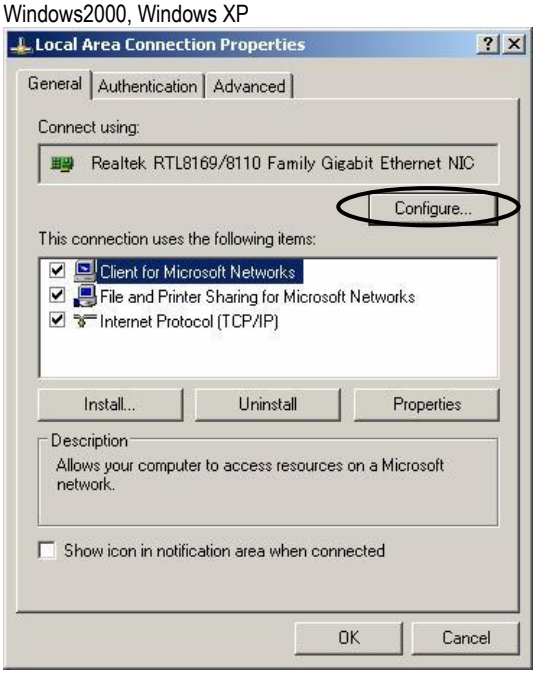
Copyright © 2005, 2006, Hitachi, Ltd.

(6) Procedure for setting negotiation



The procedure for setting negotiation of the PC is shown below.

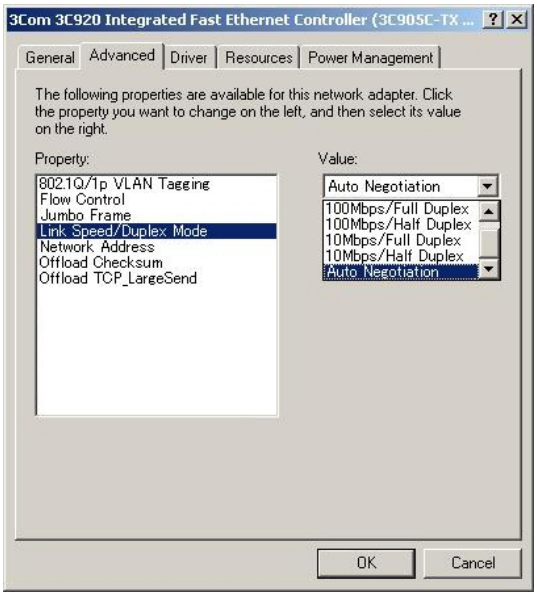
(a) Select [Start]-[Set]-[Control Panel]-[Network].



(b) If Windows 95 or Windows 98, select [Configuration]-[The following network components are installed]-Network Interface Card, and click the [Properties] button to open Network Interface Card.

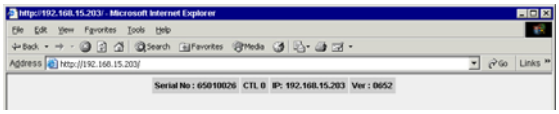
If Windows 2000 or Windows XP, click the [Configure] button in [Connect using]

Windows95, Windows98



Windows2000, Windows XP

(c) Select [Advanced] tab, click Link speed and duplex mode in [Property].

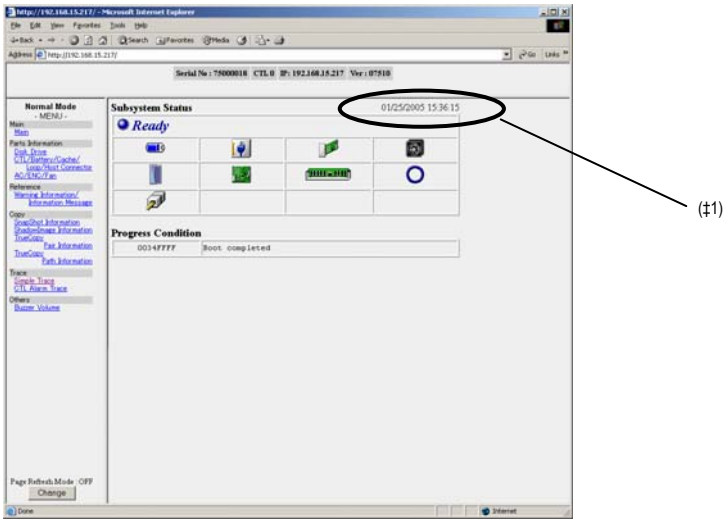


And set [Value] to auto negotiation.

Copyright © 2006, Hitachi, Ltd.

(d) After reboot maintenance PC, start up the Browser. Enter the URL window with the IP address of maintenance port to which the maintenance PC is connected. When WEB screen appears, the connection is complete.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.



(e) Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used.
To make sure the setting, refer to the instruction manual of the browser to be used.
If you cannot connect, change the LAN-cross-cable.

Copyright © 2006, Hitachi, Ltd.

3.2 When the WEB has already been connected

If the WEB has been connected, information displayed before may be still displayed.
Before starting trouble analysis based on the WEB connection, [Refresh] the WEB window.
The time when the WEB window is displayed is referenced as shown below.
Window display differs depending on microprogram revision.

‡1 : The time determined by the Device Controller RTC (Real Time Clock) is indicated here. (It is not consistent with the main PC clock.)
For setting the Device Controller RTC, refer to "2.2 Confirming and setting RTC (Real Time Clock)" (TRBL 02-0010).

Copyright © 2005, Hitachi, Ltd.

3.3 Note on WEB connecting

(1) Note on WEB using

(a) The LAN function may become temporarily unable to be connected when the update of the WEB display is repeated frequently. In this case, wait for a short time (at least one minute), then update again.

(b) When connecting the WEB of DF700, use the following browsers.

Table3.3.1 Recommended WEB hardware

No.	Item	Description	Remark
1	OS	Microsoft Windows 98, NT 4.0, 2000, XP, 2003, Solaris8, IRIX6.5, AIX4.3, 5.1	—
2	PC	Pentium (Pentium Ⅱ (233 MHz or more) is recommended), Memory 40 M bytes or more (64 M bytes or more is recommended)	—
3	WS	Turbo Sparc 170 M Hz, Memory 256 M bytes or more R10000 195 M Hz, Memory 128 M bytes or more	—
4	Disk requirement	• 60 M bytes, under ordinary maintenance work • 1.2 G bytes per one Controller, under Full Dump collection(*1) { Storing temporary file of Browser : 600 M bytes Storing Full Dump: 600 M bytes }	• Data compression tool is required for Full Dump. • Refer to WEB "3.5.3 Collecting Full Dump" (WEB 03-0370) or WEB "3.5.4 Collecting Full Dump (Full Dump(SnapShot/TCE))" (WEB 03-0400) for the capacity of Full Dump when it is uncompressed.

*1 : Full Dump collection may be requested by the Technical Support Center at the time of a tough failure.

Copyright © 2005, 2006, Hitachi, Ltd.

Table3.3.2 Support Browser List

(○ : support × : not support)

No.	Platform	OS		Browser		Supported or not supported	Java Applet supported or not supported (*2) (*3)
		Type	Ver.	Type	Ver.(*1)		
1	WS	IRIX	6.5	Netscape Navigator	4.76	○	×
		Solaris	2.6	Netscape Navigator	4.76	○	×
			8	Netscape Navigator	4.76	○	×
		AIX (*4)	4.3	Mozilla (*4)	1.5	○	×
			5.1	Mozilla (*4)	1.7	○	×
2	PC	Windows	98	Internet Explorer	6.0	○	○
			NT/2000	Internet Explorer	6.0	○	○
			XP	Internet Explorer	6.0	○	×
			2003 (IA32)	Internet Explorer	6.0	○	○
			2003 (IA64)	Internet Explorer	6.0	○	×
					6.0 (32 Bit)	○	○
		Windows	98	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×
			NT/ 2000/XP	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×
			2003 (IA32/IA64)	Netscape Navigator	7.1 (J)	○	×
					7.2 (E)	○	×

*1 : Service Pack 1 is included.
*2 : When installing the microprogram, the Maintenance PC must be started by the OS from the drive C in order to prevent a problem of security from occurring.
*3 : Java Applet is used for the following cases.
Microprogram installation, Host command trace download, and Online ENC/SENC firmware download.
*4 : It supports from the microprogram revision 0720/A-S.

Copyright © 2005, 2006, Hitachi, Ltd.

Notices on (restriction of) the support browser

In the case of Windows2003, because the strict data security is the default setting, the Web function cannot work.

In order to solve the above problem, change the setting of the browser as follows.

- Select [Tools] - [Internet Options …] - [Security] - [Custom Level …] - [Custom Setting Reset] of the browser in this order and select the setting of the security level from Medium or lower and click the "Reset" button.

  The making of the setting as Medium solves the problem. However, if you want to use Win2003 leaving the security level as High, make the following settings for the detailed items of the [Custom Level …].

  - Enable the [Active scripting] of the [Scripting].
  - Enable the [Allow META REFRESH] of the [Miscellaneous].
  - Enable the [File download] of the [Downloads].
  - Enable the [Run ActiveX controls and plug-ins] of the [ActiveX controls and plug-ins].

- There may be a case where a new line is started in a window depending on a setting of the browser. In such a case, make the character size smaller.

  < Method of character size change >

  In the case of IE

  Select "Middle" or smaller size for the "Character Size" in the "Display".

  In the case of Netscape

  Select the "Reduction of Font Size" in the "Display" and keep it being selected until paragraphs become easy to be read.

- There may be a case where an empty dialogue box is displayed during operation in the Maintenance mode. In such a case, close the window by clicking on the mark of "X" in the upper left corner of the dialogue box, restart the browser, and then make a retry from the entry of the URL.
- When a window size is changed while a page is displayed by Netscape, the succeeding operation in the Refresh mode may not be done normally. In such a case, display the page over again by clicking the Re-Display button.
- In the case of using Netscape

  Memory cache: 1024 kbytes (default) or larger

  Disk cache: 7680 kbytes (default) or larger

  < Method of cache size setting >

  Select the "Edition", "Setting", "Details", and "Cache" in this order.

  Specify sizes of the memory cache and disk cache.

- When obtaining trace information etc. with Netscape, there are cases that a sub-screen to specify the file download destination does not automatically close.

  In such a case, press a close button at the upper right corner of the sub-screen to close the sub-screen after download complete.

Copyright © 2005, 2006, Hitachi, Ltd.

- When using Netscape Navigator 7.x, select [Edit]-[Preference...]-[Advanced]-[HTTP Networking], and set "Use HTTP 1.0" in the "Direct Connection Options" and "Proxy Connection Options".
  When this setting is not made, the summary window is not displayed correctly.
- When collecting Full Dump using Netscape Navigator 4.7x, pay attention to free space in PC because information to be downloaded won't be compressed.

	Installed cache of the subsystem	Free Capacity needed on PC
RKM	1 G bytes (Minimum)	853 M bytes
	4 G bytes (Maximum)	2,970 M bytes
RKS	1 G bytes (Minimum)	720 M bytes
	2 G bytes (Maximum)	1,496 M bytes
RKXS	512 M bytes (Minimum)	405 M bytes
	1 G bytes (Maximum)	758 M bytes
RKH	2 G bytes (Minimum)	1,926 M bytes
	8 G bytes (Maximum)	5,820 M bytes

Copyright © 2006, Hitachi, Ltd.

(2) The procedure for connecting to another subsystem having the same IP address via a LAN.
In the case of connecting and maintaining two or more controllers, whose IP addresses are the same, using a Maintenance PC and cross cable of a LAN, when one of the Controllers is connected to the PC, the PC memorizes the IP address and physical address of the Controller making a pair of them. Therefore, if another Controller is connected to the PC via a LAN, the IP address is not accepted because the physical address is different.
To make the above connection via a LAN, execute the following command from the MS-DOS prompt of Windows PC in order too delete the information on the IP address stored in the arp table in the PC.

```
arp  -d  IP address
```

- IP address : IP address stored in the arp table

Example : When deleting an IP address 10.0. 0.16 (default) from the table

```
arp  -d  10.0. 0.16
```

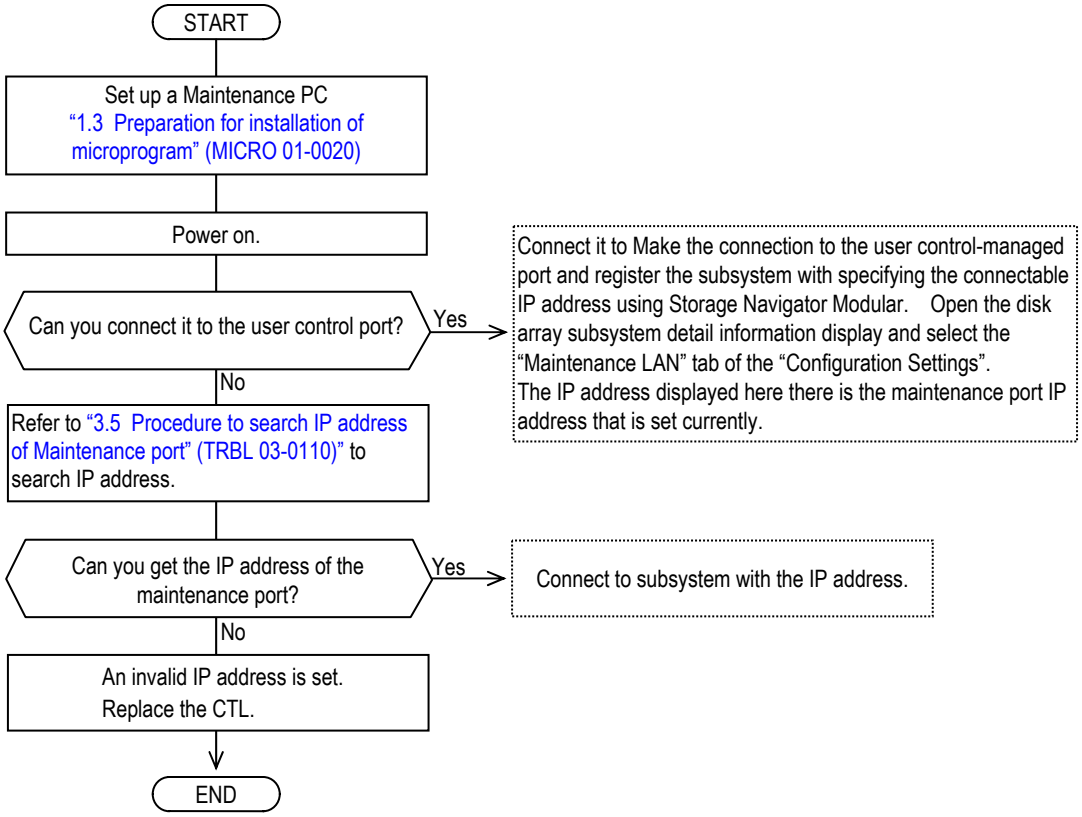
To make sure that the IP address stored in the arp table has been deleted, execute the following command from the MS-DOS prompt of Windows PC.

```
arp  -a
```

The IP address has been deleted when a message, "No ARP Entries Found" or the one informing that the specified IP address could not be found is returned from the subsystem.

(3) User authentication when connecting the Web
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

Copyright © 2006, Hitachi, Ltd.



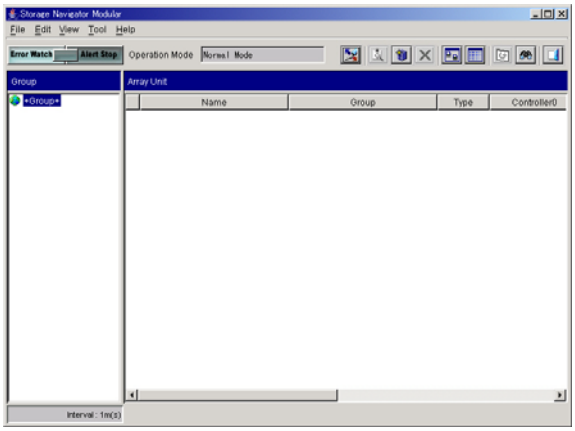
This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

3.4 Procedure for specifying maintenance port IP address

When the connection cannot be made even with the five patterns of the maintenance port IP addresses, the host address of the maintenance port IP address may have been changed.
In this case, specify the maintenance port IP address as shown below.

NOTE : When the subsystem can not communicate with Storage Navigator Modular, (for example, the controller is blockade, the subsystem is in Maintenance Mode and so on), this procedure is can not work.



Copyright © 2005, 2006, Hitachi, Ltd.

3.5 Procedure to search IP address of Maintenance port

(1) Activating the Storage Navigator Modular

(a) Execute the batch file or shell script for activating the Storage Navigator Modular.
In the case of Windows, activate the batch file, startsnm.bat.

(b) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed(‡1).

In the case of Windows, the prompt window is also displayed.
The prompt window has nothing to do with operation of Storage Navigator Modular. But don't close the prompt screen. It is unusually finished.
The icon can be minimized automatically when "Program Quitting" is selected from the properties of the batch file.
You can execute the display of the Storage Navigator Modular Operation Mode and state of the failure monitoring and the following functions in the main window.
For the operation of each function, refer to the page explaining each function.

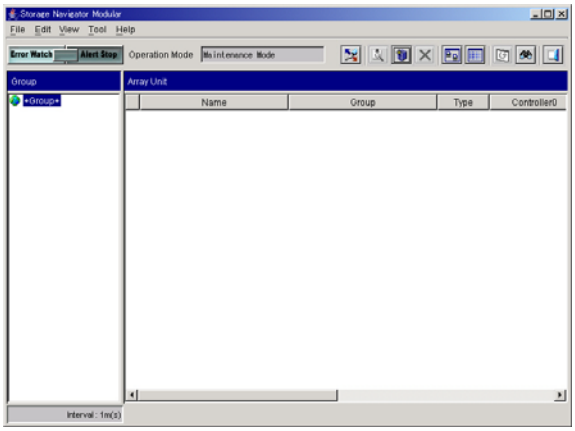
- Registration of the disk array subsystem (registration, deletion, change, and properties display)
- Execution of the failure monitoring and setting of the failure monitoring option
- Change of the Operation Mode
- Display of the version

‡1 : The mode change cannot be done at the time of the initial activation of the Storage Navigator Modular. A registration of a password validates the mode change.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Changing the Maintenance Mode

Storage Navigator Modular has three Active Modes, that is, the Normal Mode, Management Mode, and Maintenance Mode. In the Normal Mode, the program displays the configuration and statuses of the disk array. In the Management or Maintenance Mode, it can set the configuration of the disk array in addition to the function in the Normal Mode.



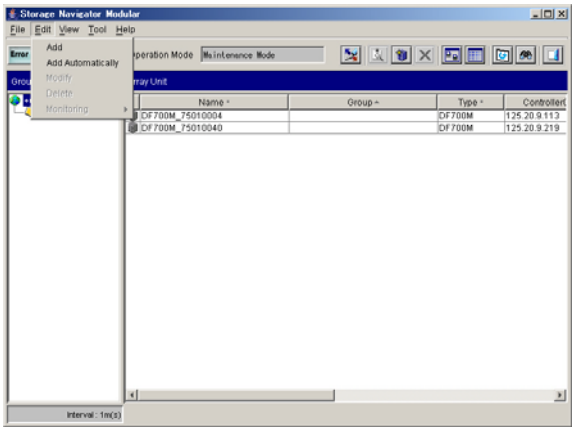
(a) Changing the Normal Mode to the Maintenance Mode

Change the Operation Mode from the Normal Mode to the Maintenance Mode.

When the log-in has been made in the Normal Mode, [Normal Mode] is displayed as a detailed information of the [Operation Mode] in the upper part of the main window.

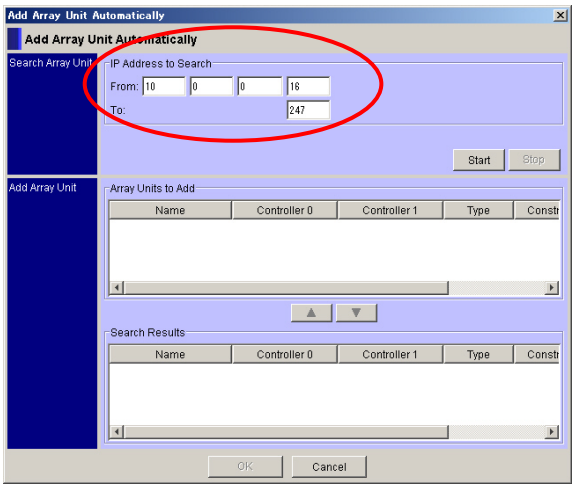
(i) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



Copyright © 2006, Hitachi, Ltd.

(3) Searching for IP address of the disk array subsystem



Search for IP address of the disk array subsystem to be operated in order to operate it from the Storage Navigator Modular.

(a) Select [Add Automatically] in the main window.

(b) Input the range of IP address to search.

Firstly, Input combination of #1 in Table 3.5.1.

[From] : Input a start IP address of the search range

[To] : Input a end IP address (only host address) of the search range

In the textbox of [From] and [To], Input following combination in Table 3.5.1.

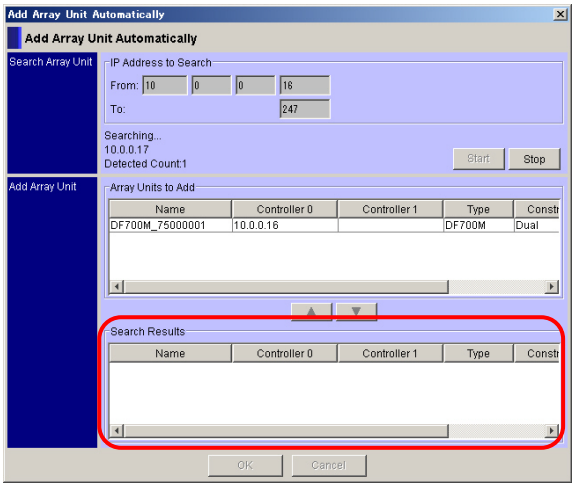


Table 3.5.1 Combination of Input to Search IP Address

No.	From				To
1	10	0	0	16	247
2	192	168	0	16	247
3	192	168	233	16	247
4	172	23	211	16	247
5	10	197	181	16	247

Copyright © 2006, Hitachi, Ltd.

(c) Press [Start], and the searching is start.

(d) The result of searching is displayed in “Search Results”.
If IP address is not displayed, retry searching with another combination in Table 3.5.1. (When you retry, change network setting of maintenance PC.)

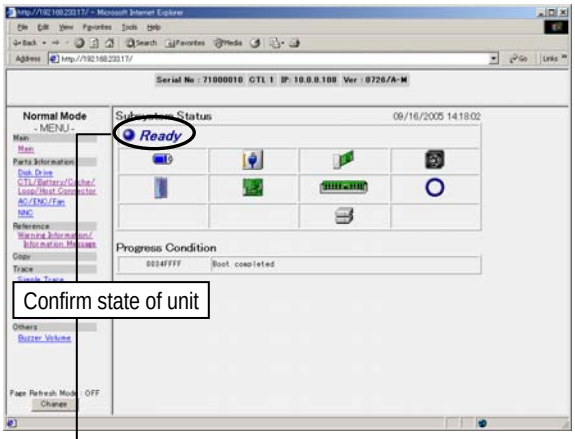
Chapter 4. Trouble Analysis by WEB Connection

Trouble analysis by WEB connection to locate a failed part in the unit and how to repair that trouble are shown below.

The flow of the trouble analysis by WEB connection is as follows.

Determine the failed part following the procedure below.

NOTE : When the log messages are checked while the WARNING LED (orange) on the front of the Basic Chassis is blinking at low speed, the WARNING LED (orange) goes out if the subsystem is not in the Warning status. If the subsystem is in the Warning status, the WARNING LED (orange) lights up.
While this WARNING LED (orange) is blinking at high speed, the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed.
The WARNING LED (orange) on the front of the Basic Chassis goes off in the maximum of 30 to 85 minutes, and the READY LED (green) lights up.



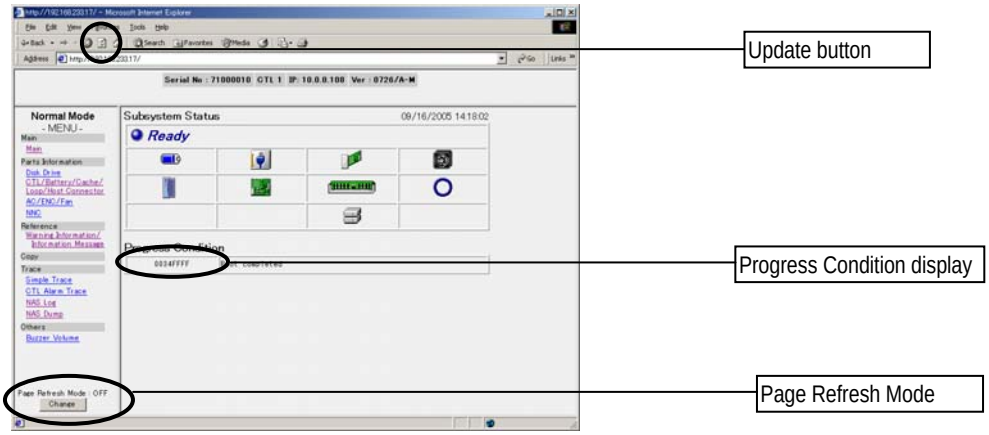
Copyright © 2005, 2006, Hitachi, Ltd.

4.1 Confirm state of unit

Check the failed part of the unit on the main window in the normal mode of the WEB.
For the replacement of the parts and recovery method, see the log messages ("4.3 Confirm log messages" (TRBL 04-0100)).

(1) Confirm indication of state of unit

The state of the unit can be confirmed in the following window.



Booting	Ready	Warning	Alarm
Booting... (Black)	Ready (Blue)	Warning (Yellow)	Alarm (Red)

Figure 4.1.1 Main Window in the Normal Mode

Copyright © 2005, Hitachi, Ltd.

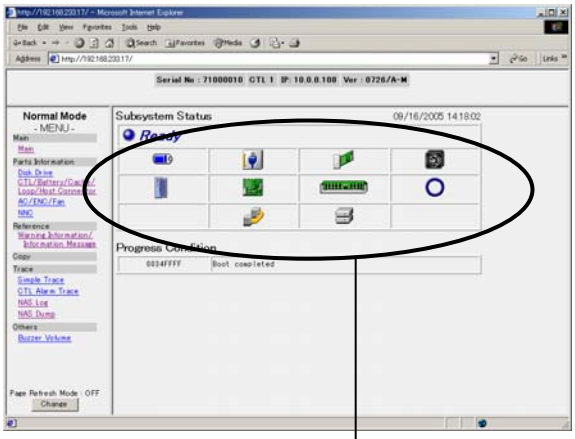
(2) Confirm indication of progress

If "Booting···" is indicated in the window of (1) (the Controller is being started up), the progress of start-up operation can be confirmed according to the following procedure.

(a) Turn on the page refresh mode (Click the [Change] button).

The window is updated automatically at the interval of 5 seconds. (If the [ON] button of the page refresh mode is indicated, the above operation is not necessary.)

If the page refresh mode is not indicated in the main window, press the update button of the browser to update the window.



(b) See the indication of progress of the window.

If the start-up operation is completed, "Boot completed" is indicated in this part.

Copyright © 2005, Hitachi, Ltd.

(3) Confirm replacement part summary

The state of each replacement parts can be confirmed with the replacement part summary.

Backup Battery Unit	Power Unit	ENC Unit	SENC Unit	Fan Assembly
Disk Drive (FC)	Disk Drive (S-ATA)	Control Unit	Cache Unit	Loop
Host Connector	Remote Path	NNC (NAS Unit)		

If any part fails, its summary becomes red.

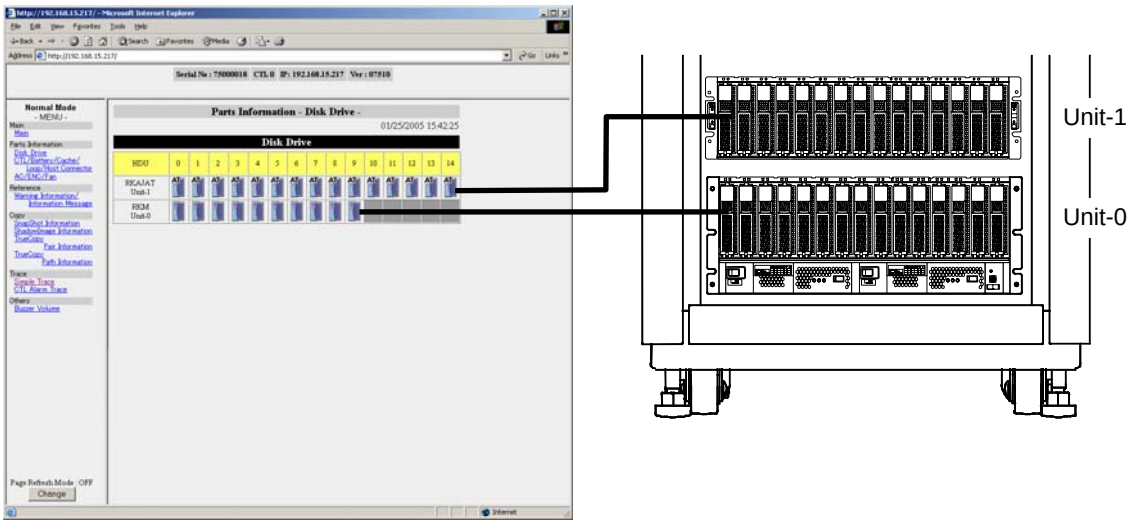
If the red part summary is clicked, the state confirmation window of the part appears and the position of the failed part is confirmed more in detail. (See "4.2 Confirm state of each part" (TRBL 04-0040))

Also, when the menu frame "Warning Information" is clicked, status of each component is displayed (See "4.2 Confirm state of each part" (TRBL 04-0040)) and the status of each component can be checked.

Copyright © 2005, Hitachi, Ltd.

4.2 Confirm state of each part

When checking the status of a component through an image, a clicking on each component of the "Summary of replacement component statuses" in the main window changes the window to that shown in Item (1) below and a detailed component status is displayed.
In this case, the window is changed in the state in which the selected (clicked) component is positioned at the top of the window. Also, a clicking on the "Parts Information" menu in the main window changes the window.
When checking the status of a component through a message, a clicking on the "Warning Information" of the menu frame in the main window changes the window to that shown in Item "(2) Procedure of the Status checking by messages" (TRBL 04-0092) and displays a detailed component status as a message. In this case, detailed status of each component can be checked. For the replacement for maintenance or recovery procedure, refer to a log message (See "4.3 Confirm log messages" (TRBL 04-0100)) and perform a recovery action following the procedure given by the each log message.



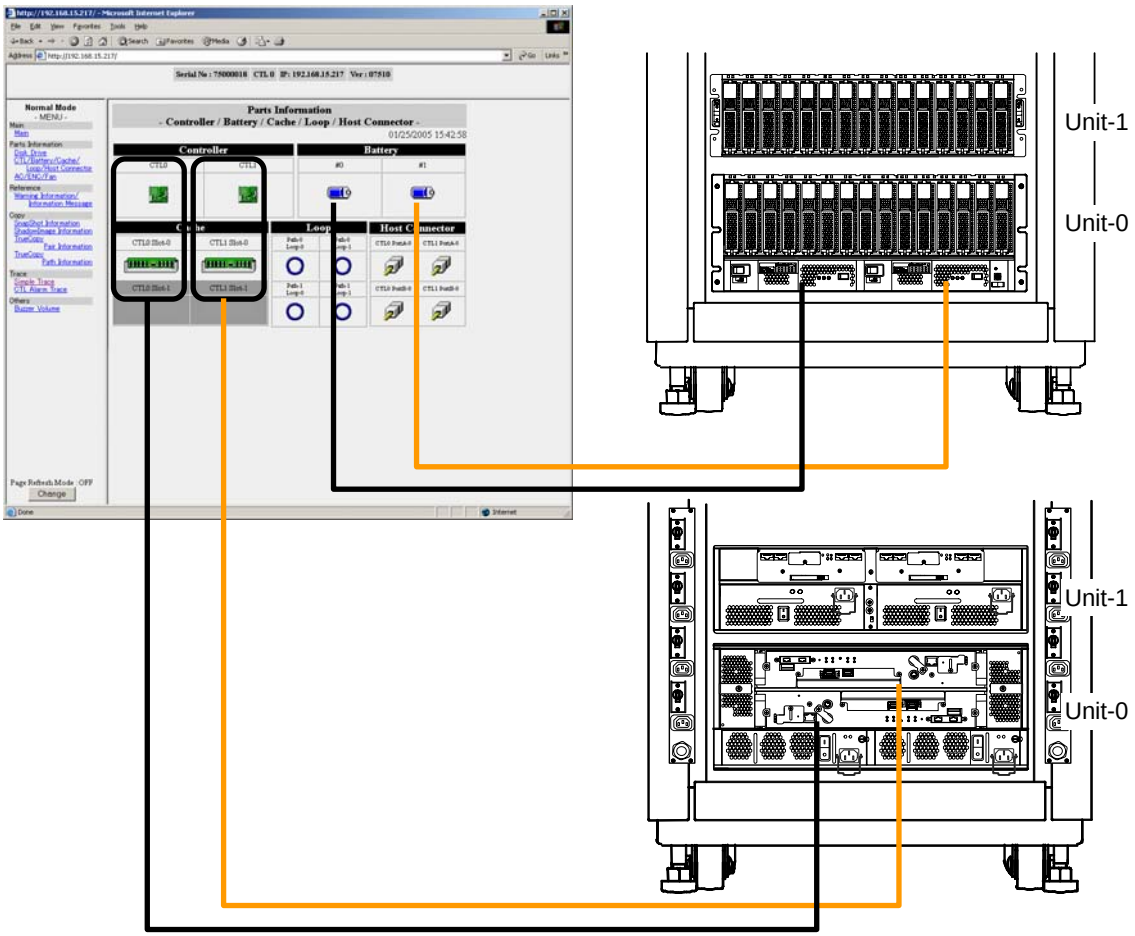
Copyright © 2005, Hitachi, Ltd.

(1) Checking the status through an image

The display screen of exchange part status displays the status of the Disk Drive, Control Unit, Cache Unit, Fan Assembly, Backup Battery Unit, Power Unit, ENC Unit (SENC Unit), Fiber Loop, NNC (NAS Unit) that are implemented. Furthermore, this is not displayed, if it is not implemented.

Also, the exchange part of abnormal status displays a red image. The Parts Information screen is shown below.

(a) Disk Drive



• Disk Drive

Image		Status
Disk Drive (FC)	Disk Drive (SATA)	
Blue	Blue	• Normal
Red	Red	• Fault has occurred to the Disk Drive
Red and Black	Red and Black	• Disk Drive port that the fault occurred is not implementing the Disk Drive
No display		• Disk Drive is not implemented (Except for the status where the Disk Drive that the fault occurred was drawn out)

Copyright © 2005, Hitachi, Ltd.

(b) Controller/Battery/Cache/Loop/Host Connector

• Control Unit

Image	Status
Green	• Normal
Red	• Shutdown of the Control Unit (Status where it is not implemented with the setting of the dual system configuration is included)
Yellow	• Fault of the battery backup circuit
No display	• Even the fault has not occurred without being implemented with the setting of single system configuration

• Backup Battery Unit

Image	Status
Green	• Normal
Red	• There is a fault or not implemented

Copyright © 2005, Hitachi, Ltd.

• Cache Unit

Image	Status
 Green	• Normal
 Red	• Fault (Status where is not implemented and extracted the fault cache memory is included)
No display	• It is not implemented and there is not a fault

• Loop

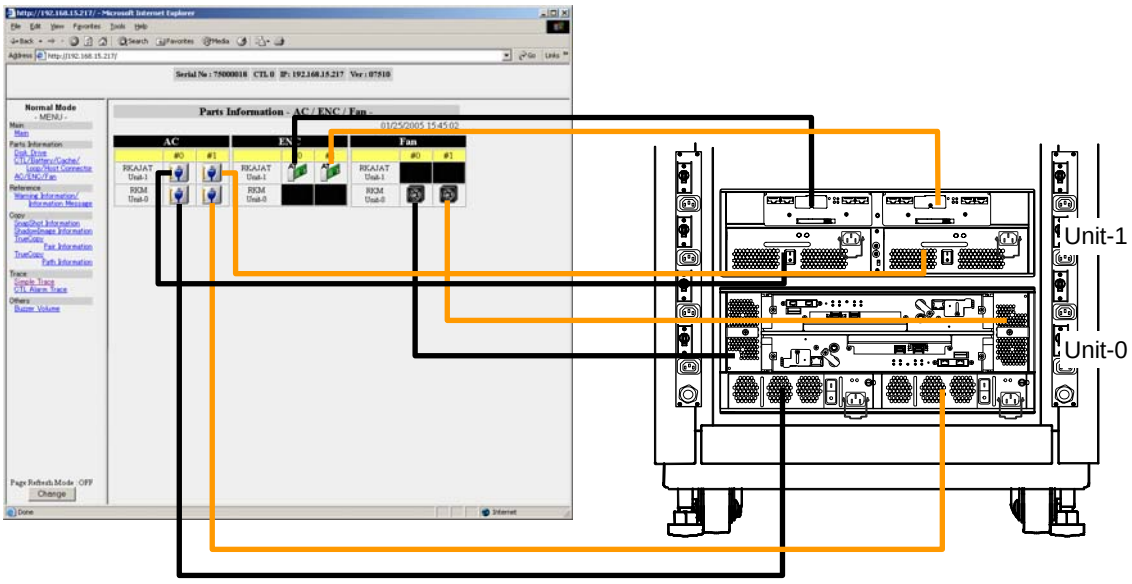


Image	Status
 Blue	• Normal
 Red	• Fault

• Host Connector

(d) NNC (NAS Unit)

• NAS OS Condition (Patrol Lamp)

Image	Status
Normal Blue	• Normal
Warning Yellow	• Warning status
Alarm Red	• Alarm status

• NAS OS Condition (Status Display)

Image	Status
NEW	• The NAS OS is not installed.
INST	• The NAS OS is in installation process.
ACTIVE	• The NAS OS is in operation and the Node is in operation.
STOP	• The NAS OS is normally stopped
DOWN	• The NAS OS is abnormally stopped
BOOT	• The NAS OS is in start process.
SHUTDOWN	• The NAS OS is in stop process.
INACTIVE	• The NAS OS is in operation and the Node is stopped.
DUMP	• A NAS Dump is being collected.
HUNGUP	• The NAS OS is hung-up.
WARN	• The NAS Manager is not installed, or the NAS OS is in operation and the status of the Node is unknown.
DISUSE	• The Control Unit is blocked, so the NAS OS of the NNC concerned cannot be used.

• Host Connector

Image	Status
Gray	• Normal
Red	• There is a fault or not implemented

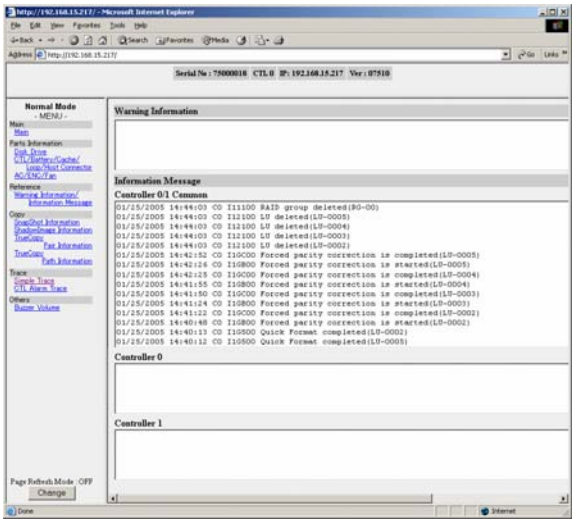
When the NAS OS is uninstalled (NEW), being installed (INST), in the middle of the start processing (BOOT), or the NAS OS installation fails, the following window is displayed.

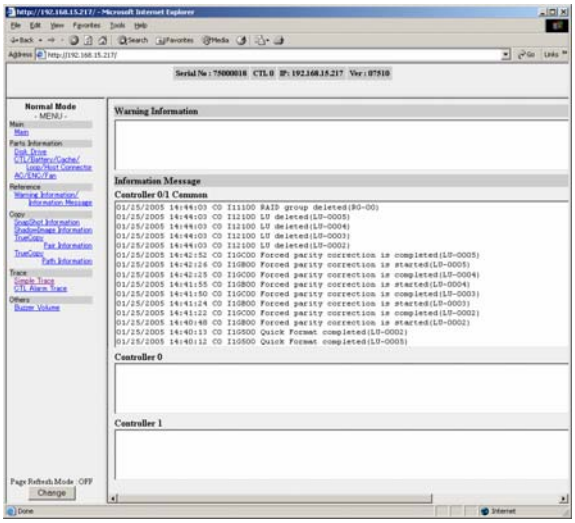


(2) Procedure of the Status checking by messages

A warning message about the failed part is displayed.

Refer to "4.3 Confirm log messages" (TRBL 04-0100) for the details of the warning messages.

When checking the status of a component through a message, a clicking on the "Warning Information" of the menu frame in the main window changes the screen to the one shown below and a detailed message explaining the component status is displayed.



Copyright © 2005, 2006, Hitachi, Ltd.

4.3 Confirm log messages

(1) Procedure for confirming log messages

Click the [Information Message] menu in the main window, and the "Information Message window" appears.

In the "Information Message window", you can identify the cause of the failure and confirm the recovery method.

The information on the failures which were detected during operation of the unit and state of the unit s indicated in the above window.

The information on the failures and state after the unit starts up is indicated in the [Controller 0/1 Common] box.

The information on the failures and state at the time of start-up of the unit is indicated for each Controller in the [Controller 0] and [Controller 1] boxes.

The contents of each message are shown below.

Copyright © 2005, Hitachi, Ltd.

(a) CUDG (Self-test at power-on) detection message

(i) Indicated message

The CUDG detection message is indicated in the [Controller 0] or [Controller 1] box as shown below.

```
Controller x
MM/DD/YYYY HH:MM:SS Cx   C0 ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆
MM/DD/YYYY HH:MM:SS Cx   B0 ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆ ◆◆◆◆◆◆◆◆
MM/DD/YYYY HH:MM:SS Cx   A0 △△△△△△△△ △△△△△△△△ △△△△△△△△ △△△△△△△△
MM/DD/YYYY HH:MM:SS Cx   90 △△△△△△△△ △△△△△△△△ △△△△△△△△ △△△△△△△△
MM/DD/YYYY HH:MM:SS Cx   80 △△△△△△△△ △△△△△△△△ △△△△△△△△ △△△△△△△△
MM/DD/YYYY HH:MM:SS Cx   70 △△△△△△△△ △△△△△△△△ △△△△△△△△ △△△△△△△△
MM/DD/YYYY HH:MM:SS Cx   60 □□□□□□□□ Y Y M M D D—— H H M M S S — ————————
MM/DD/YYYY HH:MM:SS Cx   ○○○○○○○○○○○○○○○○○○○○○○○○○○○○○○○○
MM/DD/YYYY HH:MM:SS Cx   CTLx
```

MM/DD/YYYY : Date of occurrence
HH:MM:SS : Time of occurrence
Cx : # of Controller in which failure is detected
◆◆◆◆◆◆◆◆ : PCI Config information
△△△△△△△△ : Detailed information
□□□□□□□□ : Message code
○○○○○○○○○○ : Message text (Any number of letters)
Y Y M M D D : Date of occurrence
H H M M S S : Time of occurrence
———— : Reservation area
CTLx : CUDG executing controller #

(ii) Recovery method

Recover from the failure according to the recovery method for each message code.
(For the recovery method for each message, see Message “Chapter 2. CUDG Detected Messages” (MSG 02-0000).)

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Flash/RAM micro detection message

(i) Indicated message

The Flash/RAM micro detection message is indicated in the [Controller 0/1 Common], [Controller 0], or [Controller 1] box as shown below.
The latest one is indicated at the top line.

NOTE : As the date and time of occurrence indicated by the message, the RTC set in the detection controller is used.
If the RTC is different from one control to another, the indicated time of occurrence may be different from one message to another (the message on the upper line is indicated earlier than the one on the lower line).
In this case, the actually latest message is indicated at the top, too.

(ii) Recovery method

① Collect the failure information according to " (◆◆◆◆)".

Table 4.3.1 Collecting Failure Information List

Display code	Error information you must collect
STRC	Collect Simple Trace
CTRC	Collect CTL Alarm Trace
FDMP	Collect Full Dump
NLOG	Collect NAS Log and Simple Trace
NDMP	Collect NAS Dump
PLOG	Collect Service PC Log, NAS Log, and Simple Trace
No display	None

Refer to "Chapter 7. Collecting Error Information" (TRBL 07-0000) for the details.

② Recover from the failure according to "Recovery method code (△△△△△△△△)".
Refer to the Message "Chapter 1. Before Starting Trouble Analysis" (MSG 01-0000) for the details of the messages.

Table 4.3.2 Recovery Method Code List

Display code	Recovery methods	Reference page
CTL	① Replace the Control Unit, the CALM LED of which is on. ② If the system is still abnormal, replace the other Control Unit.	Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)
BAT	Replace the Backup Battery Unit.	Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)
CACHE	Replace the Cache Unit indicated in the message text.	Replacement "2.2.6 Replacing Cache Unit" (REP 02-0540)
ENC	Replace the ENC Unit/SENC Unit indicated in the message text.	Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)
FAN	Replace the Fan Assembly.	Replacement "2.2.3 Replacing Fan Assembly" (REP 02-0300)
HDU	Replace the Disk Drive indicated in the message text.	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)
MANUAL	Refer to the manual, and recover from the failure according to the recovery methods for each message code. Hxxxxx : Failure messages (See Message "Chapter 3. Failure messages (MSG 03-0000)) Ixxxxx : Progress messages (See Message "Chapter 4. Progress messages (MSG 04-0000)) Rxxxxx : Flash detected messages (See Message "Chapter 5. Flash detected messages (MSG 05-0000)) Wxxxxx : Warning messages (See Message "Chapter 6. Warning messages (MSG 06-0000))	Message "Chapter 1. Before Starting Trouble Analysis" (MSG 01-0000)
PON	Turn on the power again.	—
PS	Replace the Power Unit indicated in the message text.	Replacement "2.2.4 Replacing Power Unit" (REP 02-0340)

Copyright © 2005, 2006, Hitachi, Ltd.

Display code	Recovery methods	Reference page
RETRY	① Retry the operation. ② If the same failure still occurs, refer to the message list in the manual, and recover from the failure according to the recovery methods for each message code.	Message "Chapter 1. Before Starting Trouble Analysis" (MSG 01-0000)
SYSPM	Set the system parameter in the WEB maintenance mode correctly.	WEB "Chapter 3. The Maintenance Mode Operation Procedure" (WEB 03-0000)
UPS	When a UPS is connected, take a recovery action referring to the UPS manual.	—
NNC	Replace the NNC Unit displayed in the message text.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #1)" (NAS 07-0120)
NNCFAN	Replace the FAN Assembly of the NNC Unit displayed in the message text.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)
NNCPS	Replace the Power Unit of the NNC Unit displayed in the message text.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #2)" (NAS 07-0120)
NNCDIM	Replace the Memory (DIMM) of the NNC Unit displayed in the message text.	DF700 NAS SOFTWARE Maintenance Manual "7.3.1 Hardware Failures (Table 7.3-2 Hardware Failures #10)" (NAS 07-0120)
NNCHCN	Replace the host connector of the NNC Unit displayed in the message text.	Replacement "2.3 Replacing the RKNAS parts" (REP 02-1050)
NNCHBD	Replace the interface board of the NNC Unit displayed in the message text.	Replacement "2.2.7 Replacing Interface Board" (REP 02-0660)
No display	This is not a problem. Recovery operation is not necessary.	—

(iii) How to read failure information

- The history of the unit after it is turned on is indicated in the Information Message.
- The message of Subsystem is Ready indicates the time when the unit is ready. The messages made after the power is turned on until the unit is ready are indicated before this message. The messages made after the unit is ready are indicated after this message.
- Particularly pay attention to Wxxxxx (Warning message), Hxxxxx (Failure messages), and Rxxxxx (Flash detection message).
- The following messages are indicated when failures occur and when they are solved. (See Table 2.2.3.)
  If the recovery message is indicated after a failure occurrence message, the failure has been solved and you do not need to solve it.

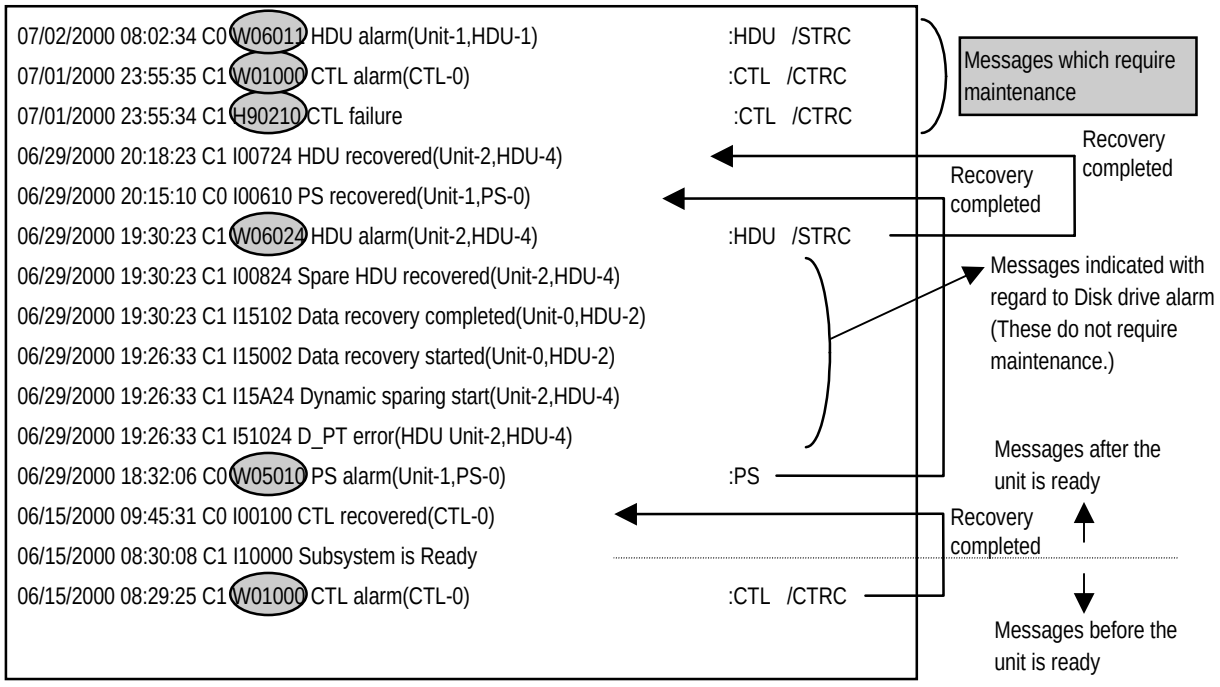

Table 4.3.3 Failure Message List

No.	Description	Failure detected messages		Failure recovery messages	
1	Controller error/recovery	W00100	CTL alarm (CTL-x)	I0010x	CTL recovered (CTL-x)
2	Battery error/recovery	W03000 W0300x	Battery alarm	I00300 I0030x	Battery recovered Battery recovered (Battery-x)
		W03100 W0310x	Battery removed		
		W03200 W0320x	Battery SW off		
		W03300 W0330x	Battery Thermal alarm		
3	Battery backup circuit error/ recovery	W0340x	Battery backup circuit alarm (CTL-x)	I0040x	Battery backup circuit recovered (CTL-x)
4	Fan error/recovery	W040xy W042HH	FAN alarm (Unit-x, FAN-y)	I005xy I005HH	FAN recovered (Unit-x, FAN-y)
		W04100	FAN alarm (CTL-Unit, FAN-x)	I00500	FAN recovered (CTL-Unit, FAN-x)
5	Power supply error/ recovery	W050xy W052HH	PS alarm (Unit-x, PS-y)	I006xy I006HH	PS recovered (Unit-x, PS-y)
		W0G400	PS alarm [RKA] (Unit-x, PS-y)		
		W0G500	PS alarm [RKAAT] (Unit-x, PS-y)		
		W0G600	PS alarm [RKAJ] (Unit-x, PS-y)		
		W0G700	PS alarm [RKAJAT] (Unit-x, PS-y)		
		W05100	PS alarm (CTL-Unit, PS-x)	I00600	PS recovered (CTL-Unit, FAN-x)
6	Disk Drive error/recovery	W060AT	SATA HDU alarm (Unit-x, HDU-y)	I007xy I007HH	HDU recovered (Unit-x, HDU-y)
		W060xy W060HH	HDU alarm (Unit-x, HDU-y)		
		W0GG00	HDU alarm [RKA] (Unit-x, HDU-y)		
		W0GH00	HDU alarm [RKAJ] (Unit-x, HDU-y)		
7	Spare Disk error/recovery	W061AT	SATA Spare HDU alarm (Unit-x, HDU-y)	I009xy I009HH	Spare HDU recovered (Unit-x, HDU-y)
		W061xy W061HH	Spare HDU alarm (Unit-x, HDU-y)		
		W0GJ00	Spare HDU alarm [RKA] (Unit-x, HDU-y)		
		W0GK00	Spare HDU alarm [RKAJ] (Unit-x, HDU-y)		
8	Loop error/recovery	W080xy	Loop alarm (Path-x, Loop-y)	I00Axy	Loop recovered (Path-x, Loop-y)
9	ENC Unit error/SENC Unit error/recovery	W090AT	SENC alarm (Unit-x, ENC-y)	I00Bxy I00BHH	ENC recovered (Unit-x, ENC-y)
		W090xy W090HH	ENC alarm (Unit-x, ENC-y)		
		W0GA00	ENC alarm [RKA] (Unit-x, ENC-y)		
		W0GB00	SENC alarm [RKAAT] (Unit-x, ENC-y)		
		W0GC00	ENC alarm [RKAJ] (Unit-x, ENC-y)		
		W0GD00	SENC alarm [RKAJAT] (Unit-x, ENC-y)

No.	Description	Failure detected messages		Failure recovery messages	
10	UPS	W0C000	UPS alarm (UPS-x)	I00D00	UPS recovered (UPS-x)
11	Path failure (detachment)/ recovery	W0F0xy	Path alarm (Remote-x, Path-y)	I030xy	Path recovered by web operation (Remote-x, Path-y)
				I031xy	Path recovered automatically
12	Occurrence/ rectification of an incomplete writing	W0G0xy	Unreadable PIN detected (Unit-x, HDU-y)	I04000	Unreadable PIN recovered
		W0G100	Unreadable PIN detected (Unit-*, HDU-*)		
13	Issue/callback of a resident LU off warning	W440xy	Permanent LU warning (CTL-x, ERR-y)	I1A2xy	Permanent LU warning recovered (CTL-x, ERR-y)
14	Excess/rectification of the threshold value of the number of pinned sub-segments	W49100	PIN is over directory threshold [write through] (DIR-x)	I6EG00	PIN over recovered [directory threshold] (DIR-x)
		W49300	PIN is over partition threshold [write through] (DIR-x, PTT-y)	I6EH00	PIN over recovered [partition threshold] (DIR-x, PTT-y)
		W49500	PIN is over RAID group threshold [write through] (DIR-x, RG-y)	I6EJ00	PIN over recovered [RAID group threshold] (DIR-x, RG-y)
15	The DM-LU failure/recovery	W49700	DM-LU write disable (LU-x)	I6EM00	DM-LU recovered (LU-x)
		W49800	All DM-LU write disabled		
16	The host connector failure/recovery	W0G300	Host connector alarm (Portxy-z)	I53A00	Host connector recovered (Portxy-z)
17	NNC (NAS Unit) failure and recovery	W5000x	NNC alarm (NNC-x)	IA1V0x	NNC recovered (NNC-x)
18	NNC (NAS Unit) partial failure and recovery	W5010x	NNC partial alarm (NNC-x)	IA1U0x	NNC recovered from partial alarm (NNC-x)
19	Occurrence and release of the limit of the priced option, Power Saving	W0GM00	SENC which may attach restrictions on Power Saving function was detected	I54C00	Power Saving function became possible to work without the limit by SENC

Example of message analysis :

4.4 TrueCopy remote replication/TrueCopy Extended Distance path confirm state

(1) Procedure for confirming log messages

By clicking the path of [Summary of the replacement parts state] in the main window, the window is changed to the following one. And the details about the path state are displayed. Also by clicking [TrueCopy Path Information] on the menu frame in the main screen, the window is changed to the following window. And the details about the path state are displayed.

Perform the maintenance operation for replacement and the recovery operation referring to "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1360).

4.5 The Priority Error Messages when "W0100x CTL alarm" is displayed

When the "W0100x CTL alarm" message is displayed, if the following message is displayed before "W0100x CTL alarm" message, follow the recovery method of the message.

(1) CUDG Detected Messages (Refer to Message "Chapter 2 CUDG Detected Messages" (MSG 02-0000) for the recovery method.)

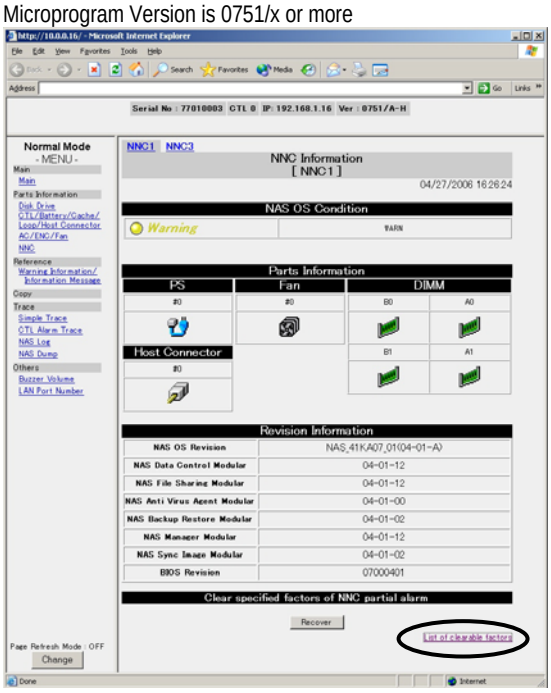
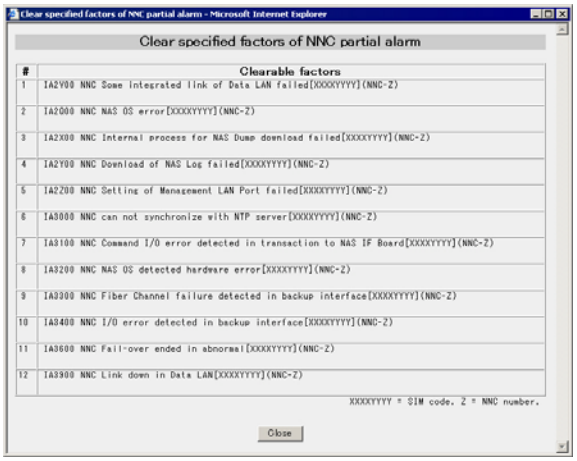
4.7 The function of the “Clear specified factors of NNC partial alarm”

There is a case where the Warning status of the Control Unit is not released and the WARNING LEDs on the array subsystem and the NAS unit are lighting up even though the recovery work for some specific NNC partial alarms.
Release the Warning status of the Control Unit and turn off each WARNING LED according to the following procedures.
The operation of the “Clear specified factors of NNC partial alarm” can be executed only to the NNC (NAS unit) connected to the Control Unit.



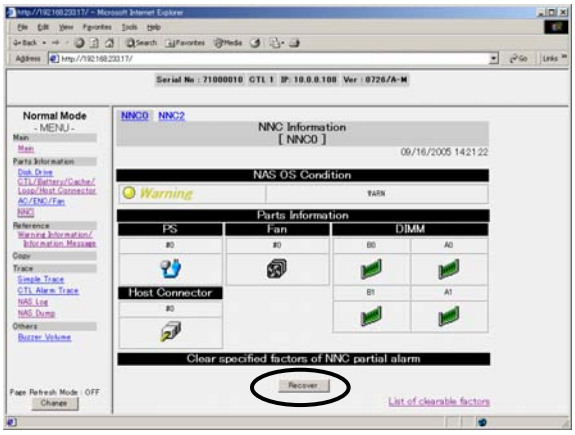
(1) Before operating “Clear specified factors of NNC partial alarm”.

(a) Click the [List of clearable factors].

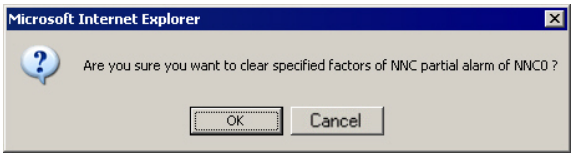


Microprogram Version is less than 0751/x

Microprogram Version is 0751/x or more



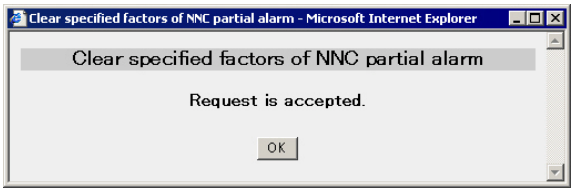
(b) Check that it is either of the lists of which the failure factors are displayed.



Copyright © 2005, 2006, Hitachi, Ltd.

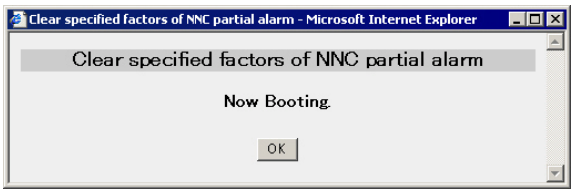
(2) Clear specified factors of NNC partial alarm.

(a) Click the [Recover] button.



(b) A message asking you to verify the setting is displayed. Click the [OK] button.

(3) Checking the NNC partial alarm recovery.



(a) When the "Clear specified factors of NNC partial alarm" is completed normally.

Click the [OK] button.

Click Warning Information on the menu window, and check that the indication of the partial alarm is turned off.

(b) When the array subsystem was booting at the time of clicking the [Recover] button.

Click the [OK] button.

Execute it again in the procedure (1) after the array subsystem becomes the READY status.

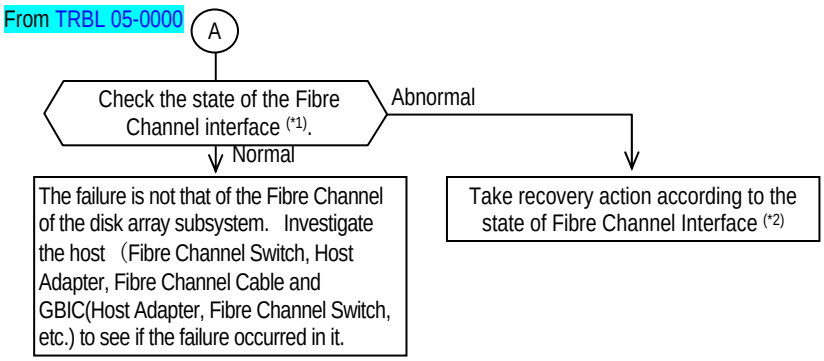
Chapter 5. Procedure for Investigating Disk Array Subsystem Regarding Fibre Channel Failure

When a failure occurs in a Fibre Channel Link between a host computer and the subsystem, judge whether or not the failure has occurred in the interface portion of the subsystem following the flowchart shown below.



- "< When the Basic Chassis is RKH/RKM, and when the FC Interface Board is installed in RKS/RKXS >" (TRBL 05-0000)
- "< When the Basic Chassis is RKS/RKXS and the FC Interface Board is not installed >" (TRBL 05-0010)

< When the Basic Chassis is RKH/RKM, and when the FC Interface Board is installed in RKS/RKXS >

*1 : This is the status of No. 8 in Table 8.2.8 of "8.2 (6) LED Indication Patterns on FC Interface Board" (TRBL 08-0260).

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Refer to Table 8.2.8 of "8.2 (6) LED Indication Patterns on FC Interface Board" (TRBL 08-0260).

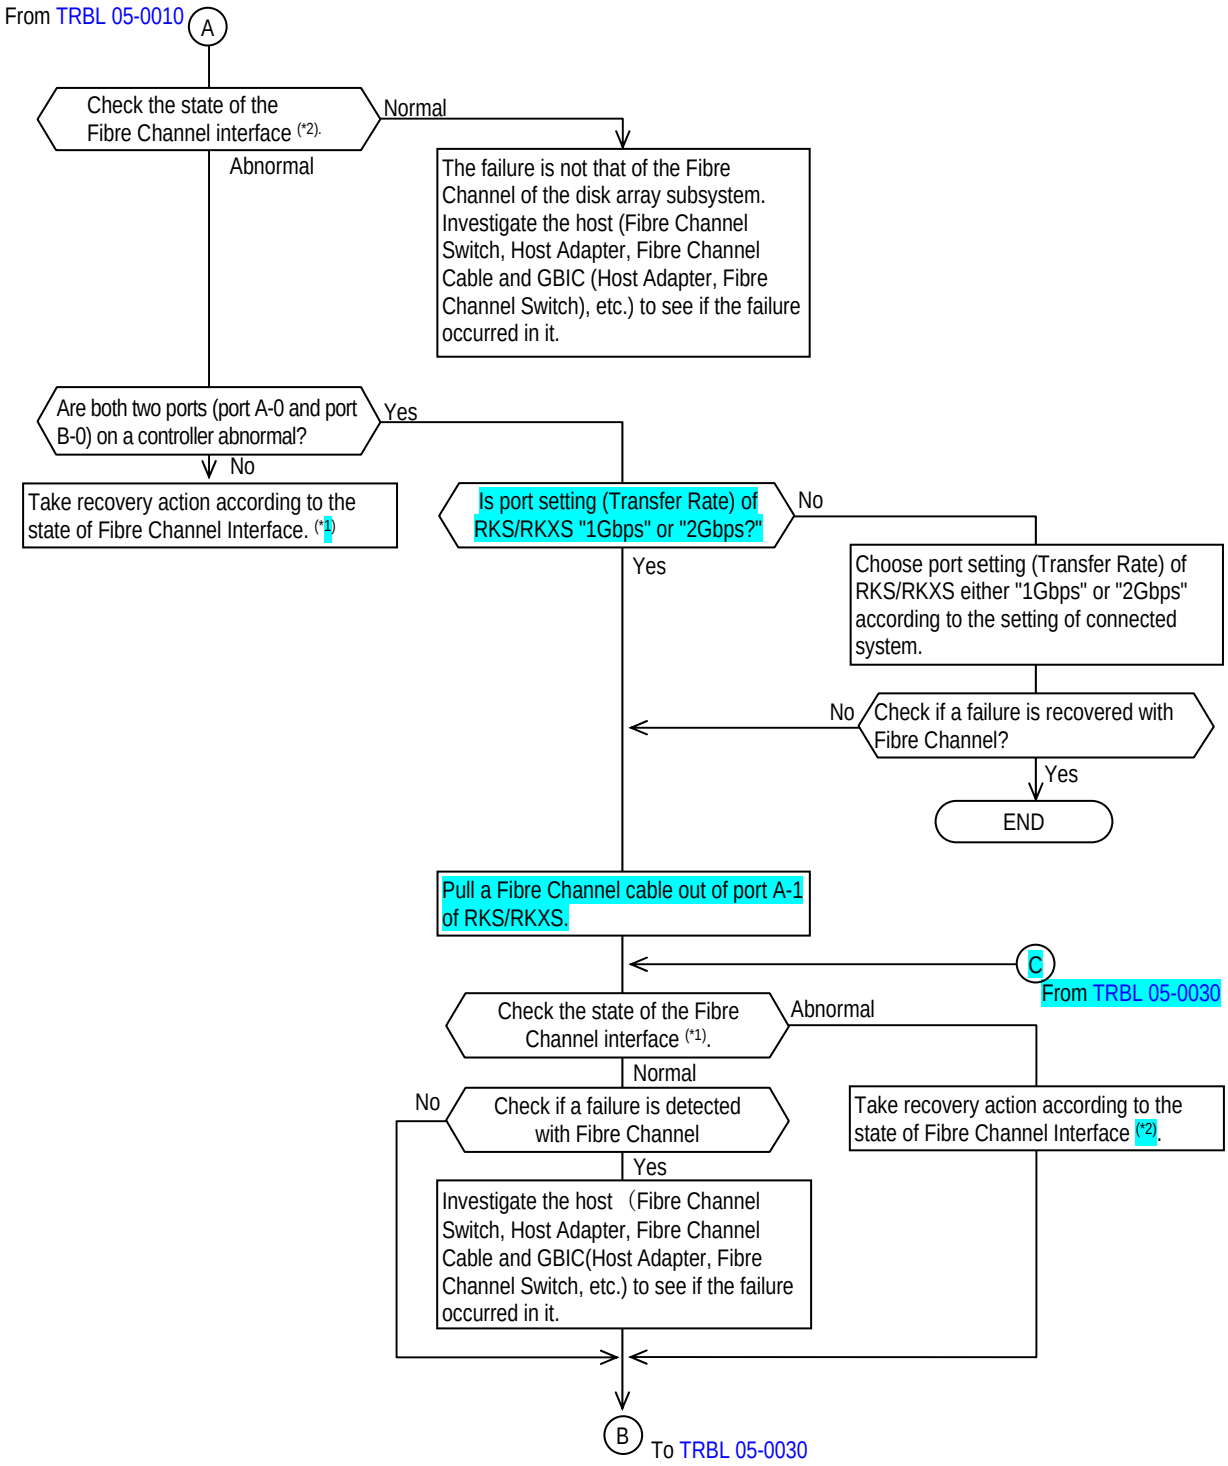
< When the Basic Chassis is RKS/RKXS and the FC Interface Board is not installed >



Preparations before the procedure for investigating RKS/RKXS regarding Fibre Channel failure
In this investigation, change the doubtful parts step by step and check interface is in Link Up state stably. While this investigation, the Host computer connected to controller of PATH that a failure occurs cannot be used. So, before start this investigation, ask a customer for the following steps.

(1) If customer's system uses Alternate Path system, ask a customer to change a path to the controller of PATH that a failure does not occur. Then, ask the customer not to fail back path automatically till this investigation is finished.
(2) If customer's system doesn't uses Alternate Path system, ask a customer to stop using a host computer connected to the controller of PATH that a failure occurs.

*1 : This is the status of No. 8 in Table 8.2.7 of "8.2 (5-3) LED Indication Patterns on Control Unit (Fibre Channel) (RKS/RKXS)" (TRBL 08-0230).

*1 : This is the status of No. 8 in Table 8.2.7 of "8.2 (5-3) LED Indication Patterns on Control Unit (Fibre Channel) (RKS/RKXS)" (TRBL 08-0230).

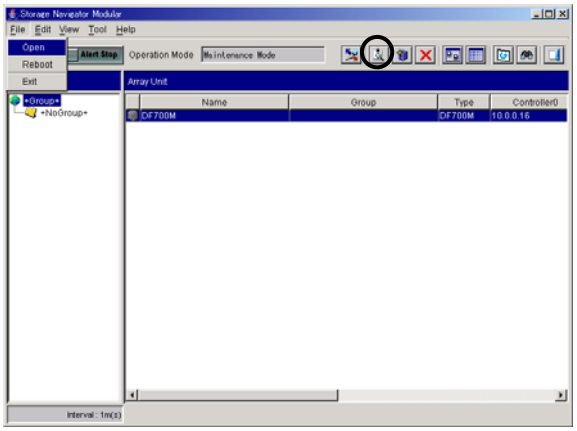
Copyright © 2005, 2006, Hitachi, Ltd.

(1) World Wide Name of LUN Manager

A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input “maintenance” for the [User Name] and “hosyu9500” for the [Password].

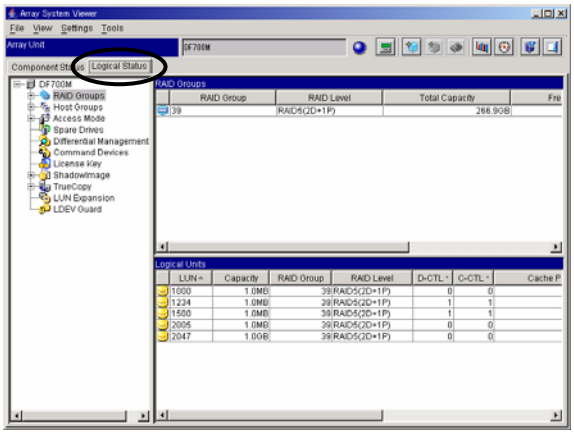
Copyright © 2005, Hitachi, Ltd.

(2) Change of WWN of LUN Manager



(a) Turn on the power supply.

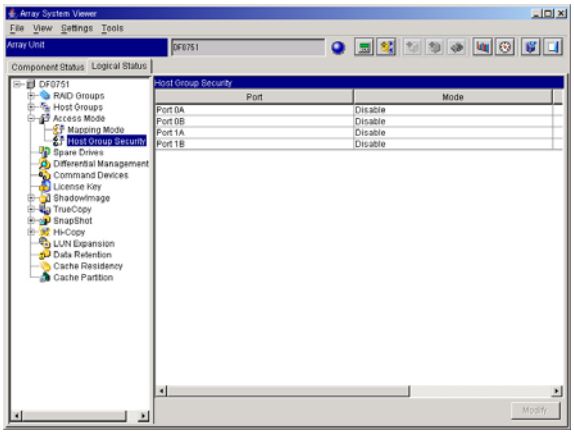
(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



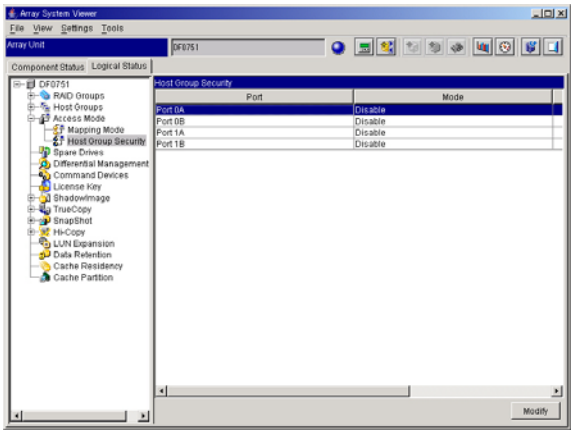
(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(d) On the unit window, click the [Logical Status] tab.

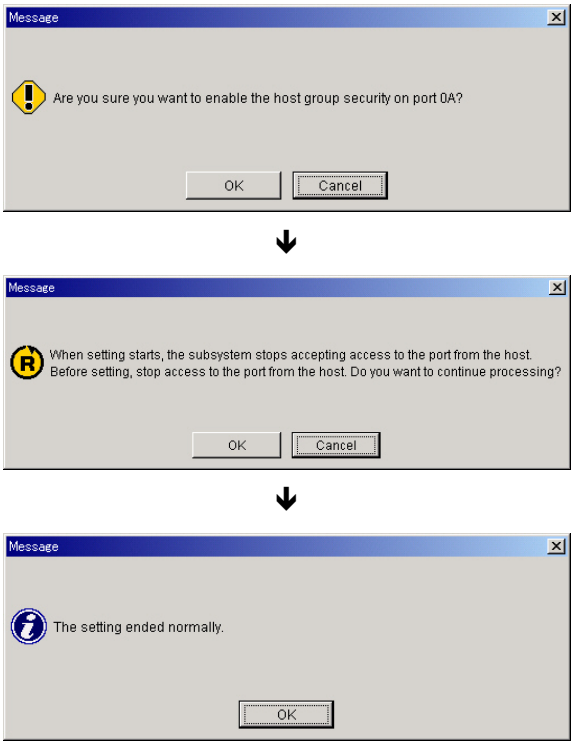


‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.

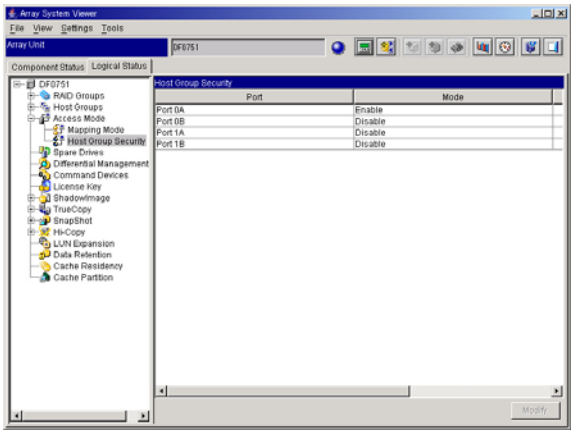
(e) Select the [Access Mode] from the tree in the unit window by double clicking it and select the [Host Group Security].

(f) Select a port, for which the WWN information is to be changed, from the [Host Group Security] displayed on the right side of the window.



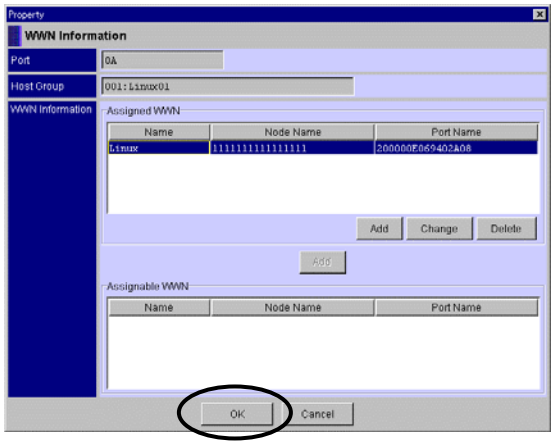
Copyright © 2005, Hitachi, Ltd.

(g) Click the [Modify] button that is displayed at the lower right part of the window.

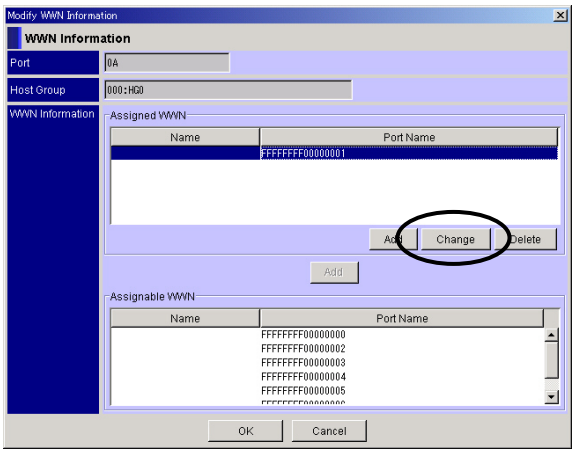


(h) Since the Modify Host Group Security dialog box is displayed, select [Enable] for the [Host Group Security] and click the [OK] button.

(i) The confirmation window is display. Click the [OK] button.

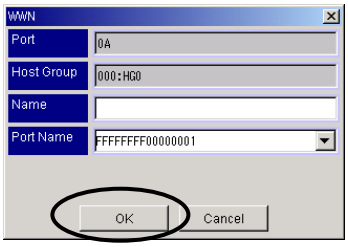


(j) Make sure that the host group security of the specified port was changed to [Enable].



Copyright © 2005, Hitachi, Ltd.

(k) Double click the [Host Groups] in the tree, and then double click the port for which you have validated the host group security. Select [WWN] by clicking the [000:G000].



(l) Click the [Modify WWN Information] button that is displayed at the lower right part of the window.

(m) Select a Name to be changed, and click the [Change] button.

(n) Enter the [Name], the [Port Name]. Then click the [OK] button.

① Name : Enter the name with half size alphabetic characters and/or numerals.
(Excluding \, /, : , , , ;, *, ?, ", <, >, | and ')
Spaces at the top or end are ignored.
An identical name cannot be used in an identical Port.

② Port Name : Enter the Port Name with sixteen hexadecimal numerals

Copyright © 2005, Hitachi, Ltd.

(o) Click the [OK] button on WWN Information Property.

(p) The confirmation window is display. Click the [OK] button.

Chapter 6. Details of Recovery Methods

6.1 Error recovery methods

Table 6.1.1 shows error recovery methods(‡1). Errors are classified into power-on errors, operation errors, data recovery errors, and power-off errors.

Table 6.1.1 Error Recovery Methods for Each Error

No.	Classification	Description	Reference page
1	The subsystem goes down.	Both controllers are blocked in the dual controller configuration. Only one controller is blocked in the single or dual controller configuration.	"6.1.1 System down" (TRBL 06-0020)
2		POWER LED on the subsystem lighted off because a Drive short-circuit failure (on the Basic Chassis or the Additional Chassis) occurred.	"Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000)
3	The subsystem does not become ready.	A loading of information from a Disk Drive failed.	"6.1.2 The subsystem does not become ready : Case 1 (Loading failure)" (TRBL 06-0050)
4		POWER LED on the subsystem lighted off because a Drive short-circuit failure (on the Basic Chassis or the Additional Chassis) occurred.	"Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000)
5	The failure occurred immediately after being ready.	The user data in the cache memory was lost because data stored in the cache memory volatilized. (A forced parity correction is required(*1).)	"6.1.3 The failure occurred immediately after being ready (Forced parity correction)" (TRBL 06-0060)
6	The power cannot be turned off.	Planned shutdown cannot be performed because the number of PIN data is too large. (due to Disk Drive and Controller error.)	"6.1.4 The power cannot be turned off : Case 1 (The number of PIN data is too large)" (TRBL 06-0420)
7		An attempt was made to save PIN data to the Disk Drive during planned shutdown but failed because a hardware error occurred.	"6.1.5 The power cannot be turned off : Case 2 (Hardware failure)" (TRBL 06-0450)
8		Planned shutdown cannot be performed because all the Disk Drives to which inheritance information is to be saved disappeared due to a DMA double error or a Disk Drive quintuple error.	"6.1.6 The power cannot be turned off : Case 3 (Control Unit failure)" (TRBL 06-0470)
9		Planned shutdown cannot be performed because PIN data cannot be saved due to a Cache memory error, etc.	"6.1.7 The power cannot be turned off : Case 4 (Cache memory failure)" (TRBL 06-0490)
10	Data recovery does not terminate normally.	Forced recovery was performed because a RD error occurred in the copy source during a correction copy.	"6.1.8 Data recovery does not terminate normally : Case 1 (Read error)" (TRBL 06-0510)
11		Data recovery terminated abnormally because a Disk Drive error occurred in the copy source during a correction copy.	"6.1.9 Data recovery does not terminate normally : Case 2 (Disk Drive failure)" (TRBL 06-0520)
12		Data recovery terminated abnormally because a Spare Disk error occurred during a copyback.	"6.1.10 Data recovery does not terminate normally : Case 3 (Spare Disk Drive failure)" (TRBL 06-0540)

*1 : When user data is lost because of volatilization of data in the cache memory, restore it in the procedure given in No.5.

‡1 : • Since the latest state of the unit is always referenced in this recovery operation, turn on the Page Refresh Mode of the WEB. (Click the [ON] button to indicate [OFF].)
• If the power is turned on again in the recovery operation, the WEB connection between the unit and browser is cut out, make it again. (Press the update button of the browser.)

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Classification	Description	Reference page
13	A failure occurred during operation.	The number of PIN segments exceeded its threshold value. (Actions to be taken when PIN OVER occurs)	"6.1.11 A failure occurred during operation : Case 1 (PIN over)" (TRBL 06-0550)
14		Data containing a LA/LRC error was detected.	"6.1.12 A failure occurred during operation : Case 2 (LA/LRC error)" (TRBL 06-0570)
15		Actions to be taken when a LU blockade occurs.	"6.1.13 A failure occurred during operation : Case 3 (LU blockade)" (TRBL 06-0590)
16		A loop failure occurred, however, the failed part cannot be located.	"6.1.14 A failure occurred during operation : Case 4 (Loop failure)" (TRBL 06-0600)
17		The command for reassignment was sent from a host computer to an LU of RAID 0.	"6.1.15 A failure occurred during operation : Case 5 (Incomplete writing)" (TRBL 06-1110)
18	The incomplete write area was registered in the restored VOL.	• The incomplete write area was registered in the P-VOL because there was the unreadable area in the pool LU durint restoring the P-VOL of Copy-on-write SnapShot. • The incomplete write was registered in the S-VOL because there was the unreadable area in the pool LU when restoring the S-VOL due to S-VOL-Takeover as a result of executing the [horctakeover] command with TrueCopy Extended Distance.	"6.1.16 The incomplete write area was registered in the restored VOL" (TRBL 06-1120)
19	A failure in SES access occurs.	Monitoring of the disk array unit became impossible because the SES access to the both ENC Units became impossible.	"6.1.17 A failure in SES access occurs" (TRBL 06-1140)
20	At the time of the NAS unit connection, the LU failure occurred (Disk Drive dual failure, user data failure, etc.)	Recovery method of the failure LU at the time of the NAS unit connection	"6.1.18 Recovery method of the failure LU at the time of the NAS unit connection" (TRBL 06-1180)
21		Recovery method of the NAS system LU failure	"6.1.19 Recovery method of the NAS system LU failure" (TRBL 06-1200)
22	A failure of the fail-over occurred at the time of NAS connection.	Recovery method at the time of the NAS system fail-over failure	"6.1.20 Recovery method at the time of the NAS system fail-over failure" (TRBL 06-1220)
23	A failure occurred at the time of controller reboot, controller replacement or micro-program replacement.	Actions to be taken when ENC cable connection was illegal or controller failure occurred.	"6.1.21 Recovery method when illegal ENC cable connection or controller failure is detected" (TRBL 06-1230)
24	A failure occurred at the time of ENC firmware replacement or ENC/SENC Unit replacement.	Actions to be taken when ENC cable connection was illegal or ENC/SENC unit failure occurred.	"6.1.22 Recovery method when illegal ENC cable connection or ENC/SENC unit failure is detected" (TRBL 06-1260)
25	A failure occurred at the time of an addition of Additional Subsystem with the subsystem power on.	Actions to be taken when ENC cable connection was illegal or Additional subsystem failure occurred.	"6.1.23 Recovery method when illegal ENC cable connection or Additional subsystem failure is detected" (TRBL 06-1290)

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Classification	Description	Reference page
26	The start of the NAS Unit after installing the NAS OS timed out.	Recovery method when the start of the NAS Unit timed out after installing the NAS OS due to the failure between the PXE-DHCP servers or between the PXE-FTP servers.	"6.1.24 Recovery method of the NAS Unit starting time-out after installing the NAS OS due to the failure between the PXE-DHCP servers or between the PXE-FTP servers" (TRBL 06-1311)
27	The Control Unit was blocked because it tried to operate with the microprogram of the old revision to which the Control Unit does not correspond due to the Control Unit replacement or the microprogram installation.	• Recovery method when the Control Unit is blocked or the subsystem goes down because the microprogram of the revision less than 0760/A and the Control Unit of the DF-F700-F2JH are mixed in the subsystem due to the installation of the Control Unit of the DF-F700-F2JH in the subsystem. • Recovery method when the Control Unit is blocked or the subsystem goes down because the microprogram of the revision less than 0760/A and the Control Unit of the DF-F700-F2JH are mixed in the subsystem due to the installation of the microproram of the revision less than 0760/A in the subsystem.	"6.1.25 Recovery method when the Control Unit whose microprogram is not supporting was detected" (TRBL 06-1313)
28	The Modular Volume Migration terminated abnormally.	One Modular Volume Migration or two or more Modular Volume Migrations terminated abnormally.	"6.1.26 Recovery method of the Modular Volume Migration which terminated abnormally" (TRBL 06-1320)
29	The subsystem became the warning status while using the Power Saving function of the priced option.	The SENC that may set the limit to the Power Saving function of the priced option was detected.	"6.1.27 Recovery method when the subsystem becomes the warning status while using the Power Saving function of the priced option" (TRBL 06-1332)

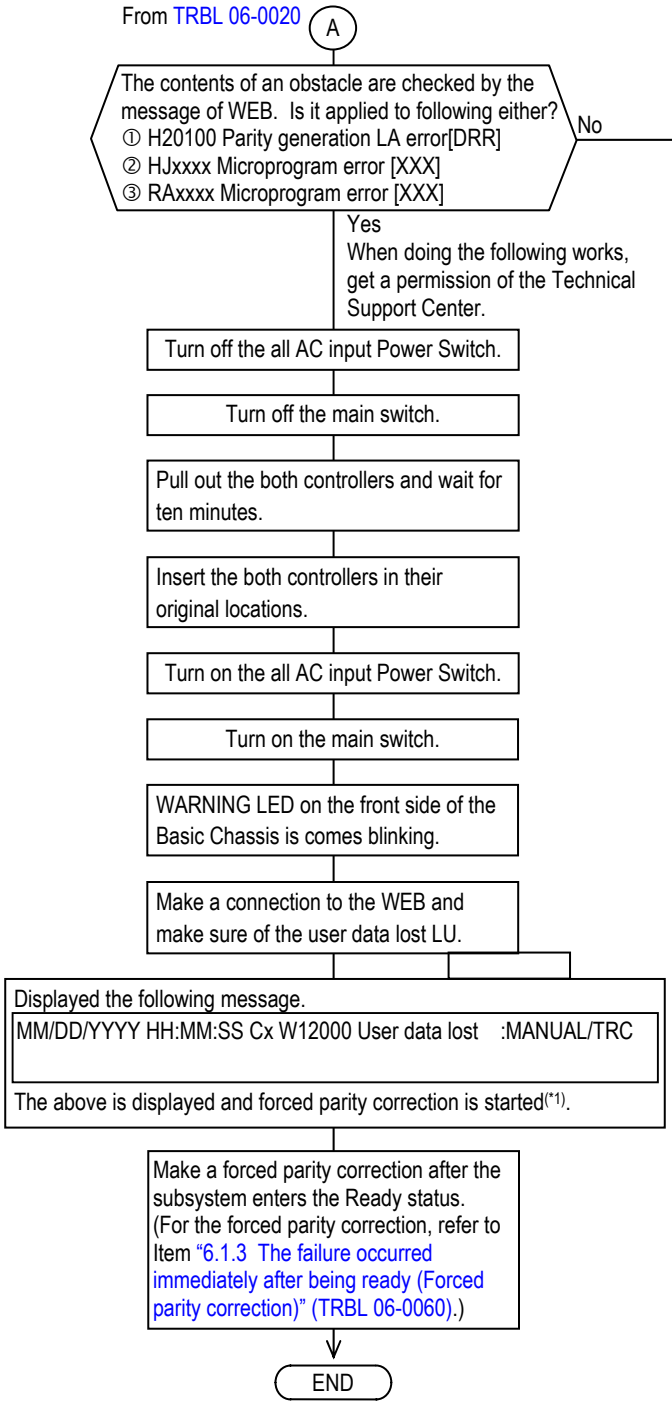
MM/DD/YYYY HH:MM:SS Cx Hxxxxxx ○○○○○○○ : △△△△△△/□□□□

Date Time Detect Controller#

xxxxx, ○○○○○○○ : △△△△△△/□□□□ Optional

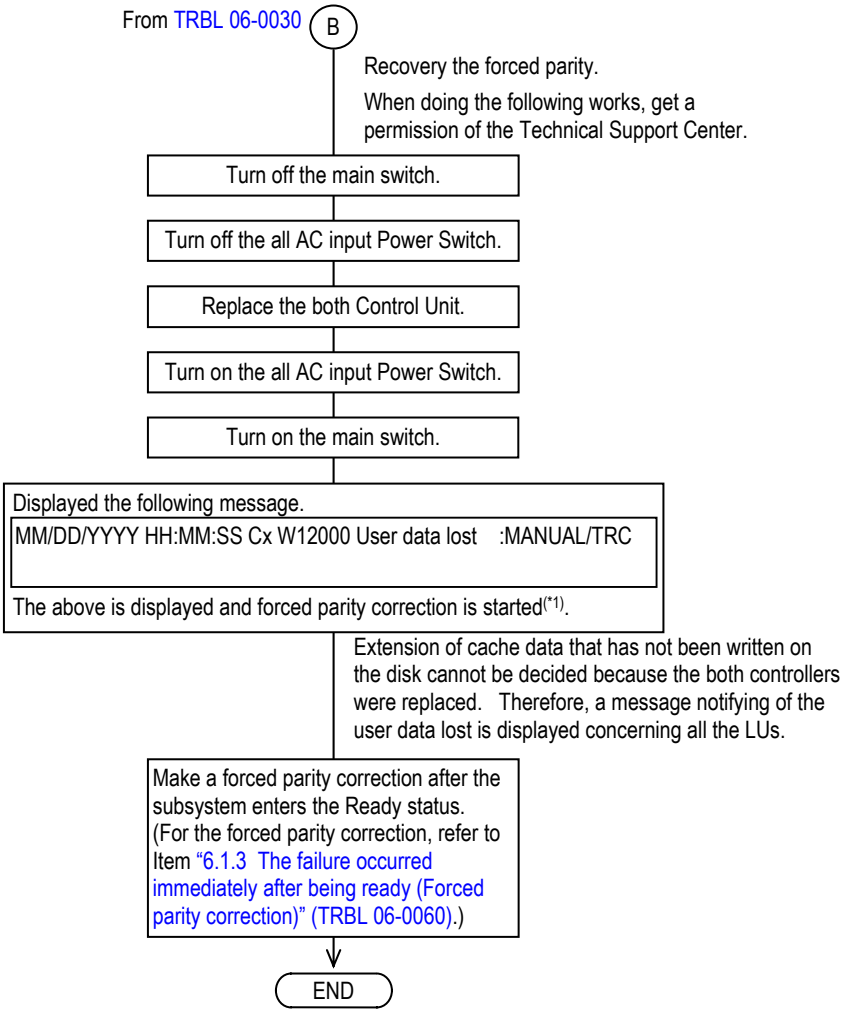
NOTE : • When the READY LED on the front side of the Basic Chassis is lights off, refer to "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000) to recover the failures.
• The recovery method shown below is for the case where blockades of both Controllers in a dual Controller configuration occur.
• The ALARM LED on the front side of the Basic Chassis comes on and the both controllers are detached. As to the CALM LED on the controller PCBA, only the CALM LED on one of the controllers, in which the failure was detected earlier, comes on.
Make sure on which controller the CALM LED is on because the recovery work is to be done starting from the controller whose CALM LED is on.

[Recovery method]



*1 : For the collection Full Dump, refer to "7.5 Collecting Full Dump" (TRBL 07-0130).

*2 : When the ALARM LED on the front side of the Basic Chassis does not go out five minutes or longer after the main switch is turned off, turn off the AC input power switch.



*3 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

*4 : For the replacement of the failed component, refer to Replacement "Chapter 2. Parts Replacement" (REP 02-0000).

(Information could not be loaded from the Disk Drive.)

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx RB8400 Download fail :MANUAL

Date Time Detect Controller#

[Recovery method]

*1 : Make the subsystem in the maintenance mode referring to WEB "Chapter 3 The Maintenance Mode Operation Procedure" (WEB 03-0000), and refer to WEB "3.3.1 Microprogram" (WEB 03-0280) for the installation procedure of the microprogram.

*2 : If this operation is executed, all the data in the Disk Drive are deleted (the RAID group and LU definition are initialized).

*3 : For initialization of the information on configuration, refer to "6.2 Initialization procedure for configuration information" (TRBL 06-1340).

*4 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

6.1.3 The failure occurred immediately after being ready (Forced parity correction)

A failure occurred immediately after the subsystem had been started up. The user data in the cache memory was lost because data stored in the cache memory volatilized.

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx xxxxxx Forced parity correction LU is detected :MANUAL
Date Time Detect Controller#

< Explanation >

A forced parity correction is made in order to synchronize parities in the disk array subsystem when data is lost because of volatilization of data in the cache memory caused by a power failure, etc. (when the subsystem cannot execute the deliberate shutdown).

The forced parity correction is made for each LU. Each LU can be in the following statuses. There are the actions to be taken of "Execution of the Forced Parity Correction" and "Skip of the Forced Parity Correction" for the LU that the subsystem determined the need for the forced parity correction.

Execute the forced parity correction basically for the LU that the subsystem determined the need for the forced parity correction.

However, the forced parity correction can be skipped in the following cases.

- In the case where the customer /SE can recognize that the system does not access the LU concerned, so that there is no data loss for the LU concerned even if the data on the Cache memory is volatilized.
- In the case where the backup data of the customer is restored in the subsystem after discarding the data of this LU at the time when the LU format is executed for the LU concerned or the LU is once deleted and recreated.
- In the case where the status of the forced parity correction of the LU concerned is "Uncorrected 2" and the drive restoration of the blocked Disk Drive which configures this LU is completed normally afterwards (the consistency of the parity data of this LU is assured due to the drive restoration, so that if the forced parity correction is skipped after completing the drive restoration normally, the status of the forced parity correction of this LU is changed to "Restored").(‡1)

‡1 : When the status of the forced parity correction of the LU concerned is "Uncorrected 2", the consistency of the parity data is assured at the time when the drive restoration of the blocked Disk Drive which configures this LU is completed normally, and the status of the forced parity correction is changed to "Restored". However, this LU can be accessed by the host computer at the time of skipping the forced parity correction for the LU, so that the host computer may access the data whose consistency of the parity data is not taken (the data generated only from the data part and the data generated including the parity data may differ, so that the read data which the subsystem returns to the host computer may be changed when the host computer reads this area).

Copyright © 2005, 2006, Hitachi, Ltd.

< Notes on making forced parity correction >

- The restoration is made using the maintenance function of Storage Navigator Modular. For the procedure concerned, refer to "10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0250).
- For a failure of a part other than the drive that occurs during forced parity correction, refer to the Replacement "2.1 Locations of Replacement Components" (REP 02-0000). For a drive failure, refer to the Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).
- The dynamic sparing cannot be instructed in the Storage Navigator Modular during the forced parity correction. When the dynamic sparing is required because the threshold value is exceeded, the dynamic sparing is not performed but the correction copy is made through a detachment of the drive concerned.
- The copy back cannot be instructed in the Storage Navigator Modular during the forced parity correction. When the copy back is required, the copy back is started automatically after the forced parity correction is completed.
- When a drive failure, PIN Over or incomplete write occurs during the forced parity correction, the data check and the operation using the Storage Navigator Modular are required again.
- For the LU status or its transfer in the forced parity correction described in the maintenance operation flow, refer to "< Change of the status in the forced parity correction >" (TRBL 06-0380). Also, for the standard time required for the recovery, refer to "< Standard time required for the forced parity correction >" (TRBL 06-0400).
- The forced parity correction recovers one LU per Control Unit. Therefore, if the LU needs multiple forced parity correction, the order of the forced parity correction should be determined by checking the Control Unit in charge of each LU (Refer to "(e) Execution of forced parity correction" (TRBL 06-0260)).
- If the data on the Cache memory is volatilized due to a power failure within one minute after performing the following work, all LUs may be required for the forced parity correction.
  ① Setting of the configuration information such as the system parameter by the Storage Navigator Modular
  ② The pair operation by RAID Manager
- When there is the LU executing the forced parity correction, if the data on the Cache memory is volatilized due to the power failure, all the LUs become the target of the forced parity correction afterwards.
- If the data on the Cache memory is volatilized due to a power failure within one minute after performing the setting of such as the system parameter configuration information in the Storage Navigator Modular, the set contents may not be reflected. Check the configuration. Be sure to check the configuration when a power failure occurs. If the configuration is not reflected, set the configuration information again.

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Data reading/writing instructed by a host
- The LU whose status of the forced parity correction is "Correcting", "Waiting", or "Waiting Disk Drive Recovery" can read from and write to the host, but the host performance may be deteriorated during the forced parity correction.
- When an LU, a status of which concerning the forced parity correction is "Being Restored", exists in the disk array subsystem, performance of host I/Os is lowered.

(2) Relations between statuses of forced parity correction and operations of the other functions
- The operation of other functions for the LU concerned is partially restricted depending on the status of the LU which is performing the forced parity correction.

*1 : When a status of an LU concerning the forced parity correction for a secondary LU is On Standby or Being Restored, a pair cannot be formed.

*2 : When a status of an LU concerning the forced parity correction for a primary LU is On Standby or Being Restored, a pair cannot be formed.

*3 : When a status of either a P-VOL or a POOL (when two or more P-VOLs/POOLs exist, any one of them) is Unrestored or Unrestored 2, a pair cannot be formed.
When a POOL (when two or more POOLs exist, any one of them) is in the On Standby or Being Restored status, a pair cannot be formed.

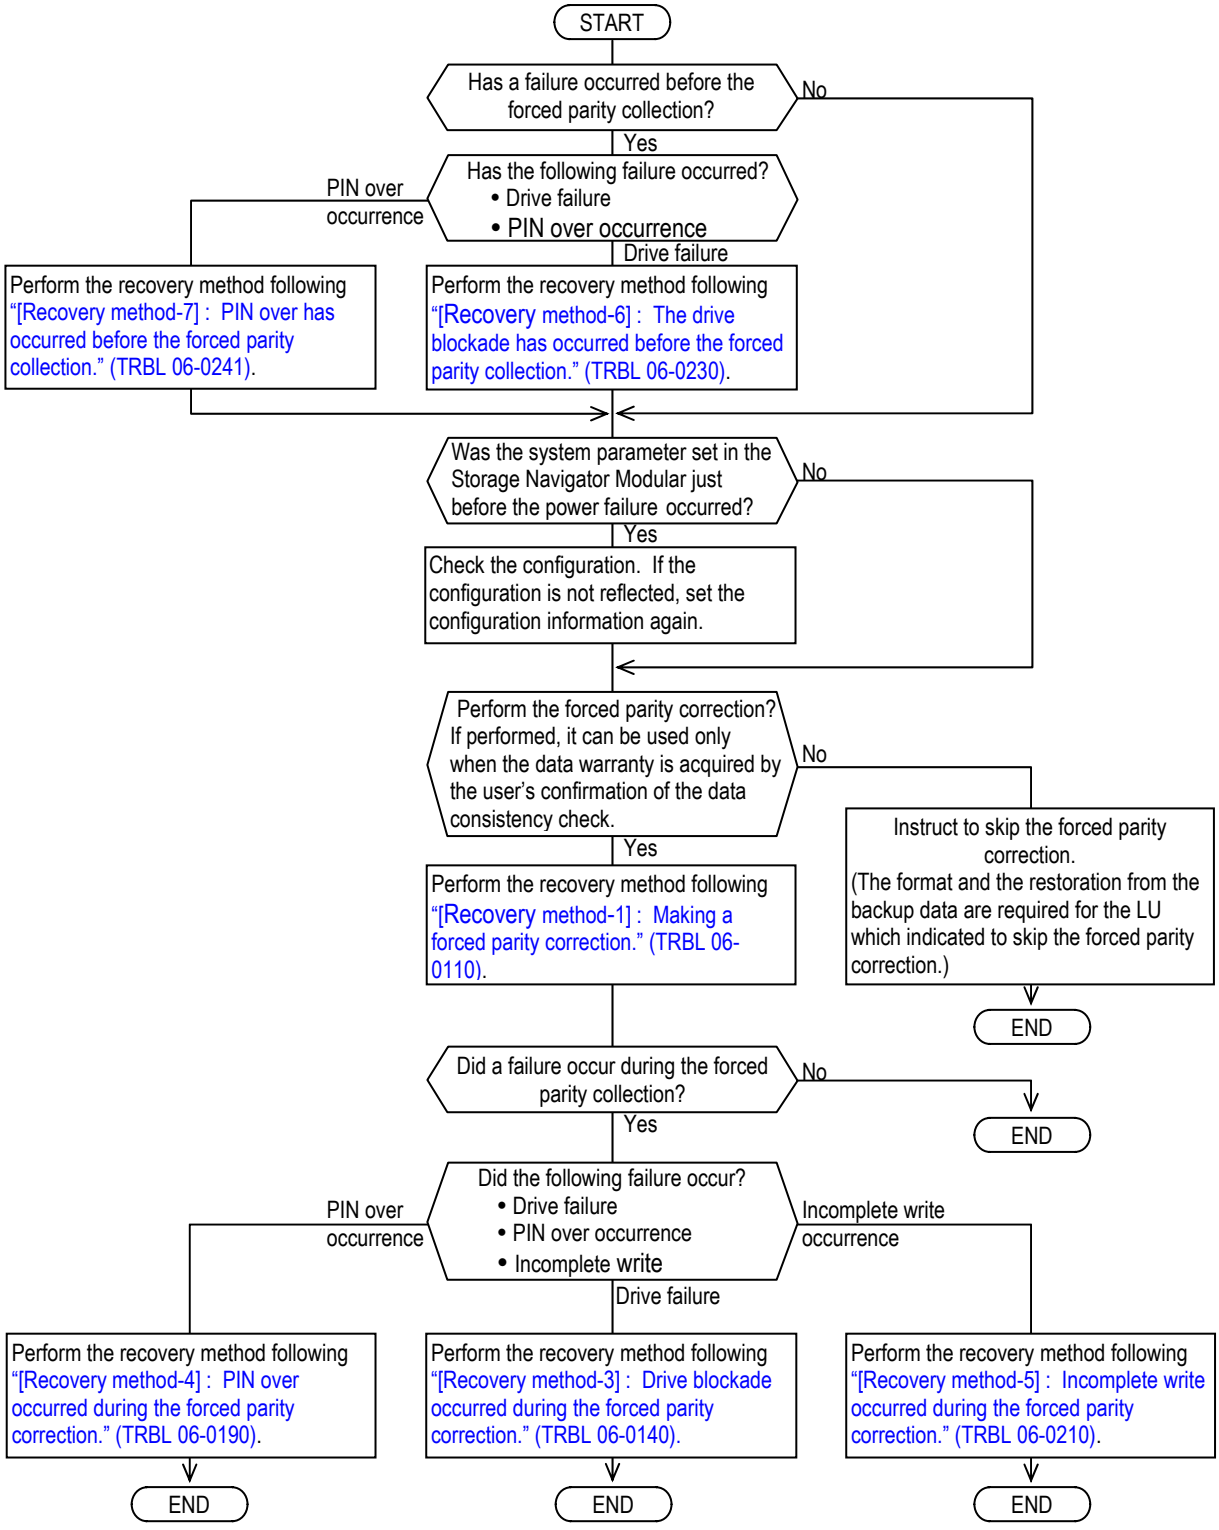
*4 : The restoration cannot be made unless a status of a P-VOL and a POOL (when two or more P-VOLs/POOLs exist, all of them) is Skip or Restored.

*5 : For "Uncorrected 2".

Copyright © 2005, 2006, Hitachi, Ltd.

- A part of the execution of the forced parity correction to the LU and the instruction of the skip is restricted while the other functions are operating or depending on the status of the LU.

No.	Function in operation	Possibility of forced parity correction	Description
1	Unification LU	Partially impossible	Though an instruction to make the restoration for a child LU cannot be issued, the restoration instructed to be made for a parent LU is also applied to a child LU.
2	Format instruction	Impossible	An instruction to make the restoration cannot be issued to an LU being formatted.
3	Microprogram hot replacement	Impossible	An instruction to make the parity correction cannot be issued during replacement of the microprogram.
4	Pseudo deliberate shutdown	Impossible	An instruction to make the restoration cannot be issued because the disk array subsystem is shut down deliberately.
5	Unformatted	Impossible	The execution of the forced parity correction and the instruction of the skip cannot be performed to the unformatted LU.
6	V-VOL of Copy-on-write SnapShot	Impossible	The execution of the forced parity correction and the instruction of the skip cannot be performed to the V-VOL of Copy-on-write SnapShot.



(3) Process of forced parity correction

- When the subsystem cannot perform the planned shutdown again due to the power failure, etc., the subsystem power is turned off, and the data on the Cache memory volatilizes during the forced parity correction, all LUs become the target of the forced parity correction.
- When a failure occurs in a Control Unit that is making the forced parity correction, the restoration is taken over by a mate Control Unit and continued. However, when the mate Control Unit is making the forced parity correction, it stands by for the restoration taken over. Also, when the Control Unit is recovered, perform the parity processing with the recovered Control Unit.

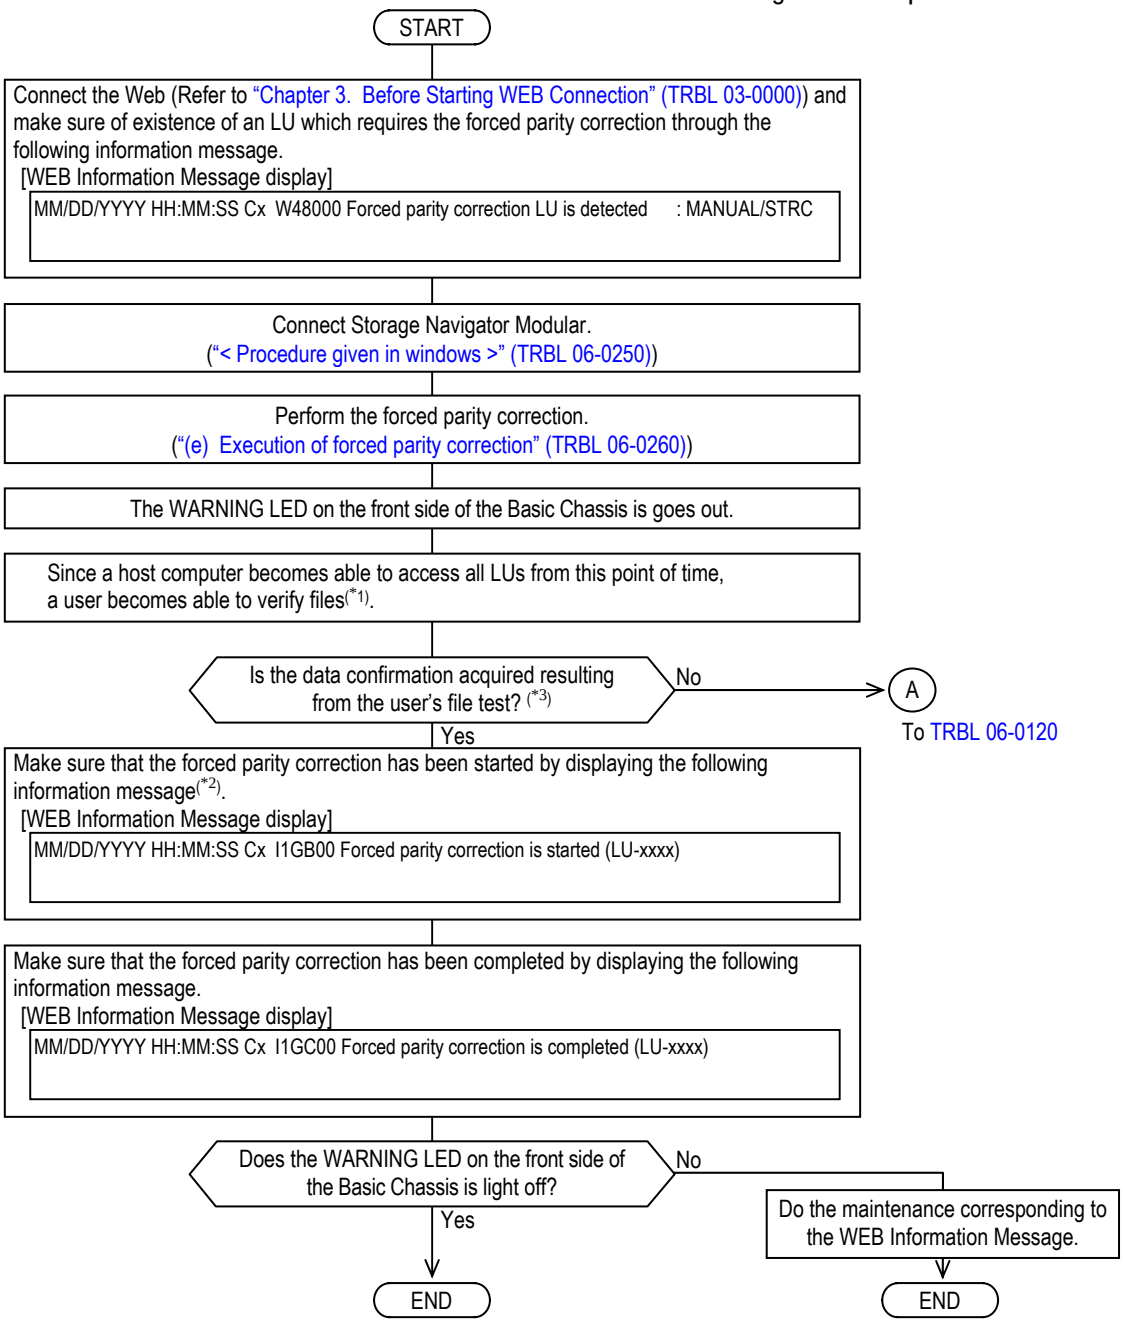
< Forced Parity Collection Maintenance Flow >

Perform the maintenance operation for the forced parity collection following the flow shown below.

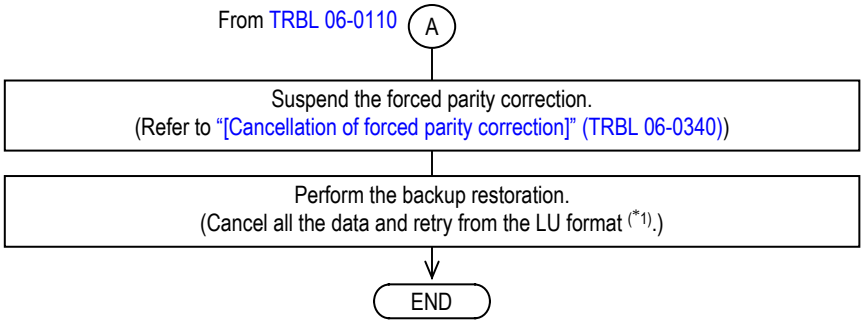


Copyright © 2005, Hitachi, Ltd.

[Recovery methods]

[Recovery method-1] : Making a forced parity correction.

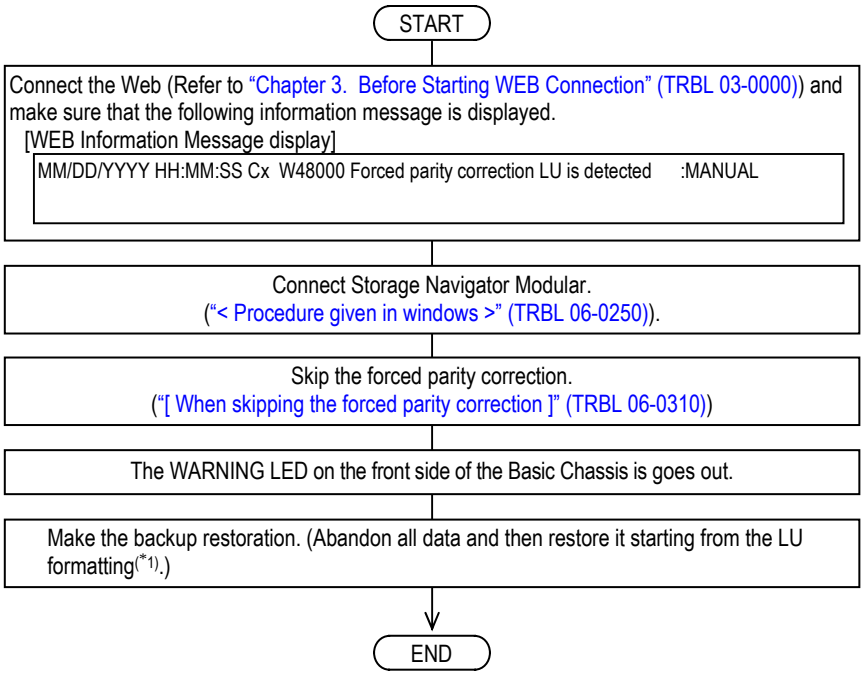
The forced parity correction resynchronizes data in Disk Drives, however, it cannot restore the data completely. Ask a user to verify the data and restore data that could not be restored using the backup data.



*1 : When a drive detachment, pin over, or incomplete writing occurs during a period from the verification of files by a user to the completion of the forced parity correction, the verification of files by the user must be done again. When a failure occurs, take recovery actions referring to "[Recovery method-3] : Drive blockade occurred during the forced parity correction." (TRBL 06-0140), "[Recovery method-4] : PIN over occurred during the forced parity correction." (TRBL 06-0190), "[Recovery method-5] : Incomplete write occurred during the forced parity correction." (TRBL 06-0210).

*2 : For a standard time required for the forced parity correction, refer to "< Standard time required for the forced parity correction >" (TRBL 06-0400).

*3 : Request the customer and the SE for the work.

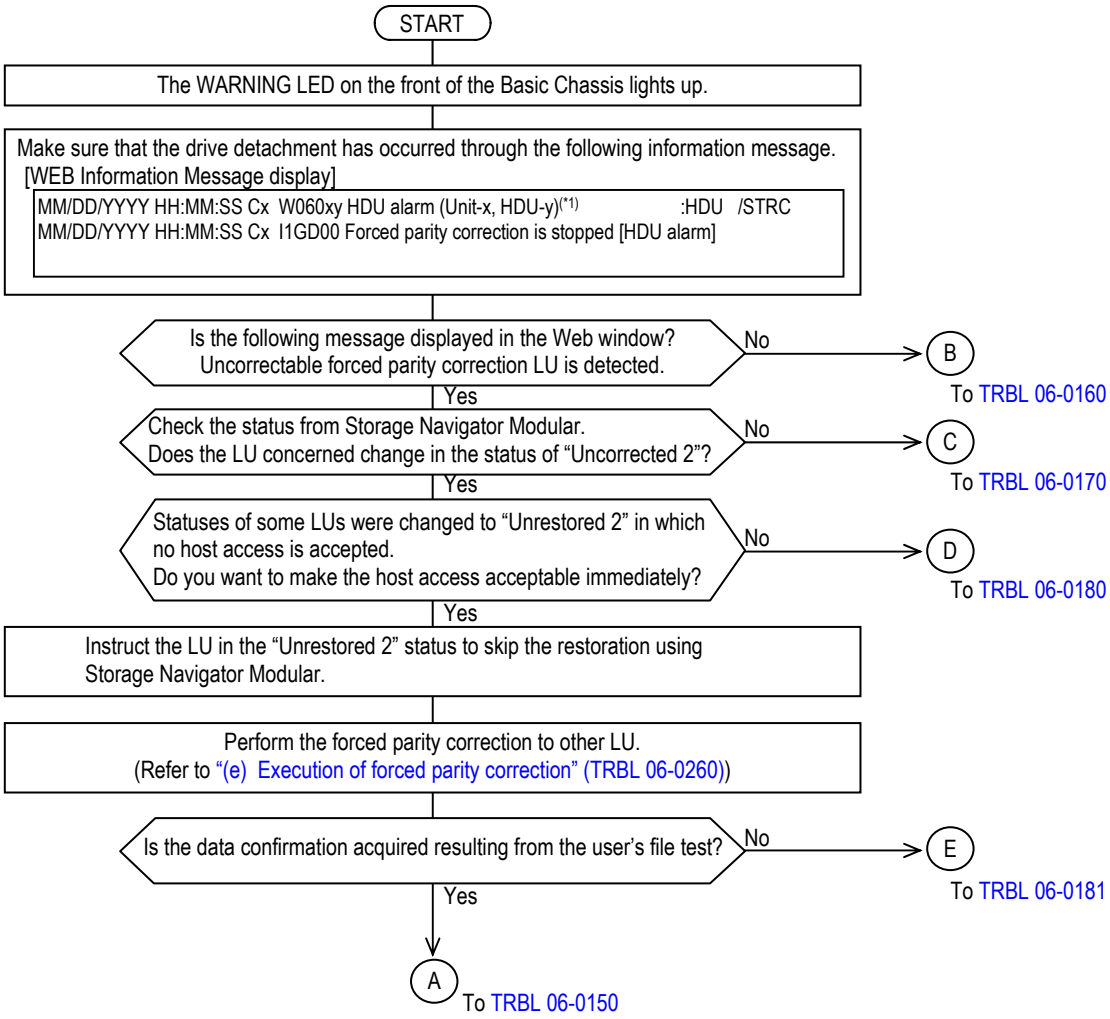


Copyright © 2005, 2006, Hitachi, Ltd.

*1 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (refer to System Parameter "3.3 Setting of LU [Procedure ③-F] Formatting LU" (SYSPR 03-0280)).
Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

Copyright © 2005, 2006, Hitachi, Ltd.

[Recovery method-2] : A forced parity correction is not made (a forced parity correction is skipped).
Because a forced parity correction is not made, data in a Disk Drive are not synchronized and an LA error, etc. may occur. Issue an instruction to skip the forced parity correction from Storage Navigator Modular, format the LU, and then make a backup restoration.



*1 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (refer to System Parameter "3.3 Setting of LU [Procedure ③-F] Formatting LU" (SYSPR 03-0280)).
Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

Copyright © 2005, 2006, Hitachi, Ltd.

[Recovery method-3] : Drive blockade occurred during the forced parity correction.
When a Disk Drive is detached during forced parity correction, the restoration is interrupted and a drive recovery action is taken.
When the Disk Drive including the LU that performs the forced parity correction instruction is blocked in the RAID Group, the status of the LU concerned changes to "Uncorrected 1" or "Uncorrected 2".
The status is also changes for the LU that unifies the LU including the blocked Disk Drive in the RAID Group. The status is not changed for the LU other than this.

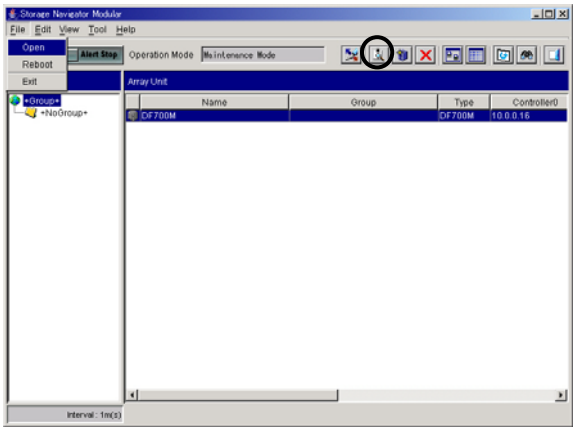
< Procedure given in windows >

(a) Connect the Web. (Refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)

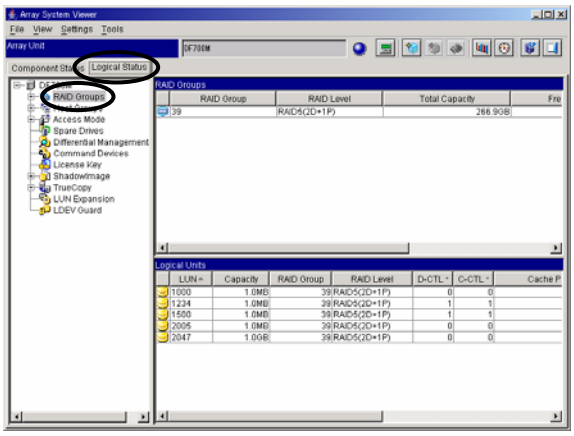
(b) Check that there is LU for which the forced parity correction is necessary by the "W48000" message in the WEB window.



(c) Connect Storage Navigator Modular.

(i) Start the Storage Navigator Modular and set the operation mode in the "Management Mode".
For details of the setting method, refer to the System Parameter "1.1 (3)-(b) Changing the Maintenance Mode" (SYSPR 01-0050).

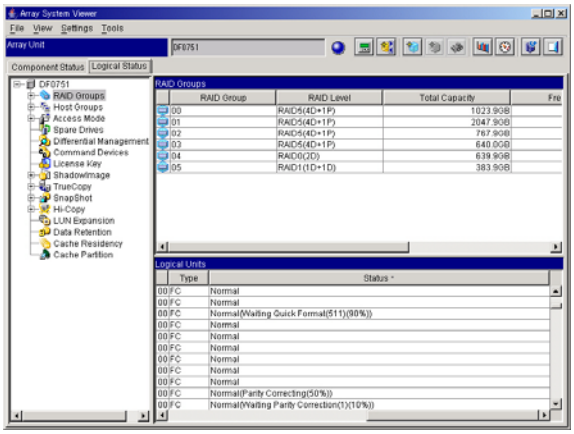
(ii) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.



- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

Copyright © 2005, Hitachi, Ltd.



(d) Click the [RAID Groups] tab after Clicking the [Logical Status] tab in the unit window.

(e) Execution of forced parity correction

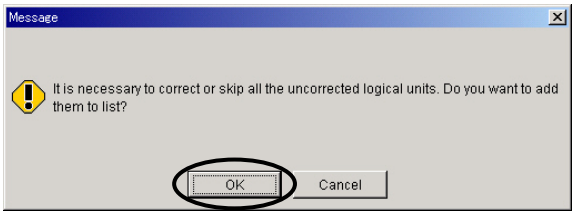
Since the LU required for the forced parity correction is displayed, execute the forced parity correction.

Select [Settings] – [Logical Unit] – [Parity Correction] in this order.

Copyright © 2005, Hitachi, Ltd.

Status Symbol of Storage Navigator Modular	Meaning	Status seen from a host	Recovery method
Uncorrected	A status in which the subsystem is waiting for an instruction to make or skip the forced parity correction issued by Storage Navigator Modular.	A status in which a host cannot instruct the LU to read or write.	Perform the forced parity correction or skip in the Storage Navigator Modular according to < Procedure given in windows > (TRBL 06-0250).
Parity Correcting (n%)	A status in which Storage Navigator Modular has issued an instruction to make the forced parity correction and the restoration is in progress.	A status in which a host can instruct the LU to read or write.	–
Waiting Parity Correction(o) (n%)	A status in which Storage Navigator Modular has issued an instruction to make the forced parity correction and is waiting for making of the restoration.	A status in which a host can instruct the LU to read or write.	–
Waiting Drive Reconstruction	Waiting Disk Drive Recovery : The forced parity correction is instructed from Storage Navigator Modular, and waiting for the replacement of the Disk Drive.	Reading and writing data from the host are enabled.	① Connect WEB (Refer to "Chapter 3 Before Starting WEB Connection" (TRBL 03-0000).) ② Replace the blocked Disk Drive referring to the Information Message on WEB (refer to Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).).
Correction Skipped	A status in which Storage Navigator Modular has issued an instruction to skip the forced parity correction.	A status in which a host can instruct the LU to read or write.	Make an LU formatting (refer to System Parameter "[Procedure ③-F]Formatting LU (SYSPR 03-0280".) and backup restoration.
–	Restored : A status in which Storage Navigator Modular issued an instruction to make the forced parity correction and the restoration has been completed.	A status in which a host can instruct the LU to read or write.	–
Uncorrected and Drive Detached	The forced parity recovery is aborted due to the Disk Drive blockade although the forced parity recovery was instructed from Storage Navigator Modular. However, the forced parity recovery is required.	Reading and writing data from the host are disabled.	① Connect the WEB (refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).). ② Replace the blocked Disk Drive referring to the Information Message on the WEB (refer to Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).). ③ Skip the forced parity correction according to < Procedure given in windows > (TRBL 06-0250) (refer to "[When skipping the forced parity correction]" (TRBL 06-0310).).

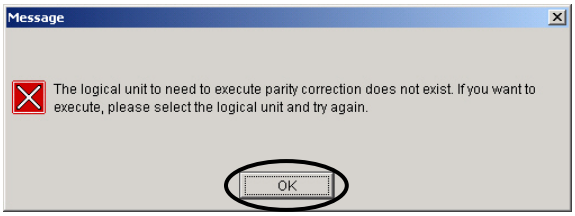
Copyright © 2005, Hitachi, Ltd.



Status Symbol of Storage Navigator Modular	Meaning	Status seen from a host	Recovery method
Correction Aborted	A status in which the forced parity correction is interrupted because of a drive detachment although Storage Navigator Modular has issued an instruction to make the restoration.	A status in which a host cannot instruct the LU to read or write.	① Connect the WEB (refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).). ② Replace the blocked Disk Drive referring to the Information Message on the WEB (refer to Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).). ③ Skip the forced parity correction according to < Procedure given in windows > (TRBL 06-0250) (refer to "[When skipping the forced parity correction]" (TRBL 06-0310).). ④ Execute the forced parity correction according to < Procedure given in windows > (TRBL 06-0250).

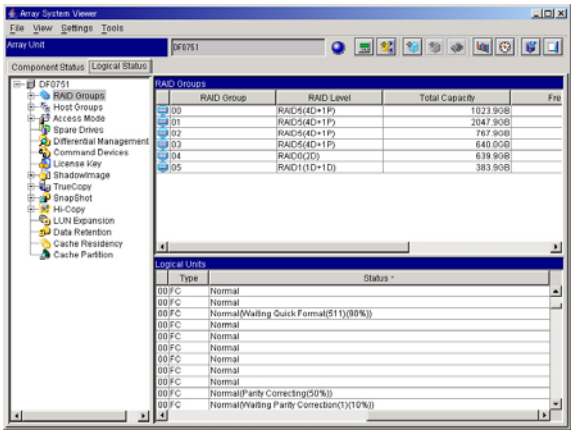
Copyright © 2005, Hitachi, Ltd.

(f) Status checking of the logical unit for the forced parity correction.



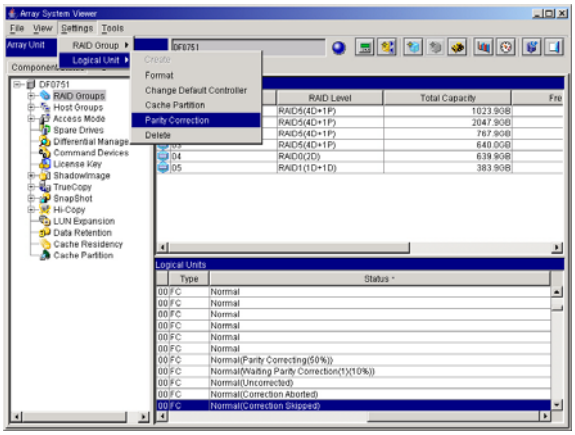
• When the status of the logical unit is “Uncorrected”

(i) Because the dialog, indicating that the LU which needs the forced parity correction exists, is displayed, click the [OK] button. The parity correction process is interrupted by clicking the [Cancel] button.



• When the status of the logical unit is other than “Uncorrected”

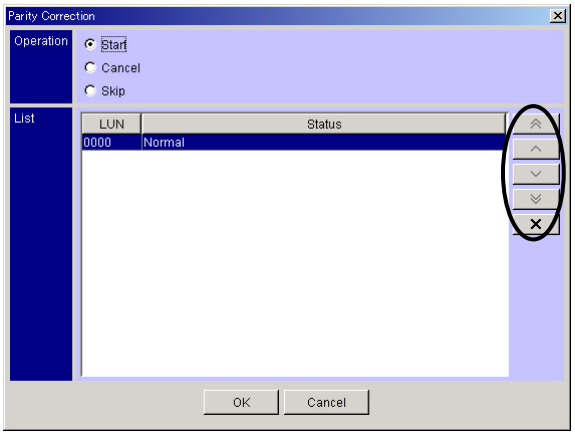
(i) Because the dialog, indicating that the logical unit for the forced parity correction target does not exist, is displayed, click the [OK] button.



(ii) Check the LU which needs to execute the forced parity correction referring to the status of the logical unit.

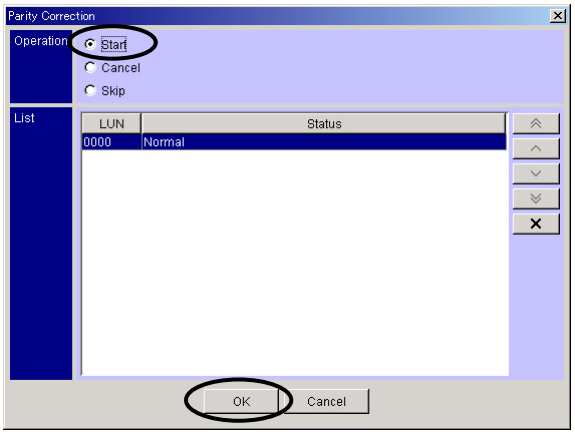
Copyright © 2005, Hitachi, Ltd.

(iii) When there is the LU to be executed by the forced parity correction, select [Setting] – [Logical Unit] – [Parity Correction] after specifying the logical unit of the target.



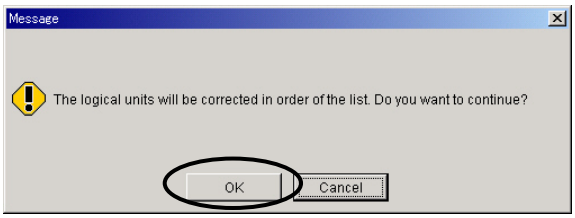
Copyright © 2005, Hitachi, Ltd.

(g) Select whether or not to make the forced parity correction.



[When making the forced parity correction]

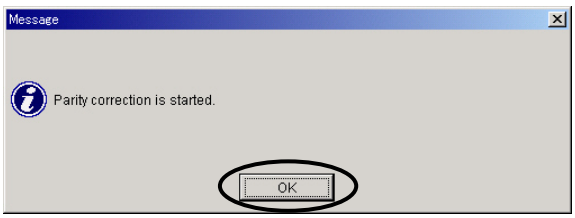
When aborting the forced parity correction while it is in progress, refer to "[Cancellation of forced parity correction]" (TRBL 06-0340).



(i) Sort the LUs in order of making forced parity correction.(‡1)(‡2)

(ii) When the sort is completed, select the [Start] radio button and click the [OK] button.

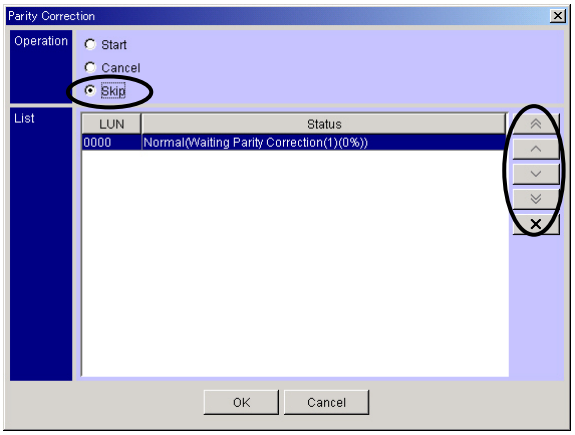
(iii) Click the [OK] button.



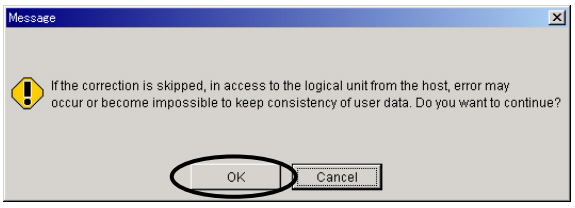
‡1 : The forced parity correction operates LU one by one in order for each Control Unit in charge of LU. Therefore, the Control Unit in charge of the LU which performs the forced parity correction should be considered to decide the sorting order.

‡2 : The forced parity correction is performed in order of the sorted LU.
However, if the LU belongs in the same RAID Group, it may not be executed in the sorted order because the process is not performed in each Control Unit.
If the forced parity correction order of the LU which belongs in the same RAID Group needs to be assured, select one LU following (g). For the remaining LU, follow the procedure for the indication of the forced parity correction from 'skip' status or 'completion of correction', and indicate the addition of the forced parity correction LU.

Copyright © 2005, Hitachi, Ltd.

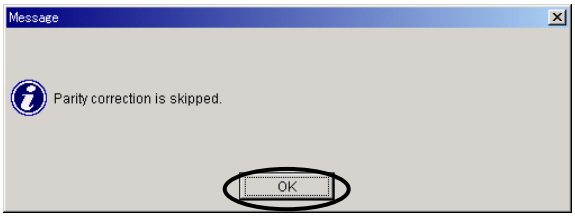


(iv) Click the [OK] button.

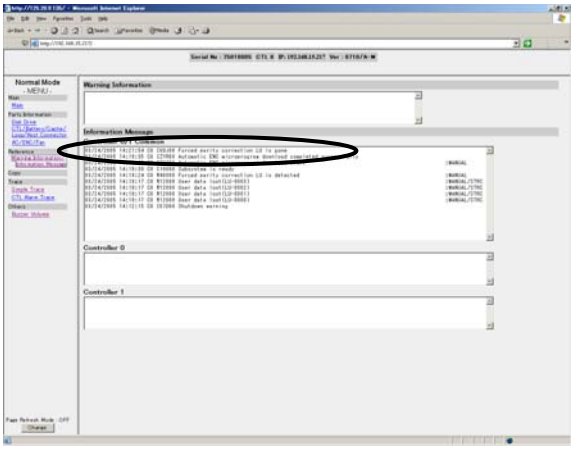


Copyright © 2005, Hitachi, Ltd.

[When skipping the forced parity correction]

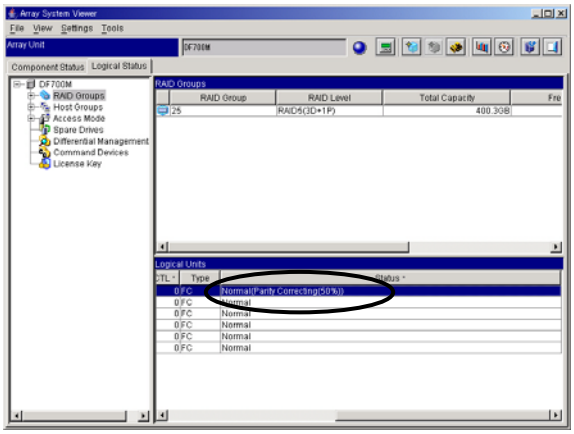


(i) Select the [Skip] radio button and click the [OK] button.



(ii) Click the [OK] button.

(iii) Click the [OK] button.

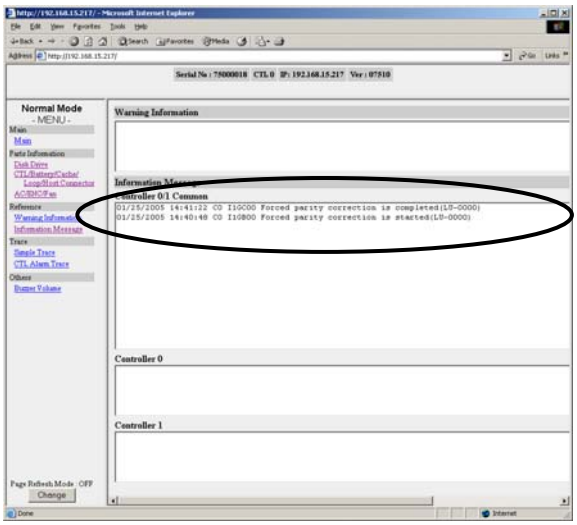


(h) Refer to a message in the Web window.

Copyright © 2005, Hitachi, Ltd.

(i) Displaying a progress rate of the forced parity correction

For the LU, the forced parity correction for which has been instructed to be made, rate of progress of the restoration is displayed in the "Status" column of the LU concerned.



LU statuses concerning a forced parity correction and display of statuses by Storage Navigator Modular.

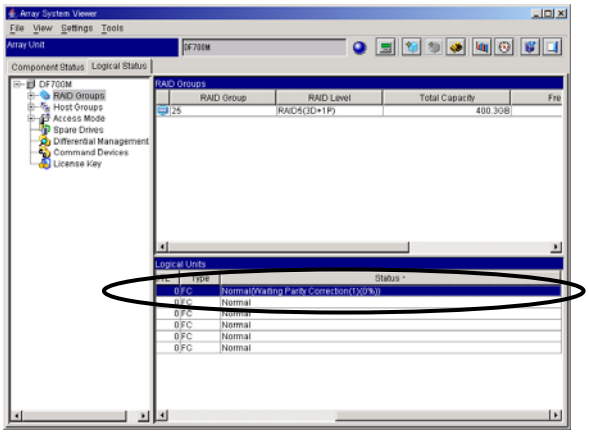
#	Status	Display by Storage Navigator Modular	Remarks
1	Being Restored	Parity Correction (n%)	n: Progress rate
2	On Standby	Waiting Parity Correction(o) (n%)	o: Waiting order n: Rate of progress
3	Waiting Disk Drive Recovery	Waiting Drive Reconstruction	—
4	Unrestored	Uncorrected	—
5	Unrestored 1	Uncorrected and Drive Detached	—
6	Unrestored 2	Correction Aborted	—
7	Restored	(No display)	—
8	Skip	Correction Skipped	—

Copyright © 2005, 2006, Hitachi, Ltd.

(j) Make sure that the forced parity correction has been completed in the Web window.

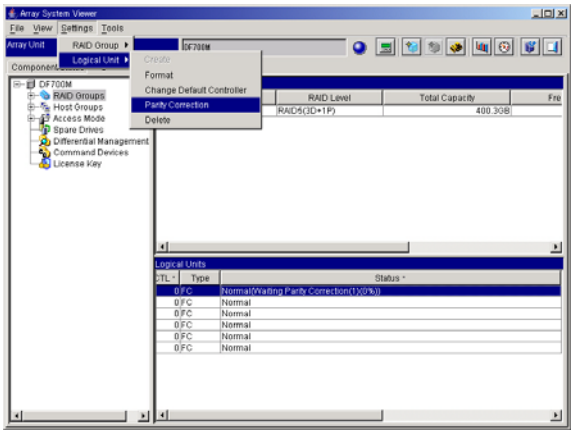
When making the forced parity correction for an LU in the "Skip" or "Restored" status, refer to "[Instruction to make a forced parity correction for an LU in the "Waiting Parity Correction" or "Restored" status]" (TRBL 06-0360).

(k) Make sure that the WARNING LED on the front side of the Basic Chassis has gone out.



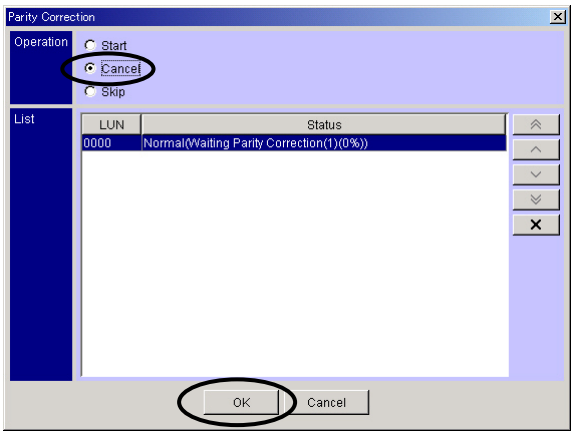
(l) Make the backup restoration. (Abandon all data and then restore it starting from the LU formatting.) Otherwise, ask a user to verify files.

Copyright © 2005, 2006, Hitachi, Ltd.



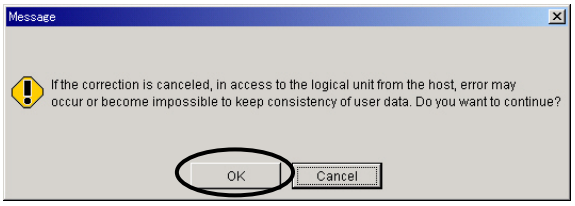
[Cancellation of forced parity correction]

The forced parity correction can be cancelled while the LU is in progress or after the correction is instructed.

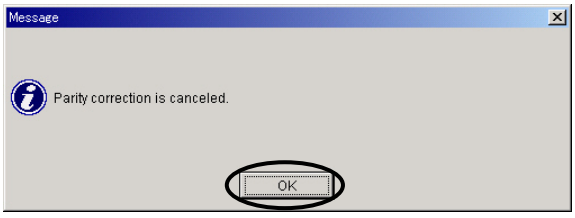


(a) Select an LU whose status displayed in the Logical unit status column is Parity Correcting or Waiting Parity Correction.

(b) Select [Settings], [Logical Unit], and [Parity Correction] in this order.



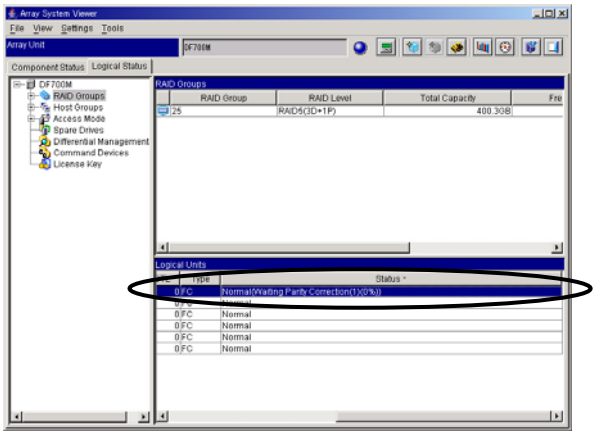
(c) Select [Cancel] and press the [OK] button.



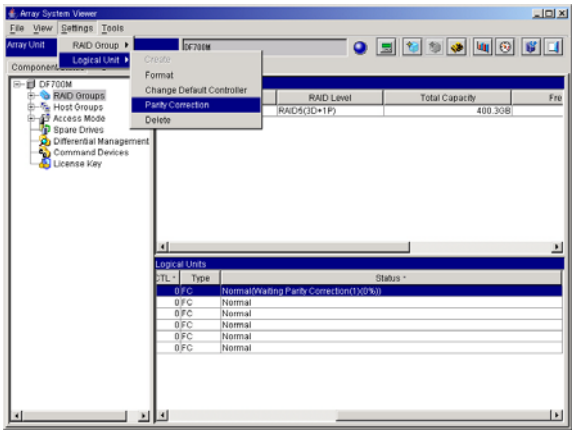
Copyright © 2005, Hitachi, Ltd.

(d) Click the [OK] button.

(e) Click the [OK] button.

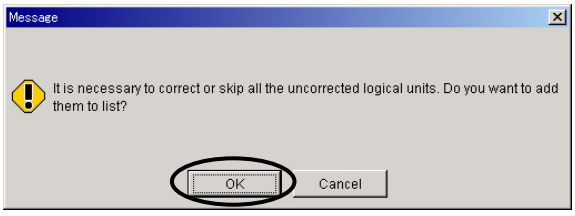


Copyright © 2005, Hitachi, Ltd.



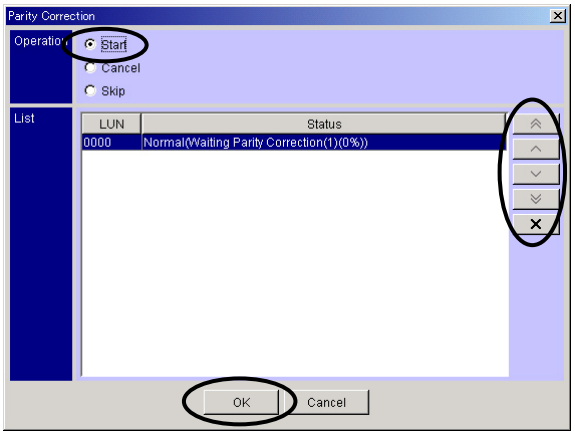
[Instruction to make a forced parity correction for an LU in the “Waiting Parity Correction” or “Restored” status]

A forced parity correction can be made for an LU in the “Waiting Parity Correction” status or for an LU for which the forced parity correction has been made.

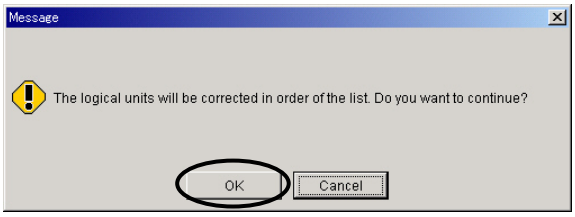


(a) Select an LU for which the “Waiting Parity Correction” status is displayed in the column of the logical unit state.

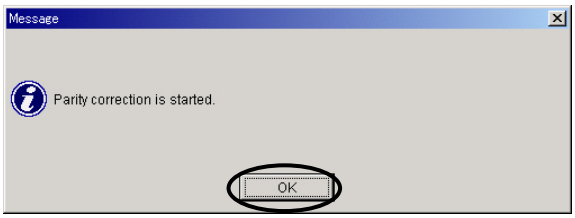
(b) In the state in which the selection above is made, select [Settings], [Logical Unit], and [Parity Correction] in this order.



(c) Click the [OK] button.



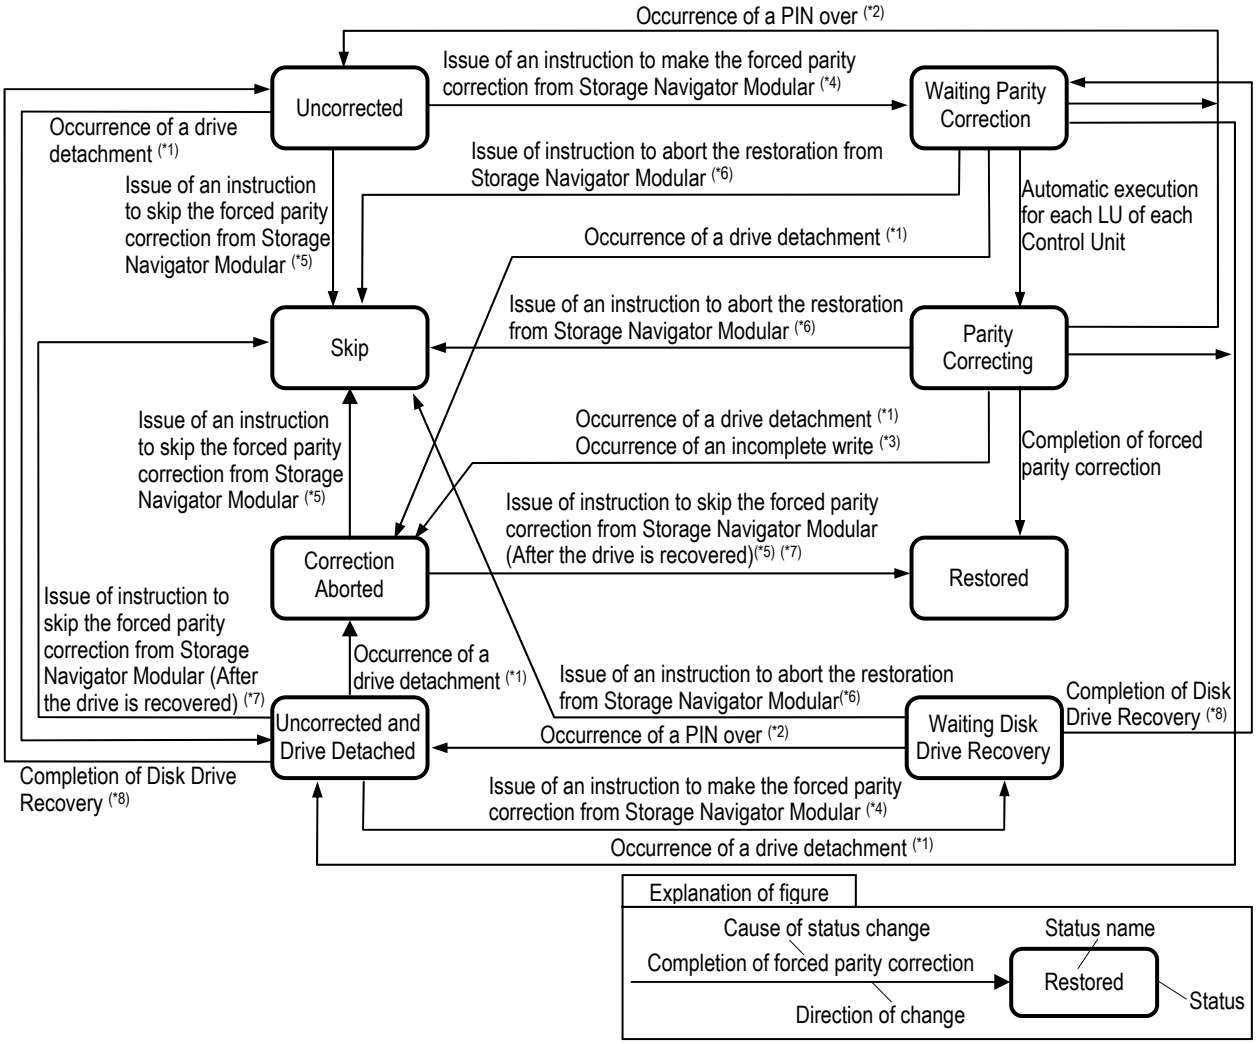
Copyright © 2005, Hitachi, Ltd.



(d) Select [Start], specify an order of making the forced parity correction, and press the [OK] button.

(e) Click the [OK] button.

(f) Click the [OK] button.



Copyright © 2005, Hitachi, Ltd.

< Change of the status in the forced parity correction >

The status of the forced parity correction changes as shown below. The status and progress rate of the restoration can be referred to for each LU using Storage Navigator Modular.

(a) Change of the status after user data is lost

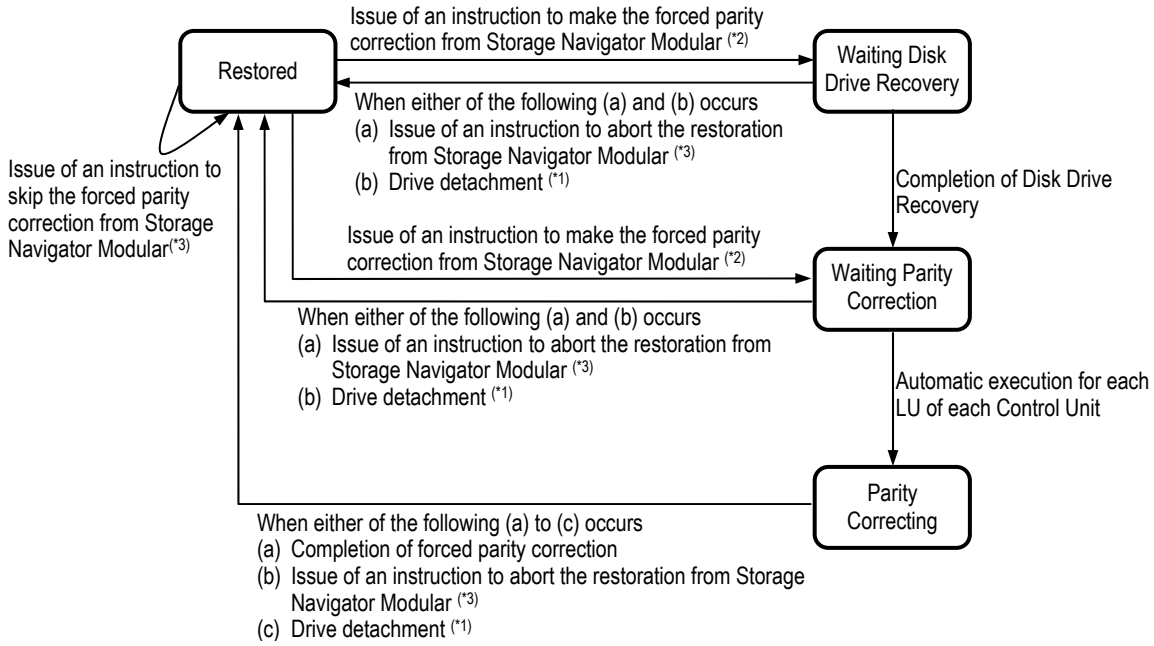
*1 : Refer to "[Recovery method-3] : Drive blockade occurred during the forced parity correction." (TRBL 06-0140).

*2 : Refer to "[Recovery method-4] : PIN over occurred during the forced parity correction." (TRBL 06-0190).

*3 : Refer to "[Recovery method-5] : Incomplete write occurred during the forced parity correction." (TRBL 06-0210).

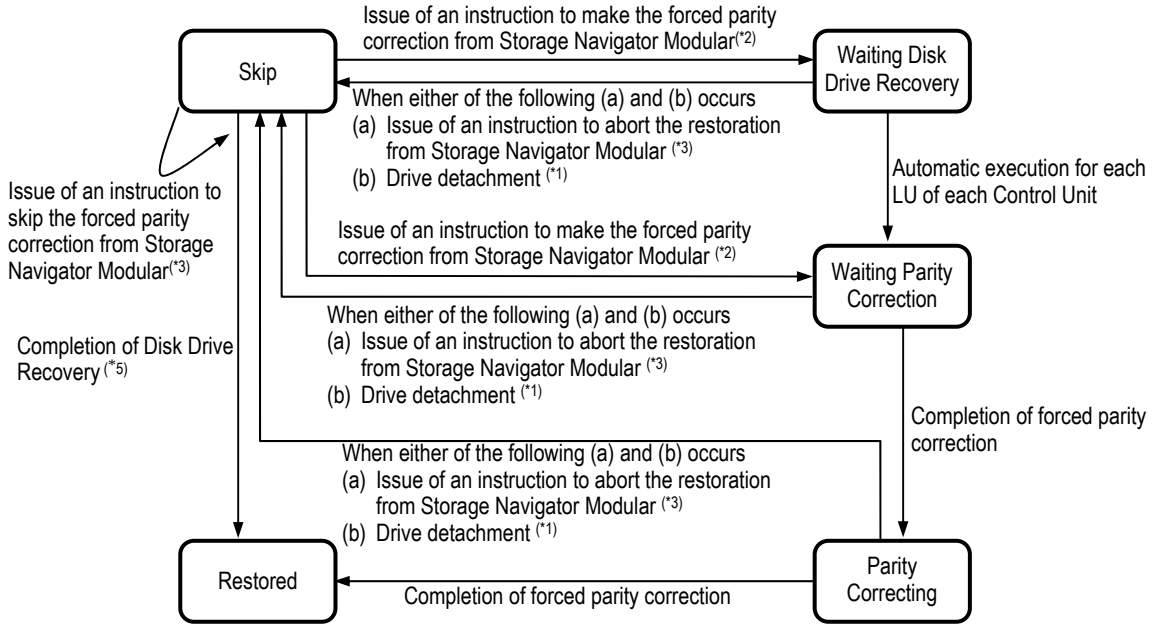
*4 : Refer to "(e) Execution of forced parity correction" (TRBL 06-0260).

*5 : Refer to "[When skipping the forced parity correction]" (TRBL 06-0310)



*6 : Refer to "[Cancellation of forced parity correction]" (TRBL 06-0340).

*7 : An LU that conforms to any of the following conditions does not enter the "Restored" status and remains in the "Skip" status.
In this case, issue an instruction to skip the forced parity correction and then issue an instruction to make the restoration.
- An LU of RAID 1+0, RAID 6
- A unified LU a part of which is included in a RAID group having a drive detachment
- An LU whose parity group is deeper than 1



*8 : The LU concerned to any of the following conditions does not change to "Disk Drive Restored". In this case, instruct the force parity correction.
- LU whose Disk Drive of a part of the unified LU is blocked and included in the RAID Group
- LU whose depth of the parity group is larger than one

Copyright © 2005, Hitachi, Ltd.

(b) Forced parity correction for an LU in the "Restored" status

(c)Forced parity correction for an LU in the "Skip" status

*1 : Refer to "[Recovery method-3] : Drive blockade occurred during the forced parity correction." (TRBL 06-0140).

*2 : Refer to "(e) Execution of forced parity correction" (TRBL 06-0260).

*3 : Refer to "[When skipping the forced parity correction]" (TRBL 06-0310)

*4 : Refer to "[Cancellation of forced parity correction]" (TRBL 06-0340).

*5 : An LU that conforms to any of the following conditions does not enter the "Restored" status and remains in the "Skip" status.

- An LU of RAID 1+0
- A unified LU a part of which is included in a RAID group having a drive detachment
- An LU whose parity group is deeper than 1

Copyright © 2005, Hitachi, Ltd.

< Standard time required for the forced parity correction >

A forced parity correction takes a long time from start to completion. (Refer to Table 6.1.2, Table 6.1.3, and Table 6.1.4.)

Standard times required for the forced parity correction are shown below.

NOTE : The data above are standard times required for a forced parity correction for one or two RAID groups.

Further, the times required for the restoration vary depending on the Disk Drive capacity, number of Disk Drives, and RAID configuration.

Also, the time when the forced parity correction processing takes becomes short about 10 to 20 % depending on the type even by the Disk Drives of the same capacity.

The forced parity correction operates one LU at a time per Control Unit. Therefore, when one Control Unit recovered the parity of two or more LUs (n LUs), the time that it takes to complete recovering all the parities of the n LUs becomes n times the standard time.

Copyright © 2005, 2006, Hitachi, Ltd.

		(28D+2P)x2	6407.1 Gbytes	500 IOPS	2200 min
	RAID 5	(4D+1P)x2	915.3 Gbytes	460 IOPS	940 min
		(15D+1P)x2	3432.3 Gbytes	540 IOPS	1270 min
	RAID 1+0	(2D+2D)x2	457.7 Gbytes	470 IOPS	940 min
		(8D+8D)x2	1830.6 Gbytes	550 IOPS	1750 min
	RAID 1	(1D+1D)x2	228.8 Gbytes	350 IOPS	1420 min

*1 : All Disk Drive capacities were calculated on the condition of 1 Gbyte =1,000,000,000 bytes. They are different from those calculated on the condition of 1 kbytes =1,024 bytes, which are actually displayed on PCs that you are using

Conditions of measurement of a time required for the forced parity correction are as follows.

- Each of all LUs belongs to different RAID group.
- Only one LU per CTL is restored and an host I/O of random reading (75%) and writing (25%) of 4-kbyte data TAG8 is executed for all the LUs.

‡1 : two RAID groups = one RAID group/controller0 and one RAID group/controller1

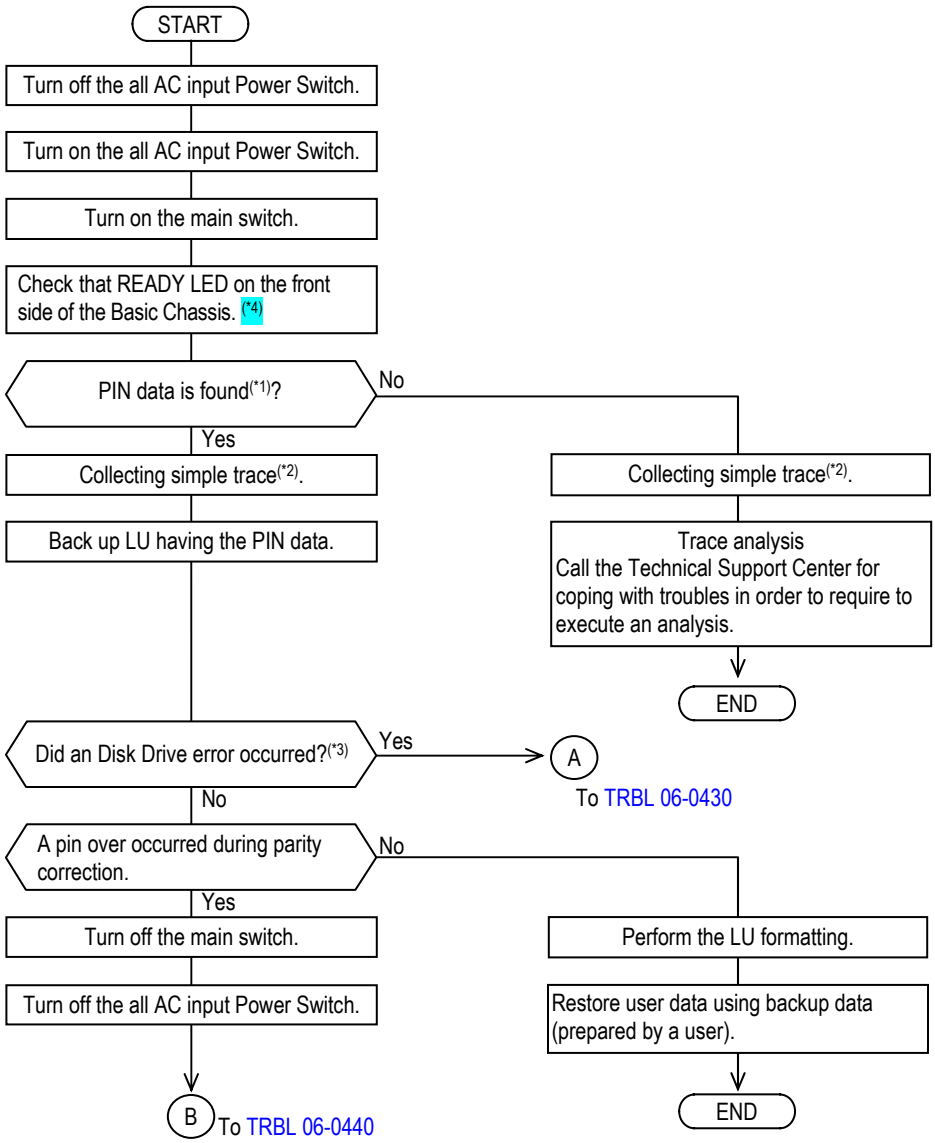
6.1.4 The power cannot be turned off : Case 1 (The number of PIN data is too large)



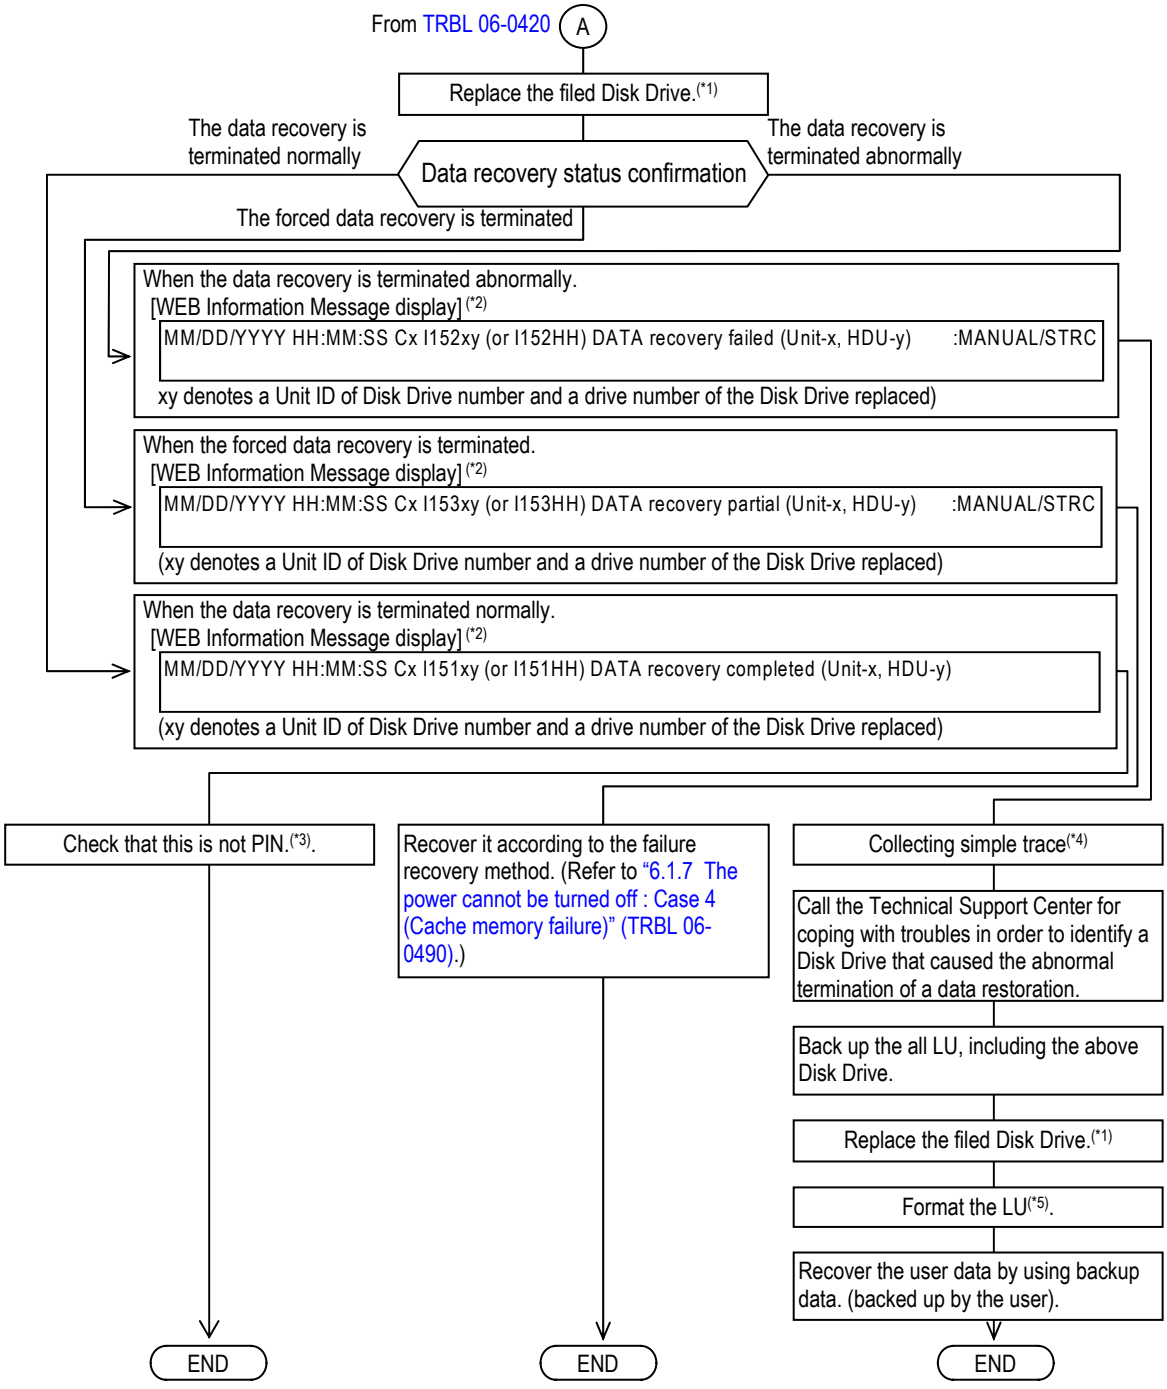
(The planned shutdown cannot be performed due to the Disk Drive/Control Unit failure)

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx HI0600 PS OFF failed [PIN] :MANUAL/CTRC

Date Time Detect Controller#

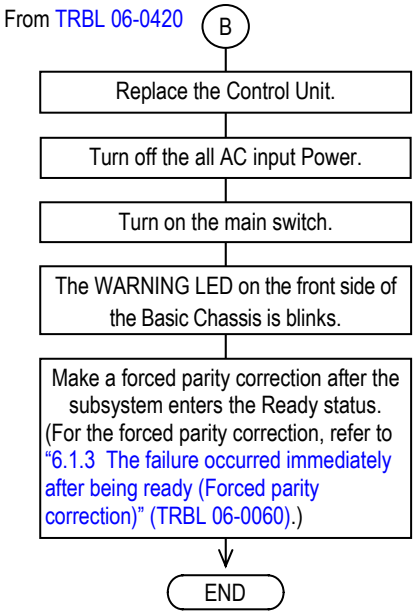
[Recovery method]



*1 : Checking the presence of PIN data is performed by the Maintenance function of Storage Navigator Modular. Refer to "10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0250).

*2 : For the collection simple trace, refer to "7.3 Collecting simple trace" (TRBL 07-0040).

*3 : For checking a Disk Drive error, refer to "8.2 (2) Trouble analysis based on LED indication of Disk Drive" (TRBL 08-0160) or "Chapter 4. Trouble Analysis by WEB Connection" (TRBL 04-0000).



*4 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : For the replacement of the Disk Drive, refer to the Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).
*2 : For the connection of the WEB, refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).
*3 : Checking the presence of PIN data is performed by the Maintenance function of Storage Navigator Modular. Refer to "10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0250).
*4 : For the Collection simple trace, refer to "7.3 Collecting simple trace" (TRBL 07-0040).
*5 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (Refer to System Parameter "3.3 Setting of LU [Procedure ③-F] Formatting LU" (SYSPR 03-0280)).
Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

[WEB Information Message display]

Any one of the following is displayed.

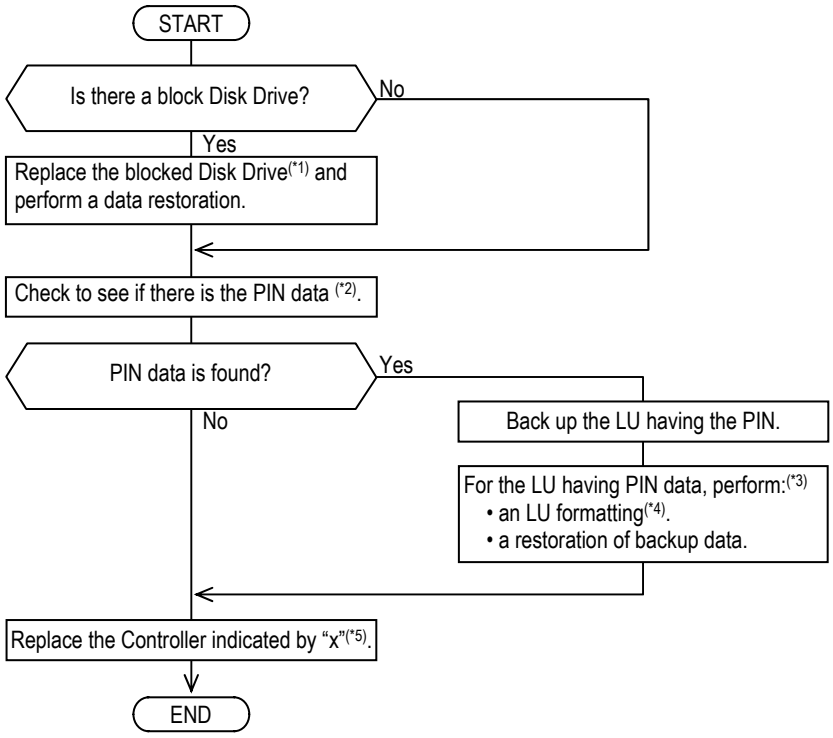
MM/DD/YYYY HH:MM:SS Cx W0G20x Parity generation LA error [DRR] (CTL-x)	:MANUAL/DMP
MM/DD/YYYY HH:MM:SS Cx HF0100 Data transfer check error [SEGPOSERR]	:MANUAL/DMP
MM/DD/YYYY HH:MM:SS Cx H20100 Parity generation LA error [DRR]	:MANUAL/DMP
MM/DD/YYYY HH:MM:SS Cx HD21xx Host transfer DMA error over (DMA-xx)	:MANUAL/DMP
MM/DD/YYYY HH:MM:SS Cx HD27xx Drive transfer DMA error over (DMA-xx)	:MANUAL/DMP



Date Time Detect Controller#

x : Controller# (0-1)

y : Transfer direction (R : Read, W : Write)

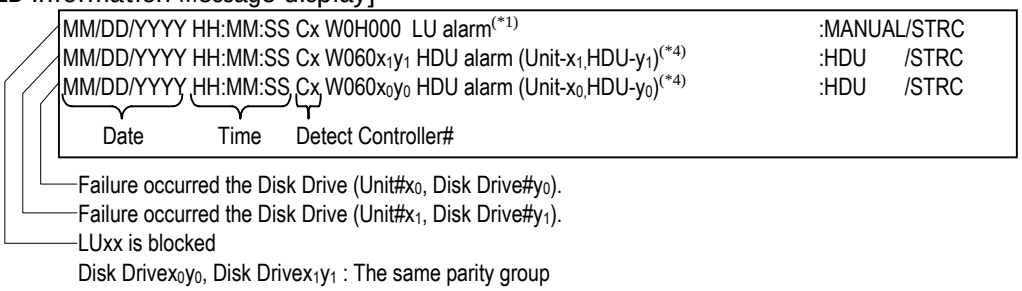
xx : DMA#(0-1)

[Recovery method]

*1 : For the replacement of the Disk Drive, refer to the Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).

*2 : Checking the presence of PIN data is performed by the Maintenance function of Storage Navigator Modular. Refer to "10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0250).

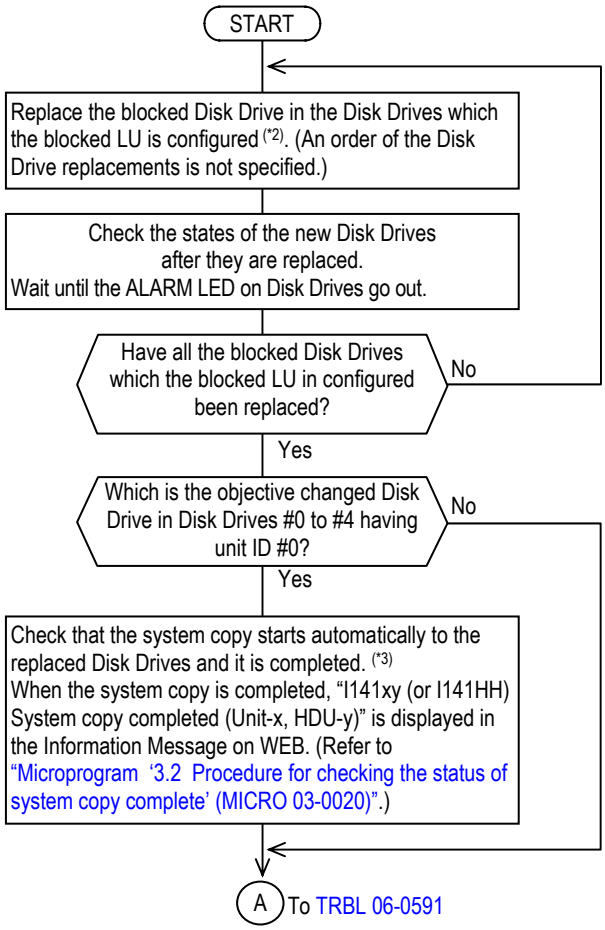
*3 : This operation is required because an LA/LRC error occurs even after the controller has been replaced if the LA/LRC data remains in the cache as PIN data.



*4 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (refer to System Parameter "3.3 Setting of LU [Procedure ③-F] Formatting LU" (SYSPR 03-0280)). Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

*5 : For the replacement of the Control Unit, refer to the Replacement "2.2.5 Replacing Control Unit" (REP 02-0390).

Copyright © 2005, 2006, Hitachi, Ltd.

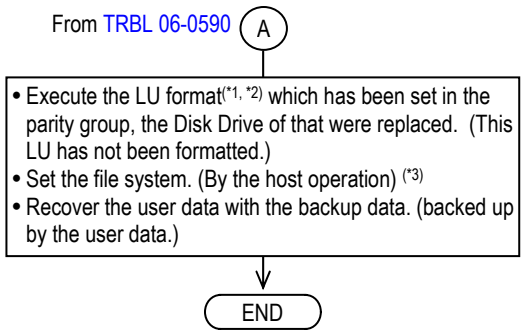


6.1.13 A failure occurred during operation : Case 3 (LU blockade)

[WEB Information Message display]

[Recovery method]

- The recovery operation must be reformed with the subsystem power turned on.



*1 : The blocked LU number is not displayed, with the message code "W0H000 LU alarm". Check the blocked LU in the Storage Navigator Modular.

*2 : For the replacement of the Disk Drive, refer to the Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).

*3 : The system copy is completed in approximately 1 minute 30 seconds for each Disk Drive.
Select [Tool] - [Configuration Setting] – [Restore Options] in the Array System Viewer window of Storage Navigator Modular, and if [Disk Drive Restore Options] is manual, the system copy must be executed manually. In this case, check that the system copy is completed after performing the restoration of the system information. Recover the system information with the maintenance function of the Storage Navigator Modular. For the operating procedure, refer to the Addition/Subtraction/Relocation "1.4.3 (5) Restoring the system information" (ADD 01-0360).

*4 : Any of W060AT, W060HH, W0GG00 and W0GH00 may be displayed other than W060xy. Also, when the Spare Disk Drive in use is blocked, any of W061xy, W061AT, W061HH, W0GJ00 and W0GK00 is displayed.

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : For the operating procedure, refer to the System Parameter "3.3 Setting of LU" (SYSPR 03-0140).

*2 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (refer to System Parameter "3.3 Setting of LU Procedure ③-F Formatting LU" (SYSPR 03-0280)).
Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

*3 : Request the customer and the SE for the work.

6.1.14 A failure occurred during operation : Case 4 (Loop failure)

A loop failure occurred, however, the failed part cannot be located

[WEB Information Message display]

When the codes, W080xy and I5Y400 to I5Y700, are indicated in the above messages, follow "(4) Actions to be taken when one of the message codes I5Y400 through I5Y700 is displayed" (TRBL 06-1090) for the maintenance.

When error messages other than W080xy Loop alarm (Path-x, Loop-y) occur at the same time, give priority to the recovery methods of those messages for the maintenance.

When the failed part cannot be identified because the above message is not displayed, go to Step "(1) Procedure for Recovery from Loop Failure" (TRBL 06-0680) and take a recovery action explained in it. When a subsystem down has occurred in the case of the dual controller configuration, go to Step "(2) Procedure for Recovery from Loop Failure (in the case of a subsystem down occurs in the dual controller configuration)" (TRBL 06-0830). When a subsystem down has occurred in the case of the single controller configuration, go to Step "(3) Procedure for Recovery from Loop Failure (in the case of a subsystem down occurs in the single controller configuration)" (TRBL 06-1020) and take a recovery action explained in it.

- Explanation of a Fibre Channel interface failure between a Control Unit and HDDs
  The Fibre Channel interface between a Control Unit and HDDs connects three points, that is, a controller, ENCs and HDDs. These three points compose a big loop.

	Control Unit to be used normally	Usage of loop (For HDDs)	RKM+RKAJ/RKA × 14	RKM+RKAJ AT× 14
			Number of HDDs in the same loop	
LOOP #0	Control Unit #0	Path #0	Max. 120	Max. 113
		Path #1	Max. 105	Max. 112
LOOP #1	Control Unit #1	Same as the above	Same as the above	Same as the above
	Control Unit to be used normally	Usage of loop (For HDDs)	RKS+RKAJ × 6	RKS+RKAJAT × 6
			Number of HDDs in the same loop	
LOOP #0	Control Unit #0	Path #0	Max. 56	Max. 53
		Path #1	Max. 49	Max. 52
LOOP#1	Control Unit #1	Same as the above	Same as the above	Same as the above
	Control Unit to be used normally	Usage of loop (For HDDs)	RKXS+RKAJAT × 6	
			Number of HDDs in the same loop	
LOOP #0	Control Unit #0	Path #0	Max. 105	
LOOP#1	Control Unit #1	Same as the above	Same as the above	
	Control Unit to be used normally	Usage of loop (For HDDs)	RKH+RKAJ/RKA × 30	RKH+RKAJ/RKA × 2+RKAJAT × 28
			Number of HDDs in the same loop	
LOOP #0	Control Unit #0	Path #0	Max. 120	Max. 113
		Path #1	Max. 105	Max. 112
		Path #2	Max. 120	Max. 113
		Path #3	Max. 105	Max. 112
LOOP#1	Control Unit #1	Same as the above	Same as the above	Same as the above

When a Fibre Channel interface failure occurs, all of these components are suspected. Therefore, identify the failed part by means of a Web message.

[Display of the WEB Information Message window]

MM/DD/YYYY HH:MM:SS Cx I1C1xy Loop diagnostic end (PATH-x, LOOP-y)	An automatic diagnosis of a failed part in the loop (Path-x, Loop-y), in which the failure occurred, was completed.
MM/DD/YYYY HH:MM:SS Cx I603xy Obstacle part unknown (PATH-x, LOOP-y)	The failed part could not be identified though an automatic diagnosis of the loop (Path-x, Loop-y), in which the failure occurred, was done.
MM/DD/YYYY HH:MM:SS Cx I1C0xy Loop diagnostic start (PATH-x, LOOP-y)	An automatic diagnosis of a failed part in the loop (Path-x, Loop-y), in which the failure occurred, was started.
MM/DD/YYYY HH:MM:SS Cx W0801y Loop alarm (PATH-1, LOOP-y)	Detach the Loop-y and change the loop to the alternating loop.
MM/DD/YYYY HH:MM:SS Cx W0800y Loop alarm (PATH-0, LOOP-y	Detach the Loop-y and change the loop to the alternating loop.
MM/DD/YYYY HH:MM:SS Cx I60200 Link Failure [LIMIT OVER]	Link failures have occurred more than its threshold value.

It diagnoses automatically in the Loop test after W080xy Loop alarm. Then the path in which the loop failure occurred is shown in the message (I1C0xy/I1C1xy).

Example:

```
MM/DD/YYYY HH:MM:SS C0 I1C110 Loop diagnostic end (Path-1,Loop-0)
MM/DD/YYYY HH:MM:SS C0 I60310 Obstacle part unknown (Path-1,Loop-0)   :MANUAL/STRC   } ①
MM/DD/YYYY HH:MM:SS C0 I1C010 Loop diagnostic start (Path-1,Loop-0)
MM/DD/YYYY HH:MM:SS C0 W06013 HDU alarm (Unit-1,HDU-3)               :HDU     /STRC   ②
MM/DD/YYYY HH:MM:SS C0 W08000 Loop alarm (Path-0,Loop-0)             :MANUAL/STRC
MM/DD/YYYY HH:MM:SS C0 W08010 Loop alarm (Path-1,Loop-0)             :MANUAL/STRC
```

In this case, a loop failure occurred in the loop, Loop-0 and Path-1 (on the CTL-0 side, for HDDs with odd numbers), shown in ①.

When error messages other than W080xy Loop alarm (Path-x, Loop-y) occur at the same time, give priority to the recovery methods of those messages for the maintenance.

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Procedure for Recovery from Loop Failure

If a loop failure (W080xy) occurs, you can open the diagnostic window of the Loop Failure Detection Function using a Web browser and execute the loop failure detection function to identify the failed HDU(s).

(a) Conditions for and notes on executing the Loop Failure Detection Function

(i) Do not execute the Loop Failure Detection Function while an LU formatting is in progress.

(ii) Do not perform the LU formatting while the Loop Failure Detection Function is being executed.

(iii) Do not pull out/insert a replacement component while the Loop Failure Detection Function is being executed.

Replace failure parts when single execution of the Loop Failure Detection Function is completed.

(Replacement failure parts: Disk Drive (Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)), Backup Battery Unit (Replacement "2.2.2 Replacing Backup Battery Unit" (REP 02-0240)), Power Unit (Replacement "2.2.4 Replacing Power Unit" (REP 02-0340)), Fan Assembly (Replacement "2.2.3 Replacing Fan Assembly" (REP 02-0300)), Control Unit (Replacement "2.2.5 Replacing Control Unit" (REP 02-0390)), ENC Unit (Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830)), and SENC Unit (Replacement "2.2.9 Replacing ENC Unit/SENC Unit" (REP 02-0830))

(iv) Procedure for recovery from a new failure occurs while the recovery operation using the Loop Failure Detection Function is in progress.

Make a recovery from the new failure preferentially. Execute the maintenance work of the Loop Failure Detection Function again from the start after another failure is recovered.

[Occurrence of a new failure]

- Interrupt the recovery operation by means of the Loop Failure Detection Function once.
- Perform a recovery action against the new failure (usual recovery procedure).
- Perform the recovery operation by means of the Loop Failure Detection Function again from the beginning.

(v) Time required to execute the Loop Failure Detection Function (Required time per HDU diagnosis)

Normally, single execution of the Loop Failure Detection Function finishes in ten seconds.

(vi) Use of the "Check List for Failed HDU Isolation".

When performing the recovery operation using the Loop Failure Detection Function, do it recording execution results of the Loop Failure Detection Function in the "(f) Check List #1 for Failed HDU Isolation" (TRBL 06-0980) and "(g) Check List #2 for Failed HDU Isolation (for all HDUs)"(TRBL 06-0990) appended to the Maintenance Manual.

To use the Check List #1 and #2 for Failed HDU Isolation, make as many copies of it as necessary for the recovery operation.

Copyright © 2005, 2006, Hitachi, Ltd.

(vii) Result of Loop Failure Detection Function Execution.

- The diagnostic results by the loop failure detection function appear as shown below in the upper right of the diagnostic window of the Loop Failure Detection Function or in the Information Message field.
  When the diagnosis result is OK : I5Z5xy Failure check OK (Path-x, Loop-y)
  When the diagnosis result is not OK : I5Z6xy Failure check NG (Path-x, Loop-y)
- When the result of the execution of the Loop Failure Detection Function is shown as "check OK", check the [OK] check box of the "Check List for Failed HDU Isolation".

(viii) When error messages other than W080xy Loop alarm (Path-x, Loop-y) occur at the same time, give priority to the recovery methods of those messages for the maintenance. Execute the maintenance work of the Loop Failure Detection Function again from the start after another failure is recovered.

(ix) Do not turn off the AC Power Unit Switch of the subsystem while the Loop Failure Detection Function is being executed.
If the AC Power Unit Switch of the subsystem is turned off while the Loop Failure Detection Function is being executed, turn off the AC Power Unit Switch of the added RKAJ/RKAJAT/RKA one, turn it on again, then turn on the AC Power Unit Switch of the subsystem.

(b) How to open the "Loop Failure Detection Function"

(i) Connect a PC and subsystem via a LAN (in order to use the WEB function). (System Parameter "1.1 (2) Connecting the LAN cross cable" (SYSPR 01-0030))

(ii) Connect to the website, http://subsystem IP address(‡1)/drvdiag.
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

‡1 : As for the IP address of the subsystem, refer to "3.1 (4) Procedure to connect portable maintenance PC to WEB" (TRBL 03-0010).

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Procedure for executing the Loop Failure Detection Function

(c-1) Confirming occurrence of a loop failure / Identifying a failed component using the Loop Failure Detection Function

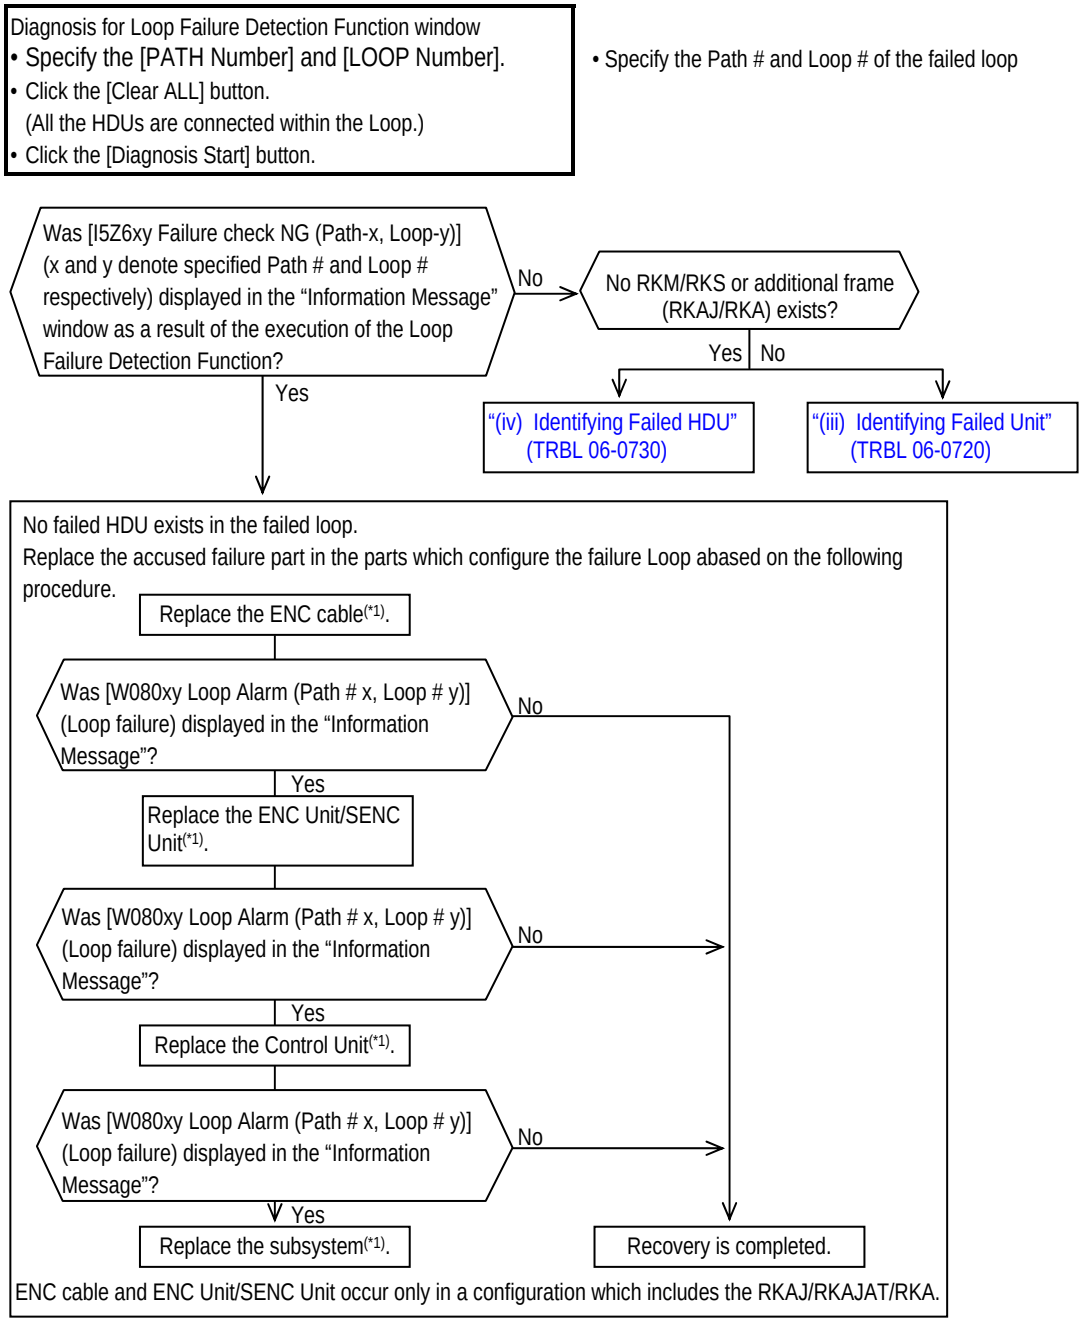
- Make sure that "W080xy Loop Alarm (Path # xx, Loop # xx) (Loop failure)" is displayed in the "Information Message" window. Enter the Path # and Loop # shown in the message in the check list.
- Execute each procedure for identifying the failed component by means of the Loop Failure Detection Function twice to make the identification of the failed component certain. (Sets of two check boxes, the 1st diagnosis result and 2nd diagnosis result, are prepared in the Check List for Failed HDU Isolation.)

(i) Identifying Failed Loops and Paths

① Identify the failed loop in which the failed HDU is installed by executing the Loop Failure Detection Function for each Path # and Loop # in the state in which all the HDUs are connected to the loop.

② Execute the Loop Failure Detection Function for both of the Loop-0 and Loop-1 of the path observed to have the loop failure.

Diagnosis for Loop Failure Detection Function window	When "Wxxxx Loop Alarm (Path #0, Loop #0)" is displayed.
• Specify the [PATH Number] and [LOOP Number]. • Click the [Check ALL] button. (All the HDUs are connected within the Loop.) • Click the [Diagnosis Start] button.	• Specify the [PATH Number] as [PATH 0]. • Specify the [LOOP Number] as [LOOP 0].



③ When [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window as a result of the execution of the Loop Failure Detection Function, the Path # and Loop # shown in parentheses represent the failed loop. Enter the failed loop identified in the check sheet.

NOTE : When the failed loop cannot be identified, identify the failed HDU by executing the Loop Failure Detection Function for all the HDU following the procedure explained in Step "(c-2) (i) Identifying Failed HDU" (TRBL 06-0750). (When doing that, use the Check List #2 for Failed HDU Isolation (For checking all HDUs).)

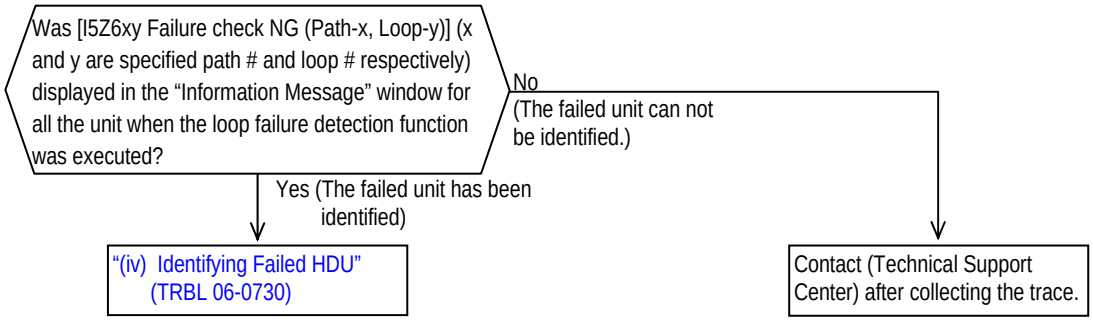
Copyright © 2005, Hitachi, Ltd.

(ii) Judging whether or not the HDU caused the failure

① Confirm that the failed HDU exists in the failed loop concerned by executing the Loop Failure Detection Function bypassing all the HDUs in the failed loop (separating them from the loop).

*1 : For the replacement of the failed component, refer to the Replacement "Chapter 2. Parts Replacement" (REP 02-0000).

Copyright © 2005, 2006, Hitachi, Ltd.



(iii) Identifying Failed Unit

① Identify the unit in which the failed HDU is installed by executing the Loop Failure Detection Function for each of all the units.

- Execute the Loop Failure Detection Function for each unit once at a time
- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button. (Clear the conditions for the preceding check.)
- Check all the HDU# check boxes of the Unit-x.
- Click the [Diagnosis Start] button

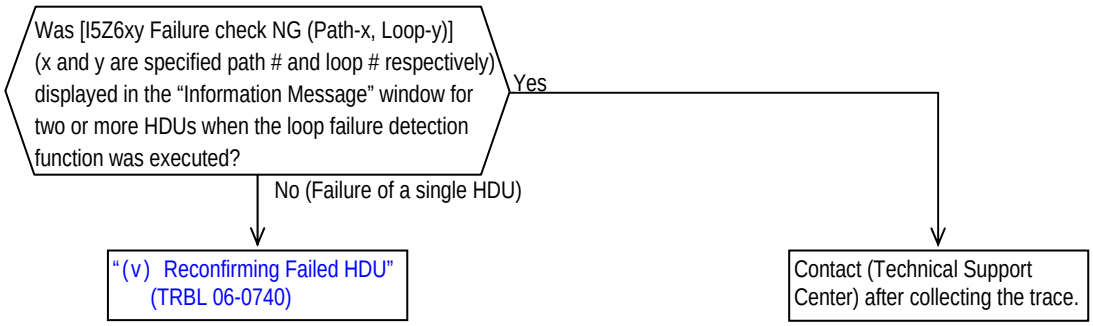
• Specify the Path # and Loop # of the failed loop.

② Enter the unit number, for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet. (It is determined that the failed component exists in the failed unity.)

Copyright © 2005, Hitachi, Ltd.

(iv) Identifying Failed HDU

① Identify a failed HDD by applying the loop failure detection function to each HDD in the failed unit, which was identified in Step (iii), one by one.

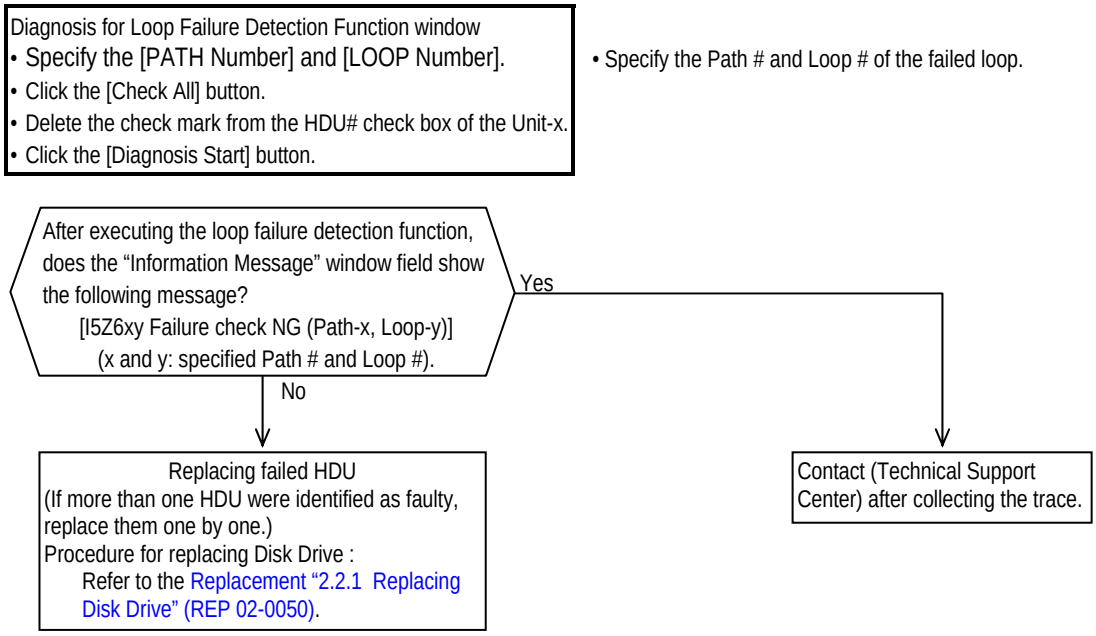


- Execute the Loop Failure Detection Function for all the HDUs of the Unit-x.

Diagnosis for Loop Failure Detection Function window

- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button.
  (Clear the conditions for the preceding check.)
- Check the HDU# check box of the Unit-x.
- Click the [Diagnosis Start] button.

• Specify the Path # and Loop # of the failed loop.



② Enter the HDU number, for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet.

Copyright © 2005, Hitachi, Ltd.

(v) Reconfirming Failed HDU

① Execute the loop failure detection function in the state in which only the HDU, which was identified as a cause of the failure in Step (iv), is disconnected from the loop and verify that no error occurs.

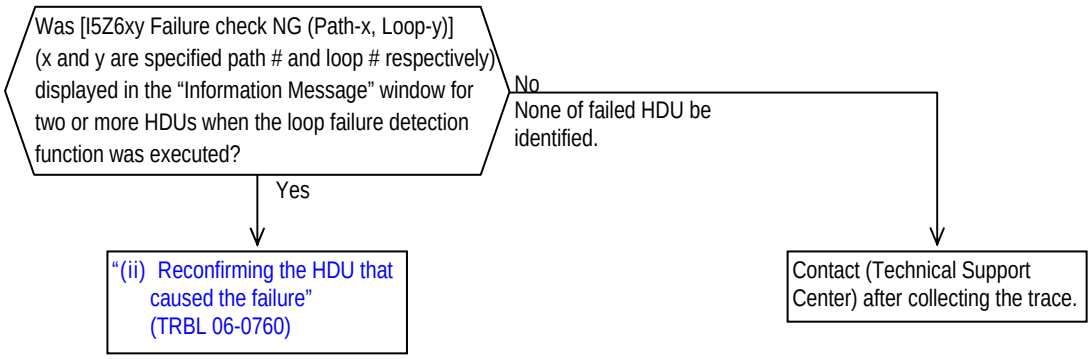
Copyright © 2005, Hitachi, Ltd.

(c-2) Confirming occurrence of a loop failure / Specifying a failed component using the Loop Failure Detection Function (Failed loop could not identified)

- When the failed loop could not identified although the operation was performed according to "(c-1) (i) Identifying Failed Loops and Paths" (TRBL 06-0700), "Confirming occurrence of a loop failure/Identifying a failed component using the Loop Failure Detection Function", identify the failed component by executing the Loop Failure Detection Function for each of all the HDUs.

(i) Identifying Failed HDU

① Identify the failed HDU by executing the Loop Failure Detection Function for each HDU.

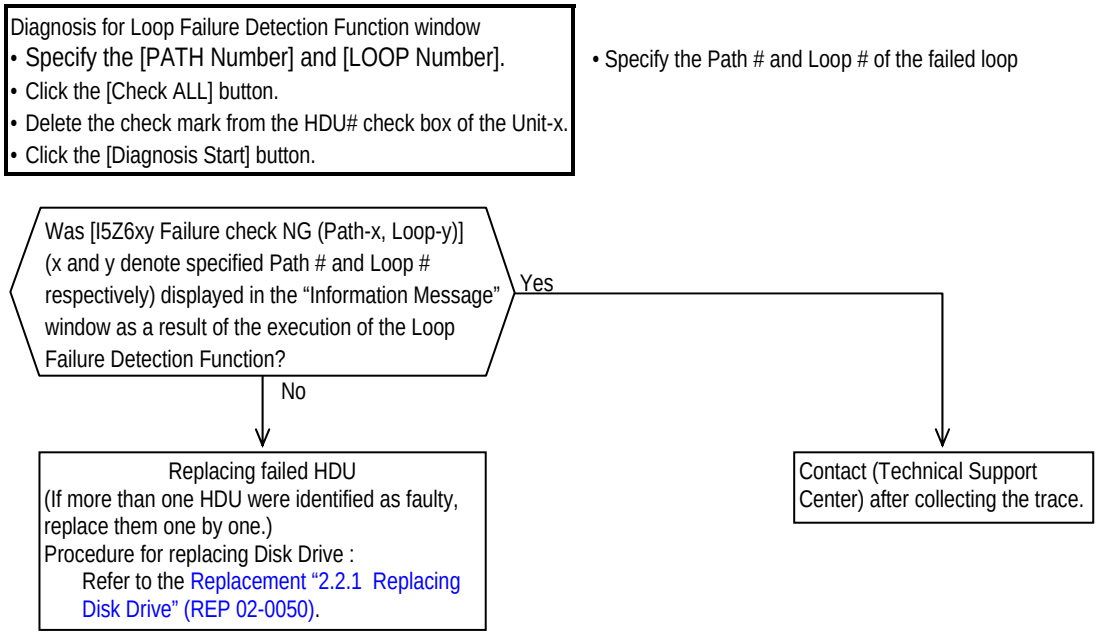


- Execute the Loop Failure Detection Function respectively and individually for all the Disk Drives of each subsystem.

Diagnosis for Loop Failure Detection Function window

- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button.
  (Clear the conditions for the preceding check.)
- Check the HDU # check box of the Unit-x.
- Click the [Diagnosis Start] button.

---> Execute it in the Path #0 and Path #1 or both of Path #2 and Path #3 of the Loop where[W080xy] occurred in "Information Message".



② Enter the HDU number, for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet.

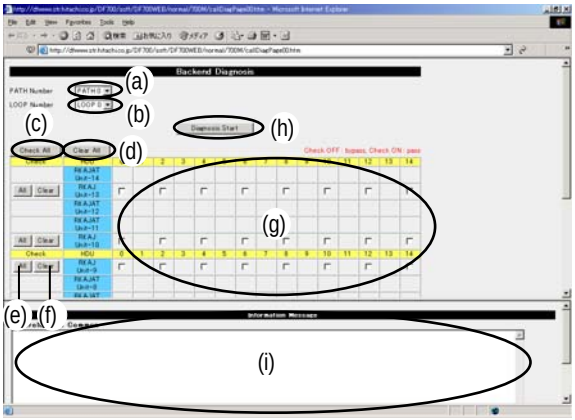
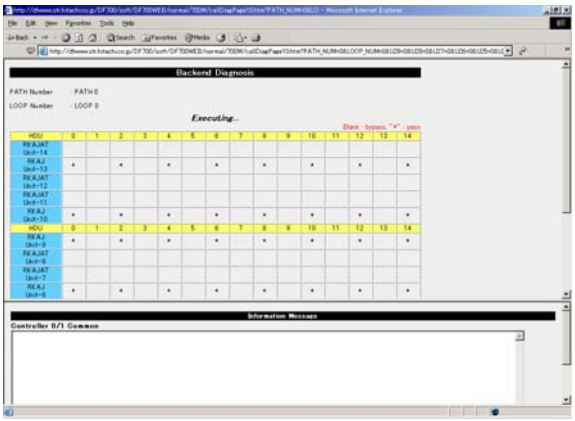
(ii) Reconfirming the HDU that caused the failure



① Execute the Loop Failure Detection Function in the state in which only the identified HDU is separated in order to verify the failed HDU.

Copyright © 2005, Hitachi, Ltd.

(d) WEB window of the Loop Failure Detection Function



(i) Window for instructing the Loop Failure Detection Function

	Element in the window	Description
(a)	A list for selecting a path number	To be used to select a path number of a loop to be diagnosed.
(b)	A list for selecting a loop number	To be used to select a loop number of a loop to be diagnosed.
(c)	“Check All” button	Makes all check boxes selected.
(d)	“Clear All” button	Makes all check boxes unselected.
(e)	“All” button	Makes all check boxes selected for each unit.
(f)	“Clear” button	Makes all check boxes unselected for each unit.
(g)	Each check box	To be used to specify whether to link the drive concerned to a selected loop. The check box is not displayed when no frame exists or no drive is installed.
(h)	“Diagnosis Start” button	Starts a diagnosis.
(i)	Information Message	Displays information on the entire system. Result of a diagnosis is also displayed here.

Copyright © 2005, 2006, Hitachi, Ltd.

(ii) Window displayed during execution of the Loop Failure Detection Function

(iii) Window displayed when the Loop Failure Detection Function ends

	Element in the window	Description
①	Display of a summary of a diagnosis result	Displays a result of a diagnosis.
②	“Complete” button	Changes a window to that of a diagnosis by the Loop Failure Detection Function.

(2) Procedure for Recovery from Loop Failure (in the case of a subsystem down occurs in the dual controller configuration)

If the subsystem went down due to a loop failure (W080xy), you can open the diagnostic window of the Loop Failure Detection Function using a Web browser and execute the loop failure detection function to identify the failed HDU(s).

(a) Conditions for and notes on executing the Loop Failure Detection Function

(i) Do not pull out/insert a replacement component while the Loop Failure Detection Function is being executed.

Replace failure parts when single execution of the Loop Failure Detection Function is completed.

(Replacement failure parts: Disk Drive, Backup Battery Unit, Power Unit, Fan Assembly, and Control Unit, ENC Unit, SENC Unit)

(ii) Procedure for recovery from a new failure occurs while the recovery operation using the Loop Failure Detection Function is in progress.

Make a recovery from the new failure preferentially. Execute the maintenance work of the Loop Failure Detection Function again from the start after another failure is recovered.

[Occurrence of a new failure]
- Interrupt the recovery operation by means of the Loop Failure Detection Function once.
- Perform a recovery action against the new failure (usual recovery procedure).
- Perform the recovery operation by means of the Loop Failure Detection Function again from the beginning.

(iii) Time required to execute the Loop Failure Detection Function (Required time per HDU diagnosis)

Normally, single execution of the Loop Failure Detection Function finishes in ten seconds.

Use of the "Check List for Failed HDU Isolation".

When performing the recovery operation using the Loop Failure Detection Function, do it recording execution results of the Loop Failure Detection Function in the "(f) Check List #1 for Failed HDU Isolation" (TRBL 06-0980) or "(g) Check List #2 for Failed HDU Isolation (for all HDUs)" (TRBL 06-0990) appended to the Maintenance Manual.

To use the Check List #1 and #2 for Failed HDU Isolation, make as many copies of it as necessary for the recovery operation.

(iv) Result of Loop Failure Detection Function Execution.

- The diagnostic results by the loop failure detection function appear as shown below in the upper right of the diagnostic window of the Loop Failure Detection Function or in the Information Message field.

  When the diagnosis result is OK : I5Z5xy Failure check OK (Path-x, Loop-y)

  When the diagnosis result is not OK : I5Z6xy Failure check NG (Path-x, Loop-y)
- When the result of the execution of the Loop Failure Detection Function is shown as "check OK", check the [OK] check box of the "Check List for Failed HDU Isolation".

(v) When error messages other than W080xy Loop alarm (Path-x, Loop-y) occur at the same time, give priority to the recovery methods of those messages for the maintenance.

Execute the maintenance work of the Loop Failure Detection Function again from the start after another failure is recovered.

Copyright © 2005, 2006, Hitachi, Ltd.

(vi) Do not turn off the AC Power Unit Switch of the subsystem while the Loop Failure Detection Function is being executed.
If the AC Power Unit Switch of the subsystem is turned off while the Loop Failure Detection Function is being executed, turn off the AC Power Unit Switch of the added RKAJ/RKAJAT/RKA one, turn it on again, then turn on the AC Power Unit Switch of the subsystem.

(vii) If the failure occur in all of the four loops, the Loop Failure Detection function cannot be used. In this case, contact the Technical Support Center.

(viii) When an instruction to isolate two or more HDUs in the same RAID group is given using the Failed HDU Isolation function, user data will be lost.

(ix) When a failure has occurred in a loop of the Path #0 and Loop #0 in the case of the single controller configuration, the Loop Failure Detection Function cannot be used.
Take a recovery action according to Step "(3) Procedure for Recovery from Loop Failure (in the case of a subsystem down occurs in the single controller configuration)" (TRBL 06-1020).

(b) How to start the loop failure detection function

(i) Connect the PC and the subsystem via the LAN (for using the Web function). (System Parameter "1.1 (2) Connecting the LAN cross cable" (SYSPR 01-0030))

(ii) Press the RST SW on the both controllers to enter the Web maintenance mode.
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

(iii) Connect to the website, http://subsystem IP address(‡1)/drvdiag.
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(iv) In the startup mode window (Boot Up Mode Backend Diagnostic), select Enable and then choose the OK button.

(v) In the startup mode window, choose the Reboot button to restart the device.

(vi) Check the READY LED on the front side of the Basic Chassis.
- If the READY LED is Low-speed blinking, connect to http://device-IP-address/drvdiag, and then open the loop failure detection function window.
- In a case other than that where the READY LED is Low-speed blinking, retry the operation in (b).
  If the READY LED is not Low-speed blinking after the retry, contact the (Technical Support Center) (for replacing the subsystem).

‡1 : As for the IP address of the subsystem, refer to "3.1 (4) Procedure to connect portable maintenance PC to WEB" (TRBL 03-0010).

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Procedure for executing the Loop Failure Detection Function

(c-1) Confirming occurrence of a loop failure / Identifying a failed component using the Loop Failure Detection Function

- Execute each procedure for identifying the failed component by means of the Loop Failure Detection Function twice to make the identification of the failed component certain. (Sets of two check boxes, the 1st diagnosis result and 2nd diagnosis result, are prepared in the Check List for Failed HDU Isolation.)

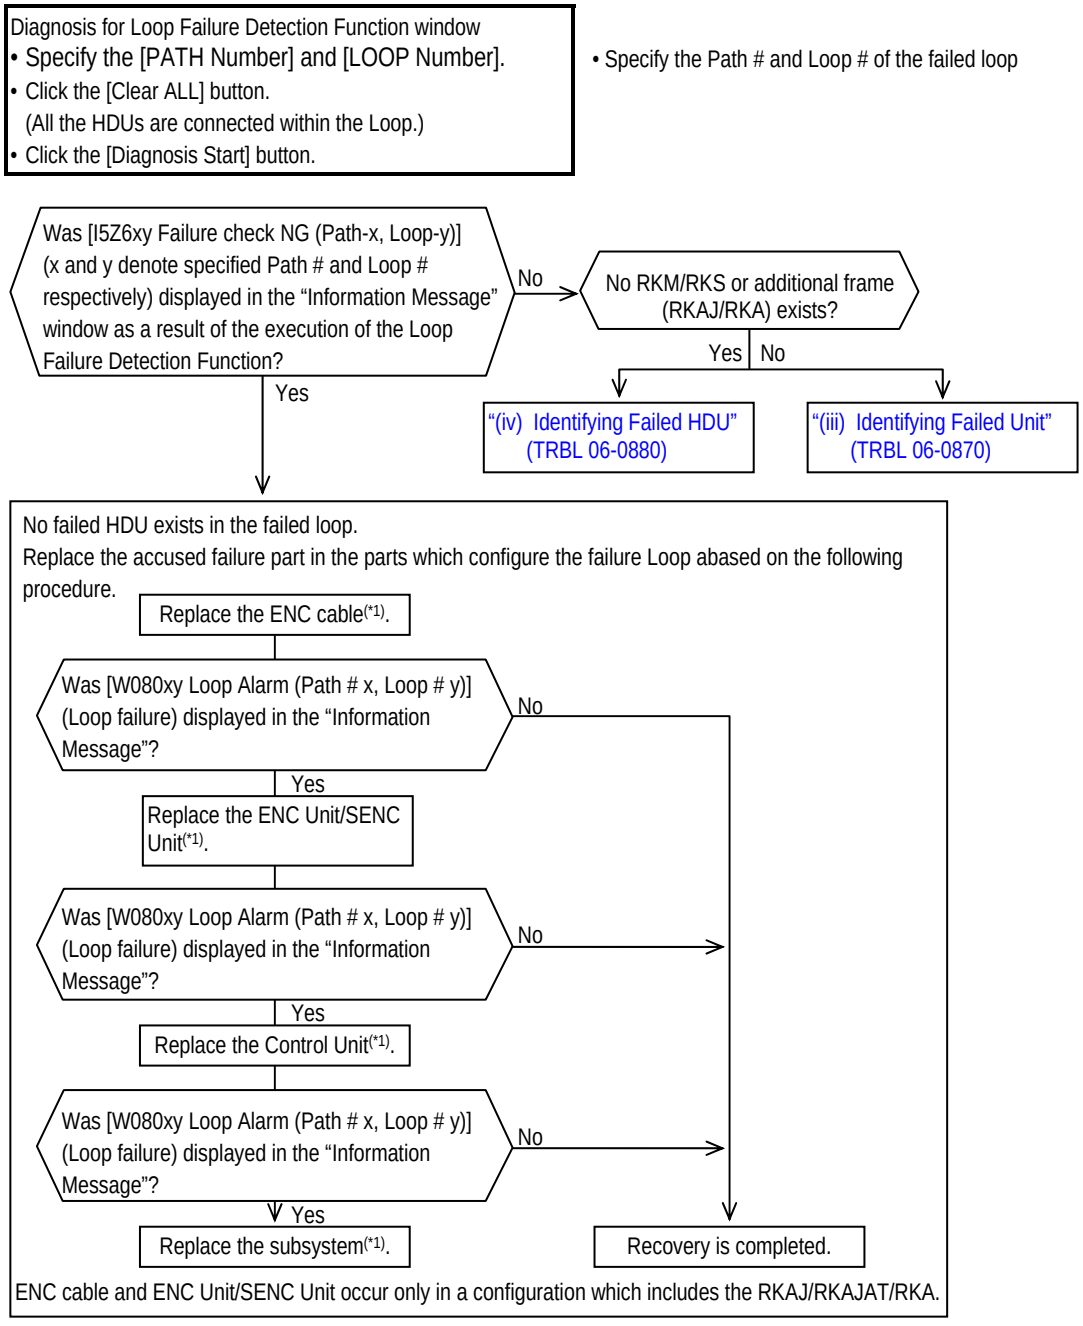
(i) Identifyng Failed Loops and Paths

① Identify the failed loop in which the failed HDU is installed by executing the Loop Failure Detection Function for each Path # and Loop # in the state in which all the HDUs are connected to the loop.

② Execute the Loop Failure Detection Function for both of the Loop-0 and Loop-1 of the path observed to have the loop failure.

Diagnosis for Loop Failure Detection Function window	When "Wxxxx Loop Alarm (Path #0, Loop #0)" is displayed.
• Specify the [PATH Number] and [LOOP Number]. • Click the [Check ALL] button. (All the HDUs are connected within the Loop.) • Click the [Diagnosis Start] button.	• Specify the [PATH Number] as [PATH 0]. • Specify the [LOOP Number] as [LOOP 0].

③ When [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window as a result of the execution of the Loop Failure Detection Function, the Path # and Loop # shown in parentheses represent the failed loop. Enter the failed loop identified in the check sheet.



④ Perform the procedures from "(ii) Judging whether or not the HDU caused the failure" (TRBL 06-0860) to "(v) Reconfirming Failed HDU" (TRBL 06-0890), and identify the failed HDU for each one of the failed loops.

NOTE : When the failed loop cannot be identified, identify the failed HDU by executing the Loop Failure Detection Function for all the HDU following the procedure explained in Step "(c-2) (i) Identifying Failed HDU" (TRBL 06-0910). (When doing that, use the Check List #2 for Failed HDU Isolation (For checking all HDUs).)

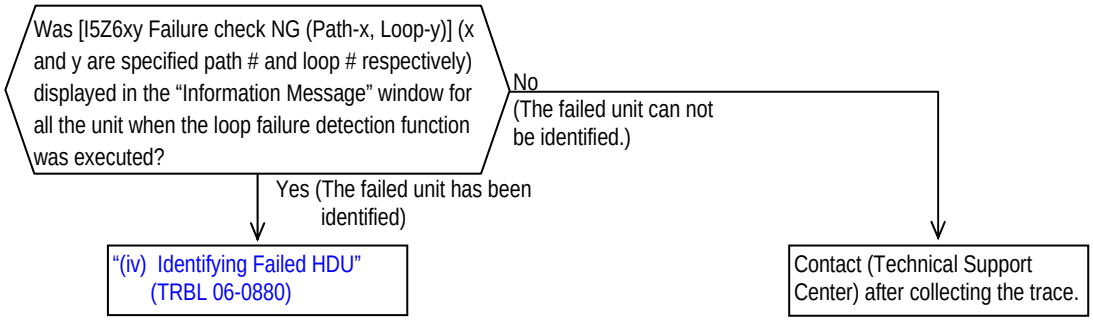
Copyright © 2005, Hitachi, Ltd.

(ii) Judging whether or not the HDU caused the failure

① Confirm that the failed HDU exists in the failed loop concerned by executing the Loop Failure Detection Function bypassing all the HDUs in the failed loop (separating them from the loop).

*1 : For the replacement of the failed component, refer to the Replacement "Chapter 2. Parts Replacement" (REP 02-0000).

Copyright © 2005, 2006, Hitachi, Ltd.



(iii) Identifying Failed Unit

① Identify the unit in which the failed HDU is installed by executing the Loop Failure Detection Function for each of all the units.

- Execute the Loop Failure Detection Function for each unit once at a time
- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button.
  (Clear the conditions for the preceding check.)
- Check all the HDU# check boxes of the Unit-x.
- lick the [Diagnosis Start] button.

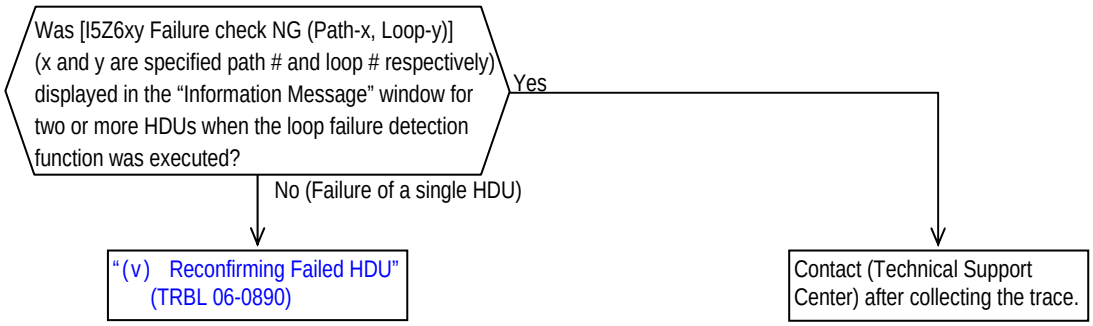
• Specify the Path # and Loop # of the failed loop.

② Enter the unit number, for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet. (It is determined that the failed component exists in the failed unit.)

Copyright © 2005, Hitachi, Ltd.

(iv) Identifying Failed HDU

① Identify a failed HDD by applying the loop failure detection function to each HDD in the failed unit, which was identified in Step (iii), one by one.

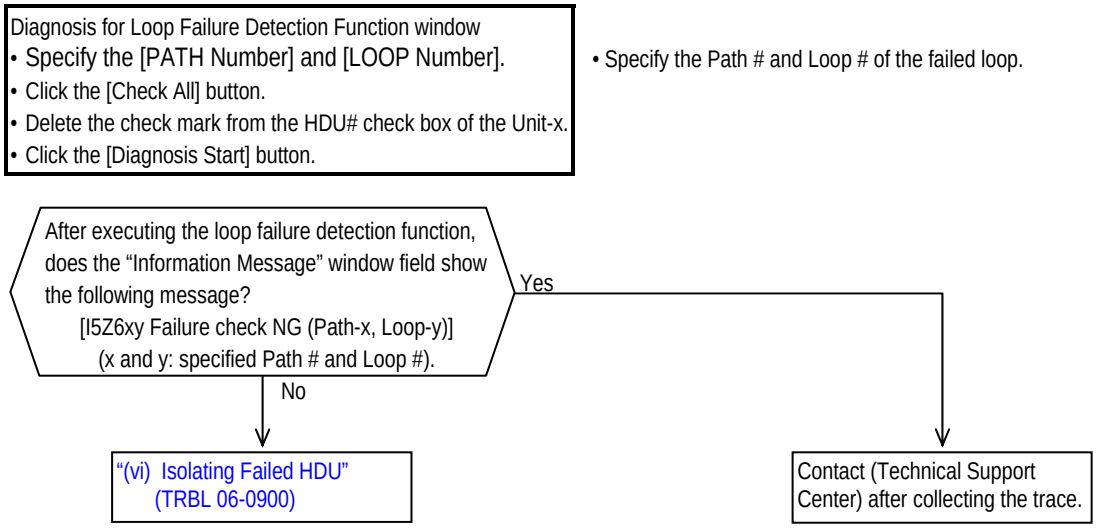


- Execute the Loop Failure Detection Function for all the HDUs of the Unit-x.

Diagnosis for Loop Failure Detection Function window

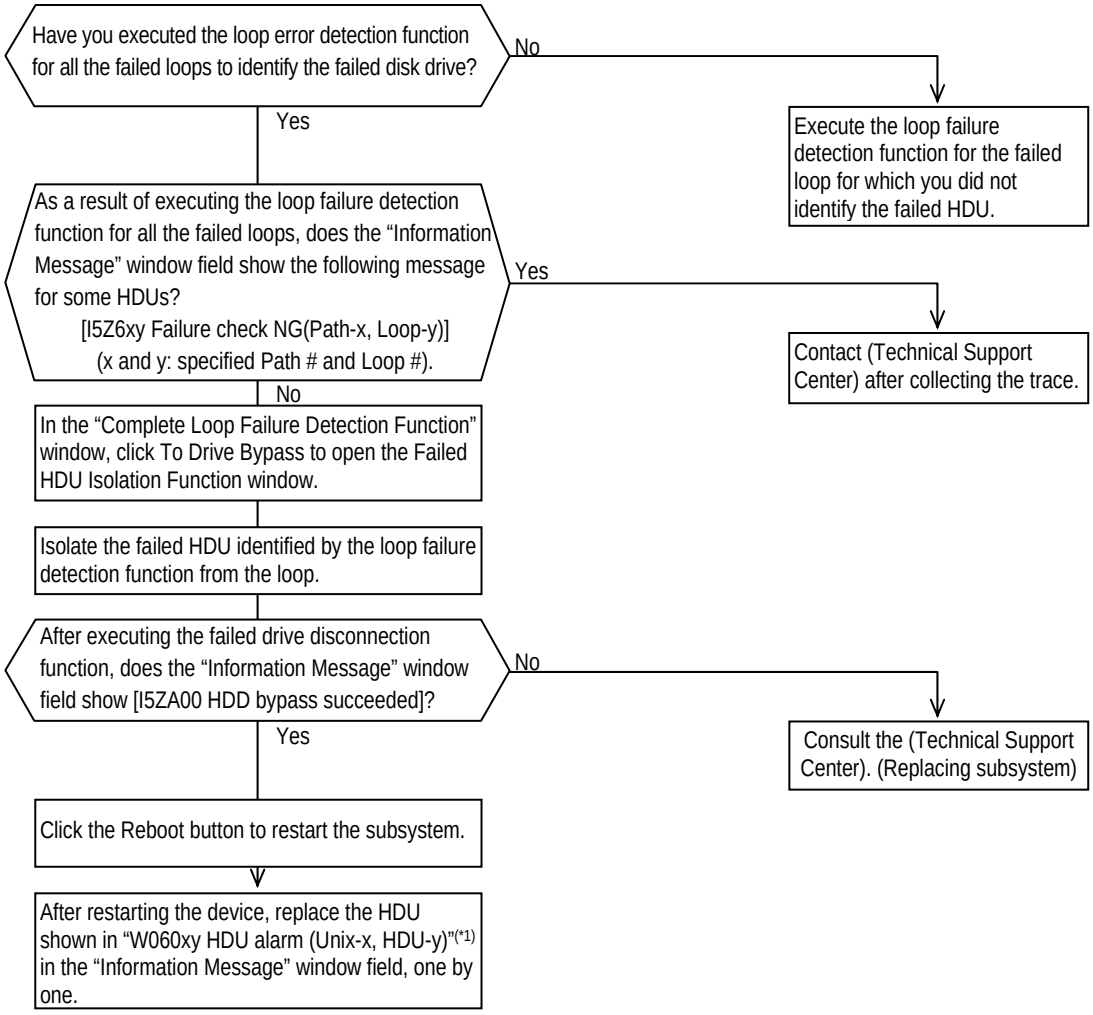
- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button.
  (Clear the conditions for the preceding check.)
- Check the HDU# check box of the Unit-x.
- Click the [Diagnosis Start] button.

• Specify the Path # and Loop # of the failed loop.



② Enter the HDU number for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet.

Copyright © 2005, Hitachi, Ltd.



(v) Reconfirming Failed HDU

① Execute the loop failure detection function in the state in which only the HDU, which was identified as a cause of the failure in Step (iv), is disconnected from the loop and verify that no error occurs.

Copyright © 2005, Hitachi, Ltd.

(vi) Isolating Failed HDU

NOTE : If you isolated multiple HDU in the same RAID group from the loop, restarting the subsystems deletes the user data.

*1 : Any of W060AT, W060HH, W061xy, W061AT, W061HH, W0GG00, W0GH00, W0GJ00 and W0GK00 may be displayed other than W060xy.

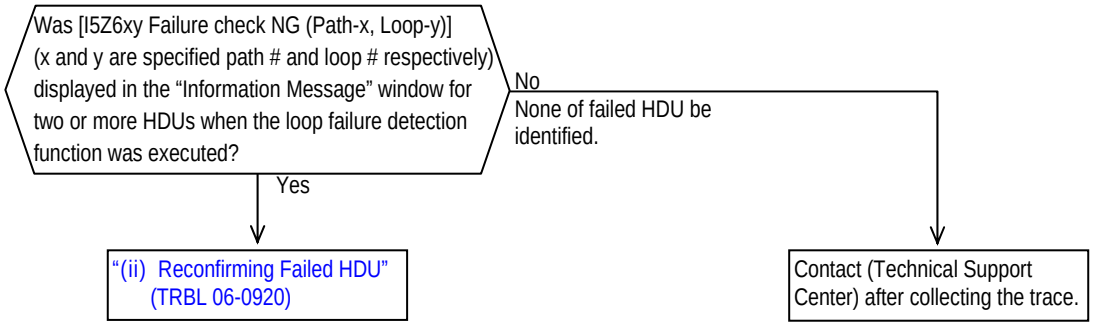
Copyright © 2005, 2006, Hitachi, Ltd.

(c-2) Confirming occurrence of a loop failure / Specifying a failed component using the Loop Failure Detection Function (Failed loop could not identified)

- When the failed loop could not identified although the operation was performed according to "(c-1) (i) Identifyng Failed Loops and Paths" (TRBL 06-0850), "Confirming occurrence of a loop failure/Identifying a failed component using the Loop Failure Detection Function", identify the failed component by executing the Loop Failure Detection Function for each of all the HDUs.

(i) Identifying Failed HDU

① Identify the failed HDU by executing the Loop Failure Detection Function for each HDU.

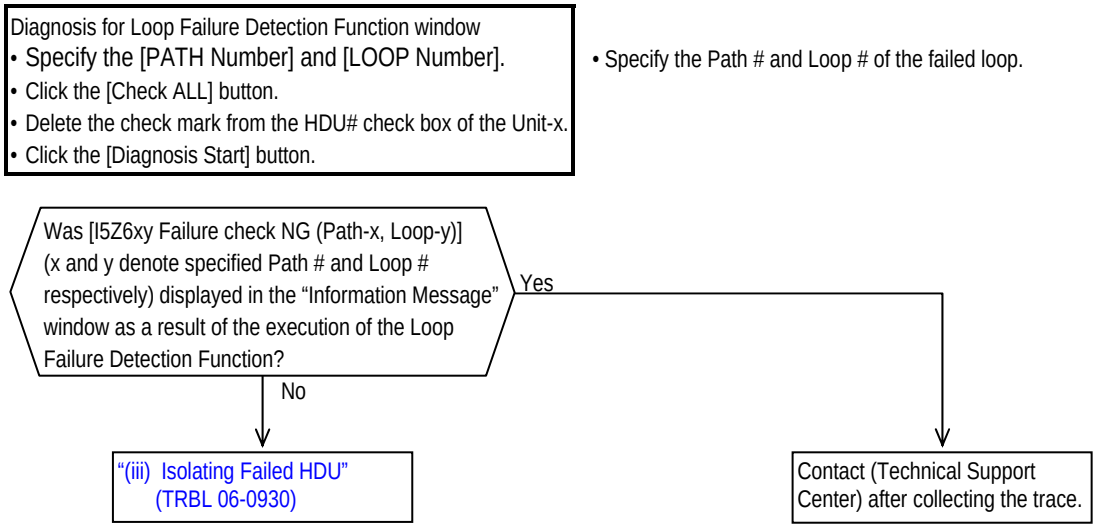


- Execute the Loop Failure Detection Function for all the HDUs of the each unit.

Diagnosis for Loop Failure Detection Function window

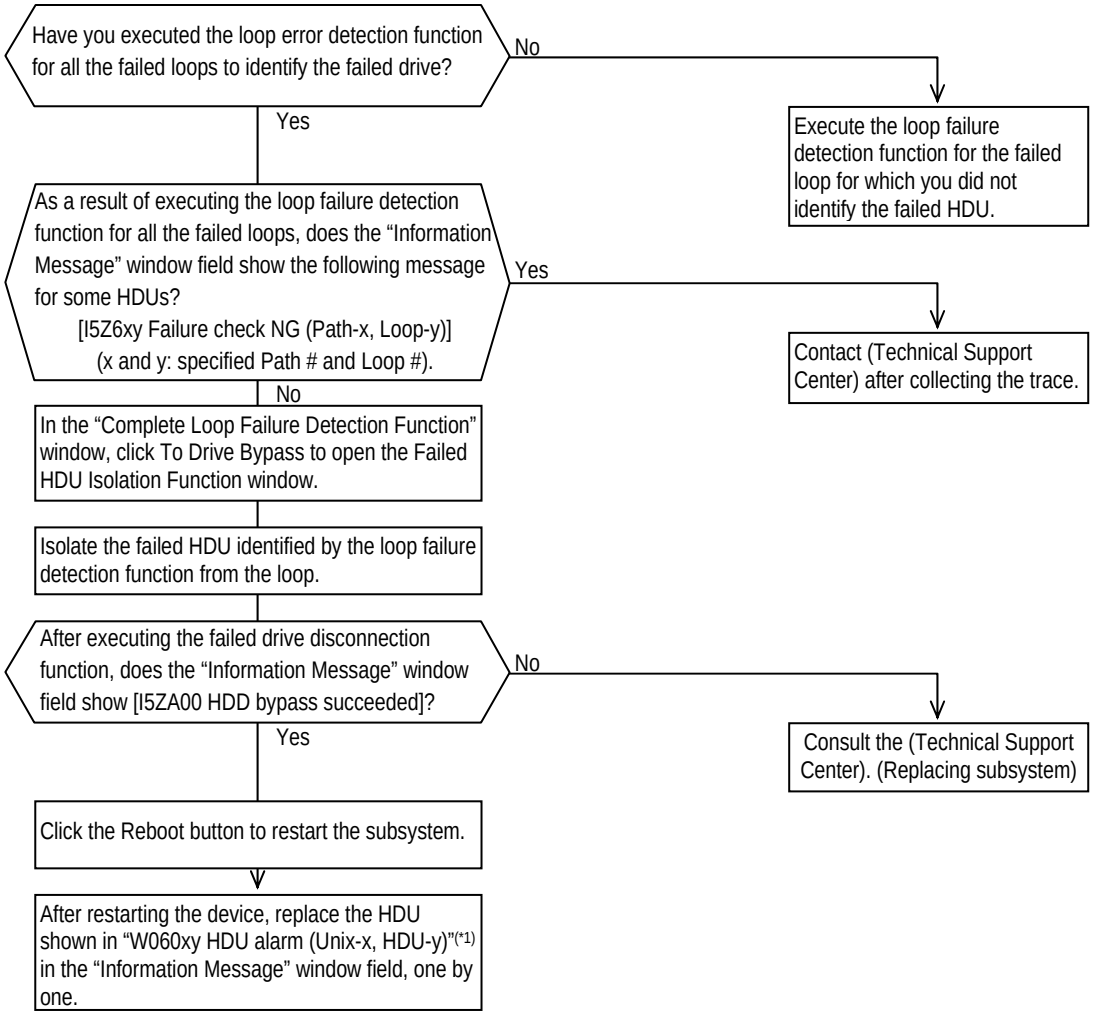
- Specify the [PATH Number] and [LOOP Number].
- Click the [Clear All] button.
  (Clear the conditions for the preceding check.)
- Check the HDU# check box of the Unit-x.
- Click the [Diagnosis Start] button.

---> Execute it in the Path #0 and Path #1 or both of Path #2 and Path #3 of the Loop where [W080xy] occurred in "Information Message".



② Enter the HDU number, for which [I5Z6xy Failure check NG (Path-x, Loop-y)] (x and y denote specified Path # and Loop # respectively) is displayed in the "Information Message" window, in the check sheet.

Copyright © 2005, 2006, Hitachi, Ltd.

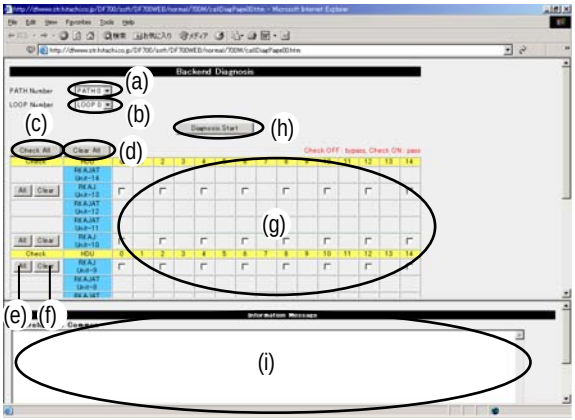


(ii) Reconfirming Failed HDU

① Execute the Loop Failure Detection Function in the state in which only the identified HDU is separated in order to verify the failed HDU.

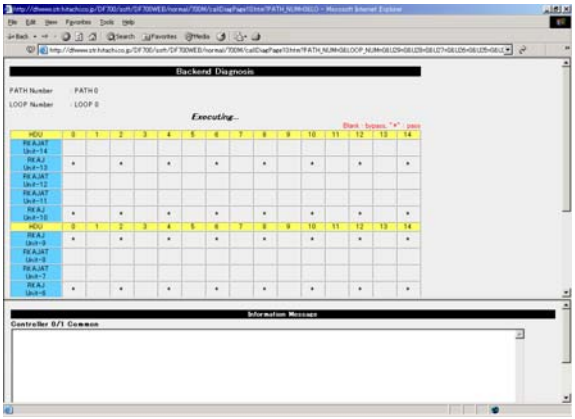
Copyright © 2005, Hitachi, Ltd.

(iii) Isolating Failed HDU



*1 : Any of W060AT, W060HH, W061xy, W061AT, W061HH, W0GG00, W0GH00, W0GJ00 and W0GK00 may be displayed other than W060xy.

Copyright © 2005, 2006, Hitachi, Ltd.



(d) WEB window of the Loop Failure Detection Function

(i) Window for instructing the Loop Failure Detection Function

	Element in the window	Description
(a)	A list for selecting a path number	To be used to select a path number of a loop to be diagnosed.
(b)	A list for selecting a loop number	To be used to select a loop number of a loop to be diagnosed.
(c)	“Check All” button	Makes all check boxes selected.
(d)	“Clear All” button	Makes all check boxes unselected.
(e)	“All” button	Makes all check boxes selected for each unit.
(f)	“Clear” button	Makes all check boxes unselected for each unit.
(g)	Each check box	To be used to specify whether to link the drive concerned to a selected loop. The check box is not displayed when no frame exists or no drive is installed.
(h)	“Diagnosis Start 2” button	Starts a diagnosis.
(i)	Information Message	Displays information on the entire system. Result of a diagnosis is also displayed here.

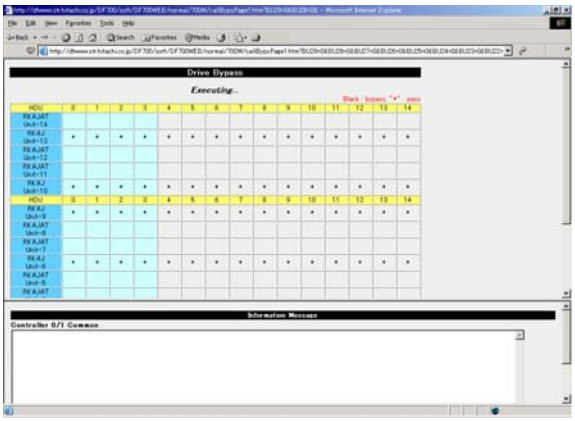
(ii) Window displayed during execution of the Loop Failure Detection Function

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) Window displayed when the Loop Failure Detection Function ends

	Element in the window	Description
①	Display of a summary of a diagnosis result	Displays a result of a diagnosis.
②	A linkage with the Failed HDU Disconnection function	Change a window to that of the Failed HDU Disconnection function.
③	"Complete" button	Changes a window to that of a diagnosis of the Loop Failure Detection functions.

Copyright © 2005, Hitachi, Ltd.



(e) WEB window of the Failed HDU Isolation Function

(i) Starting window of Failed HDU Isolation Function

	Element in the window	Description
(a)	Each check box	To be used to specify whether to bypass the drive concerned (whether to remove the check mark).
(b)	"Bypass Start" button	Starts the bypassing operation.
(c)	Information Message	Displays progress of the bypassing operation.

(ii) Window showing a running state of the Failed HDU Isolation Function

Copyright © 2005, Hitachi, Ltd.

(iii) Completion window of the Failed HDU Isolation Function

	Element in the window	Description
①	Display of a summary of a diagnosis result	Displays a result of the diagnosis.
②	"Retry" button	Changes a window to that for disconnecting a failed HDU.
③	"Trace" button	Starts a collection of a trace.
④	"Reboot" button	Restarts the subsystem.

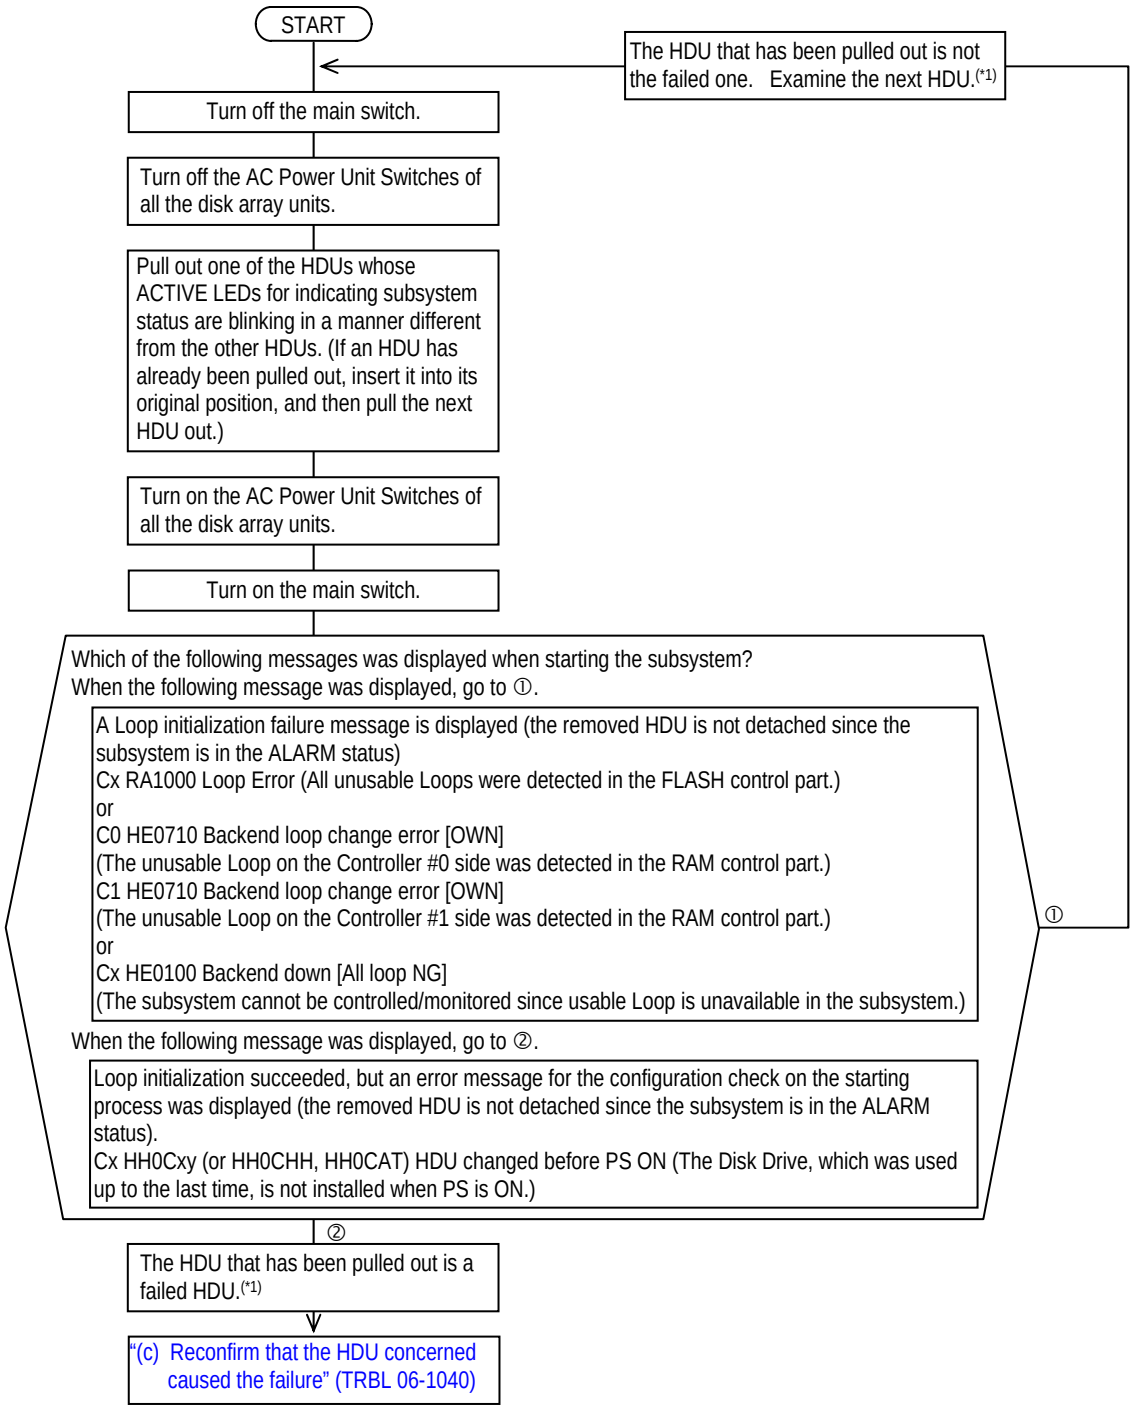
(3) Procedure for Recovery from Loop Failure (in the case of a subsystem down occurs in the single controller configuration)

The Loop Failure Detection Function cannot be used because it is impossible to start the subsystem. Therefore, identify the failed HDU following the procedure below.

NOTE : Execute the procedure recording the history of locating the failed part on the "(e) Check List #3 for Failed HDU Isolation (for all HDUs)" (TRBL 06-1060).

(a) Turn off/on the subsystem.

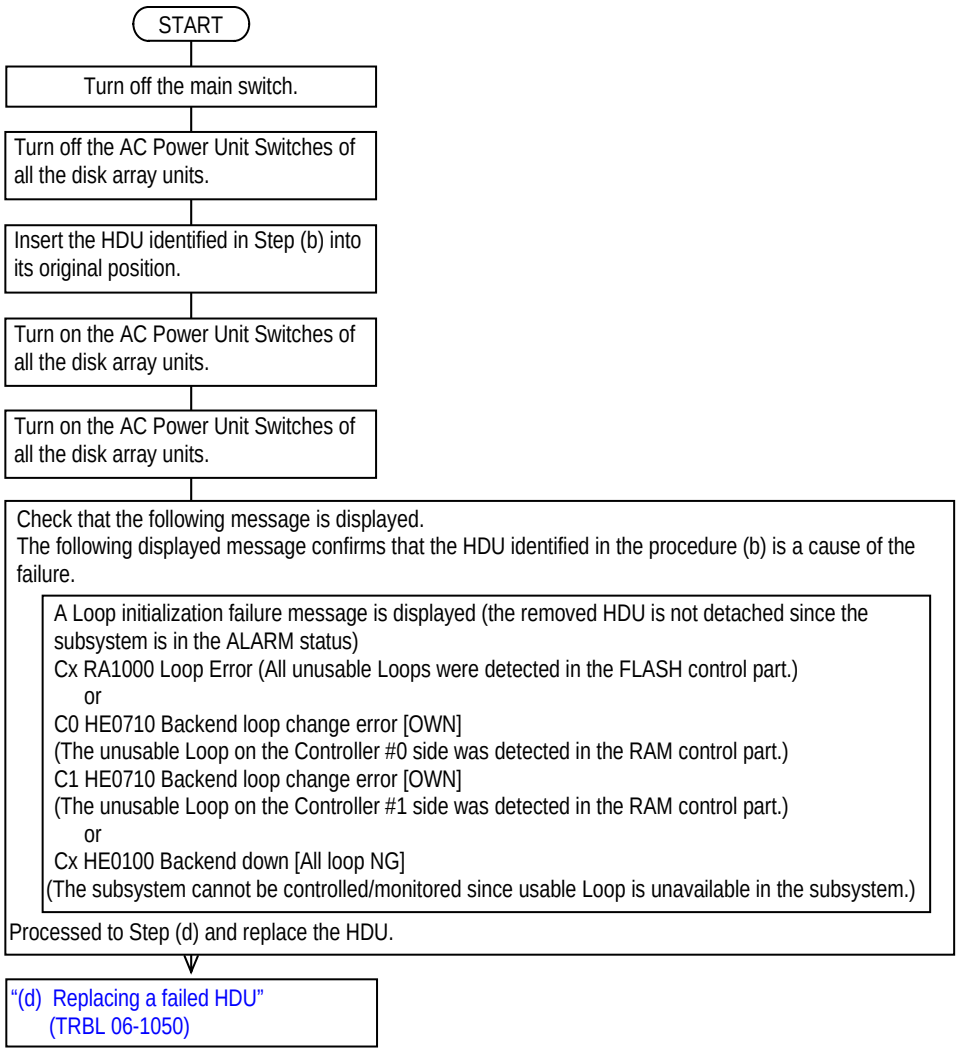


Check if the subsystem recovers from a starting failure.

Copyright © 2005, Hitachi, Ltd.

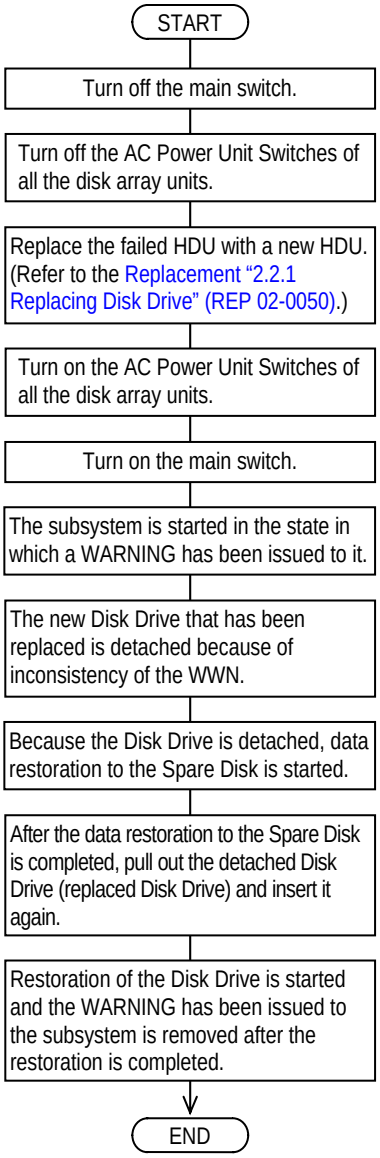
(b) Identifying the failed HDU

Start the subsystem in the status that the HDU is isolated from the subsystem, and identify the HDU causing a starting failure.



*1 : Because the recovery actions are started automatically when the Spare Disk exists, it is necessary to wait for completion of the Disk Drive recovery twice.

Copyright © 2005, 2006, Hitachi, Ltd.



(c) Reconfirm that the HDU concerned caused the failure

Install the specified HDU in the original location, start the subsystem and check that the error occurs again.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) Replacing a failed HDU

Copyright © 2005, Hitachi, Ltd.

(e) Check List #3 for Failed HDU Isolation (for all HDUs)

NOTE : To use this check list, make as many copies of it as necessary for the recovery operation.

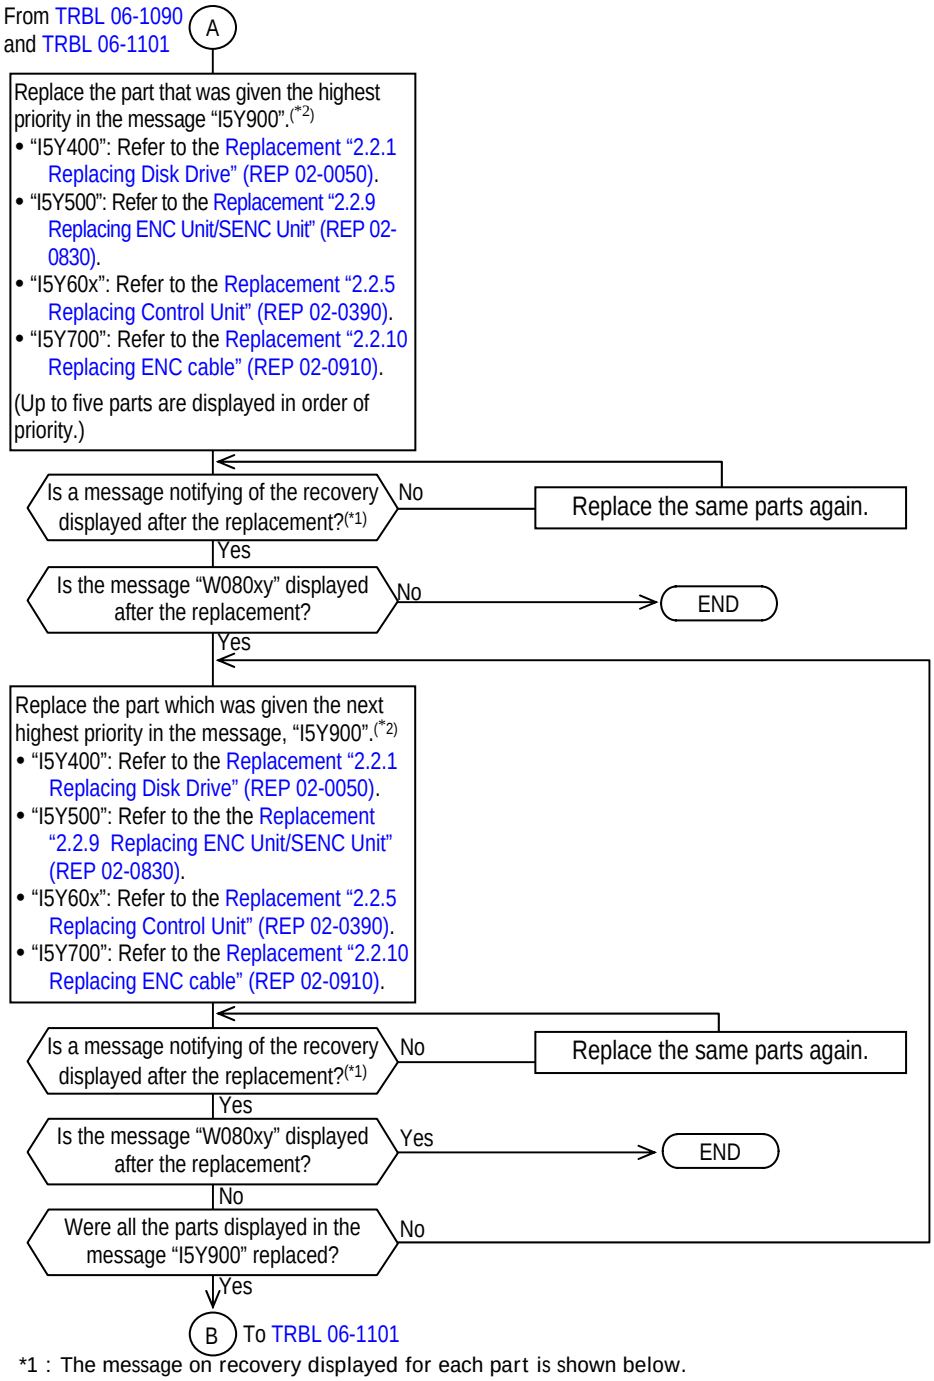
(4) Actions to be taken when one of the message codes I5Y400 through I5Y700 is displayed
[Recovery method]

*1 : The example of displayed two types of priority level indications of "I5Y900" is described as follows.

I5Y000 Obstacle HDU search start

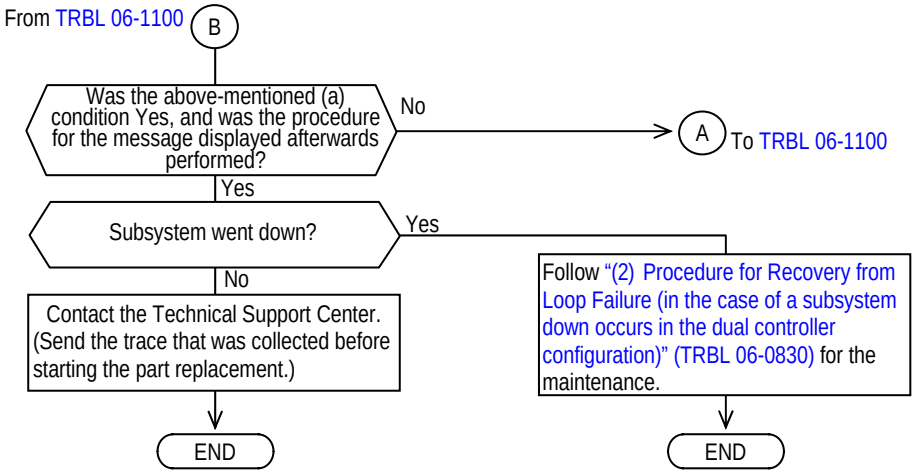


I5Y900 Part change priority (number-1)	:MANUAL	
I5Y500 BKE diagnostic result (Unit-02,ENC-1)	:ENC /STRC	First type
I5Y900 Part change priority (number-2)	:MANUAL	
I5Y500 BKE diagnostic result (Unit-01,ENC-1)	:ENC /STRC	
I5Y900 Part change priority (number-3)	:MANUAL	
I5Y700 BKE diagnostic result (Unit-01-02,ENC-1)	:MANUAL/STRC	

I5Y900 Part change priority (number-1)	:MANUAL	
I5Y500 BKE diagnostic result (Unit-03,ENC-1)	:ENC /STRC	Second type
I5Y900 Part change priority (number-2)	:MANUAL	
I5Y500 BKE diagnostic result (Unit-02,ENC-1)	:ENC /STRC	
I5Y900 Part change priority (number-3)	:MANUAL	
I5Y700 BKE diagnostic result (Unit-02-03,ENC-1)	:MANUAL/STRC	

I5Y100 Obstacle HDU search end

*2 : Replace parts according to the order of priority shown in the message "I5Y900" displayed after the first detachment of the loop. Though a message of the same kind may be displayed repeatedly, neglect it.



Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The message on recovery displayed for each part is shown below.
"I007xy", "I007HH", "I009xy", "I009HH": Disk Drive
"I00Bxy", "I00BHH": ENC Unit or ENC cable
"I0010x": Control Unit
In the same way, the message on failure displayed for each part is shown below. If any of the following messages is displayed, replace the same part again.
"W073xy", "W073HH": Disk Drive
"I605xy", "I605HH", "W0B0xy": ENC Unit or ENC cable
"W0100x": Control Unit

*2 : Replace parts according to the order of priority shown in the message "I5Y900" displayed after the first detachment of the loop. Though a message of the same kind may be displayed repeatedly, neglect it.

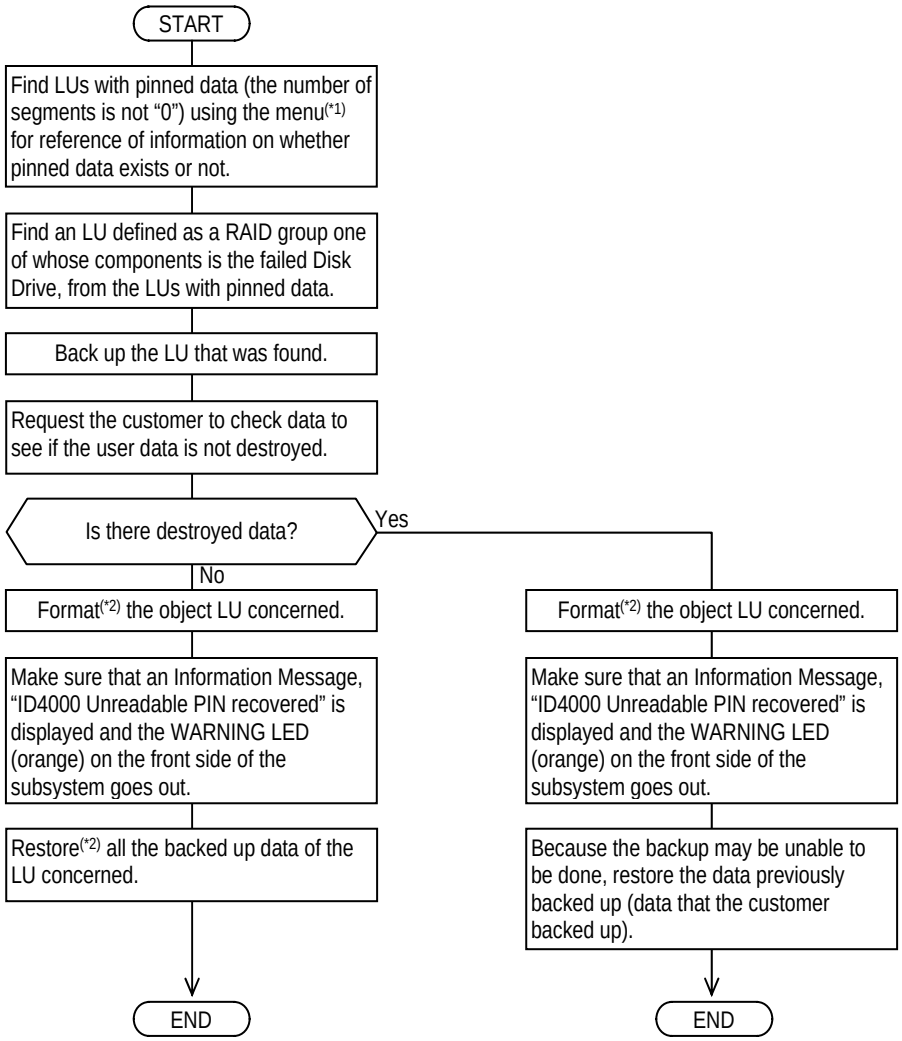
6.1.15 A failure occurred during operation : Case 5 (Incomplete writing)



(The command for reassignment was sent from a host computer to an LU of RAID 0)

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx W0G0xy Unreadable PIN detected (Unit-x, HDU-y) :MANUAL/STRC

Date Time Detect Controller #

[Recovery method]

*1 : Checking the presence of PIN data is performed by the Maintenance function of Storage Navigator Modular. Refer to "10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0250).

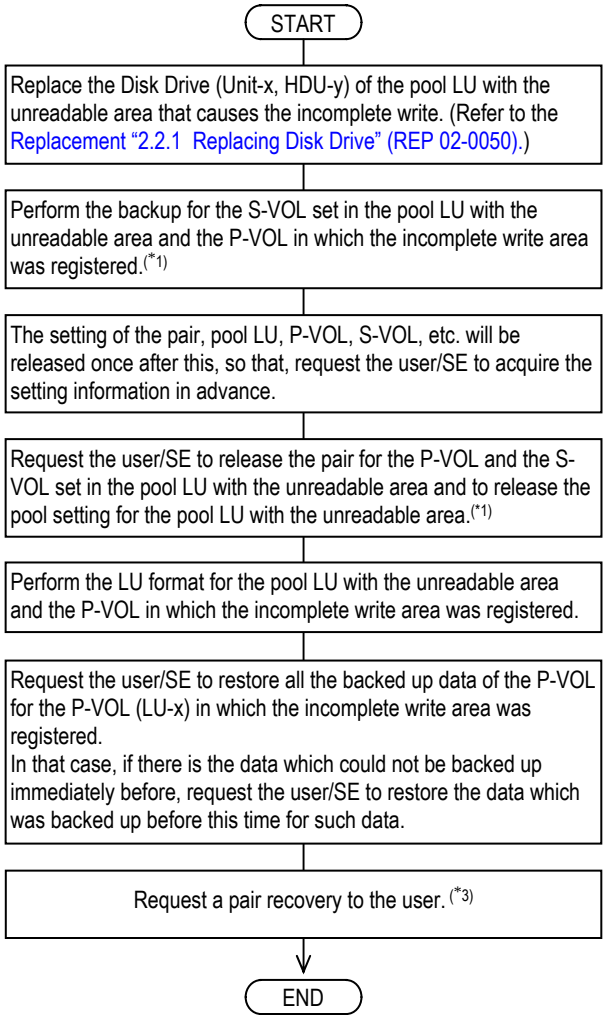
*2 : Concerning the backup and restoration, request the customer to do them.

*3 : There may be a case that the LU formatting fails. In this case, request a user to check if a sense code is reported in the log of a host computer. When the reported sense code is "05-9552" or "05-9577", the LU concerned is an object of ShadowImage in-system replication, TrueCopy remote replication, TrueCopy Extended Distance or Copy-on-write SnapShot. Therefore, request a user to release the pair and execute the LU formatting again after it is released (refer to System Parameter "3.3 Setting of LU [Procedure ③-F]Formatting LU" (SYSPR 03-0280)). Also, the backup restoration cannot be done for the LU whose access attribute is set as other than Read/Write by Data Retention Utility because it cannot be formatted or written.

Copyright © 2005, 2006, Hitachi, Ltd.

6.1.16 The incomplete write area was registered in the restored VOL

(The write incomplete area was registered in the P-VOL because there was the unreadable area in the pool LU during the restoration of the P-VOL of Copy-on-write SnapShot. Or the incomplete write area was registered in the S-VOL because there was the unreadable area in the pool LU when restoring the S-VOL due to S-VOL-Takeover as a result of executing the horctakeover command with TrueCopy Extended Distance.)



(1) In case of the failure with Copy-on-write SnapShot

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx I6D300 Unreadable PIN resisted (Unit-x, HDU-y, LU-z) :MANUAL/STRC

Date Time Detect Controller# Pool LU Disk Drive(*1) Primary VOL (*2)

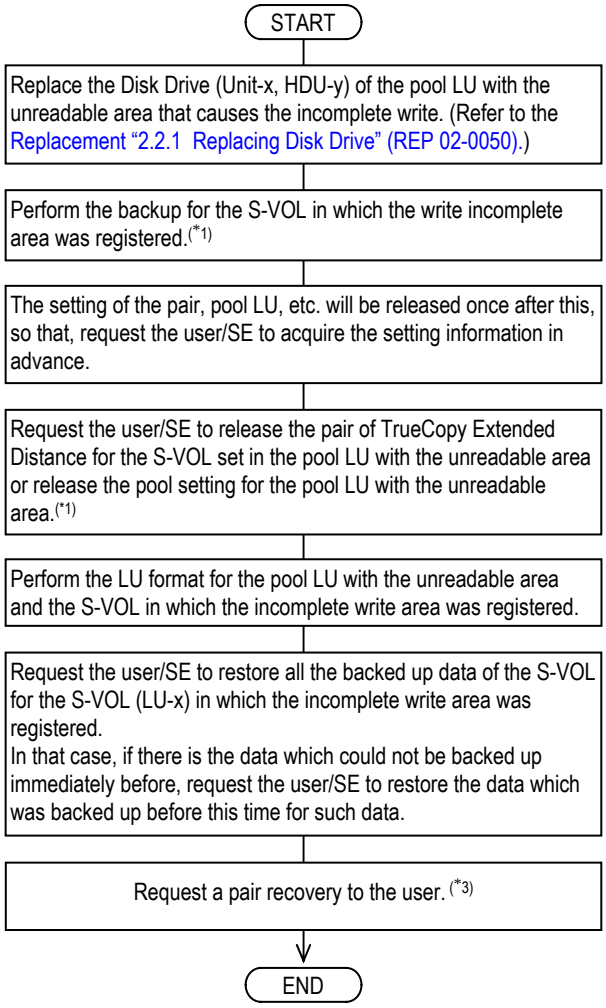
[Recovery method]

*1 : If the pair release is performed, the data of the S-VOL is lost. Therefore, be sure to execute the backup of the S-VOL before performing the pair release.

*2 : For the LU format, refer to the System Paramter "3.3 [Procedure ③-F] Formatting LU" (SYSPR 03-0280).

*3 : The secondary VOL data backed up and the primary VOL have the same capacity. Therefore, do not restore the secondary VOL data backed up for the secondary VOL, which executed pair setting again. Also, execute ①setting of the pool, ②setting of the P-VOL, ③setting of the V-VOL and ④pair formation to restore the pair.

Copyright © 2005, 2006, Hitachi, Ltd.



(2) In case of the failure with TrueCopy Extended Distance

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx I6D300 Unreadable PIN resisted (Unit-x, HDU-y, LU-z) :MANUAL/STRC

Date Time Detect Controller# Pool LU Disk Drive(*1) Primary VOL (*2)

[Recovery method]

*1 : If the pair release is performed, the data of which the previous cycle was determined and saved in the pool LU was lost. Therefore, be sure to execute the backup of the S-VOL before performing the pair release.

*2 : For the LU format, refer to the System Paramter "3.3 [Procedure ③-F] Formatting LU" (SYSPR 03-0280).

*3 : Execute ① setting of the pool LU and ② pair formation to restore the pair.

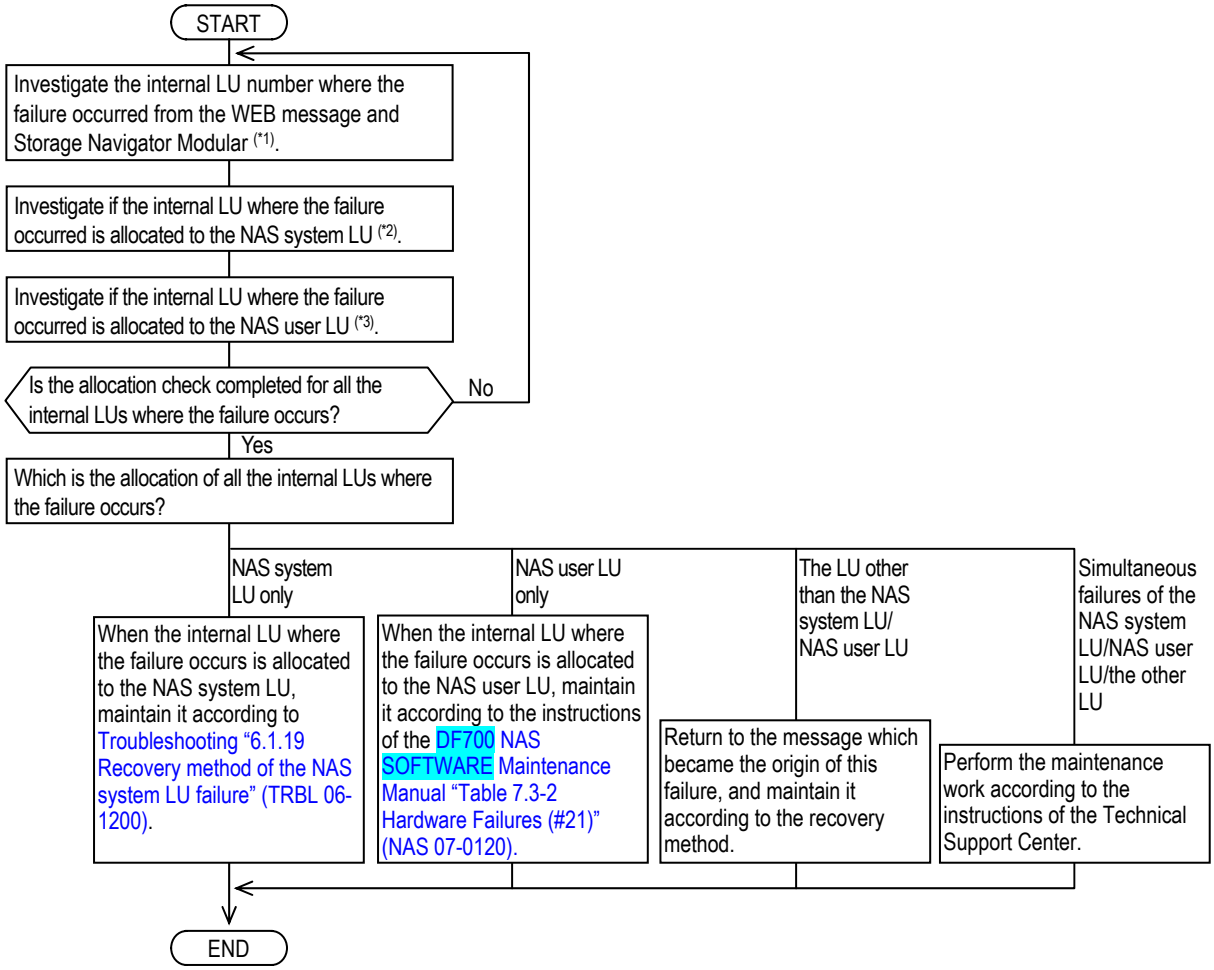
6.1.18 Recovery method of the failure LU at the time of the NAS Unit connection



If the LU failure (Disk Drive dual failure, user data failure, etc.) occurred at the time of the NAS unit connection, recover it according to each recovery procedure after checking that the allocation of the internal LU where the failure occurs is either of the following, according to the flow shown below.

- It is allocated to the NAS system LU.
- It is allocated to the NAS user LU.
- It is allocated to neither the NAS system LU nor the NAS user LU.

NOTE : When the NAS system LU, the NAS user LU, and the other LU become failures at the same time, the recovery work is performed in the following order, but be sure to perform it according to the instructions of the Technical Support Center.

① Recover of the NAS system LU failure
② Recover of the NAS user LU failure
③ Recover of the LU failure other than the above-mentioned

[Checking method]

*1: Refer to "(1) Method of determining the failure LU" (TRBL 06-1190) for the method of determining the internal LU number where the failure occurs.

*2: Refer to System Parameter "3.7.1 Setting, change or deletion the system LU allocation"(SYSPR 03-0440) to refer to the current setting of the NAS system LU.
The list of the NAS system LU can be checked without performing "setting, change or deletion".

*3: Refer to System Parameter "3.7.2 Setting, change or deletion the user LU allocation" (SYSPR 03-0480) to refer to the current setting of the NAS user LU.
The list of the NAS user LU can be checked without performing "setting, change or deletion".

Copyright © 2005, 2006, Hitachi, Ltd.

(1) Method of determining the failure LU

The method of determining the internal LU of the failure LU differs depending on the message which detected the failure. Determine the internal LU number of the LU where the failure occurs according to the procedures shown below.

Massage code	Method of determining the failure LU	Reference page
I152xy I152HH	The RAID Group # is acquired from the blocked Disk Drive, and the degeneration LU (displayed in pink) of the target RAID Group # is targeted.(*1)	Storage Navigator Modular (for GUI) User's Guide "4.1 Displaying a RAID Group/Logical Unit Definition" (88 page)
I1GU00	All LUs in which the PIN information is displayed are targeted.	"10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0050)
I301AT I301xy I301HH	The RAID Group # is acquired from the blocked Disk Drive, and the degeneration LU (displayed in pink) of the target RAID Group # is targeted.(*2)	Storage Navigator Modular (for GUI) User's Guide "4.1 Displaying a RAID Group/Logical Unit Definition" (88 page)
W0G0xy W0G100	All LUs in which the PIN information is displayed are targeted.	"10.2.4 Displaying Logical Unit Failure Data Information" (TRBL 10-0050)
W0G20x	It becomes similar to I1GU00.(*3)	It becomes similar to I1GU00.
W0H000	The unformatted LU (displayed in gray) is targeted from the Storage Navigator Modular.	Storage Navigator Modular (for GUI) User's Guide "4.1 Displaying a RAID Group/Logical Unit Definition" (88 page)
W12000	The LU number displayed in the message text is targeted.	–

6.1.19 Recovery method of the NAS system LU failure

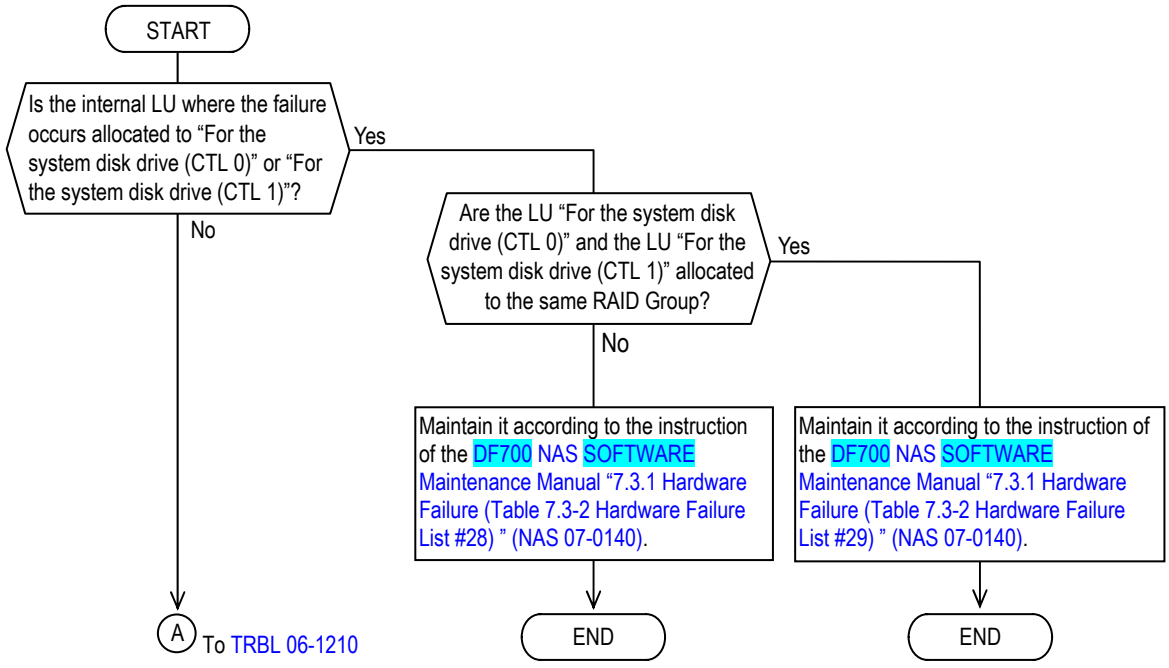
When a NAS system LU failure occurred at the time of NAS unit connection, maintain it according to the flow of the recovery method shown below.

NOTE : For the notation of the NAS system LU, the display of the GUI window of the Storage Navigator Modular and the correspondence of the notation of "DF700 NAS SOFTWARE Maintenance Manual" are as follows.

Display of the GUI window of the Storage Navigator Modular	Notation of "DF700 NAS SOFTWARE Maintenance Manual"
System Disk(CTLx)	NAS OSLU
System Common Volume	NAS Cluster Management LU
Backup Volume for Common	Backup LU of NAS Cluster Management LU
Volume for Dump(CTL0)	Dump LU
Working Area for Dump	Error information LU
Command Device	Command device

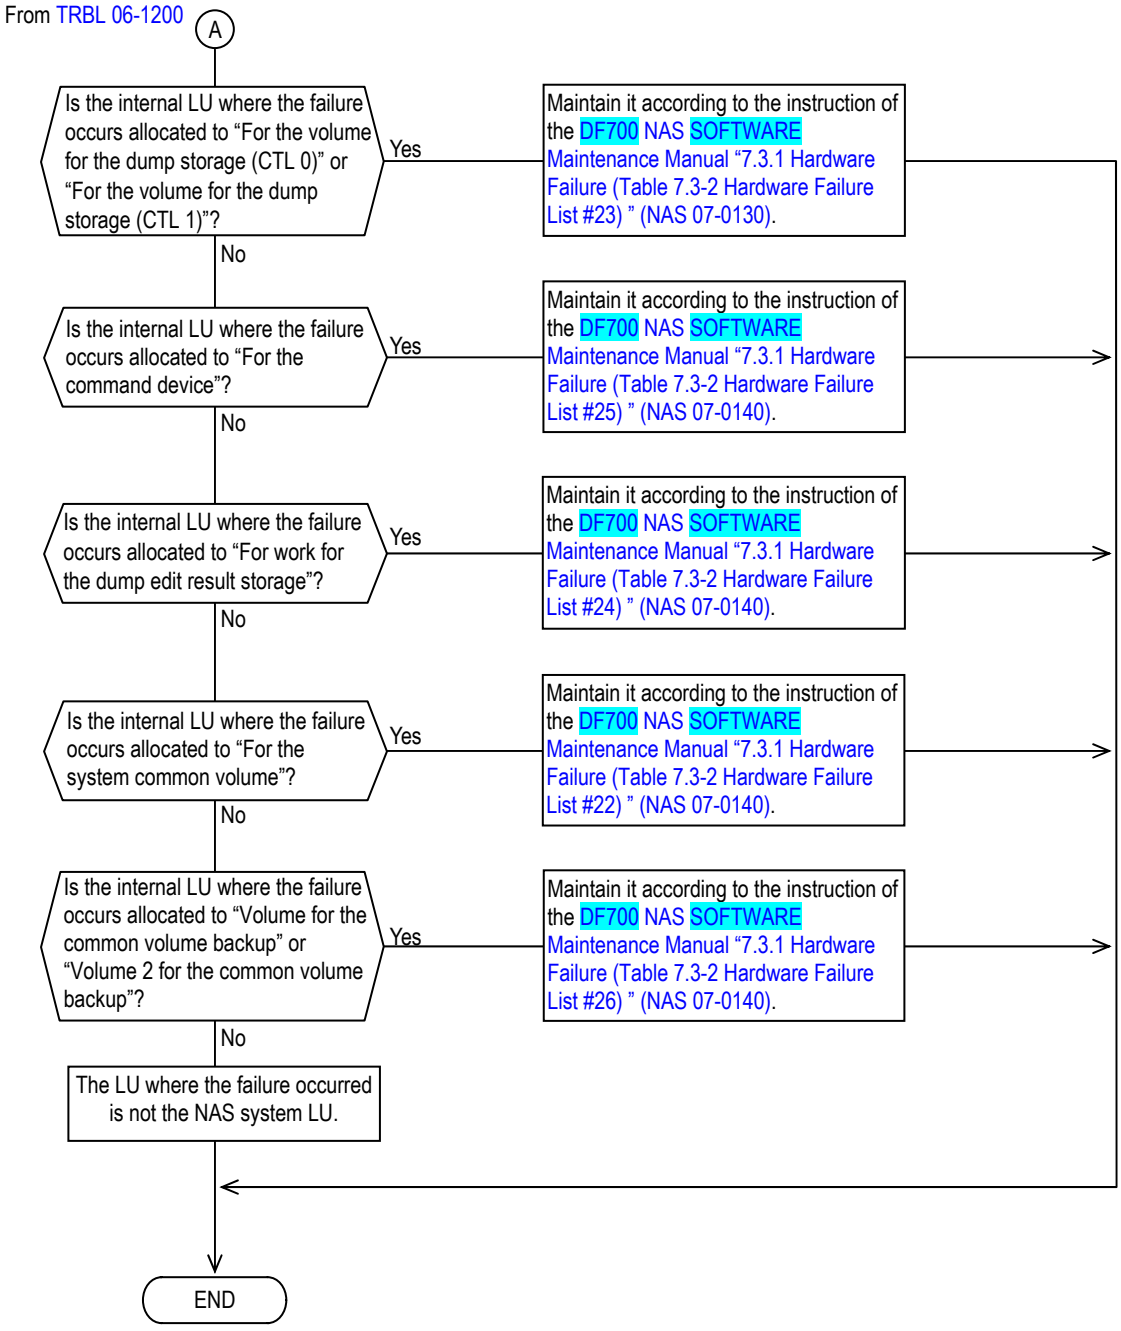
[Checking method]

When an obstacle occurs in a plurality of NAS system LU simultaneously, please according to follows.



① When an obstacle occurs in both "For the system disk drive (CTL 0)" and "For the volume for the dump storage (CTL 0)", please conserve according to a procedure of "For the system disk drive (CTL 0)".

② When an obstacle occurs in both "For the system disk drive (CTL 1)" and "For the volume for the dump storage (CTL 1)", please conserve according to a procedure of "For the system disk drive (CTL 1)".



③ When an obstacle occurs in all of "For the system common volume", "For work for the dump edit result storage" and "For the command device", please conserve according to a procedure of "For the system common volume".

④ When an obstacle occurs in both "Volume for the common volume backup" and "Volume 2 for the common volume backup", please conserve according to a procedure of" Volume for the common volume backup".

⑤ Please conserve by instructions of Technical Support Center in a case aside from ① to ④.

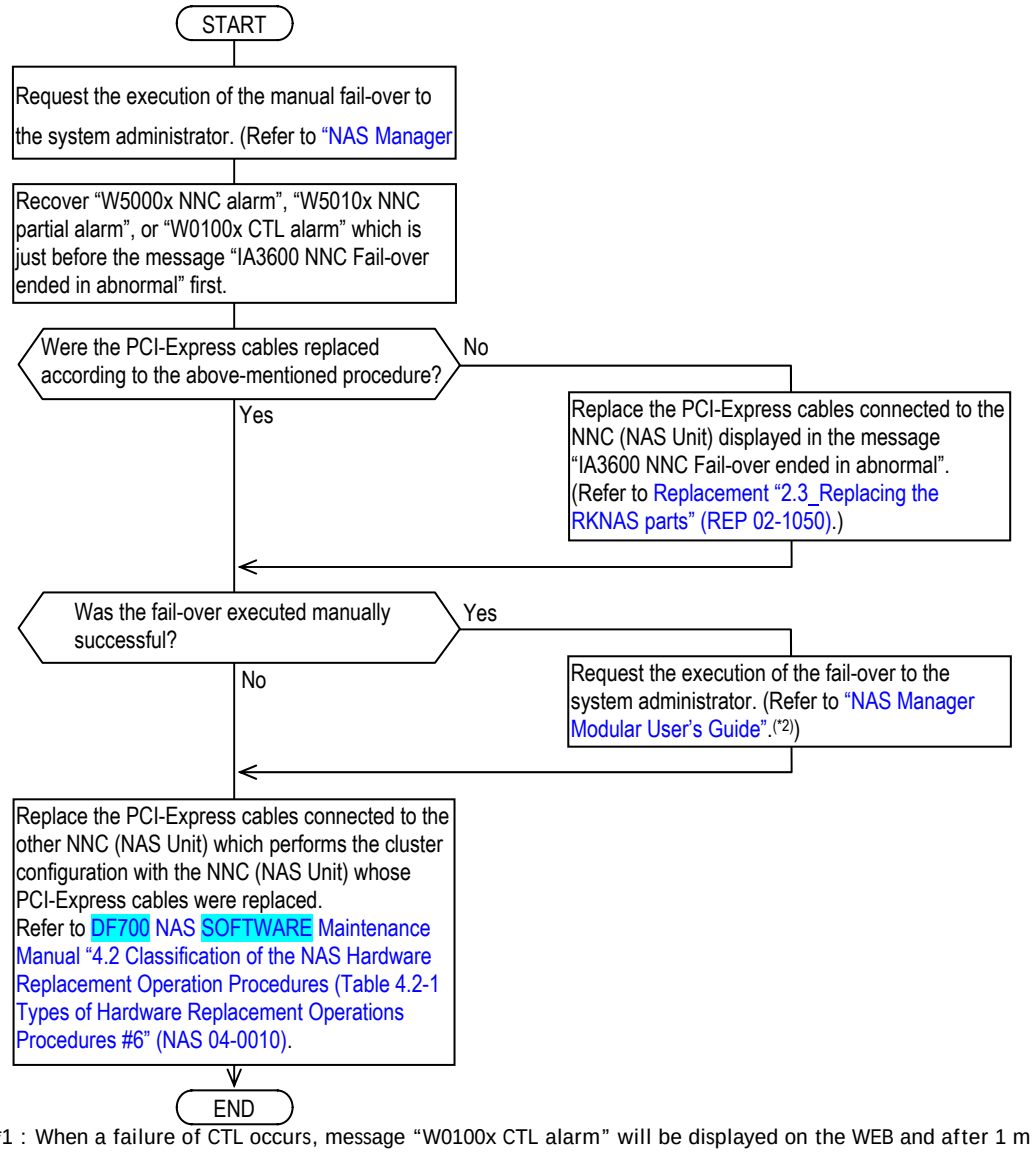
6.1.20 Recovery method at the time of the NAS system fail-over failure



When the fail-over of the NAS Unit failed, recover it according to the following procedure.

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx IA3600 NNC Fail-over ended in abnormal [xy] (NNC-z) :MANUAL/NLOG

Date Time Detect Controller#

[Checking method]

*1 : When a failure of CTL occurs, message "W0100x CTL alarm" will be displayed on the WEB and after 1 minute (typically) message "IA3500 NNC Fail-over started" will be appear on the WEB.
But depending on the failure cause, message "IA3500 NNC Fail-over started" wouldn't appear though the fail over process is in progress. In that case, please ask the system administrator to check (1) whether failure message KAQG7210-E has issued and (2) the status of the resources, in order to confirm the fail over is in progress.

*2 : Please ask the system administrator not to carry out the failback when the I/O load is heavy. (e.g. during the execution of the COPY series command (paircreate, pairresync etc.) of TrueCopy remote replication, TrueCopy Extended Distance, ShadowImage in-system replication, Copy-on-write SnapShot)
When such COPY series command is in progress, there are possibility to fail the failback. In that case, please ask the system administrator to retry the failback after the completion of the COPY series command execution.

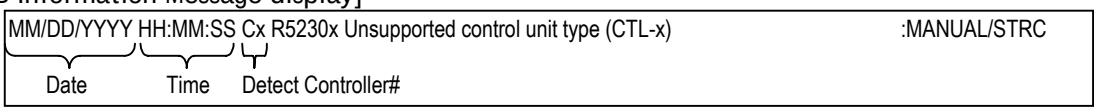
6.1.25 Recovery method when the Control Unit whose microprogram is not supporting was detected

When "R5230x" is displayed, the update installation of the microprogram which is supporting the Control Unit of the new model name is not performed, or the model name of the installed Control Unit is incorrect. Therefore, perform the maintenance according to the following procedure.
Check the adaptable microprogram revision referring to Microprogram "1.9 Adaptable microprogram revision" (MICRO 01-0360).

(1) A failure occurs at the time of power-on
[Concrete phenomenon]
- When all the Control Units were replaced to the Control Units of the DF-F700-F2JH in the status where the power of the subsystem of the microprogram revision less than 0760/A is turned off, and then the subsystem power is turned on, the replaced Control Unit was blocked and the subsystem became Ready.
- When all the Control Units were replaced to the Control Units of the DF-F700-F2JH in the status where the power of the subsystem of the microprogram revision less than 0760/A is turned off, and then the subsystem power is turned on, all the Control Units were blocked and the subsystem went down.
- When the subsystem in which the Control Unit of the DF-F700-F2JH is installed was changed to the maintenance mode, the microprogram of the revision less than 0760/A was installed, and the subsystem was restored to the normal mode, all Control Units were blocked and the subsystem went down.
- When the system start attribute of the subsystem configured with the single controller and in which the microprogram of the revision less than 0760/A is installed was changed to the dual active mode and the Control Unit of the DF-F700-F2JH was added, the added Control Unit was blocked.



(2) A failure occurred when one Control Unit is inserted in the Basic Chassis in the status where the other Control Unit is operating.
[Concrete phenomenon]
- When one Control Unit is replaced to the Control Unit of the DF-F700-F2JH in the status where the subsystem configured with the dual controller and in which the microprogram of the revision less than 0760/A is installed is Ready, the replaced Control Unit did not recover.

(3) A failure occurred when the microprogram was replaced by the Storage Navigator Modular.
[Concrete phenomenon]
- When the microprogram of one Control Unit was replaced to the microprogram of the revision less than 0760/A in the status where the subsystem in which the Control Unit of the DF-F700-F2JH is installed is Ready, the Control Unit whose microprogram was replaced was blocked.

Table 6.1.5 Consistency of the Model Name of the Control Unit and the Revision of the Microprogram

Model Name of Control Unit	Revision of Microprogram
DF-F700-F1JH	0732/A-H or more
DF-F700-F2JH	0760/A-H or more

[Recovery method]

[Recovery method-1] : When a failure occurred at the time of power-on

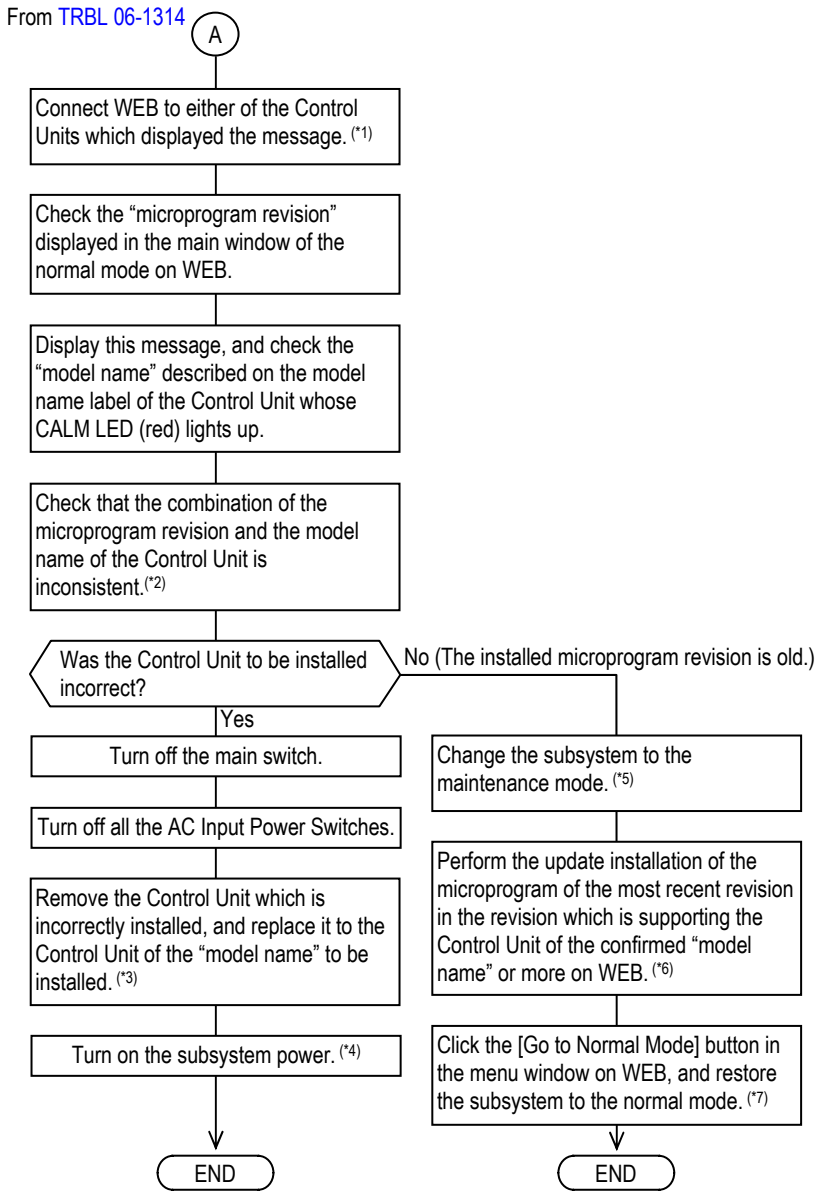
*1 : "R5230x Unsupported control unit type (CTL-x)" is displayed in the Control Unit individual information of the Information Message on WEB for the blocked Control Unit, and the CALM LED (red) lights up.

*2 : Refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).

*3 : Refer to "Table 6.1.5 Consistency of the Model Name of the Control Unit and the Revision of the Microprogram" (TRBL 06-1313).

*4 : Refer to Installation "1.7.2 Subsystem power off (Sequential shutdown)" (INST 01-0310).

*5 : Refer to Replacement "2.2.5 Replacing Control Unit" (REP 02-0390).

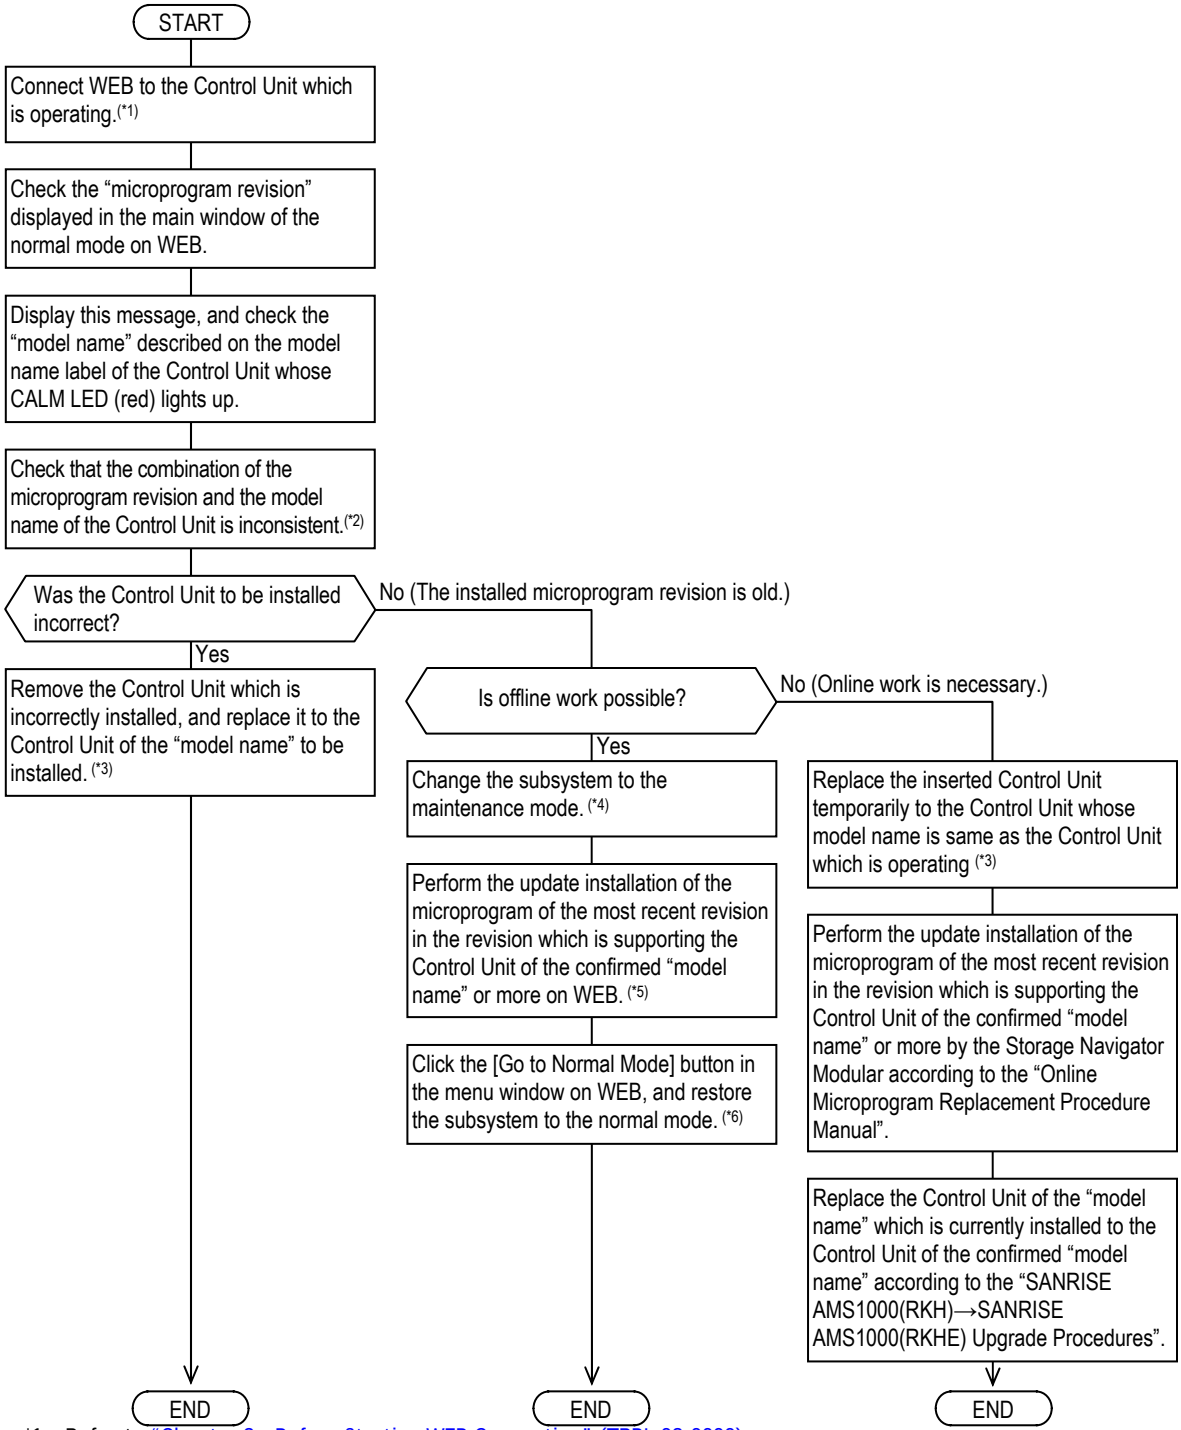


*6 : Refer to Installation "1.7.1 Subsystem power on" (INST 01-0290).

*7 : Refer to WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

*8 : Refer to WEB "3.3.1 Microprogram" (WEB 03-0280).

*9 : Refer to WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440).



Copyright © 2006, Hitachi, Ltd.

*1 : Refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).
*2 : Refer to "Table 6.1.5 Consistency of the Model Name of the Control Unit and the Revision of the Microprogram" (TRBL 06-1313).
*3 : Refer to Replacement "2.2.5 Replacing Control Unit" (REP 02-0390).
*4 : Refer to Installation "1.7.1 Subsystem power on" (INST 01-0290).
*5 : Refer to WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).
*6 : Refer to WEB "3.3.1 Microprogram" (WEB 03-0280).
*7 : Refer to WEB "3.7 Return Method to the Normal Mode" (WEB 03-0440).

6.1.26 Recovery method of the Modular Volume Migration which terminated abnormally

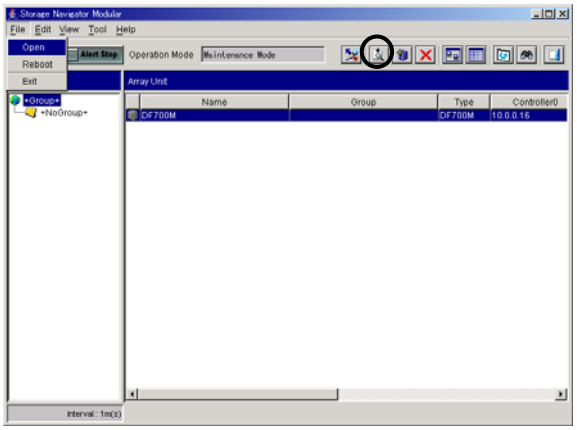
[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx I6ER00 Modular Volume Migration failed (LU-x/y) :MANUAL/STRC
MM/DD/YYYY HH:MM:SS Cx I6ES00 Modular Volume Migration failed

Date Time Detect Controller#

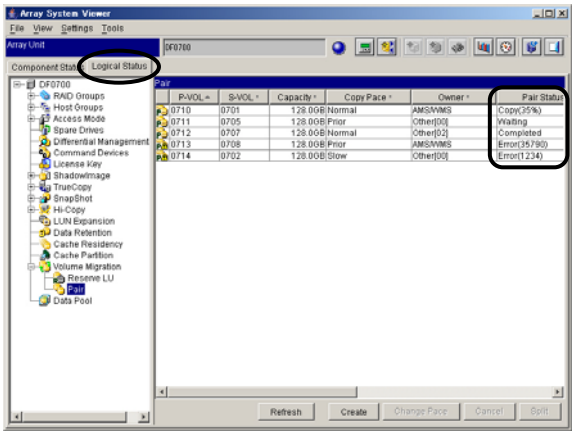
[Recovery method]

Copyright © 2006, Hitachi, Ltd.



(1) Check the status of the pair of the Modular Volume Migration

(a) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to System Parameter "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050), "Registering the newly introduced DF in the Storage Navigator Modular" in Subsection 1.1.



(b) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (Refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100).)

(c) On the unit window, click the [Logical Status] tab.

(d) Click [Volume Migration] of the tree view.

(e) Click [Pair] of [Volume Migration] of the tree view.
The list of the pairs and the information of each pair are displayed in the list view.

Copyright © 2006, Hitachi, Ltd.

(f) When the Modular Volume Migration terminated abnormally and the pair changed to PSUE, "Error (failure factor code)" is displayed in [Pair Status]. The pair displayed [Error] in [Pair Status] is the pair whose Modular Volume Migration terminated abnormally.

(g) Check the failure factor code for each pair whose Modular Volume Migration terminated abnormally referring to [Pair Status]. (Refer to Message "Chapter 12 Failure Factor Codes of the Modular Volume Migration" (MSG 12-0000) for the details.)

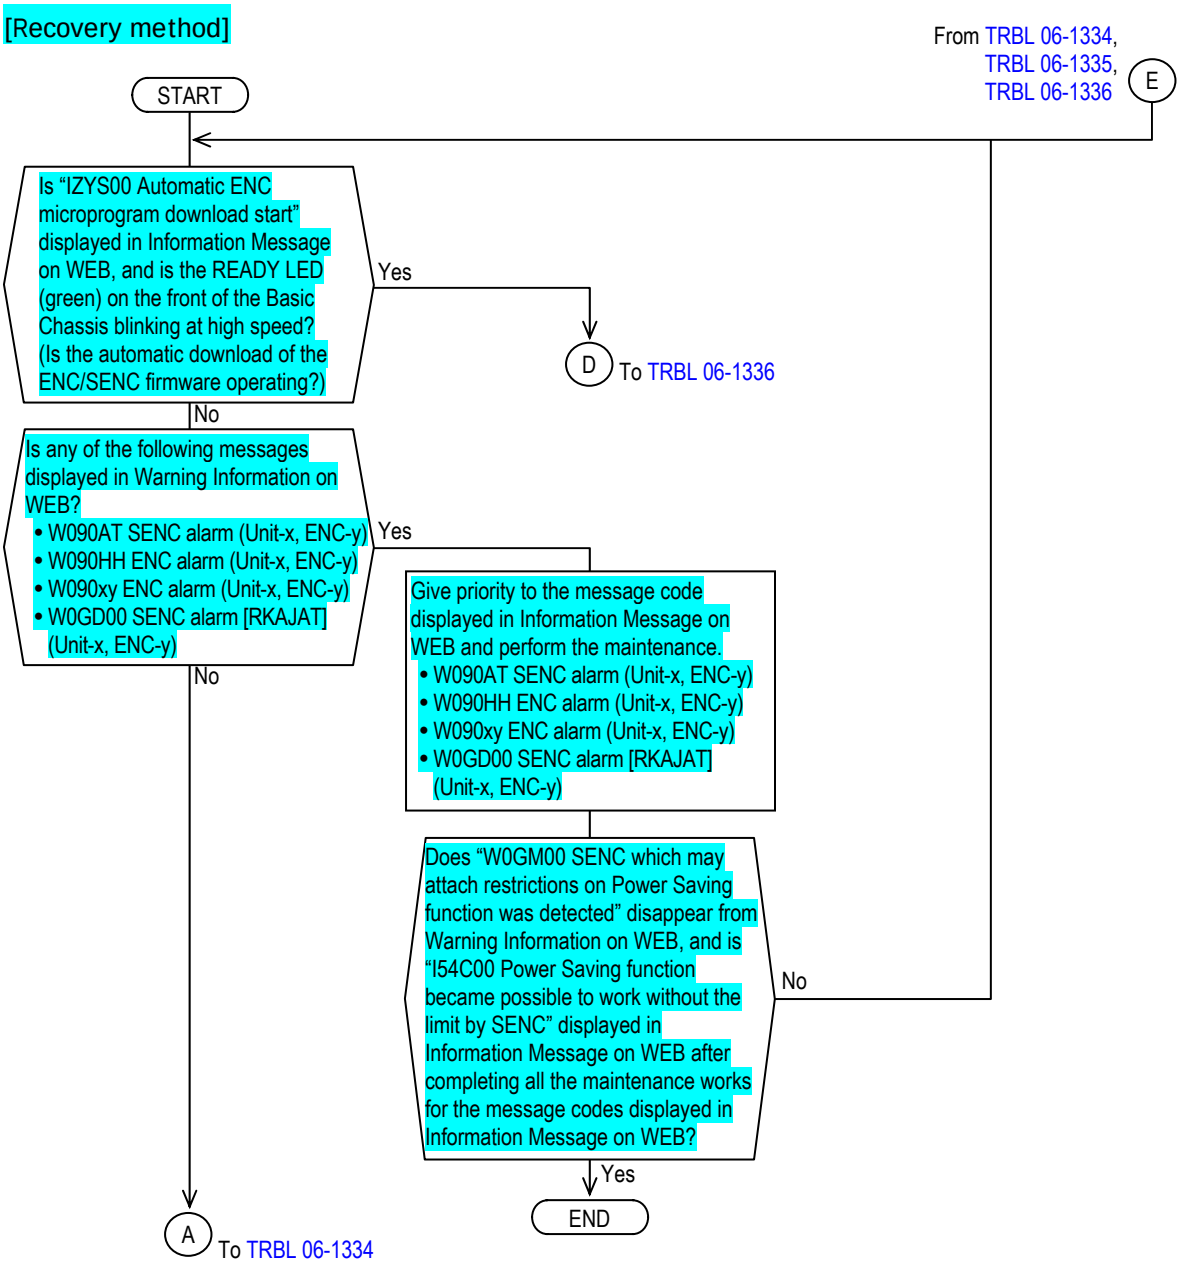
6.1.27 Recovery method when the subsystem becomes the warning status while using the Power Saving function of the priced option

[WEB Information Message display]

MM/DD/YYYY HH:MM:SS Cx W0GM00 SENC which may attach restrictions on Power Saving function was detected :MANUAL/STRC

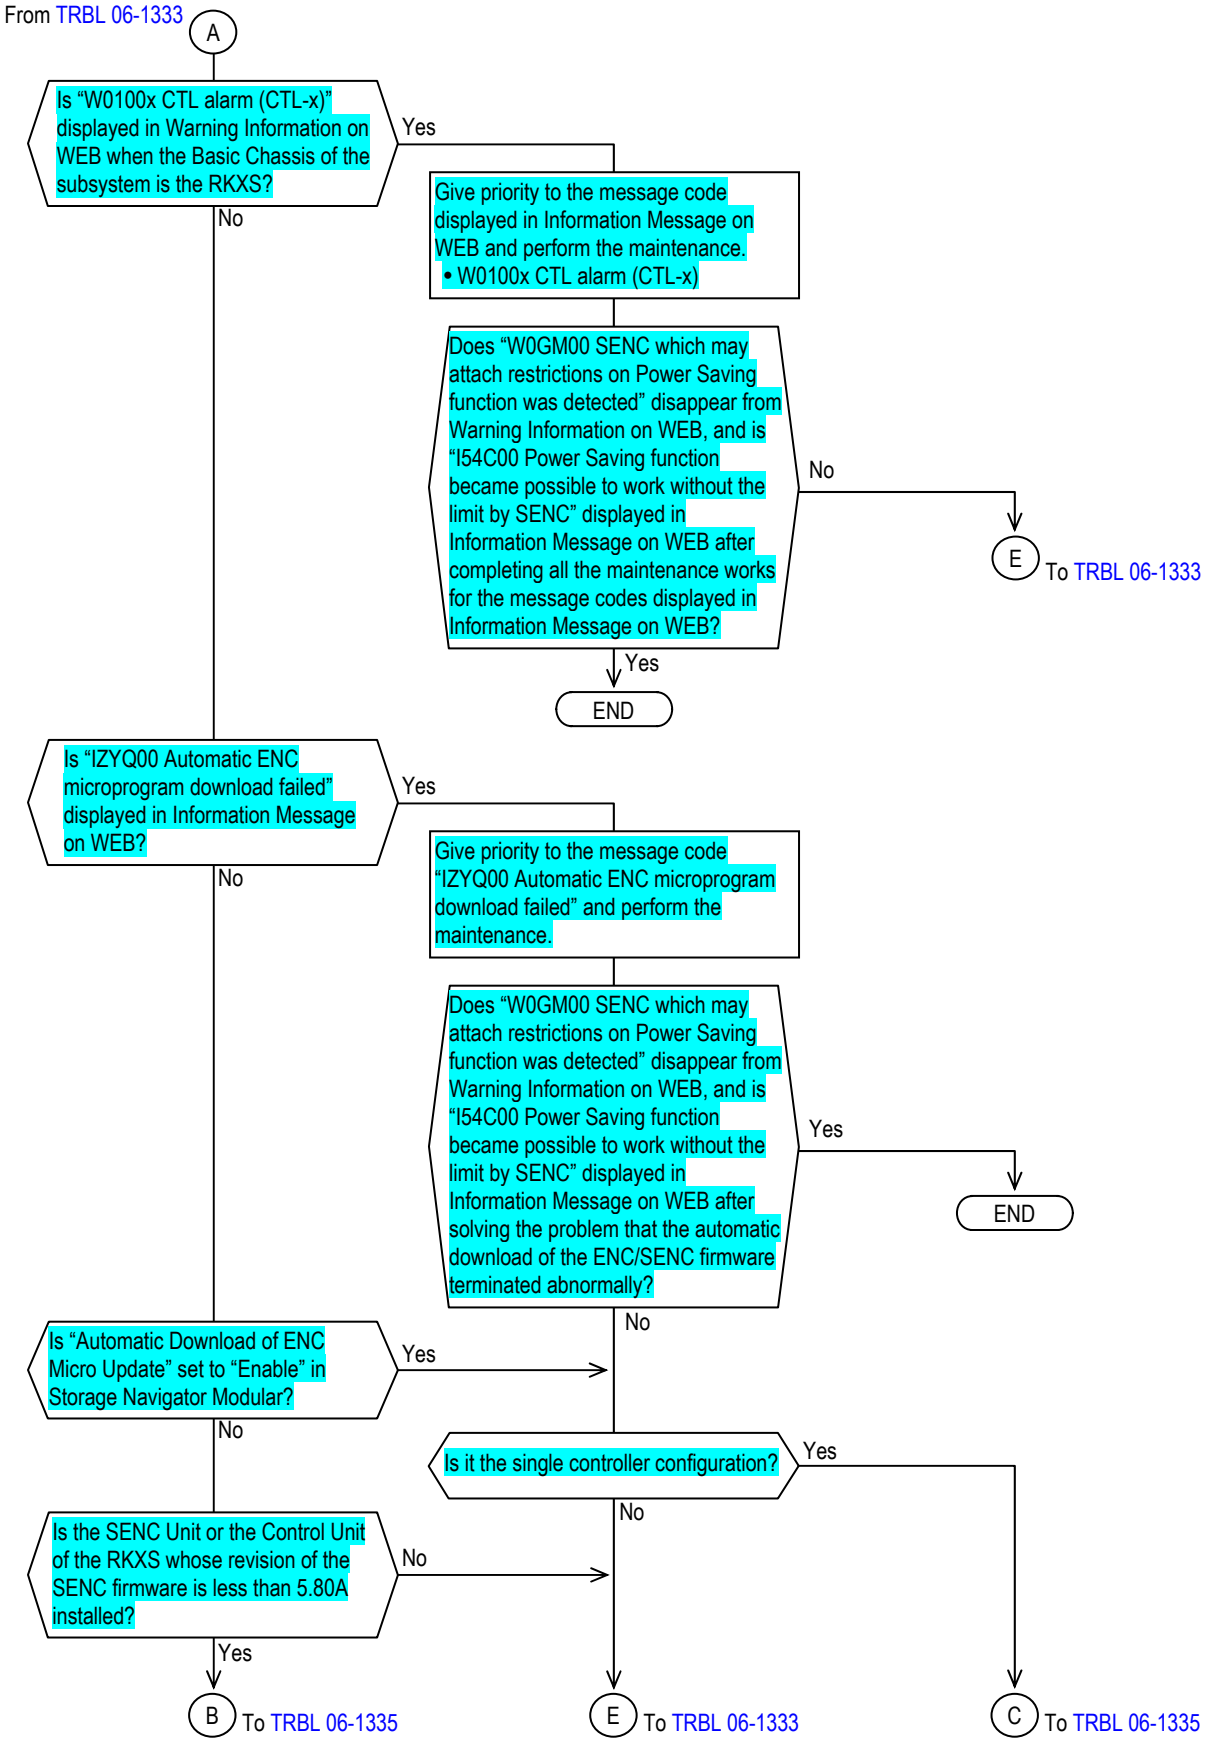
Date Time Detect Controller#

[Opportunities]



When this message is displayed in Warning Information on WEB, the WARN LED (orange) on the front of the Basic Chassis is lighting up or blinking, and the subsystem is in the Warning status.

When the Power Saving function of the priced option is enabled, this message may be displayed in Warning Information on WEB in the following opportunities.



1. When the Control Unit of the RKXS is blocked
2. When the SENC Unit is blocked
3. When the SENC Unit of the RKAJAT is replaced to the SENC Unit whose revision of the SENC firmware is less than 5.80A with the subsystem power turned off, and then the subsystem power is turned on and the subsystem becomes the Ready status
4. When the Control Unit of the RKXS is replaced to the Control Unit whose revision of the SENC firmware is less than 5.80A with the subsystem power turned off, and then the subsystem power is turned on and the subsystem becomes the Ready status
5. When the subsystem downloads the SENC firmware whose revision is less than 5.80A offline, and then the subsystem reboots and the subsystem becomes the Ready status
6. When the RKAJAT installing the SENC Unit whose revision of the SENC firmware is less than 5.80A is added to the subsystem online and the addition is completed
7. When the RKAJAT installing the SENC Unit whose revision of the SENC firmware is less than 5.80A is added to the subsystem with the subsystem power turned off, and then the subsystem power is turned on and the subsystem becomes the Ready status
8. When the SENC Unit installing the SENC firmware whose revision is less than 5.80A is installed in the RKAJAT and Power Saving of the priced option is unlocked
9. When the SENC Unit installing the SENC firmware whose revision is less than 5.80A is installed in the RKAJAT and Power Saving of the priced option is set from “Disable” to “Enable”
10. When the subsystem is the dual controller configuration, the Control Unit of the RKXS installing the SENC firmware whose revision is less than 5.80A is installed in the RKXS, and Power Saving of the priced option is unlocked
11. When the subsystem is the dual controller configuration, the Control Unit of the RKXS installing the SENC firmware whose revision is less than 5.80A is installed in the RKXS, and Power Saving of the priced option is set from “Disable” to “Enable”
12. When the Control Unit of the RKXS installing the SENC firmware whose revision is less than 5.80A is added to the RKXS with the subsystem power turned off to change the RKXS from the single mode to the dual active mode, and then the subsystem power is turned on and the subsystem becomes the Ready status

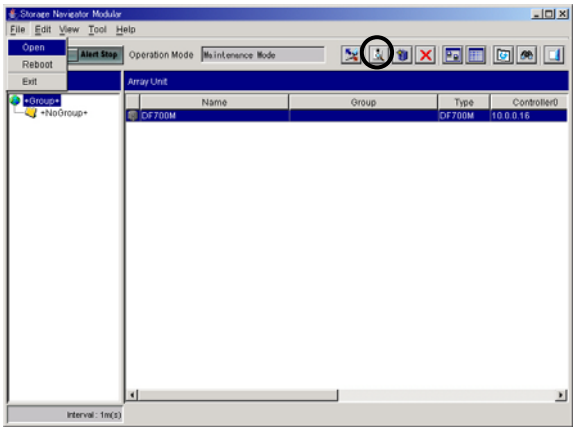
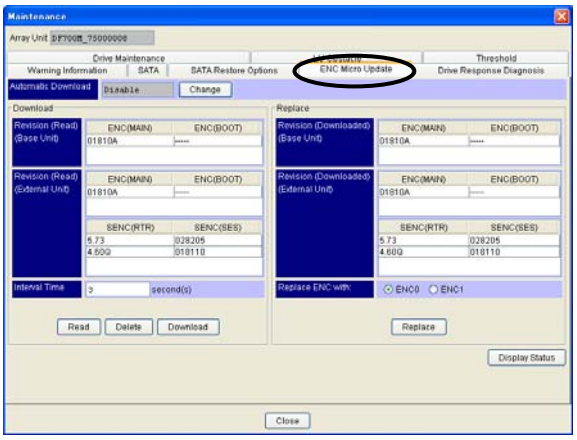
[Automatic download of the ENC/SENC firmware and revision check]

(1) Display of the [ENC Micro Update] tab



(a) Start the Storage Navigator Modular and set the Operation Mode in the "Maintenance Mode". For the procedure for changing to the Maintenance mode, refer to "1.1 (3)(b) Changing the Maintenance Mode" (SYSPR 01-0050), "Registering the newly introduced DF in the Storage Navigator Modular" in Subsection 1.1.

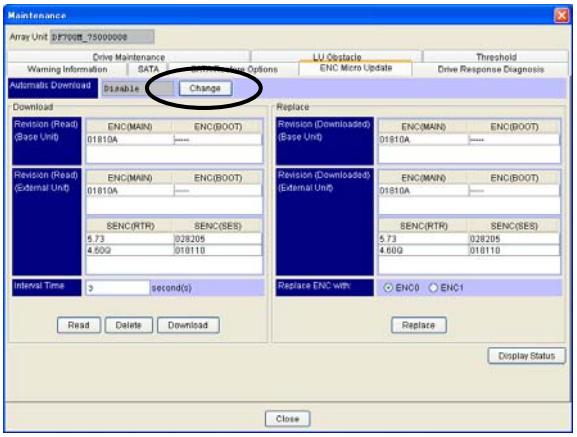
(b) Click an icon of the disk array subsystem you want to set in the main window.



There are three ways of the selection methods as shown below.

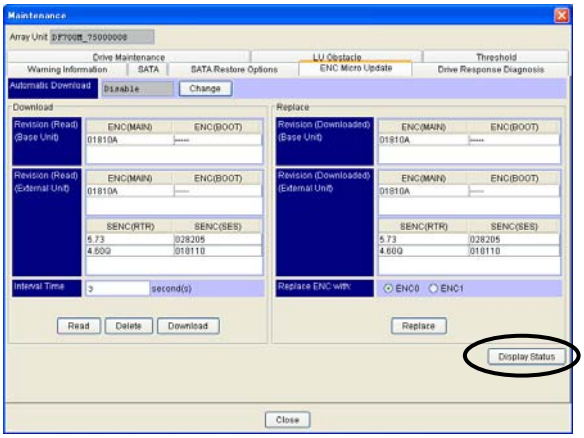
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



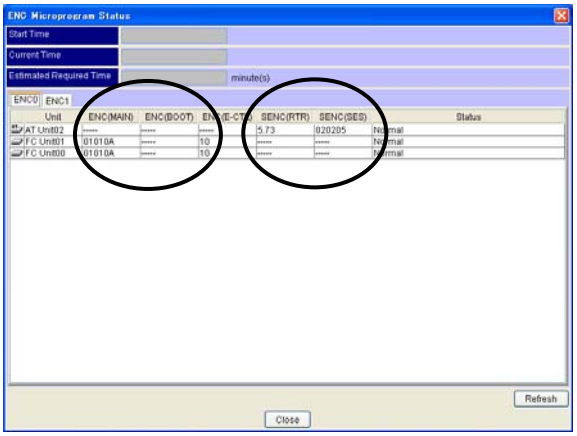
(c) Select the "ENC Micro Update" tab in the Storage Navigator Modular maintenance window.

Copyright © 2006, Hitachi, Ltd.



(2) Setting of the automatic download

(a) Press the [Change] button of the automatic download and set [Disable] or [Enable].



(3) Checking the revision

(a) Display the revision of the current ENC/SENC firmware by selecting the [Display Status] button.

(b) Check the revision of the current ENC/SENC firmware.

Copyright © 2006, Hitachi, Ltd.

6.2 Initialization procedure for configuration information

NOTE : Be careful that the whole data on the disk will be erased (RAID groups and LU definitions will be initialized.) when this operation is performed.
Even if the configuration information is initialized, the Boot Options and the System Parameter maintain the present setting value.

NOTE : Be careful that if there is a LU whose access attribute is set by Data Retention Utility, initialization of configuration information is not possible.

(1) Turn on the main switch of the subsystem.

(2) Entering the Maintenance mode by WEB is required to initialize Configuration Information.
The method for entering the Maintenance mode varies depending on statuses of the READY LED (green) and ALARM LED (red) on the front side of the Basic Chassis.
- When the READY LED (green) is on, proceed to the procedure starting from the step (4).
- When the ALARM LED (red) is on, wait for three minutes after making sure of the lighting of it, proceed to the procedure starting from the step (4).
- Also proceed to the procedure starting from the step (3) in the case where the READY LED (green) and ALARM LED (red) do not come on after waiting for ten minutes when the power is turned on. (Refer to Figure 6.2.1.)

(3) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

(4) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed. When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed.

(5) Changing the Maintenance Mode.
- Single Controller
  Press the RST SW of the single Control Unit. (While pressing RST SW, the RST LED is on.)
  Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).
- Dual Controller

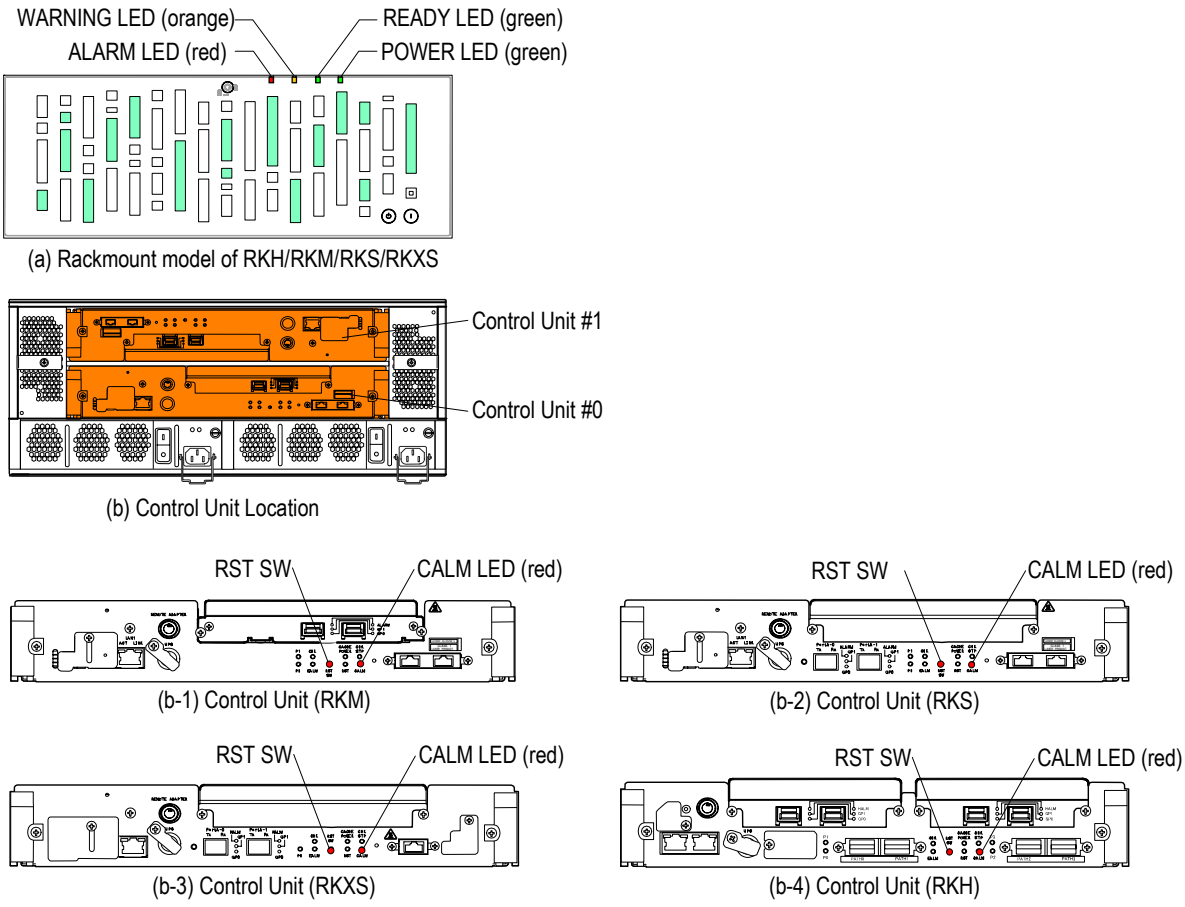
(a) Press the RST SW of the Control Unit #0. (While pressing RST SW, the RST LED is on.)
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

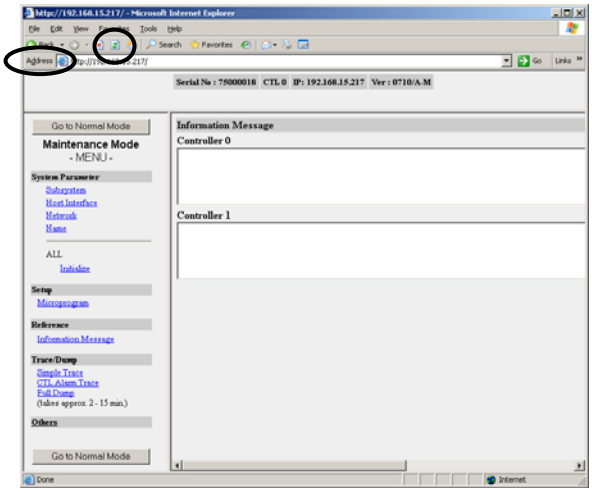
Copyright © 2006, Hitachi, Ltd.

(b) Press RST SW on Controller No.1, right after CALM LED turned on (within ten (10) seconds after CALM LED turned on).
(Sometimes the buzzer may beeps when the RST SW is pressed, however, you do not have to stop it until these operations are completed.)
When the CALM LED of the Control Unit #0 does not go out in spite of the above operation, power off the subsystem, return to step (1) without pulling out nor insert the Controller, and execute the procedure over again.

NOTE : Because the Control Unit is shutdown status for the Maintenance Mode, the command from the host is impossible execution. Please change it to the Maintenance Mode after the confirmation of separation of the device from the host or shutdown of the host.

When CALM LED on Control Unit #0 turns off and READY LED on the front side of the Basic Chassis is turns off, it transfers to Maintenance mode.





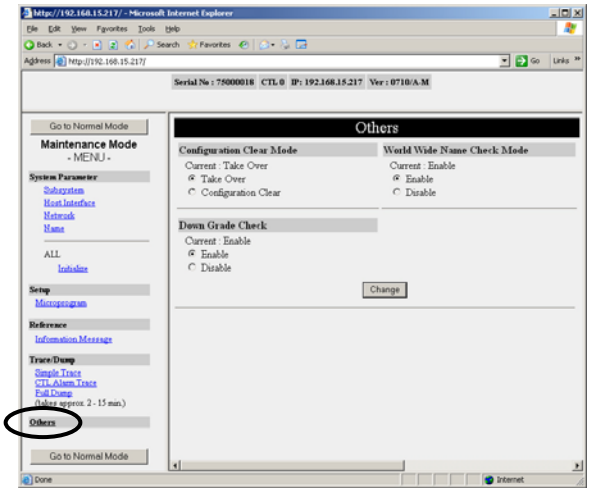


Figure 6.2.1 Indication Locations of LED

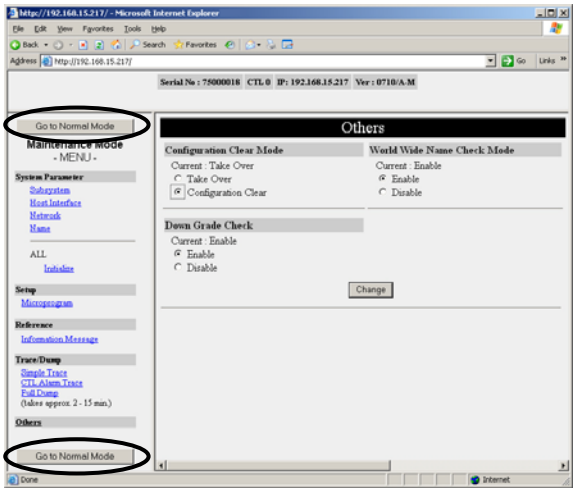
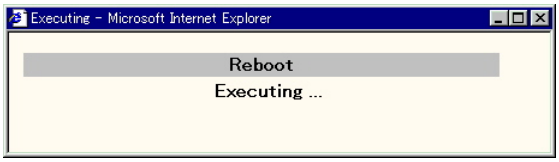
Copyright © 2006, Hitachi, Ltd.

(6) Enter the IP address of the LAN connector for maintenance, to which the service PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button. (For the procedure for connecting the Web, refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

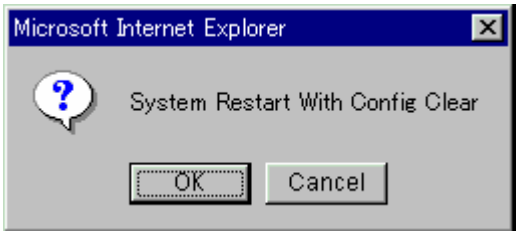


(7) Click "Others" in the menu frame.
The following window appears.

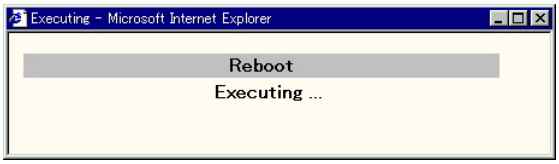


(8) Select the "Configuration Clear" radio button of [Configuration Clear Mode], then click the "Change" button.
"Current" of the "Configuration Clear Mode" is displayed as "Configuration Clear."

Copyright © 2006, Hitachi, Ltd.



(9) Click “Go To Normal Mode”. There are two “Go To Normal Mode” buttons, one at the top of the menu frame and the other at the bottom. Select either of them.



The following window is displayed while the above operation is executed.

(10) The following confirmation message is displayed at the later time for a while. Please click [OK] for the continuation.

The following window is displayed while the above operation is executed.

(11) If rebooting is finished, the subsystem is ready. (It usually takes about four minutes to become the READY status (about five minutes in case of the RKH).)
At this time, check that the READY LED (green) lights up after waiting for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of the RKH) when the READY LED (green) is blinking at high speed, or waiting for the maximum of 30 to 85 minutes when the WARNING LED (orange) is blinking at high speed.

6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used

When the pair of TrueCopy remote replication and the pair of TrueCopy Extended Distance share the Path, the Path blockade can be recovered by satisfying the recovery condition of each program product.

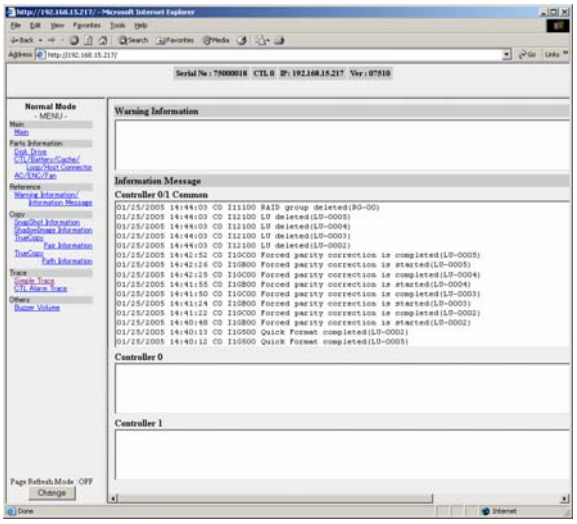
(1) Procedure for recovery from path detachment

(a) General flowchart of procedure for recovery from path detachment

*1 : The recovery from the path detachment may have been made by virtue of the automatic path recovery function. When a message informing of the completion of the recovery is displayed in the Information Message window, no revalidation is necessary. If the recovery has not been made, be sure to perform the revalidation.

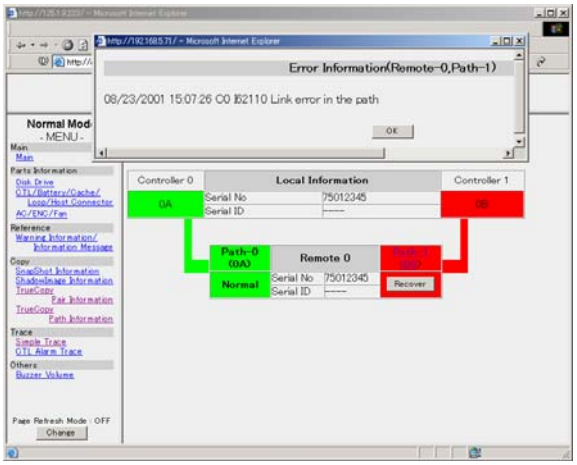
*2 : For the message when the acquisition of the cause of the path detachment was unsuccessful, refer to "Table 6.3.1 Path Detachment Causes and Priority Orders of Maintenance Works" (TRBL 06-1410).

*3 : For the message when the revalidation is performed, refer to "Table 6.3.3 List of Messages Displayed when Path Is Revalidated" (TRBL 06-1440).



*4 : When the PATH blockade recovers, "I030xy Path recovered by web operation (Remote-x, Path-y)", or "I031xy Path recovered automatically (Remote-x, Path-y)" is displayed in the Information Message on WEB, and the display of "W0F0xy Path alarm (Remote-x, Path-y) disappears from the Warning Information on WEB.

*5 : Other system PATH indicates Path-1 when the PATH which recovered the PATH blockade is Path-0, and Path-0 when the PATH which recovered the PATH blockade is Path-1.



Copyright © 2006, Hitachi, Ltd.

The example of the WEB window when the PATH blockade of TrueCopy remote replication occurs is shown below.

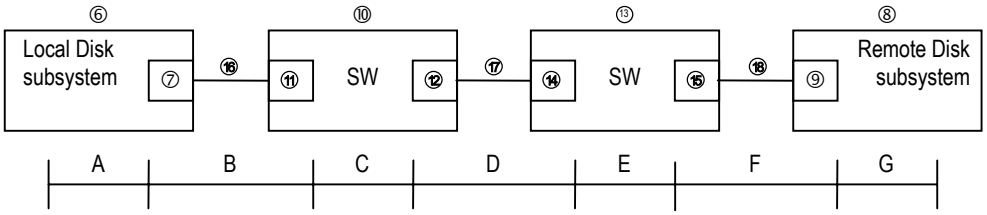
(b) Maintenance to be done against each cause of path detachment

The failed part cannot be ascertained depending on the type of the failure because the path detachment is a route failure.

Therefore, this manual only defines zones where a failure occurs for each path connection form and make the priority order of the zones and parts within the each zone clear.



[Procedure 1] Make sure of the path connection form.

Direct connection

① : Local Disk subsystem main body
② : Local Disk subsystem interface
③ : Remote Disk subsystem main body
④ : Remote Disk subsystem interface
⑤ : Connecting cable between the Disk subsystem's

Connection via SW

⑥ : Local Disk subsystem main body
⑦ : Local Disk subsystem interface
⑧ : Remote Disk subsystem main body
⑨ : Remote Disk subsystem interface
⑩ : Local side SW
⑪ : Local side GBIC of the local side SW
⑫ : Remote side GBIC of the local side SW
⑬ : Remote side SW
⑭ : Local side GBIC of the remote side SW
⑮ : Remote side GBIC of the remote side SW
⑯ : Connection cable between the local Disk subsystem and the local side SW
⑰ : Connection cable between the local side SW and the remote side SW
⑱ : Connection cable between the remote Disk subsystem and the remote side SW

Zone A : ⑥
Zone B : ⑦⑪⑯
Zone C : ⑩
Zone D : ⑫⑭⑰
Zone E : ⑬⑮⑱
Zone F : ⑨
Zone G : ⑧

Copyright © 2006, Hitachi, Ltd.

[Procedure 2] Perform a maintenance work referring to the priority order of zones and parts shown in Table 6.3.1 according to a cause of the path detachment.

NOTE : • Every time when a part is replaced from the order with a high priority, go to "[Procedure 3]" (TRBL 06-1430), and perform the revalidation in the TrueCopy Path Information window of the WEB following "6.3 (1) (a) General flowchart of procedure for recovery from path detachment" (TRBL 06-1360).

• The maintenance method varies depending on the reference number (① to ⑱) that represents each part.

The maintenance method corresponding to each number is shown below.

①③⑥⑧ → Since a failure of some kind has occurred in each DF700 subsystem, perform a maintenance work according to the LED indications or a WEB message.

②④⑦⑨ → Replacement of the I/F portion is required.
When replacing the I/F portion, an entire CTL must be replaced in the case of the part of the basic port (Port #0) because the part is integrated with the CTL, whereas only the Interface Board is to be replaced in the case of the part of the added port (Port #1).

Other than the above → Replacement the SW main body, the GBIC, or the cable.

Copyright © 2006, Hitachi, Ltd.

Table 6.3.1 Path Detachment Causes and Priority Orders of Maintenance Works

No.	Message text	Path detachment cause	Failure symptom	Priority order of maintenance objects(*1)	Path recovery method
1	Link error in the attached link (Port-x)	The threshold value of the route failure counter on the local side was exceeded.	• A link down was detected. • A link failure was detected.	Direct : ② → ④ → ⑤ SW : B → C	• The path revalidation from the WEB must be done.
2	Link error in the path	The threshold value of the path route failure counter was exceeded.	• An illegal transferred data length was detected.	Direct : ② → ④ → ⑤ SW : B → F → D → C → E	
3	Link down time-out (Port-x)	The link down time of the path set for the port concerned elapsed longer than 15 seconds.	• The link down time of the port for which a path has already been set elapsed longer than 15 seconds.	Direct : ② → ④ → ⑤ SW : B → C	• Automatic recovery
4	Path not connected	The remote Disk subsystem concerned is not connected.	• No remote Disk subsystem, for which a path was to be set, existed on the loop though a log-in was requested. • The WWN which has been set was not registered in the SW. <In the case of RKS/RKXS configuration> At either following condition, the path was detached. - The microprogram version less than 0760/A on remote DF(RKS/RKXS) was applied. - The 4Gbps FC Interface Board on remote or local DF(RKS/RKXS) was not added.	Direct : a → ④ → ③ → ② → ⑤ SW : a → G → F →D → E → C a : Firstly, check if the remote Disk subsystem is connected and if the connection is correctly made.	
5	Path login failed	The log-in to the path concerned failed.	• Though a log-in to a port expected to exist was attempted, it failed because allowable number of retrials were not successful.	Direct : ④ → ② → ⑤ SW : G → F → D → B → E → C (F : ⑨ → ⑮ → ⑱)	• The path revalidation from the WEB must be done.
6	Path login resource shortage	Resource of the path concerned was insufficient.	• Insufficiency(*2) of the resource was reported in a response made at the time of the log-in.	Direct : ④ SW : ⑨ The system configuration is illegal. (Propriety of the system configuration must be checked by an SE or a user.)	• The path revalidation from the WEB must be done.

*1 : A numeral and alphabetic character denote a part and zone respectively.

• Priority order of failed parts in each zone (a zone contains more than one part) is shown below.

Zone B : ⑪ → ⑦ → ⑯

Zone D : ⑫ → ⑭ → ⑰

Zone F : ⑲ → ⑨ → ⑱

*2 : The insufficient resource means that 128 log-in's have already been made for the port when 128 log-in's per port are allowed.

Copyright © 2006, Hitachi, Ltd.

No.	Message text	Path detachment cause	Failure symptom	Priority order of maintenance objects(*1)	Path recovery method
7	Fabric connection failed (Port-x)	Switch trouble	• The FLOGI sequence terminated abnormally. (Sending and response of FLOGI/ PLOGI/ RCS_ID/ RFT_ID/ PRT_ID/ SCR/RSCN terminated abnormally.)	Direct : None SW : B → C	• The path revalidation from the WEB must be done.
8	RSP not ready (Key [02], Code [xxyy])	Command RSP failure (Failure of the command issued from a Disk subsystem to another Disk subsystem)	Not Ready	Direct : ③ SW : ⑧	• The path revalidation from the WEB must be done.
9	RSP medium error (Key [03], Code [xxyy])		Medium Error	Direct : ③ SW : ⑧	
10	RSP hard error (Key [04], Code [xxyy])		Hard Error	Direct : ③ SW : ⑧	
11	RSP illegal request (Key [05], Code [xxyy])		Illegal Request	Direct : ① → ③ SW : ⑥ → ⑧	
12	RSP abort command P (Key [0B], Code [xxyy])		Aborted Command (path)	Direct : ④ → ② → ⑤ SW : F → B → D → E → C	
13	RSP abort command C (Key [0B], Code [xxyy])		Aborted Command (CTL)	Direct : ③ SW : ⑧	
14	RSP miscompare (Key [0E], Code [xxyy]) RSP status error [xx] RSP other field error RSP etc. (Key [xx])		Others	Direct : ① → ③ SW : ⑥ → ⑧	
15	Command time out	Command time-out (Failure of the command issued from a Disk subsystem to another Disk subsystem)	• Two or more times of time-out were detected in execution of the same command.	Direct : ④ → ② → ⑤ SW : G → F → D → B → E → C (F : ⑨ → ⑮ → ⑱)	• The path revalidation from the WEB must be done.
16	Remote sequence number error	Inconsistency of the remote Disk subsystem sequence No.	• The sequence No. of the remote Disk subsystem is inconsistent.	Direct : ③ SW : ⑧	• The path revalidation from the WEB must be done.
17	Path alarm for CTL alarm (Remote-x, Path-y)	CTL detachment	• A detachment of the own controller occurred.	Direct : ① SW : ⑥	• Automatic recovery
18	Port un-mounting error	Non-installation of the port	• The port is not installed.	Direct : ② SW : ⑦	• The path revalidation from the WEB must be done.
19	Remote option disable [TrueCopy Basic]	Locking of the remote Disk subsystem [TrueCopy remote replication]	• The [TrueCopy remote replication] priced optional function of the remote Disk subsystem is locked.	Direct : ③ SW : ⑧	• The path revalidation from the WEB must be done
20	Remote option disable [TrueCopy Extended Distance]	Locking of the remote Disk subsystem [TrueCopy Extended Distance] (*2)	• The [TrueCopy Extended Distance] (*2) priced optional function of the remote Disk subsystem is locked.	Direct : ③ SW : ⑧	• The path revalidation from the WEB must be done

*1 : A numeral and alphabetic character denote a part and zone respectively.

• Priority order of failed parts in each zone (a zone contains more than one part) is shown below.

Zone B : ⑪ → ⑦ → ⑯

Zone D : ⑫ → ⑭ → ⑰

Zone F : ⑮ → ⑨ → ⑱

*2 : The insufficient resource means that 128 log-in's have already been made for the port when 128 log-in's per port are allowed.

Copyright © 2006, Hitachi, Ltd.

No.	Message text	Path detachment cause	Failure symptom	Priority order of maintenance objects(*1)	Path recovery method
21	Remote pate setting unsupported on the remote Subsystem	The function for setting paths between subsystems of different models is not supported.	• The function for setting paths between subsystems with different system settings is not supported.	Direct : ③ SW : ⑧	• The path revalidation from the WEB must be done • Update the microprogram of the remote subsystem to revision 0760/A or later.

*1 : A numeral and alphabetic character denote a part and zone respectively.

• Priority order of failed parts in each zone (a zone contains more than one part) is shown below.

Zone B : ⑪ → ⑦ → ⑯

Zone D : ⑫ → ⑭ → ⑰

Zone F : ⑮ → ⑨ → ⑱

*2 : The insufficient resource means that 128 log-in's have already been made for the port when 128 log-in's per port are allowed.

[Procedure 3] Proceed to the procedure subsequent to "6.3 (1) (a) General flowchart of procedure for recovery from path detachment" (TRBL 06-1360).

When the getting of the path detachment cause has failed or the revalidation has terminated abnormally, perform a maintenance work following the recovery procedure shown in Table 6.3.2 and Table 6.3.3 according to the message displayed.

Table 6.3.2 List of Messages Displayed when Getting of Path Detachment Cause Failed

No.	Sub-window message	Meaning of message	Recovery method
1	Cannot get alarm information because specified function is lock.	The cause cannot be get because the [TrueCopy remote replication] or [TrueCopy Extended Distance] function is locked.	Unlock and validate the [TrueCopy remote replication] or [TrueCopy Extended Distance] function and get the cause of the path detachment again.
2	Cannot get alarm information because it is booting now.	The cause cannot be get because the subsystem is being booted.	Get the cause of the path detachment again after the subsystem enters the Ready status.
3	Cannot get alarm information because it does not register for remote equipment.	The cause cannot be get because the specified remote DF number is illegal.	Update the browser. If the path is still detached, get the cause of the path detachment again.
4	Cannot get alarm information because specified function is disable.	The cause cannot be get because the [TrueCopy remote replication] or [TrueCopy Extended Distance] function is invalid although it is unlocked.	Validate the [TrueCopy remote replication] or [TrueCopy Extended Distance]function and get the cause of the path detachment again.
5	Cannot get alarm information because it does not register for this path.	The cause cannot be get because the specified path does not exist.	Update the browser. If the path is still detached, get the cause of the path detachment again.
6	Cannot get alarm information because this path's status is normally.	The cause cannot be get because the specified path has already become normal.	Update the browser. If the path is still detached, get the cause of the path detachment again.

Copyright © 2006, Hitachi, Ltd.

Table 6.3.3 List of Messages Displayed when Path Is Revalidated

No.	Sub-window message	Meaning of message	Recovery method
1	Do you recover this path?	Do you want to revalidate the specified path?	—
2	Executing...	The revalidation of the specified path is being executed.	—
3	This recovery was completed successfully.	The revalidation of the specified path was completed normally.	—
4	This recovery failed.	The revalidation of the specified path terminated abnormally.	It is presumed that the path was detached owing to another cause or the replaced part was not correct. Perform a maintenance work again following the procedure against the path detachment.
5	Cannot recover this path because specified function is lock.	The path revalidation cannot be done because the [TrueCopy remote replication] or [TrueCopy Extended Distance] function is locked.	Unlocked and validate the [TrueCopy remote replication] or [TrueCopy Extended Distance] function and execute the path revalidation again.
6	Cannot recover this path because it is booting now.	The path revalidation cannot be done because the subsystem is being booted.	Execute the path revalidation again after the subsystem enters the Ready status.
7	Cannot recover this path because it does not register for this remote equipment.	The path revalidation cannot be done because the specified remote DF number is illegal.	Execute the path revalidation again after updating the browser.
8	Cannot recover this path because CTL is alarm.	The path revalidation cannot be done because the controller is detached.	Execute the path revalidation again after recovering the controller from the detachment.
9	Cannot recover this path because specified function is disable.	The path revalidation cannot be done because the [TrueCopy remote replication] or [TrueCopy Extended Distance] function is invalid though it is unlocked.	Execute the path revalidation again after validating the [TrueCopy remote replication] or [TrueCopy Extended Distance] function.
10	Cannot recover this path because it does not register for this path.	The path revalidation cannot be done because the specified path does not exist.	Execute the path revalidation again after updating the browser.
11	Cannot recover this path because this path's status is normally.	The path revalidation cannot be done because the specified path has already become normal.	Execute the path revalidation again after updating the browser.
12	Cannot recover this path because it is executing LU Format.	The path revalidation cannot be done because an LU formatting is being executed.	Execute the path revalidation again after the LU formatting is completed.
13	Cannot recover this path because it is executing Synchronized cache.	The path revalidation cannot be done because the SyncCache command is being executed.	Execute the path revalidation again after the execution of the SyncCache command is completed.
14	Cannot recover this path because it is executing Array unit shutdown.	The path revalidation cannot be done because the pseudo-deliberate shutdown is being executed.	Execute the path revalidation again after the pseudo-deliberate shutdown has been completed.
15	Cannot recover this path because Power OFF>	The path revalidation cannot be done because the deliberate shutdown is being executed.	Execute the path revalidation again after starting up the subsystem.

Chapter 7. Collecting Error Information

When any failure occurs, the information on it saved in the Control Unit can be collected. The purpose of this function is to facilitate pursuit of factors of failures and shorten the time consumed for analysis of them.
The failure information is collected by the following three methods.

(1) Collection Simple Trace

Use the normal or maintenance mode using a Web browser to download the trace information and configuration information from the controller to the browser terminal.
You can collect a simple trace while the device is running. You can also collect it when the ALARM LED is lit on the device.
For details of the procedure for the collection, refer to "7.3 Collecting Simple Trace" (TRBL 07-0040).

(2) Collecting CTL Alarm Trace

The controller contains information about the time when the controller is shut down. Use the normal or maintenance mode using a Web browser to download this information from the controller to the browser terminal.
The CTL alarm trace can be collected after recovering the blocked controller.
For details of the procedure for the collection, refer to "7.4 Collecting CTL Alarm Trace" (TRBL 07-0080).

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

(3) Collecting Full Dump

The information saved in the Controller is downloaded to the browser terminal by using the maintenance mode of WEB.

Controller 0/1 Common

```
MM/DD/YYYY HH:MM:SS Cx □□□□□□ ○○○○○○○○○○○○  : △△△△△△/◆◆◆◆
MM/DD/YYYY HH:MM:SS Cx □□□□□□ ○○○○○○○○○○○○  : △△△△△△/◆◆◆◆
                          :
```

For details of the procedure for the collection, refer to "7.5 Collecting Full Dump" (TRBL 07-0130).

The failure information is collected by different methods, depending on the configuration and condition of the unit.
Collect the failure information securely according to "7.2 Judge collection of failure information" (TRBL 07-0020).

Copyright © 2005, 2006, Hitachi, Ltd.

(4) NAS Log collection

The log information on the NAS OS stored in the disk is downloaded to the browser terminal by using the normal mode of WEB.

The NAS Log can be collected while the NAS Unit is operating, but when the ALARM LED lights on, it cannot be collected. Also, when the Control Unit connected to the NAS Unit on the collected side is blocked, the NAS log cannot be collected.

Because the access information between the clusters is necessary for the analysis work, collect the NAS Logs for both NAS Units in the cluster.

Also, collect "Full Mode" uniformly unless otherwise instructed.

Refer to "7.6 NAS log collection" (TRBL 07-0230) for the details of the collection method.

(5) NAS Dump collection

The full memory information on the NAS stored in the disk is downloaded to the browser terminal by using the normal mode of WEB.

The NAS Dump can be collected after the recovery of the NAS Unit which was generated in the Disk Drive at the failure occurrence opportunity or had the generation instruction executed manually.

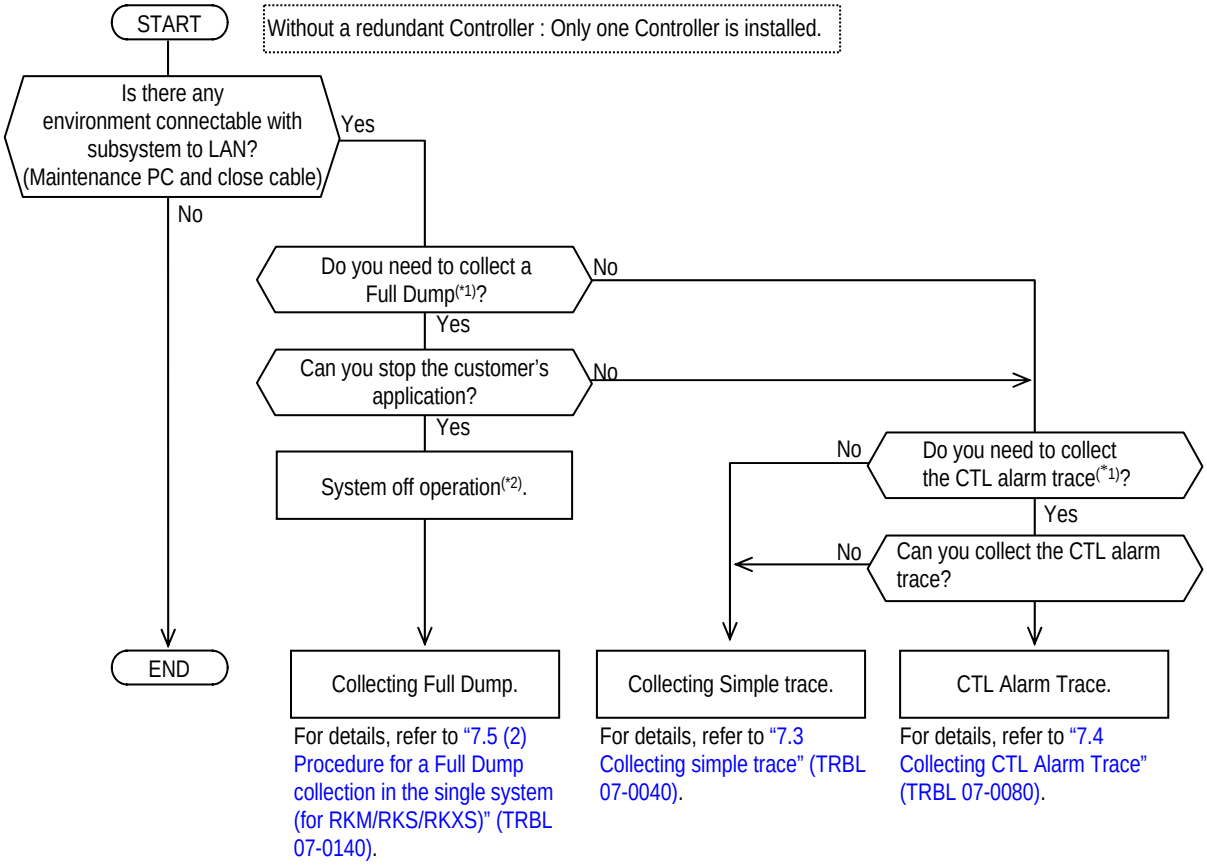
Refer to "7.7 NAS dump collection" (TRBL 07-0280) for the details of the collection method.

(6) Maintenance PC log collection

The Maintenance PC log indicates the log file of Storage Navigator Modular installed in the Maintenance PC and the log file of NAS Setup. The collection method is the same as that of the log file of Storage Navigator Modular.

Refer to "9.1.3 (1)② Collecting log files" (TRBL 09-0030) for the details of the collection method.

7.1 Time to collect failure information



Collect the failure information in the following cases.

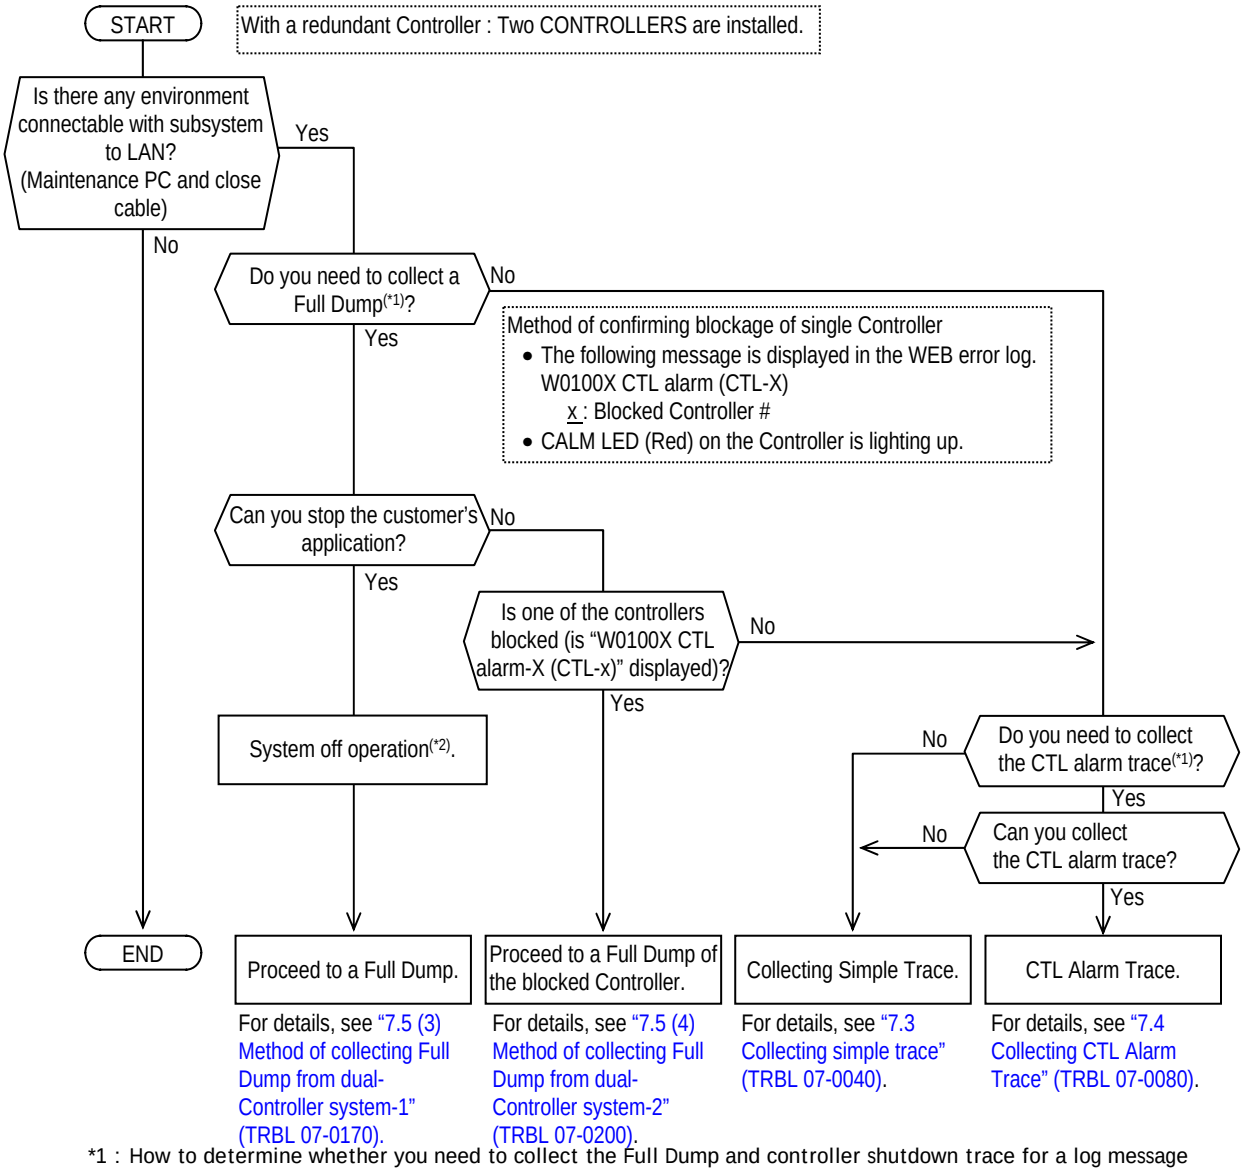
(1) A failure was reported to the work-station server, client for maintenance, WEB browser, or Storage Navigator Modular.
(2) The WARNING LED (orange) on the front of the Basic Chassis blinked or lit up.
(3) The ALARM LED (red) on the front of the Basic Chassis lit up.
(4) The slow down of the NAS OS occurred in the NAS system.
(Refer to "Chapter 11 Procedure for Determining Failure of Network Side in NAS System" (TRBL 11-0000) for the procedure for determining the NAS OS slow down.)

Copyright © 2005, 2006, Hitachi, Ltd.

7.2 Judge collection of failure information

(1) Flow of judgment of collection of failure information for system having single Controller (without a redundancy Controller)

*1 : How to determine whether you need to collect the Full Dump and controller shutdown trace for a log message



① See the last five characters (124th to 128th characters) in the log message.
(For details about the log messages, refer to "4.3 Confirm log messages" (TRBL 04-0100).)

② /STRC : You need to collect the Simple Trace.
/CTRC : You need to collect the CTL Alarm Trace.
/FDMP : You need to collect the Full Dump.

*2 : When the power control mode is Remote (when the rotary switch is set to 2, 4, 5, 6, or 8), take care that the subsystem power is also turned off if the host computer is powered off. (Refer to the Installation "1.8 Setting the Power Control Mode (Local/Remote Mode)" (INST 01-0380). When the subsystem is powered off, a Full Dump cannot be done.)
When the mode is Remote, perform the Full Dump in the state in which no access (I/O) from the host computer is made. (Refer to "7.5 Collecting Full Dump" (TRBL 07-0130).)

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Flowchart for determining to produce a memory dump in the case of the dual configuration. (with the redundant Controller.)

*1 : How to determine whether you need to collect the Full Dump and controller shutdown trace for a log message

① See the last five characters (124th to 128th characters) in the log message.
(For details about the log messages, refer to "4.3 Confirm log messages" (TRBL 04-0100).)

② /STRC : You need to collect the Simple Trace.
/CTRC : You need to collect the CTL Alarm Trace.
/FDMP : You need to collect the Full Dump.
/NLOG : Needs the NAS Log and the simple trace collection.
/NDMP : Needs the NAS Dump collection.
/PLOG : Needs the log of the Maintenance PC Log, the NAS Log, and the simple trace collection.

*2 : When the power control mode is Remote (when the rotary switch is set to 2, 4, 5, 6, or 8), take care that the subsystem power is also turned off if the host computer is powered off. (Refer to the Installation Installation "1.8 Setting the Power Control Mode (Local/Remote Mode)" (INST 01-0380). When the subsystem is powered off, a Full Dump cannot be done.)
When the mode is Remote, perform the Full Dump in the state in which no access (I/O) from the host computer is made. (Refer to "7.5 Collecting Full Dump" (TRBL 07-0130).)

Copyright © 2005, 2006, Hitachi, Ltd.

7.3 Collecting simple trace

Using Simple Trace Collection, the trace information stored in the controller and the configuration information are collected.

The method of collecting the simple trace is shown below.

(1) Before collecting the simple trace

(a) Items to be prepared

Collection is performed using the normal mode of WEB or Maintenance mode.
For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary.
For collecting the simple trace, disk space of 520 M bytes is required. (260 M bytes for temporary data and 260 M bytes for Full Dump data)
Under ordinary maintenance works, disk space of no less than 5 M bytes is required.

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN-cross-cable.
At the time of the RKNAS connection, remove the cover of the LAN connector for the maintenance in the RKNAS (rear side), and connect the LAN connector for the maintenance and the LAN connector of the Maintenance PC.

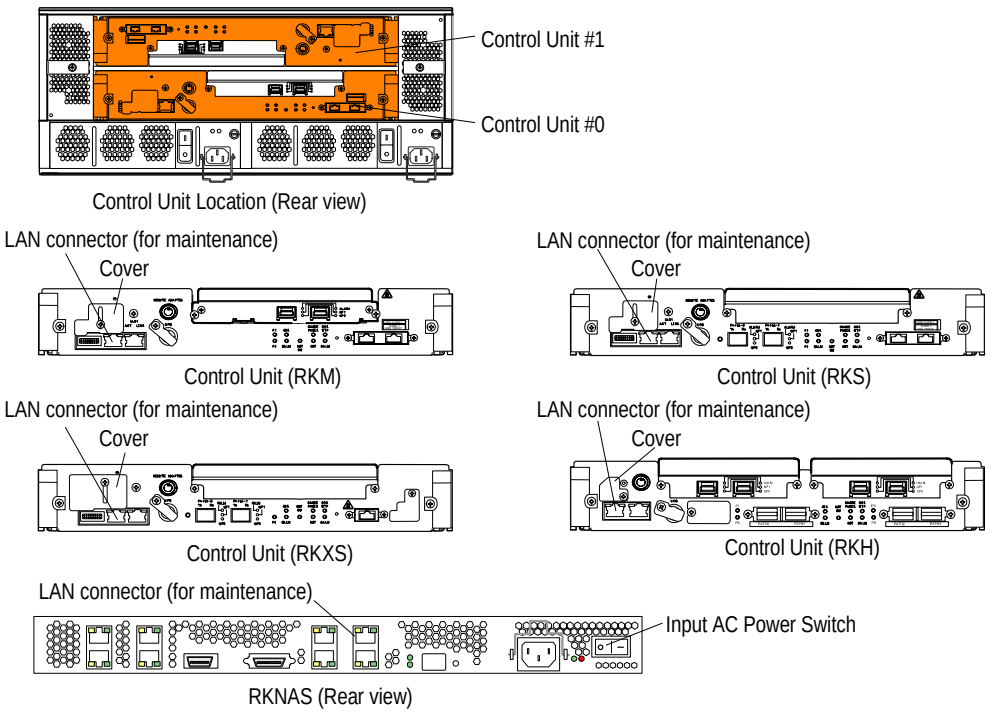


Figure 7.3.1 LAN Connector Position

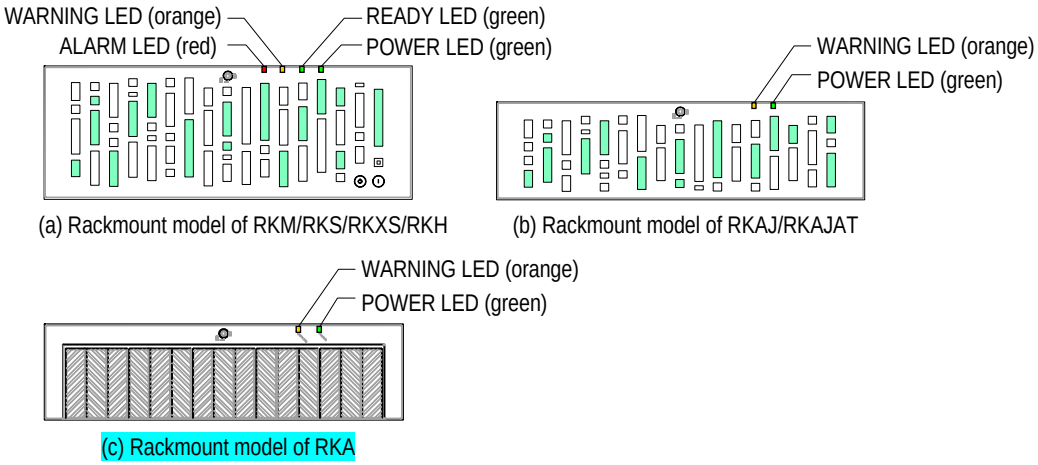
Copyright © 2005, 2006, Hitachi, Ltd.

(c) With Simple Trace Collection, the information of both controllers can be collected from one controller. Therefore, this function does not need to be performed from both Controllers. (As a file name during the collection, "smpl_trc0.dat" is provided for the collection from Control Unit #0, and "simpl_trc1.dat" for the collection from Control Unit #1".)

(d) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

(e) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed.
When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. There is no problem if it blinks slowly (at intervals of one second).

(f) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] - [Cache] - [Clear Cache] in this order.



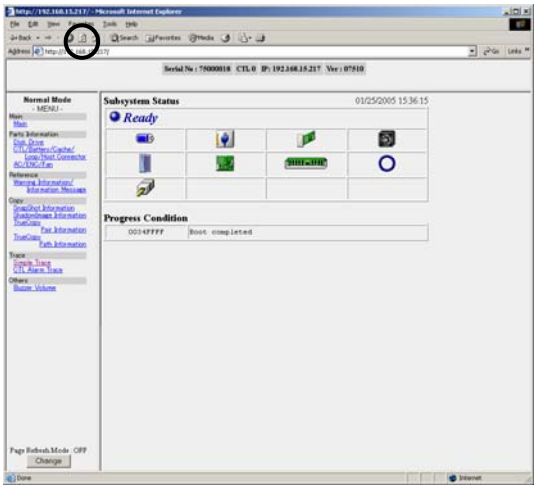


Figure 7.3.2 Indication Locations and Names of LED (Front Bezel)

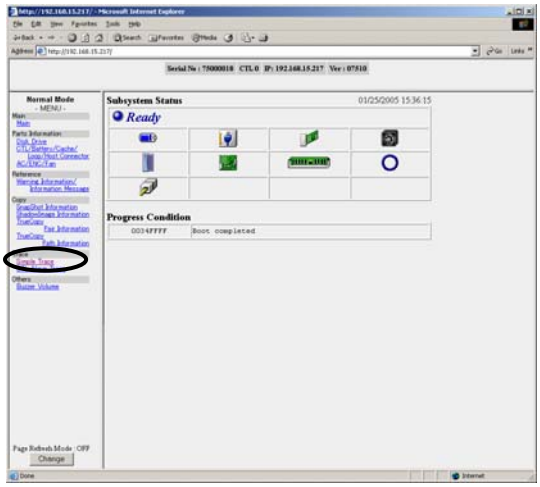
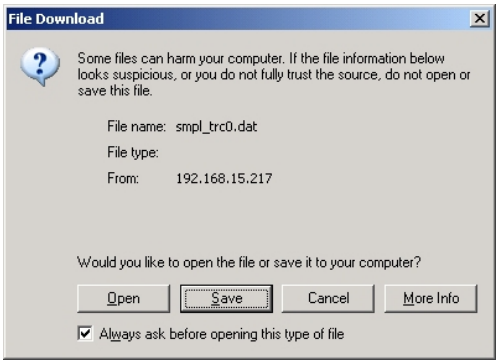
Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for a simple trace collection



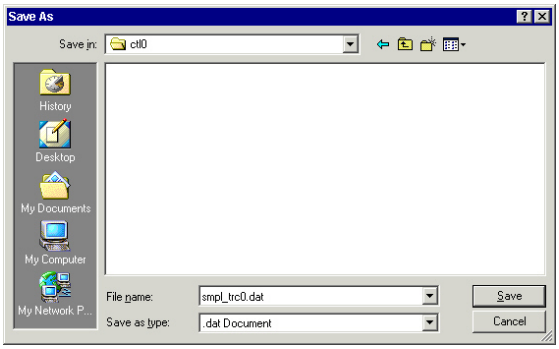
(a) Enter the IP address of the LAN connector for maintenance, to which the service PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button. (For the procedure for connecting the Web, refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)

(b) When Windows XP Service Pack2 or Windows 2003 Service Pack1 is used in the OS of the maintenance PC, collect the simple trace after changing the setting of the following Internet Explorer.



- Select [Tools] - [Internet Options] from the Internet Explorer menu.
- Select the [Privacy] tab, check [Blocked pop-up] of [Pop-up block], and click the [Set] button.
- Set [Filter level] to [Medium] in the [Setting pop-up block] window and click the [Close] button.
- Select [OK] button in the [Internet Options] window.

(c) Collect the simple trace according to the WEB and the following procedure.
Click "Trace" in the menu frame of "Simple Trace".



Copyright © 2005, 2006, Hitachi, Ltd.

(d) The following dialog is displayed.
Click the [Save] button.

(e) Select the place to save the file and file name (Default file name: CTL#0:smpl_trc0.dat, CTL#1: smpl_trcl.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed.
When the down-loading completes, the progress indicating message window is closed.

In this procedure Simple trace is collected by WEB Normal mode. Similarly, Simple trace can be collected by WEB Maintenance mode through Menu Frame.
For entering Maintenance mode, refer to the WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

When the USB memory needs to store the simple trace information, refer to "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300).

‡1 : There may be a case where the default file name is given as "ctla_trc0.dat..dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

Copyright © 2005, 2006, Hitachi, Ltd.

7.4 Collecting CTL Alarm Trace

Through the CTL Alarm Trace collection, detailed information (the CTL Alarm Trace) on the immediately previous Controller blockage stored in the Controller is collected.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

Since the above-mentioned CTL Alarm Trace information is taken over from the blocked Control Unit to the replaced Control Unit, it can be collected after the Control Unit is recovered from the failure. If the Control Unit is blocked while collecting the CTL ALARM TRACE may not be collected normally. Therefore, in this case, collect the CTL ALARM TRACE again.

The method of collecting the CTL ALARM TRACE is shown below.

(1) Before collecting the CTL ALARM TRACE

(a) Items to be prepared

The CTL Alarm Trace is collected in the normal mode or the maintenance mode of the WEB. For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary. For collecting the CTL ALARM TRACE, disk space of 520 M bytes per one Control Unit is required. (260 M bytes for temporary data and 260 M bytes for Full Dump data)

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN cross cable. At the time of the RKNAS connection, remove the cover of the LAN connector for the maintenance in the RKNAS (rear side), and connect the LAN connector for the maintenance and the LAN connector of the Maintenance PC.

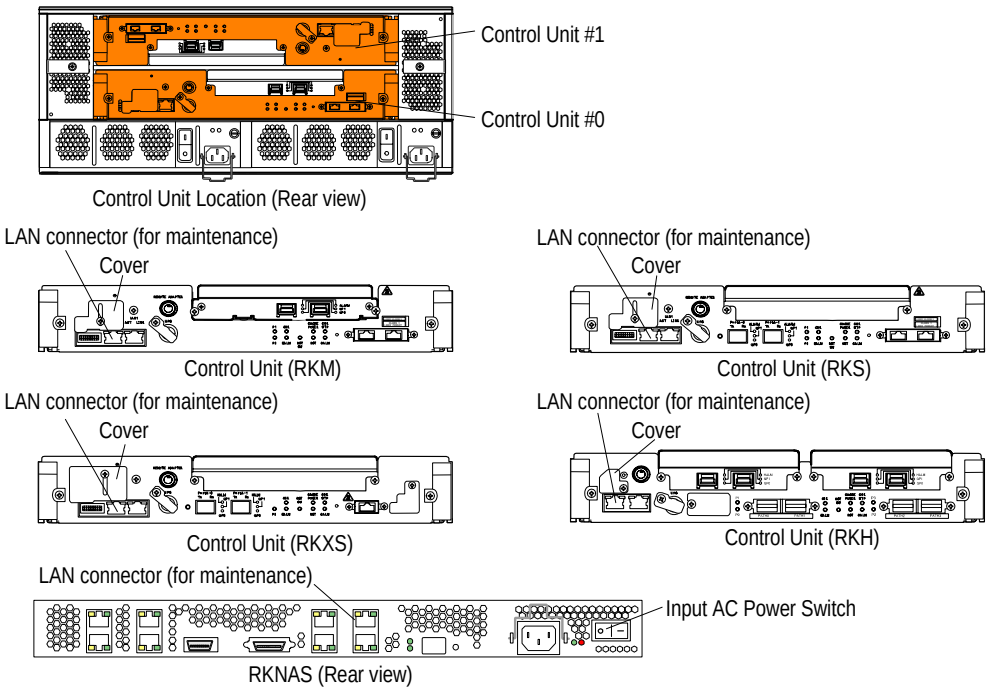


Figure 7.4.1 LAN Connector Position

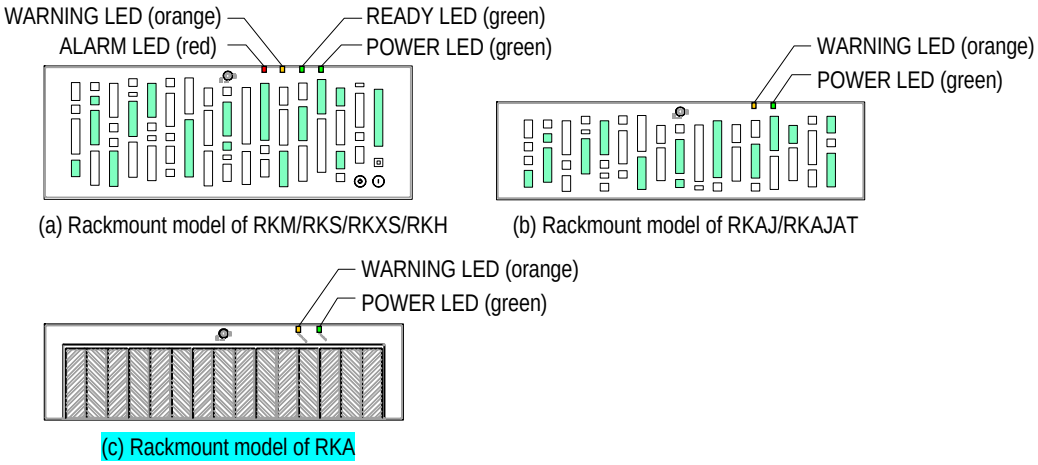
Copyright © 2005, 2006, Hitachi, Ltd.

(c) Collect the CTL Alarm Trace information from each Control Unit.
Save the files collected from different controllers into different directories or put different names to them so that you will see from which controller they were collected.

(d) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 50 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

(e) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed.
When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. There is no problem if it blinks slowly (at intervals of one second).

(f) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.



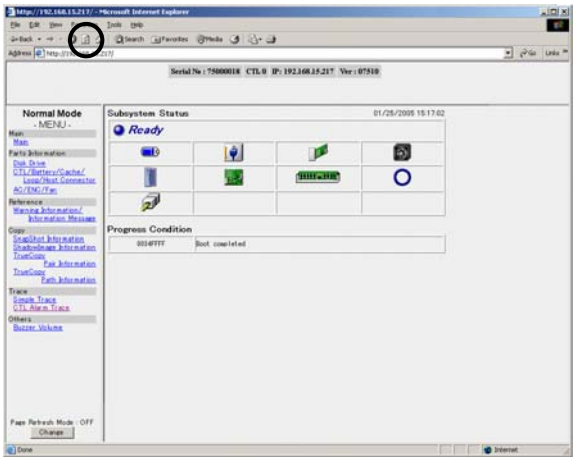


Figure 7.4.2 Indication Locations and Names of LED (Front Bezel)

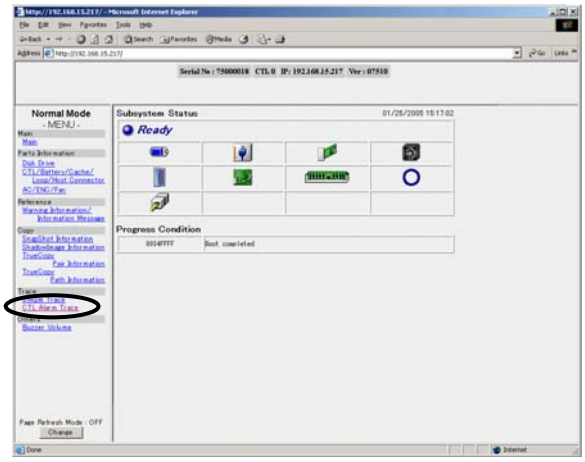
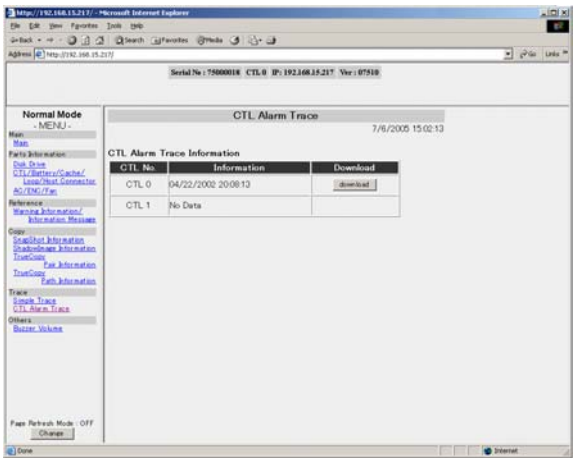
Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for collecting a CTL Alarm Trace



(a) Enter the IP address of the LAN connector for maintenance, to which the service PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button. (For the procedure for connecting the Web, refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)

(b) When Windows XP Service Pack2 or Windows 2003 Service Pack1 is used in the OS of the maintenance PC, collect the CTL ALARM Trace after changing the setting of the following Internet Explorer.



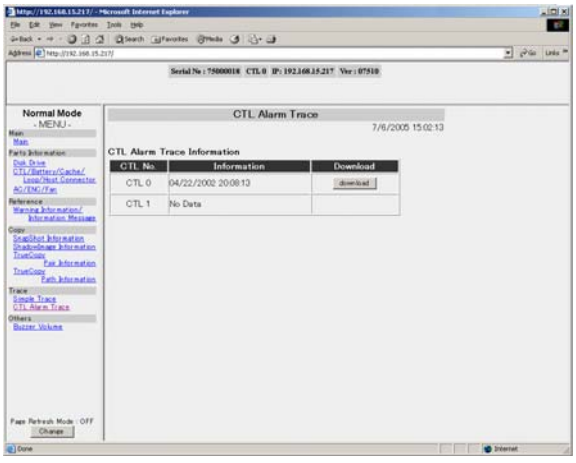
- Select [Tools] - [Internet Options] from the Internet Explorer menu.
- Select the [Privacy] tab, check [Blocked pop-up] of [Pop-up block], and click the [Set] button.
- Set [Filter level] to [Medium] in the [Setting pop-up block] window and click the [Close] button.
- Select [OK] button in the [Internet Options] window.

(c) Collect the memory dump according to the WEB and the following procedure.
Click "CTL Alarm Trace" in the menu frame of "Trace".

Copyright © 2005, 2006, Hitachi, Ltd.

If CTL Alarm Trace exists, the CTL Alarm Trace information window is displayed.

Description of information

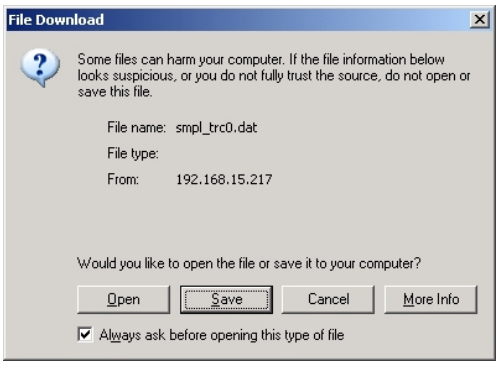


"Not Ready" ····· Indicates the situation where the trace area is not established in the device.

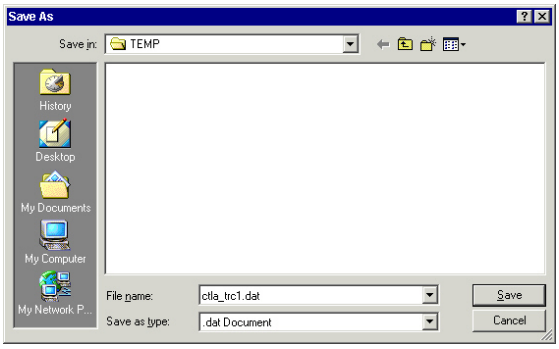
"No Data" ····· CTL Alarm Trace information does not exist or while information is being created.

"MM/DD/20YY hh:mm:ss" ····· CTL Alarm Trace information exists.

NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL Alarm Trace may not be collected normally. Therefore, collect the Simple Trace.
If Simple Trace cannot be obtained through detached Control Unit, connect the Maintenance PC to the Control Unit at the opposite side, and collect the Simple Trace.



(d) Press the "Download" button on the Control Unit side to be collected in "CTL Alarm Trace information".(‡1)



‡1 : An error message may be displayed. If it is displayed, click [OK], and collect the CTL Alarm Trace again after waiting for a while.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) The following dialog is displayed. Click the [Save] button.

(f) Select the place to save the file and file name (Default file name: ctla_trc0.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed. When the down-loading completes, the progress indicating message window is closed.

In this procedure is collected by WEB Normal mode. Similarly, CTL Alarm Trace can be collected by WEB Maintenance mode through Menu Frame.
For entering Maintenance mode refer to WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

‡1 : There may be a case where the default file name is given as "ctla_trc0.dat.dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

Copyright © 2005, 2006, Hitachi, Ltd.

7.5 Collecting Full Dump

The method of collecting the Full Dump is shown below.

(1) Before collecting the Full Dump

(a) Items to be prepared

The Full Dump is collected in the maintenance mode of the WEB.
For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary.
For collecting the Full Dump, disk space of 3.6 G bytes per one Control Unit is required. (1.8 G bytes for temporary data and 1.8 G bytes for Full Dump data)

(b) Remove the cover on the Device Control Unit. Connect the LAN-Connecter for maintenance and the LAN-Connecter of Maintenance PC with a LAN-cross-cable.
At the time of the RKNAS connection, remove the cover of the LAN connector for the maintenance in the RKNAS (rear side), and connect the LAN connector for the maintenance and the LAN connector of the Maintenance PC.

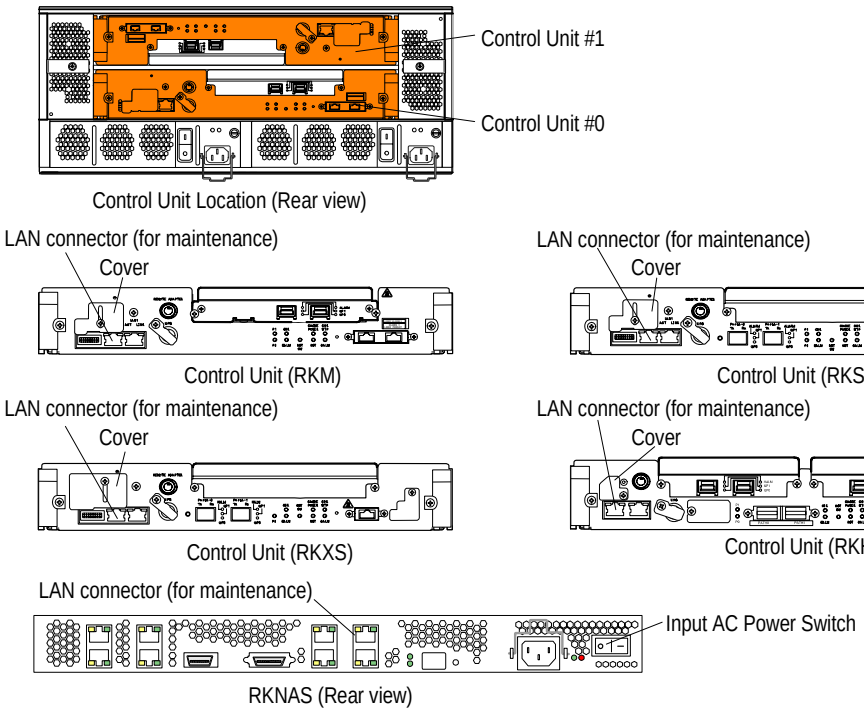


Figure 7.5.1 LAN Connector Location

(c) Collect the Full Dump information from each Control Unit.
Save the files collected from different controllers into different directories or put different names to them so that you will see from which controller they were collected.

(d) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 60 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed.
When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. There is no problem if it blinks slowly (at intervals of one second).

(f) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - and [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] - [Cache] - [Clear Cache] in this order.

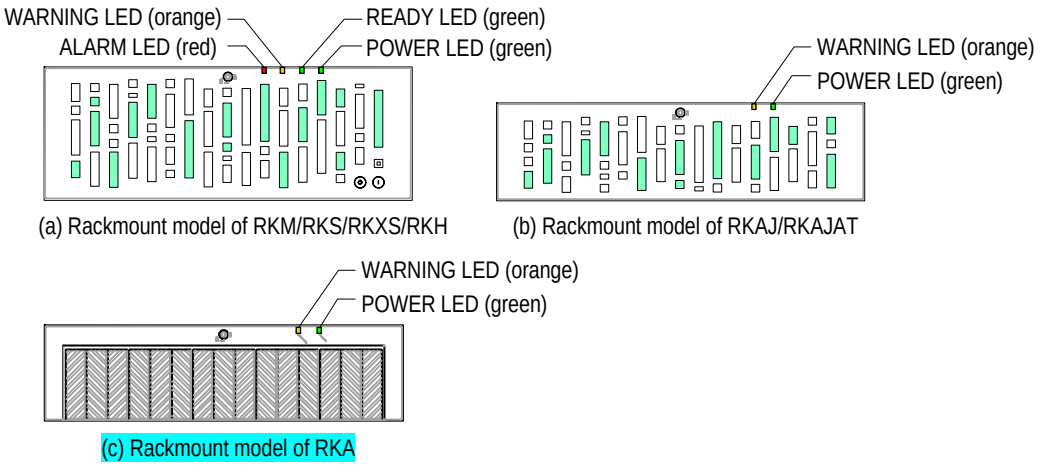

Figure 7.5.2 Indication Locations and Names of LED (Front Bezel)

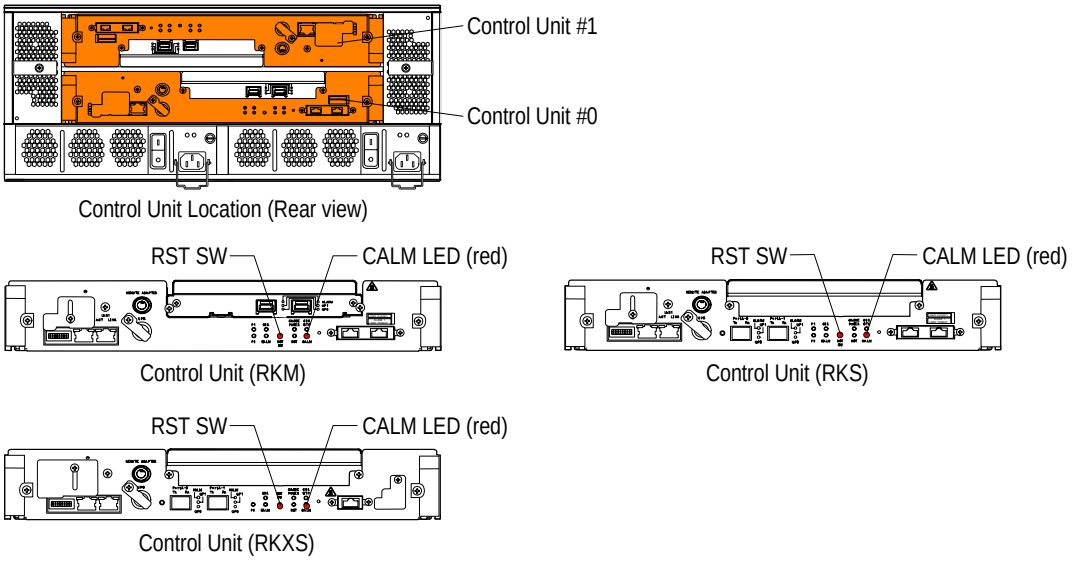
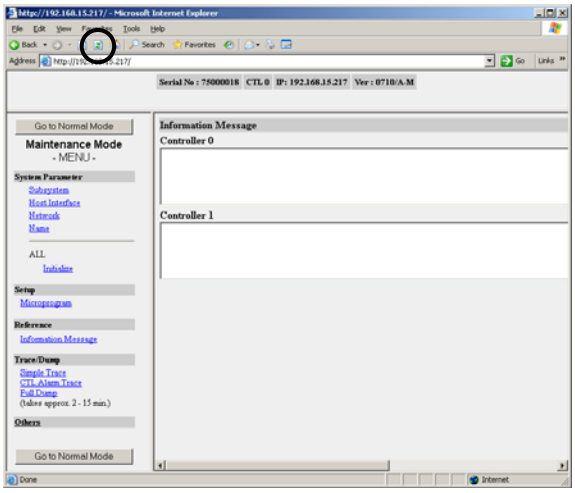
This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

(2) Procedure for a Full Dump collection in the single system (for RKM/RKS/RKXS)

(a) Please push the RST SW of Control Unit. (While pressing RST SW, the RST LED is on.)
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter). (The Controller enters the WEB maintenance mode.)





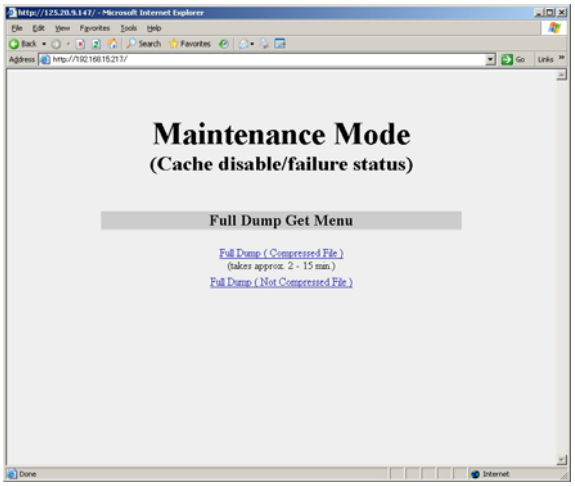


Figure 7.5.3 Indication Locations of Control Unit

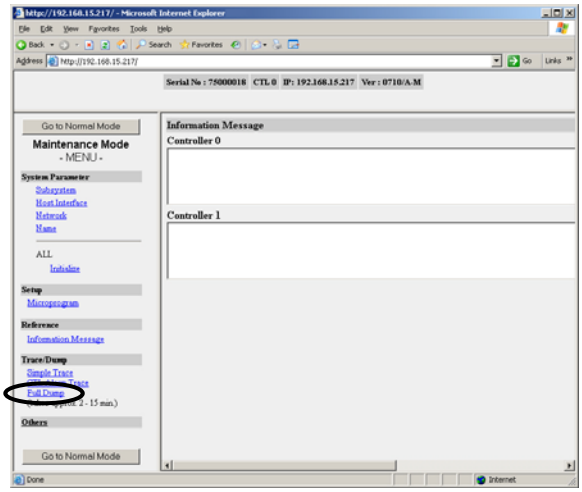
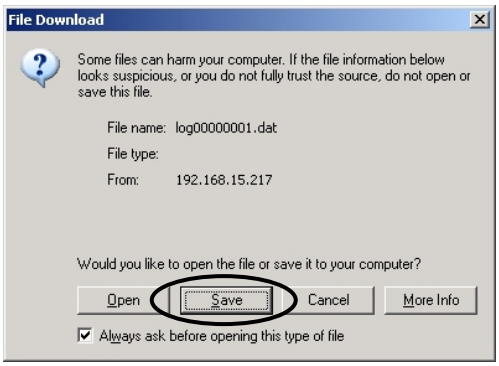
Copyright © 2005, 2006, Hitachi, Ltd.

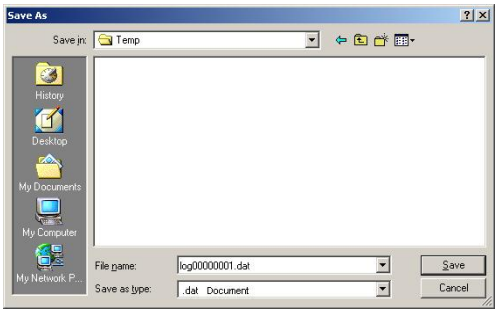
(b) Enter the IP address of the LAN connector for maintenance, to which the service PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Refresh button or click the [View] – [Refresh]. (For the procedure for connecting the Web, refer to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).) A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].



The cache memory access failure occurs when the following window is displayed. Refer to WEB "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).



Copyright © 2005, 2006, Hitachi, Ltd.



(c) Collect the Full Dump according to the WEB and the following procedure.
Click "Full Dump" in the menu frame of "Trace/Dump".

The following dialog is displayed. Click the [Save] button.

Select the place to save the file and file name (Default file name: logx.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed. When the down-loading completes, the progress indicating message window is closed. There is no problem although it is displayed that the presumption remaining time is uncertain in the dialog box during the download.

‡1 : There may be a case where the default file name is given as "logx.dat.dat" depending on the setting of the PC. In this case, reset the file name to "logx.dat" or any other name. (x: Controller serial numbers)

Copyright © 2005, Hitachi, Ltd.

(3) Method of collecting Full Dump from dual-Controller system-1

Interrupting the customer operation and collecting Full Dump information of the both Control Units under dual system configuration

NOTE : When the Full Dump is collected with the Control Unit blocked, it is necessary to collect the Full Dump from the Control Unit that is blocked.

(a) Press the RST SW of the blocked Control Unit. (If both Control Units are normal or blocked, press the RST SW of either one.) (While pressing RST SW, the RST LED is on.)

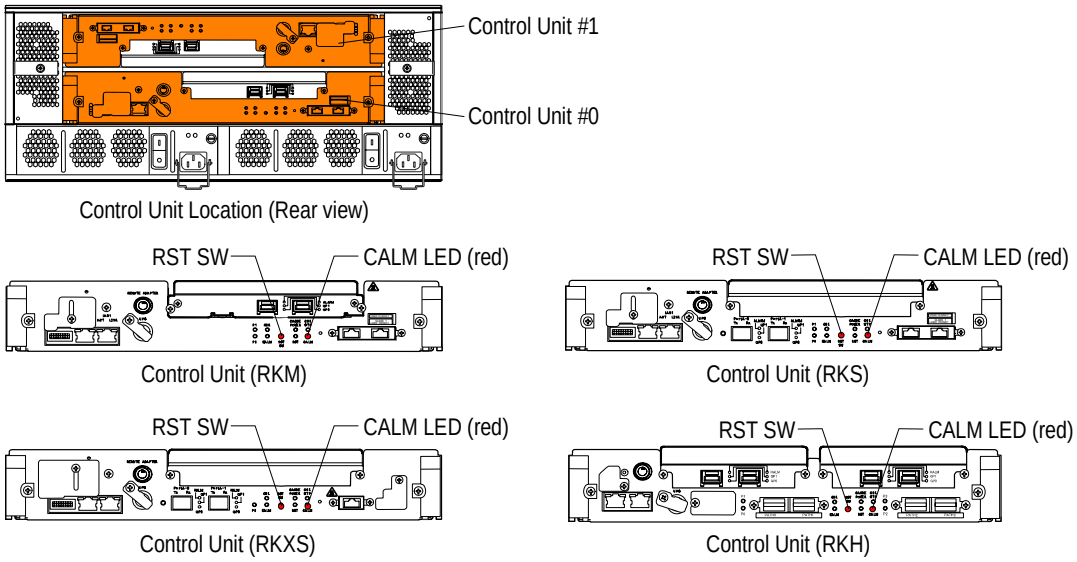
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

Wait for a while (about ten seconds) and check that the CALM LED of the Control Unit lights up.

Within ten seconds after the CALM LED lights up, press the RST SW of the other Control Unit. (Sometimes the buzzer may beeps when the RST SW is pressed, however, you do not have to stop it until these operations are completed.)

When ten seconds or longer pass after the CALM LED of the Control Unit concerned comes on, return to the beginning of the step (a) and execute the procedure over again. (When the above procedure is executed, the both Control Units enter the Maintenance mode of the WEB.)

The CALM LED on the Control Unit of which RST SW was pressed first goes off, and READY LED on the Front Bezel goes off.



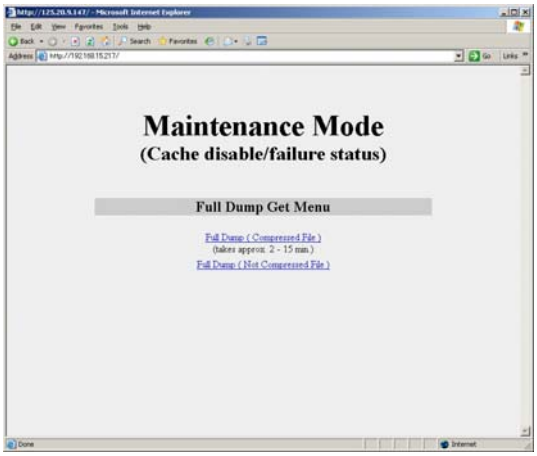


Figure 7.5.4 Indication Locations of Control Unit

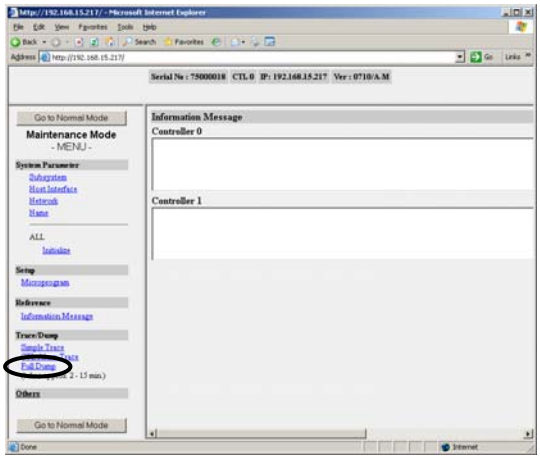
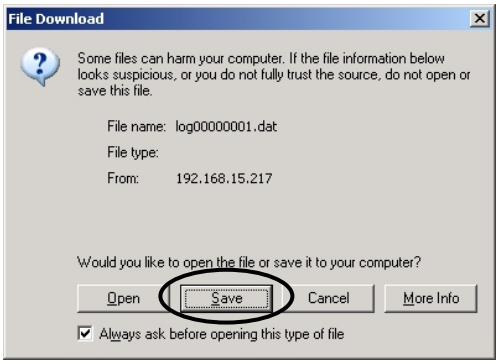


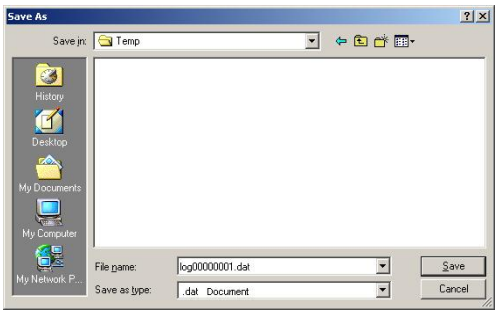
Copyright © 2005, 2006, Hitachi, Ltd.

(b) Input the IP address of the controller from which the Full Dump will be collected, through the browser. If the system has been connected to the WEB, press the "Refresh" button to update the page.
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

The cache memory access failure occurs when the following window is displayed. Refer to WEB "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).



(c) Collect the Full Dump according to the WEB and the following procedure.
Click "Full Dump" in the menu frame of "Trace/Dump".



Copyright © 2005, 2006, Hitachi, Ltd.

The following dialog is displayed. Click the [Save] button.

Select the place to save the file and file name (Default file name: logx.dat <x:Controller serial numbers>) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed.
When the down-loading completes, the progress indicating message window is closed.
There is no problem although it is displayed that the presumption remaining time is uncertain in the dialog box during the download.

(d) Return to (b) and collect the Full Dump from the other Control Unit.
(Save the Full Dump files collected from different Control Units into different directories or put different names to them so that you will see from which controller they were collected.)

‡1 : There may be a case where the default file name is given as "logx.dat.dat" depending on the setting of the PC. In this case, reset the file name to "logx.dat" or any other name.

Copyright © 2005, 2006, Hitachi, Ltd.

(4) Method of collecting Full Dump from dual-Controller system-2

Collecting Full Dump information of detached Control Unit under dual system configuration

NOTE : Collect the Full Dump from only the blocked Control Unit. (The CALM LED (red) of the blocked controller is lighting up.)

(a) Press the RST SW of the blocked Control Unit. (While pressing RST SW, the RST LED is on.)
Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).
(The Control Unit will be set in the maintenance mode of the WEB.)

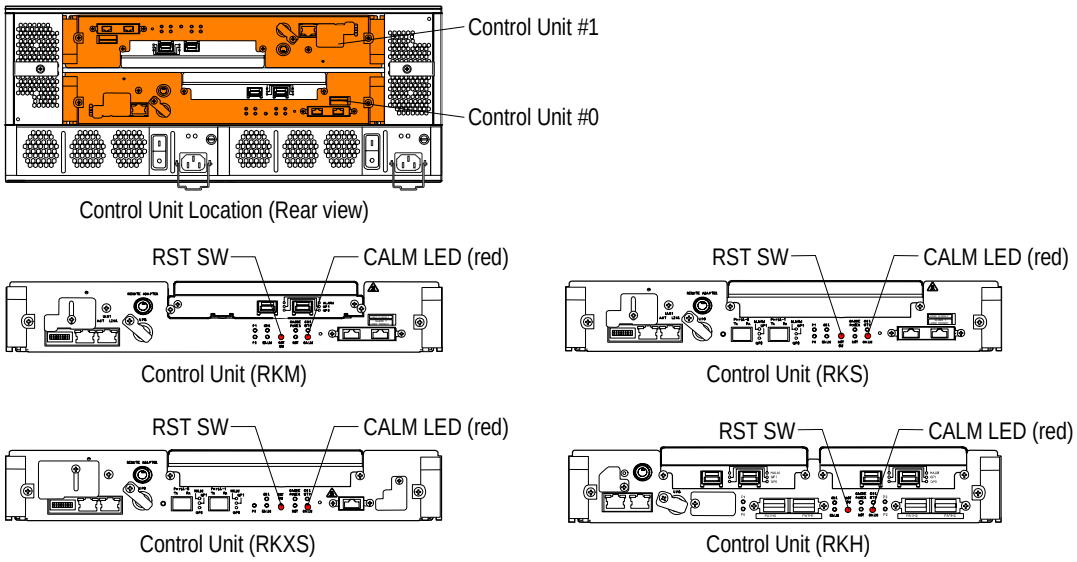


Figure 7.5.5 Indication Locations of Control Unit

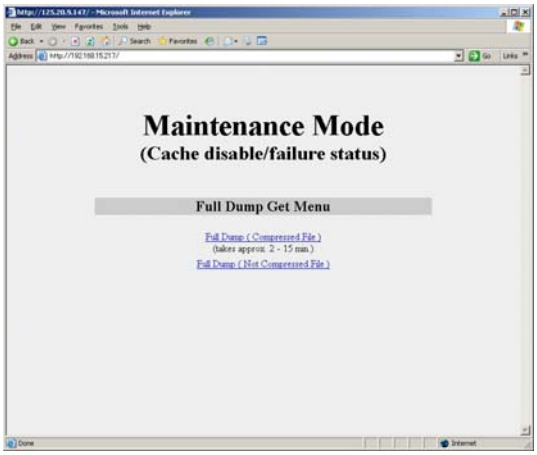
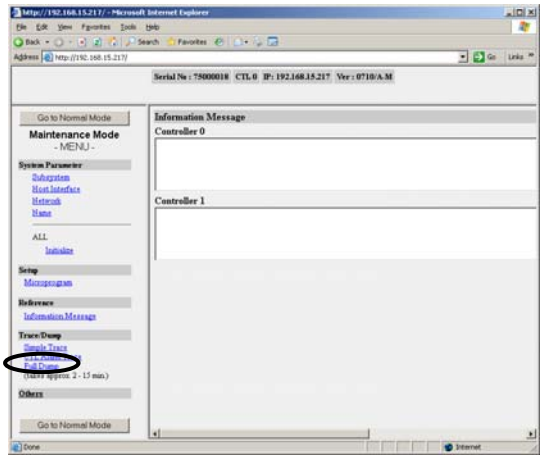


Copyright © 2005, 2006, Hitachi, Ltd.

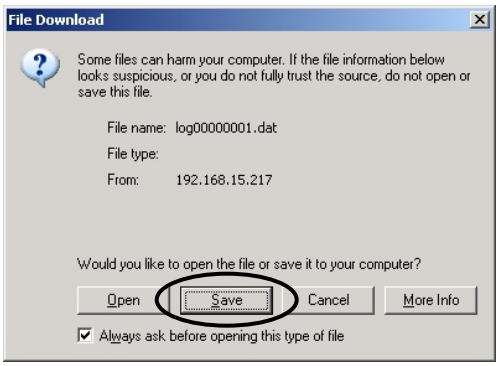
(b) Input the IP address of the Control Unit from which the blocked Control Unit, through the browser.

If the system has been connected to the WEB, press the update button to update the page.



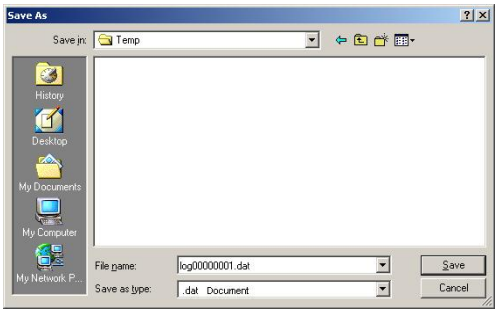
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

The cache memory access failure occurs when the following window is displayed. Refer to WEB "3.1.1 WEB Operation in the Maintenance Mode during the Cache Memory Access Failure" (WEB 03-0040).



(c) Collect the Full Dump according to the WEB and the following procedure.

Click "Full Dump" in the menu frame of "Trace/Dump".



Copyright © 2005, 2006, Hitachi, Ltd.

The following dialog is displayed. Click the [Save] button.
If the following dialog is not displayed even after five minutes passed, click the [Close] button on the upper right of the browser and close the browser. After that, open the browser again and retry from the procedure (b).

Select the place to save the file and file name (Default file name: logx.dat <x:Controller serial numbers>) and click [Save](‡1).
When the download is not completed(‡2) or the message window is not displayed even after five minutes passed, click the [Close] button on the upper right of the browser and close the browser. After that, open the browser again and retry from the procedure (b).

The down-loading is started and the progress indicating message window is displayed.
When the down-loading completes, the progress indicating message window is closed.
There is no problem although it is displayed that the presumption remaining time is uncertain in the dialog box during the download.

‡1 : There may be a case where the default file name is given as "logx.dat.dat" depending on the setting of the PC. In this case, reset the file name to "logx.dat" or any other name.
‡2 : Refer to the content displayed in "Full Dump" in "Trace/Dump" listed in the menu frame of WEB for the standard at time that the download of the Full Dump is completed.

Copyright © 2005, 2006, Hitachi, Ltd.

7.6 NAS Log collection

In the NAS Log collection, the NAS OS log information on the NAS OS stored in the disk is collected.

Next, the collection method of the NAS is displayed.

(1) Before collecting the NAS log

(a) Item to be prepared

The collection uses the normal mode of WEB.

For connecting to WEB, the terminal in which a browser is installed is necessary. Also, the Disk Drive with the available disk space of 150 M bytes or more is necessary for the NAS Log collection.

(b) Remove the cover of the LAN connector for the maintenance of the RKNAS (rear side), and connect the LAN connector for the maintenance and that for the service PC with the LAN cross cable.

NOTE : When the NAS Log is acquired from the PC connected to the LAN for control, it is required to access both of the user control port of the Disk Array subsystem and the control port of the NAS Unit from the PC. (It is recommended that both IP addresses are the same segments.)

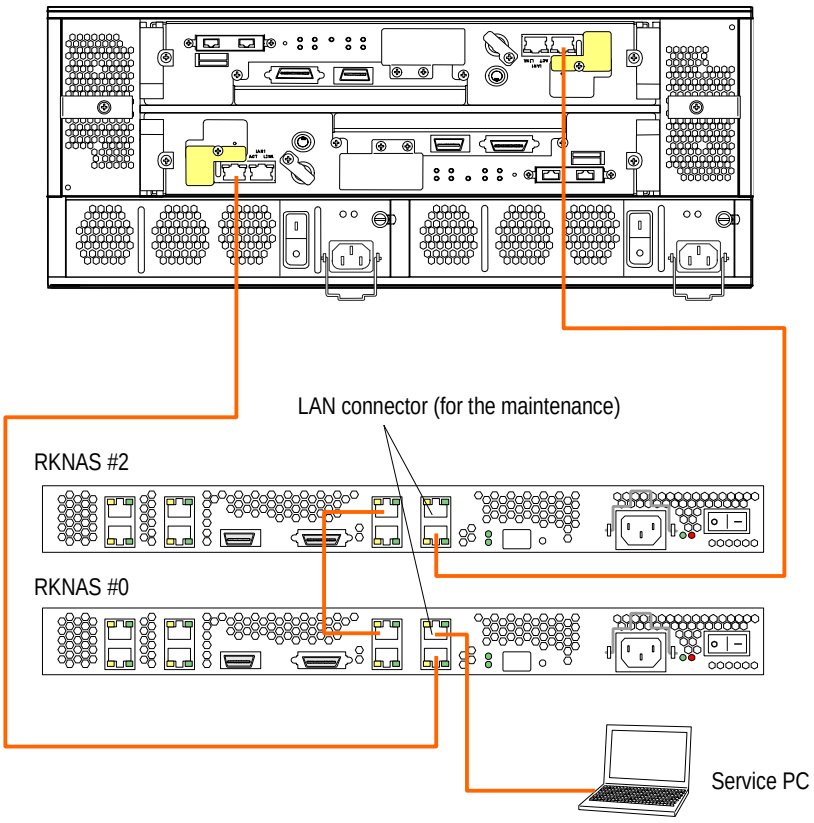


Figure 7.6.1 Connecting LAN Cables for NAS

Copyright © 2005, 2006, Hitachi, Ltd.

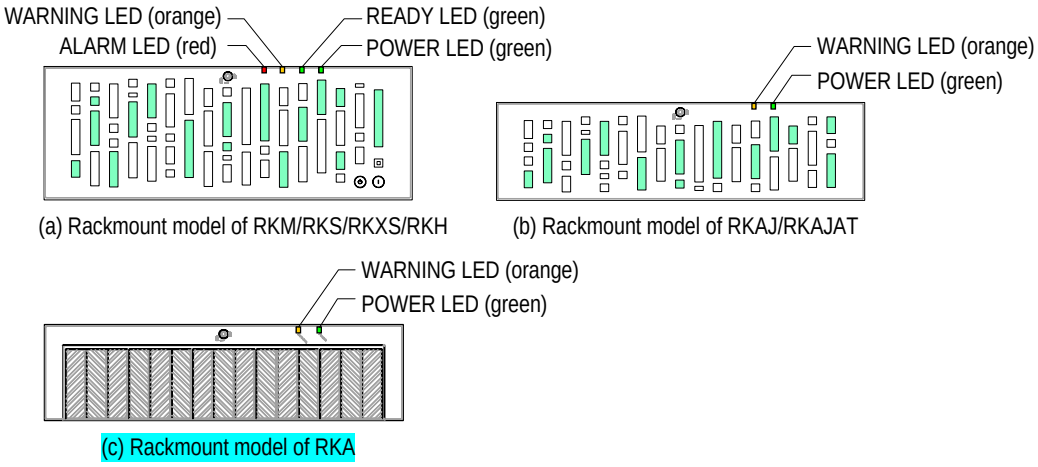
(c) The NAS Log collects information on each NAS Unit.
Because the access information between the clusters is required for the analysis work, collect the NAS Log for both NAS Units in the cluster.
Store it by changing the directory or file name of each NAS Unit, so that the collected file may distinguish the NAS Unit.

NOTE : The NAS Log of both NAS Unit can be collected from the Maintenance PC connected to one of the NAS Unit, but in this case, connect it to WEB after inputting the IP address of the Control Unit connecting to the NAS Unit.

(d) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 60 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

(e) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed.
When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. There is no problem if it blinks slowly (at intervals of one second).

(f) Clear the Cache of the browser according to the following procedure as not to store the old data collected last time.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.



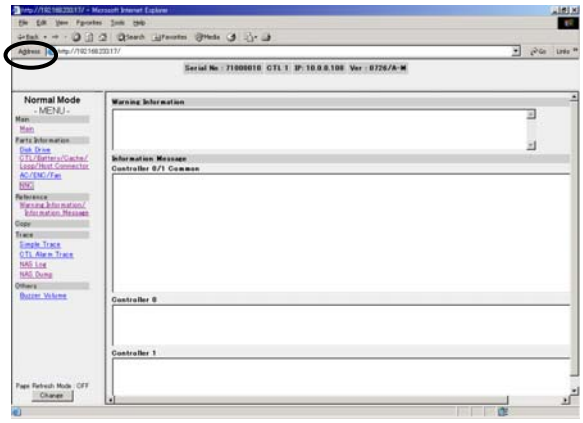


Figure 7.6.2 Indication Locations and Names of LED (Front Bezel)

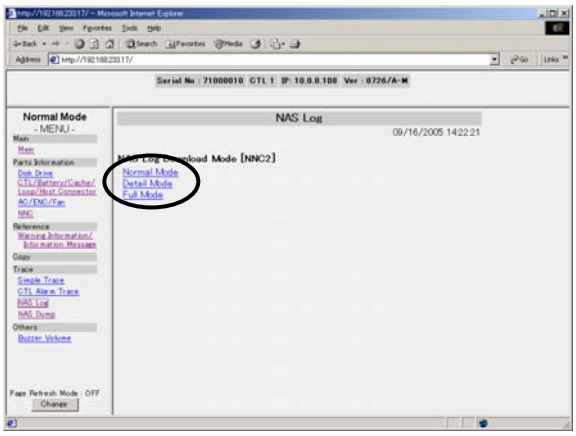
Copyright © 2005, 2006, Hitachi, Ltd.

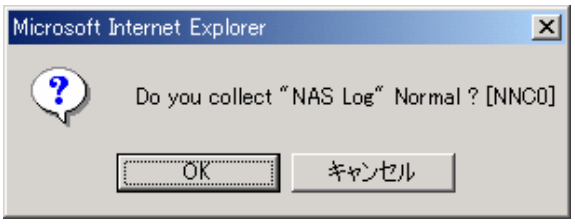
(2) Collection method of the NAS Log

NOTE : Do not perform the next NAS Log collection in one Control Unit until the NAS Log collection processing ends.
The operation when executing the NAS Log collection from two or more WEB and external application at the same time is not guaranteed.

(a) Input the IP address of the Control Unit to which the NAS Unit is connected from the browser. Update the page by clicking the update button or [Display] – [Update to latest information] when having connected it to WEB (refer to "Chapter 3 Before Starting WEB Connection" (TRBL 03-0000)).
In the case of WEB connection or WEB operation, [User name] and [Password] may be requested.
In that case, input the user name "maintenance" and the password "hoshu9500".

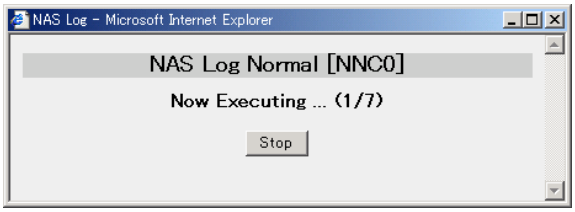


(b) Collect the memory dump in the following procedure according to WEB.
Click "NAS Log" in "Trace" of the menu frame.

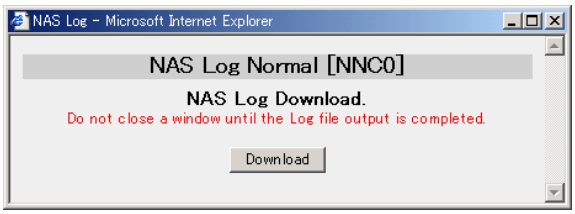


Copyright © 2005, 2006, Hitachi, Ltd.

(c) Select the collection mode in “NAS Log”, and click it.

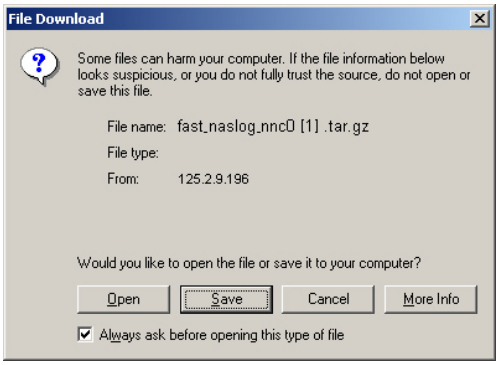


Collection mode	Use	Capacity (standard)	Collection time (standard)
Normal Mode	Collect it only when there is a special instruction. (It is limited to when the remote collection of “Full Mode” and ”Detail Mode” are impossible on the capacity side.)	About 4 M bytes (One NNC)	About 1 minute (One NNC)
Detail Mode	Collect it only when there is a special instruction. (It is limited to when the remote collection of “Full Mode” is impossible on the capacity side.)	About 12 M bytes (One NNC)	About 1 minute (One NNC)
Full Mode	If there is no special instruction, collect all in “Full Mode”.	About 150 M bytes (One NNC)	About 4 minutes (One NNC)



(d) The confirmation message is displayed. Click the [OK] button.

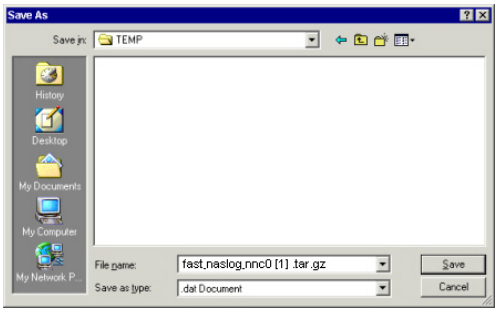
The following dialog is displayed.



(e) The following dialog is displayed when ending. Click the [Download] button.

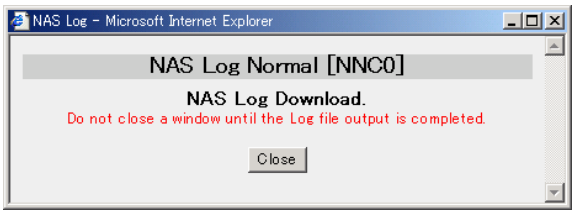
NOTE : Do not close this dialog while you download the NAS Log into the service PC. The NAS Log may not be able to be collected when closing it.

Copyright © 2005, 2006, Hitachi, Ltd.



(f) The following dialog is displayed. Click [Save].

(g) Specify the storage location of the file and the file name, and click [Save](‡1).
A default file name is as follows in the collection mode.



Item	Collection Mode		
	Normal Mode	Detail Mode	Full Mode
NNC 0	fast_naslog_nnc0[1].tar.gz	naslog_nnc0[1].tar.gz	full_naslog_nnc0[1].tar.gz
NNC 1	fast_naslog_nnc1[1].tar.gz	naslog_nnc1[1].tar.gz	full_naslog_nnc1[1].tar.gz
NNC 2	fast_naslog_nnc2[1].tar.gz	naslog_nnc2[1].tar.gz	full_naslog_nnc2[1].tar.gz
NNC 3	fast_naslog_nnc3[1].tar.gz	naslog_nnc3[1].tar.gz	full_naslog_nnc3[1].tar.gz

NOTE : There may be the cases where the numerical value of "[1]" of the file name is not 1 and "[1]" part is not attached depending of the browser environment.

The down-loading is started and the progress indicating message window is displayed.
When the down-loading completes, click [Close] button.

(h) Click [Close] button.

‡1 : A file name can be changed to "optional file name.tar.gz".

Copyright © 2005, 2006, Hitachi, Ltd.

7.7 NAS Dump collection

Collect the full memory information on the NAS Unit stored in the disk for the NAS Dump collection.

(1) Before collecting the NAS Dump

(a) Item to be prepared

The collection uses the normal mode of WEB.

The PC terminal in which the browser and the FTP server (IIS) are installed is necessary to connect it to WEB (Refer to DF700 NAS SOFTWARE Maintenance Manual "8.1.2 Installing a PXE Server Suite and FTP Server" (NAS 08-0000) for the procedure for installing the FTP server). Moreover, the initial setting is required for the FTP server (IIS) (Refer to DF700 NAS SOFTWARE Maintenance Manual "8.1.3 Configuring an FTP Server" (NAS 08-0090) for the detail). Also, the Disk Drive with the available disk space of 800 M bytes or more is necessary for the NAS Dump collection.

(b) Remove the cover of the LAN connector for the maintenance of the RKNAS (rear side), and connect the LAN connector for the maintenance and that for the service PC with the LAN cross cable.

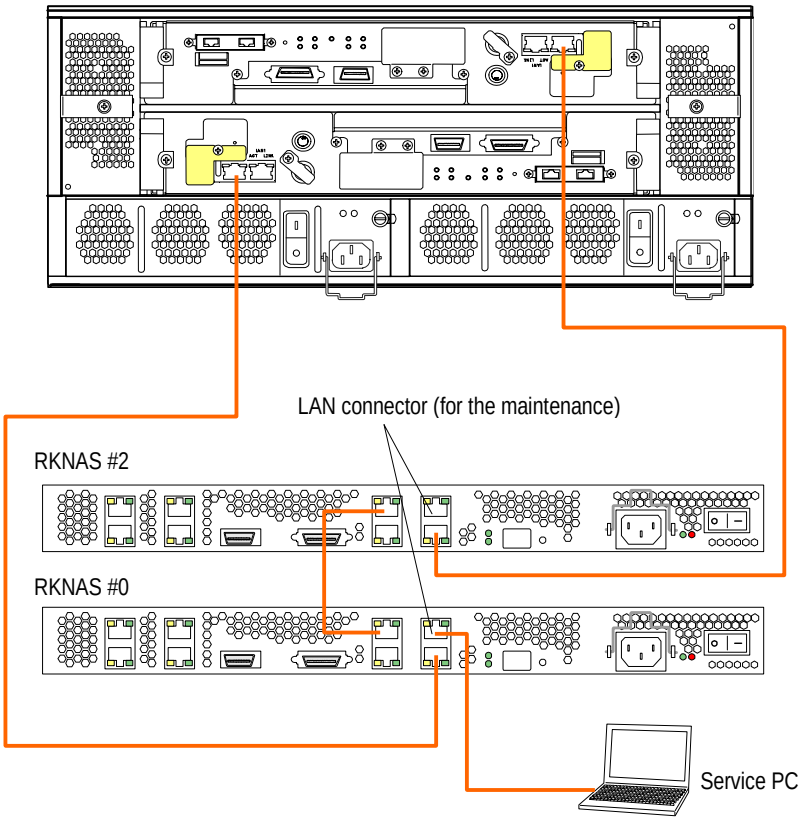


Figure 7.7.1 Connecting LAN Cables for NAS

Copyright © 2005, 2006, Hitachi, Ltd.

(c) The NAS Dump collects information on each NAS Unit.
Store it by changing the directory or file name of each NAS Unit, so that the collected file may distinguish the NAS Unit.

(d) Check that the READY LED (green) on the front of the Basic Chassis is not blinking at high speed.
When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 60 minutes (or 40 to 60 minutes in case of the RKH) until the READY LED (green) lights up because the automatic download of the ENC/SENC firmware is being executed.

(e) Check that the WARNING LED (orange) on the front of the Basic Chassis (RKM/RKS/RKXS/RKH) is not blinking at high speed.
When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, wait for the maximum of 30 to 85 minutes until the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up because the update of the flash program or the automatic download of the ENC/SENC firmware at the time of turning the power on in the single controller configuration is being executed. There is no problem if it blinks slowly (at intervals of one second).

(f) Clear the Cache of the browser according to the following procedure as not to store the old data collected last time.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.

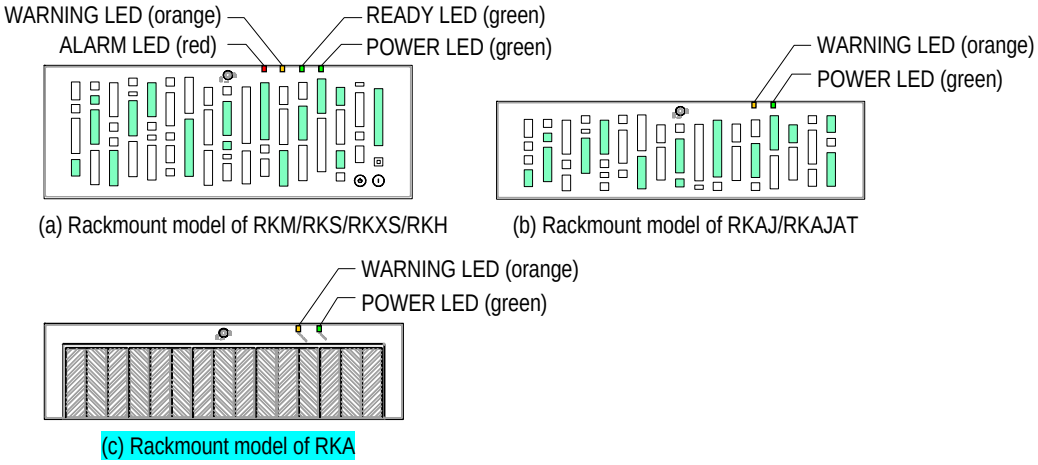

Figure 7.7.2 Indication Locations and Names of LED (Front Bezel)

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Collection method of the NAS Dump

The operation of the NAS Dump collection consists of two steps as shown below.

(a) NAS Dump generation instruction

The full memory information of the NAS Unit is generated in the volume for the dump storage (Disk Drive). (Refer to DF700 NAS SOFTWARE Maintenance Manual "3.4.7 Obtaining NAS Dump" (NAS 03-0490) for the detailed procedure.)

(b) Download of the dump file

The dump file transferred to the volume for the dump storage is downloaded in the service PC. (Refer to DF700 NAS SOFTWARE Maintenance Manual "3.4.10 Downloading Dump Files" (NAS 03-0650) for the detailed procedure.)

7.8 Storing simple trace information in the USB memory

Insert the USB memory in a Maintenance PC and give procedure to store the collected Simple Trace in the USB memory.

(1) The USB memory outline

Data read/write is enabled only by inserting the USB memory in the USB port in the Maintenance PC.

(a) How to use the USB memory

NOTE : When using the USB memory in Windows XP/2000 for the first time, the USB memory is automatically recognized and the driver is installed.

(i) Remove the USB memory cap and insert the memory in the USB port in the Maintenance PC.

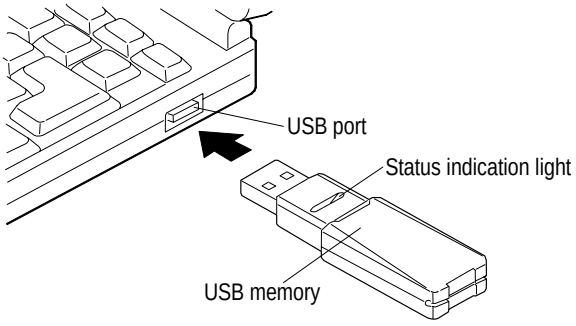

Figure 7.8.1 USB Memory Insertion

(ii) The "Removal Disk" icon is added to the "My Computer".

(iii) The added icon indicates the USB memory.

(iv) Data read/write is enabled as well as the hard disk.

(b) The status indication light identifies the USB memory operation

The status indication light can identify the USB memory operation status inserted in the Maintenance PC. Handle the USB memory with care depending on the operation status.

- Fast blink: during read/write operation
  Do not remove the USB memory.
- Slow blink: waiting
  It can be removed following the procedure "when removing".

Copyright © 2005, Hitachi, Ltd.

(2) Procedure for storing in the USB memory

(a) Store simple trace in the USB memory.

Store the simple trace information collected in "7.3 Collecting simple trace" (TRBL 07-0040) in the USB memory by copying and pasting.

(b) How to remove the USB memory

Perform the following procedure when removing the memory in the status that the Maintenance PC power is on.

The following procedure is not necessary when removing the memory with the Maintenance PC power turned off.

(i) Click the [ icon] in the task tray.

(ii) Click the displayed message.

(iii) Click the [OK] button if the message is displayed.

(iv) Check that the status indication light is slowly blinking (waiting) or lighting off before removing the memory.

Copyright © 2005, Hitachi, Ltd.

Chapter 8. Trouble Analysis by LED Indication

8.1 Trouble Analysis by LED Indication of Front Bezel

(1) LED positions on Front Bezel

The positions on LED's are shown below. Refer to "8.2 (9) Trouble analysis based on LED indication of NAS Unit" (TRBL 08-0340)for the NAS Unit.

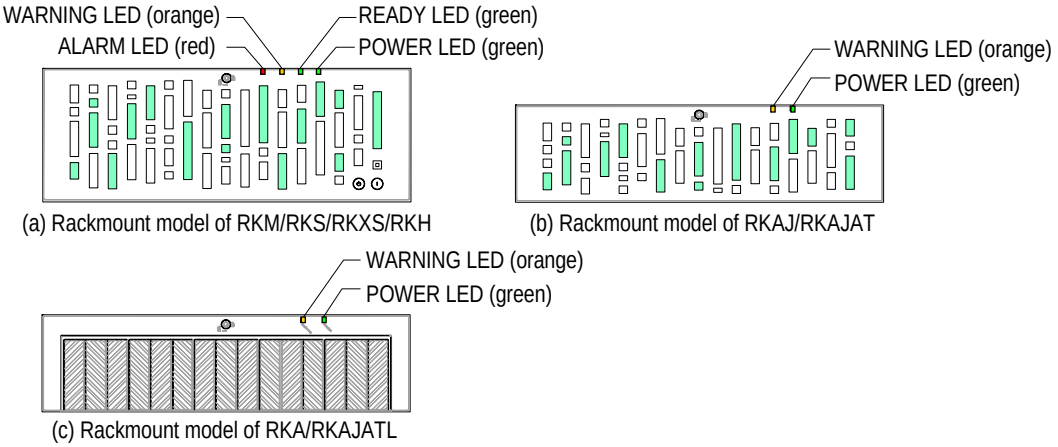

Figure 8.1.1 Locations and Name of LED

Copyright © 2005, 2006,Hitachi, Ltd.

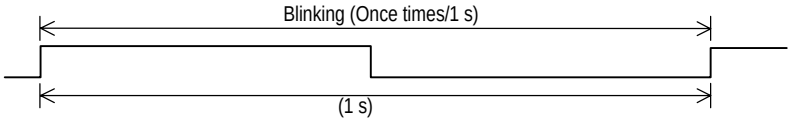
(2) Trouble analysis procedure

The states of the units indicated by the LED indication patterns of the Front Bezel and the actions to take against them are shown below.

Table 8.1.1 LED Indication Patterns on Front Bezel

(○ : On ✧ : Blinking × : Off — : Not depend)

No	LEDs						State of unit	Actions to take	Failure
	Basic subsystem				Additional subsystem				
	ALARM (Red)	WARNING (Orange)	READY (Green)	POWER (Green)	POWER (Green)	WARNING (Orange)			
1(*1)	×	×	○	○	○	×	Normal.	Recovery operation is not necessary.	—
2	×	×	×	×	—	×	Power is turned off, or failures of the Power Unit, two Fan Assemblies or short-circuit of each part occurs.	Analyze the failure following "8.1 (3) (a) Trouble analysis on the indication on the POWER LED of Basic subsystem. (When the POWER LED is not on)" (TRBL 08-0040).	Parts failure: (Basic subsystem) Drive failure: (Basic subsystem)
	○	×	×	○	×	×		Analyze the failure following "8.1 (3) (b) Trouble analysis on the indication on the POWER LED of Additional subsystem. (Not POWER LED on)" (TRBL 08-0100).	Parts failure: (Additional subsystem) Drive failure: (Additional subsystem)
3	○	×	×	×	×	×	Power Unit, Control Unit or ENC Unit/ SENC Unit has dual failed.	1. Check that power cable is connected correctly. 2. Check LED indication of Power Unit. (Refer to "Table 8.2.3 LED Indication Patterns on Power Unit" (TRBL 08-0171).) 3. Check LED indication of Control Unit. (Refer to "Table 8.2.5 LED Indication Pattern-1 on Control Unit" (TRBL 08-0200)", "Table 8.2.6 LED Indication Pattern-2 on Control Unit" (TRBL 08-0210).) 4. Check LED indication of ENC Unit/SENC Unit. (Refer to "Table 8.2.9 LED Indication Patterns on ENC Unit" (TRBL 08-0290), "Table 8.2.10 LED Indication Patterns on SENC Unit" (TRBL 08-0310).)	Parts failure.



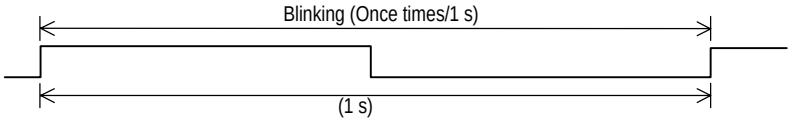
*1 : This is not a failure status

Copyright © 2005, 2006, Hitachi, Ltd.

(○ : On ✧ : Blinking × : Off — : Not depend)

No	LEDs						State of unit	Actions to take	Failure
	Basic subsystem				Additional subsystem				
	ALARM (Red)	WARNING (Orange)	READY (Green)	POWER (Green)	POWER (Green)	WARNING (Orange)			
4	×	×	×	○	—	—	A failure occurred during power-on process.	1. Check LED indication of Control Unit. (Refer to "Table 8.2.7 LED Indication Pattern-3 on Control Unit" (TRBL 08-0230).) 2. If CALM LED of one Control Unit or more does not light up, wait READY LED to light up (for at least 10 min). 3. Proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and then detect a failure with WEB.	Parts failure. (Basic subsystem) Failure must be detected with WEB.
5	✧(*1) (Slowly blinking)	×	×	○	—	—	A serious failure occurred while power on. Example: User data was lost.	Proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and then detect a failure with WEB.	Failure must be detected with WEB.
6	○	×	×	○	—	—	A failure occurred during self-test at time when power is turned on.	Check LED indication of Control Unit. (Refer to "Table 8.2.7 LED Indication Pattern-3 on Control Unit" (TRBL 08-0230).)	Parts failure. (Basic subsystem)

*1 : Slowly blinking

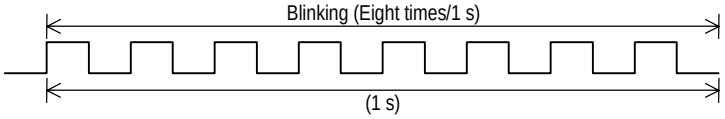


Copyright © 2005, 2006, Hitachi, Ltd.

(○ : On ✧ : Blinking × : Off — : Not depend)

No	LEDs						State of unit	Actions to take	Failure
	Basic subsystem				Additional subsystem				
	ALARM (Red)	WARNING (Orange)	READY (Green)	POWER (Green)	POWER (Green)	WARNING (Orange)			
7	×	○	○	○	○	×	A failure which does not stop operation occurred in Basic subsystem.	Check LED indication of each Basic subsystem part. (Refer to "8.2 Trouble Analysis by LED Indication of Each Part" (TRBL 08-0150)).	Parts error. (Basic subsystem)
					○	○	A failure which does not stop operation occurred in Additional subsystem. (*2)	Check LED indication of each Additional subsystem part. (Refer to "8.2 Trouble Analysis by LED Indication of Each Part" (TRBL 08-0150).)	Parts error. (Additional subsystem)
8	×	✧(*1) (Slowly blinking)	○	○	—	—	A failure which does not stop operation occurred in unit (It must be detected with WEB).	Proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and then detect a failure with WEB.	Failure must be detected with WEB.
9	○	✧(*1) (Slowly blinking)	×	○	—	—	A failure which does not stop operation occurred in unit.	Proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and then detect a failure with WEB.	Failure must be detected with WEB.
10	—	✧(*3) (Fast blinking)	—	—	—	—	Latest revision maintenance function of flash program is executed.	Wait until fast blinking stops.	No error.

*1 : Slowly blinking



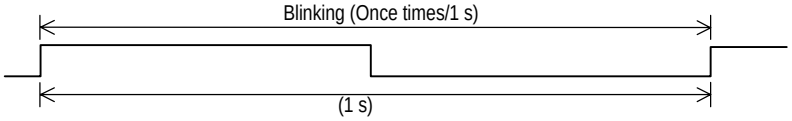
*2 : Under the following conditions, Additional subsystem WARNING LED could not light up. However, the each part's ALARM LED or ALM LED lights up. (Excluding the condition (2) below.)

(1) When the ALM LED of the ENC Unit/SENC Unit came on before the subsystem became ready during startup of the subsystem.

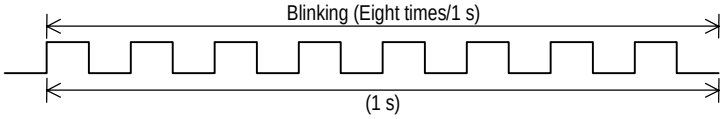
(2) When the ALM LED of the ENC Unit/SENC Unit came on and the ENC Unit/SENC Unit was pulled out.

(3) When the failed ENC Unit/SENC Unit was replaced and the ALM LED of the ENC Unit/SENC Unit came on after that (However, the ALM LED is on immediately after the ENC Unit/SENC Unit is inserted. If the ALM LED does not go out after one minute elapses, the replaced ENC Unit/SENC Unit should be judged out of order.)

*3 : Fast blinking

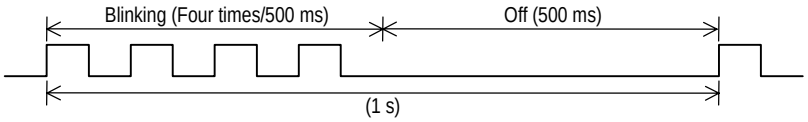


Copyright © 2005, 2006, Hitachi, Ltd.



(○ : On ✧ : Blinking × : Off — : Not depend)

No	LEDs						State of unit	Actions to take	Failure
	Basic subsystem				Additional subsystem				
	ALARM (Red)	WARNING (Orange)	READY (Green)	POWER (Green)	POWER (Green)	WARNING (Orange)			
11	×	✧(*3) (Fast blinking + Slowly blinking)	○	○	—	—	The most recent revision maintenance function of the flash program is being executed, and the failure (it must be detected with WEB), which allows the subsystem to operate, occurs.	Wait until fast blinking stops. Then, proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and detect the failure with WEB.	Failure must be detected with WEB.
12	×	×	✧(*1) (Slowly blinking)	○	—	—	The ENC/SENC firmware download or Drive firmware download process is completed.	Restart a device.(*4)	—
13	×	○	✧(*1) (Slowly blinking)	○	—	—	The ENC/SENC firmware download or Drive firmware download process is terminated abnormally.	Proceed to "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000), and detect a failure with WEB.	Failure must be detected with WEB.
14	×	×	✧(*2) (Fast blinking)	○	—	—	The ENC/SENC firmware is being automatic downloaded.	Wait as it is until there is no high-speed blinking (for the maximum of 30 to 50 minutes, but for the maximum of 40 to 60 minutes in case of the RKH).	—



*1 : Slowly blinking

*2 : Fast blinking

*3 : Fast blinking + Slowly blinking

*4 : If the array subsystem connected to the NAS Unit is restarted, the cluster between the NAS Units stops. When the array subsystem is unavoidably restarted, execute it after stopping the cluster between the NAS Units and stopping the NAS OS of both NAS Units. Start the cluster between the NAS Units again after completing the restart of the array subsystem.

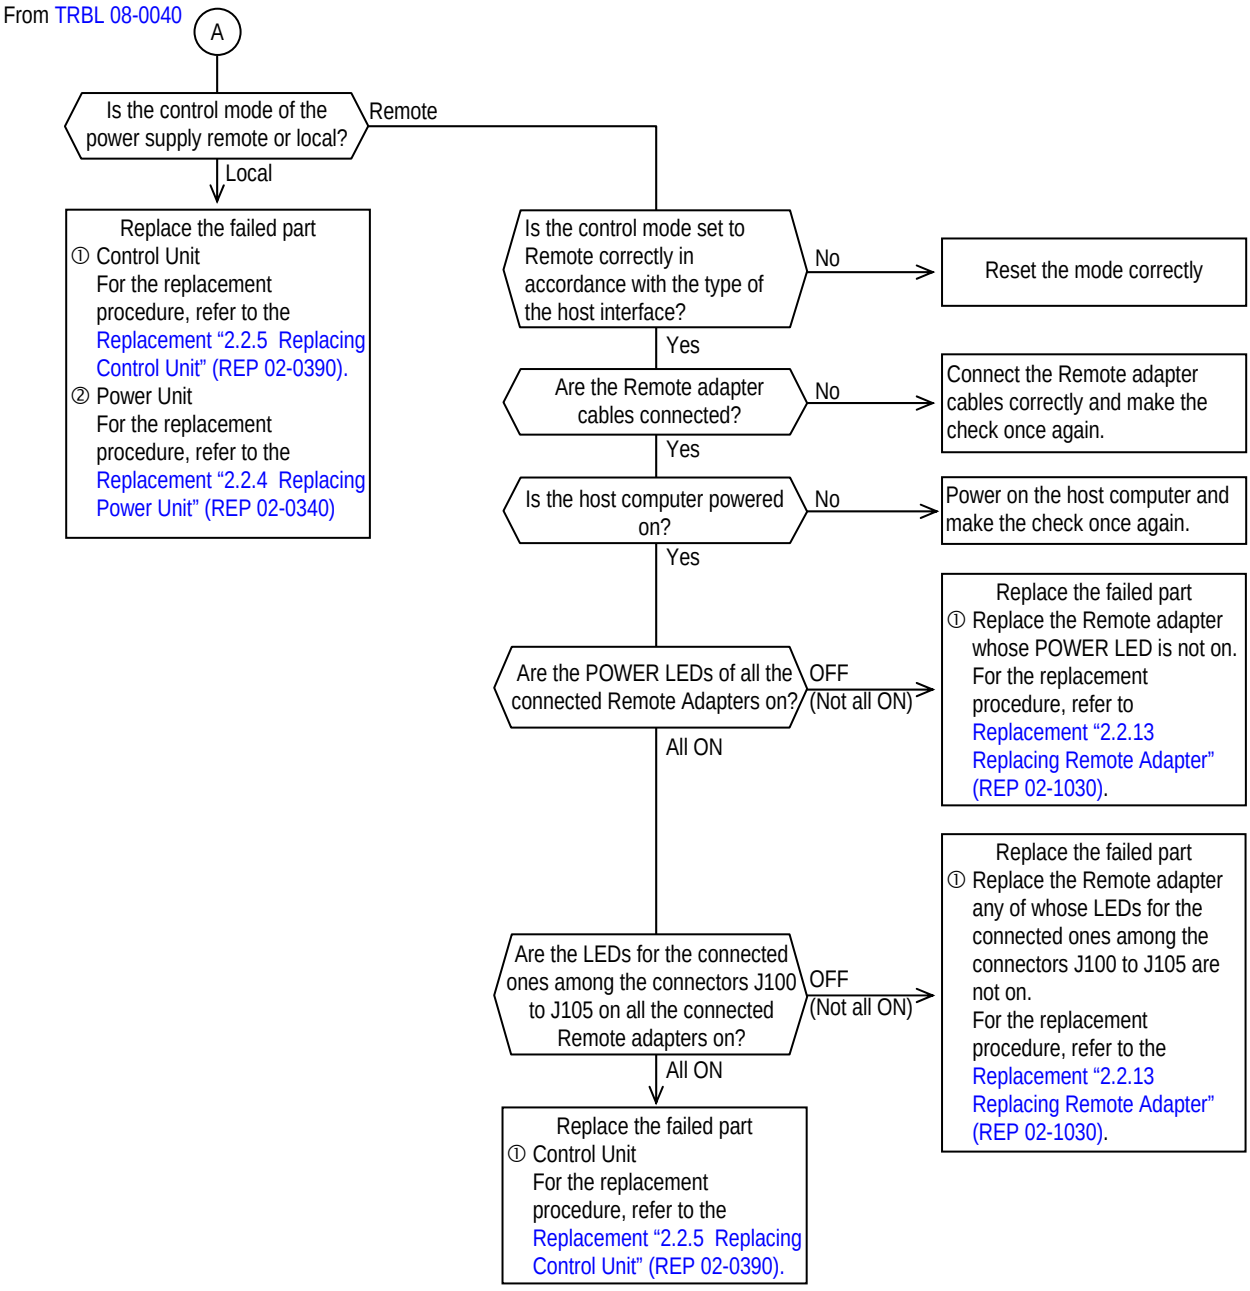
This page is for editorial purpose only.

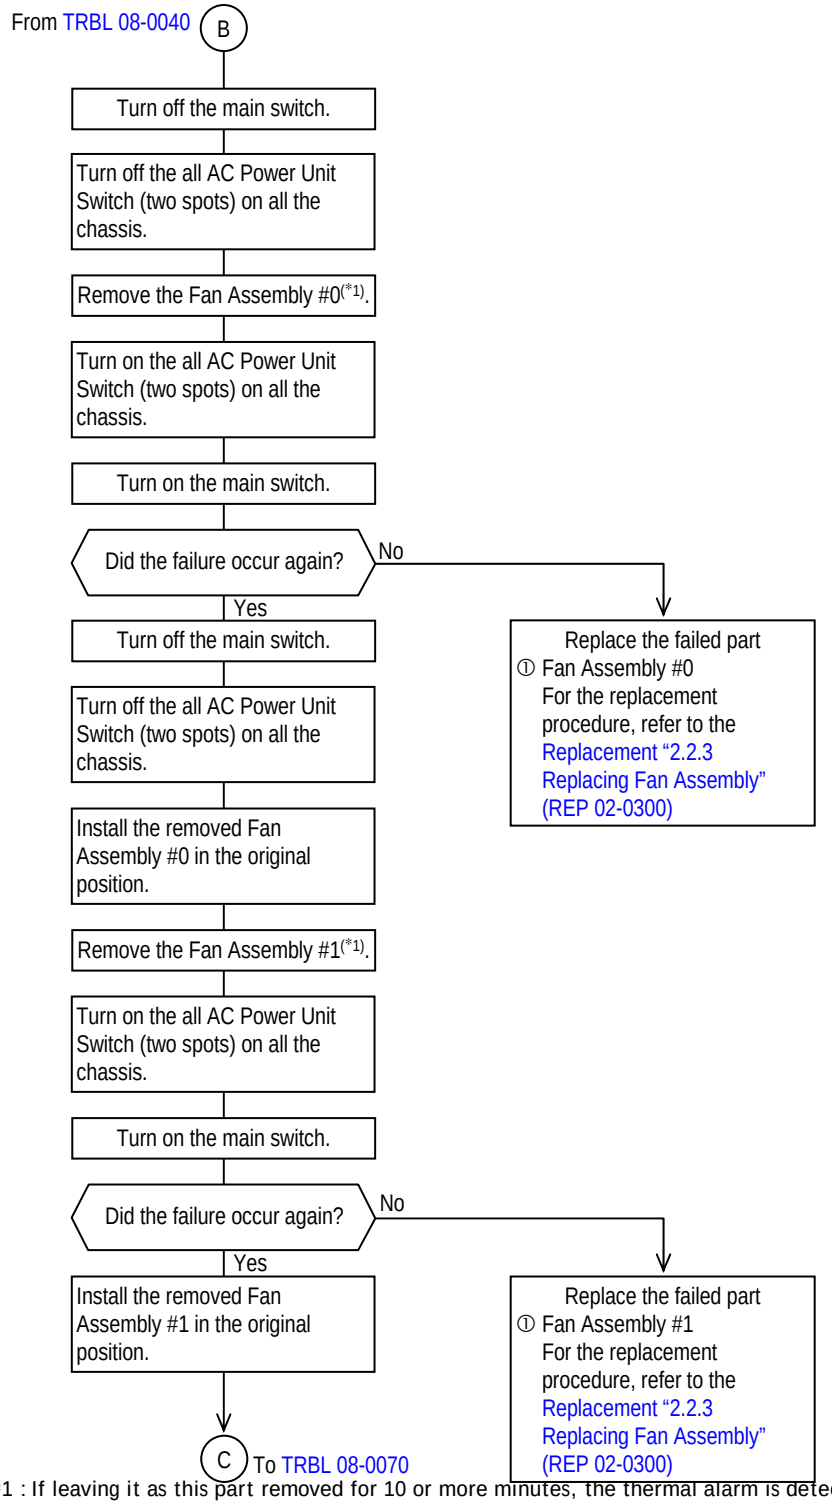
Copyright © 2005, Hitachi, Ltd.

(3) Trouble analysis by the indication of the POWER LED

Analyze the cause of the POWER LED failure following the flowchart.



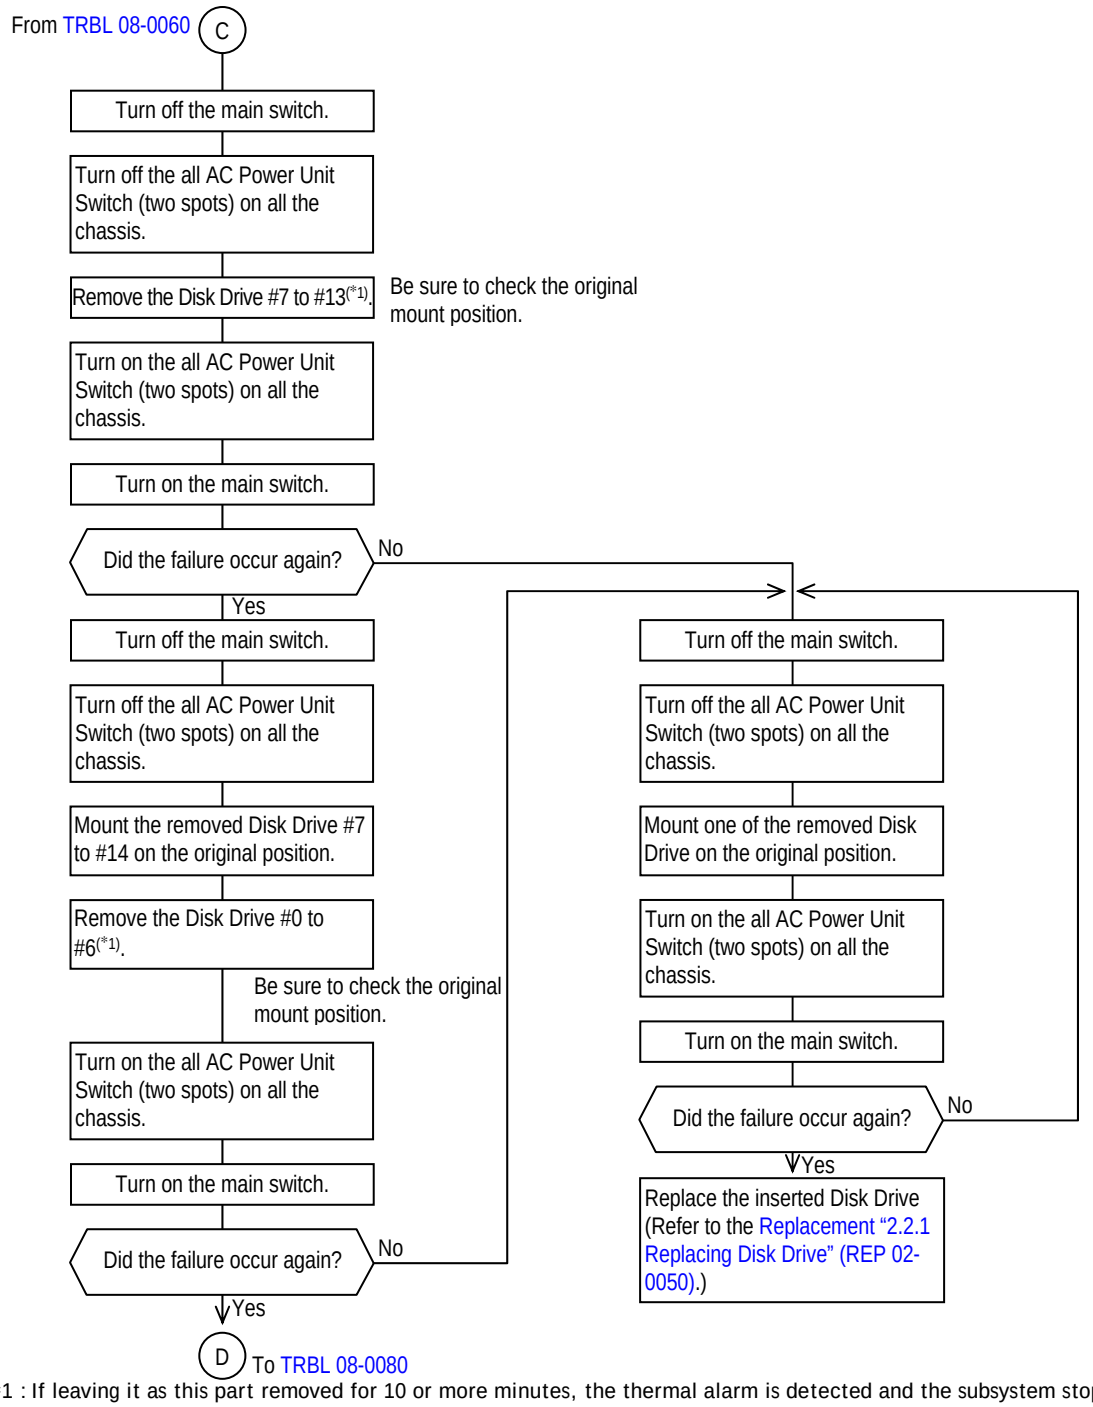
(a) Trouble analysis on the indication on the POWER LED of Basic subsystem. (When the POWER LED is not on)



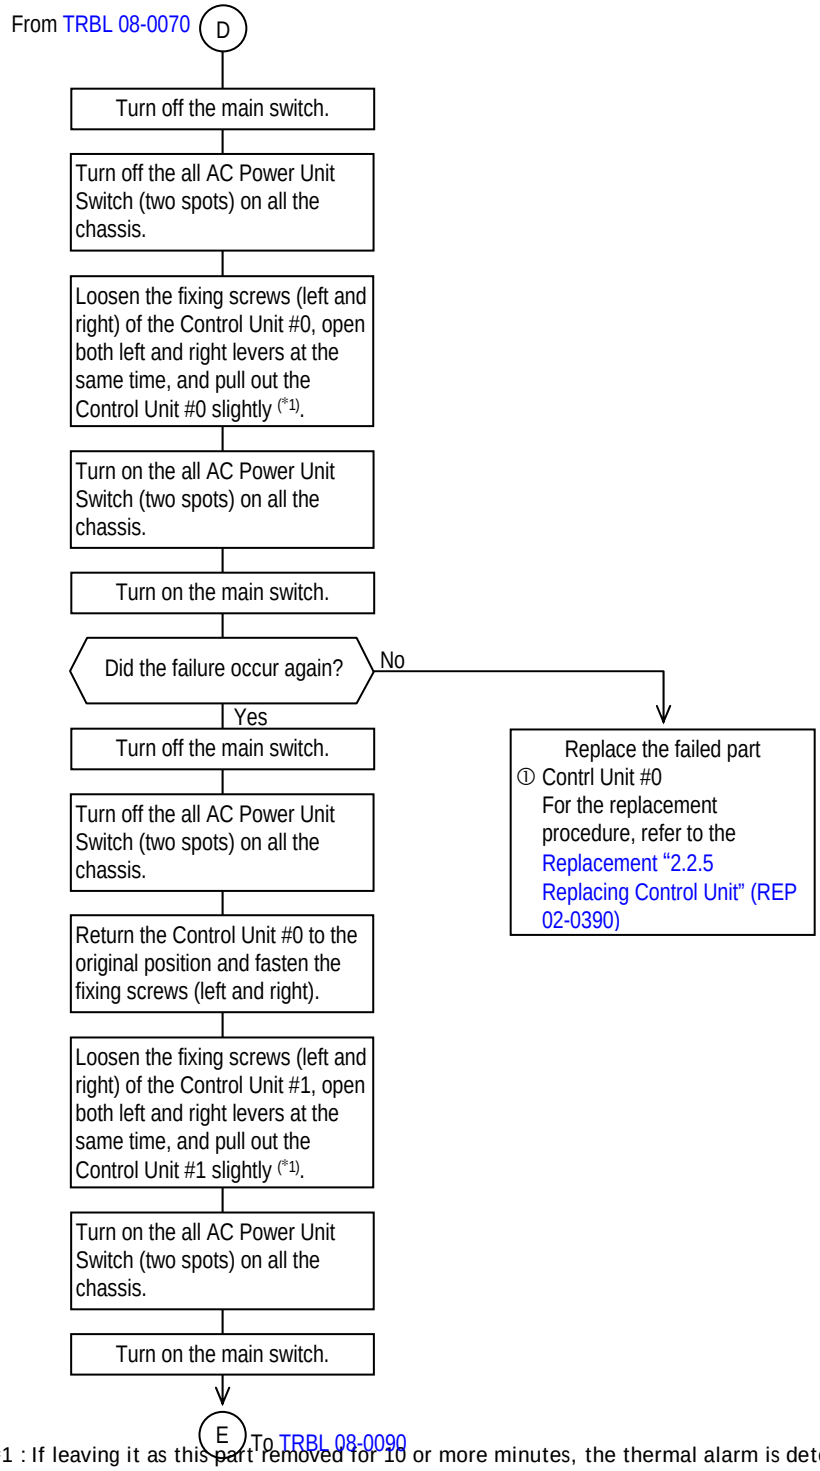
*1 : The CALM LED of the Control Unit is on until the subsystem becomes ready, however, this does not mean that the Control Unit is faulty. If the CALM LED does not go out after the subsystem has become ready, replace the Control Unit.

*2 : This operation is not needed when the AC Power Unit Switch and the main switch have already been turned on.

Copyright © 2005, 2006, Hitachi, Ltd.

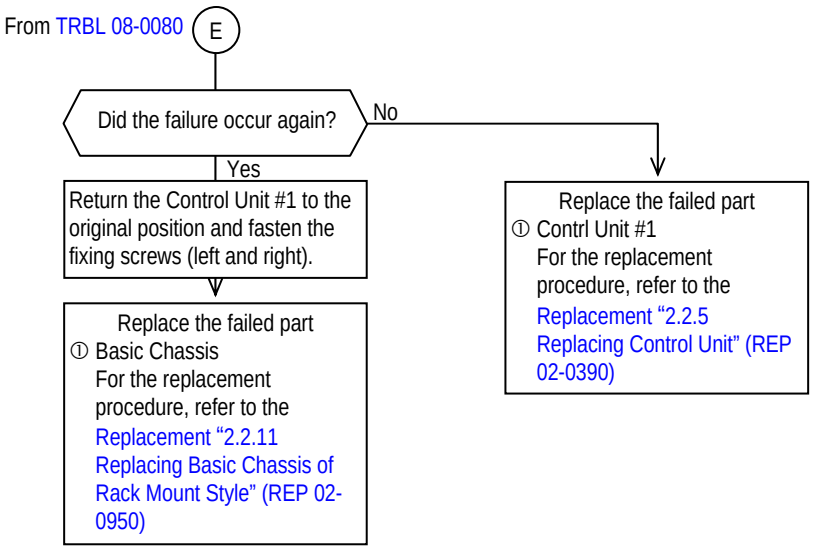


Copyright © 2005, 2006, Hitachi, Ltd.



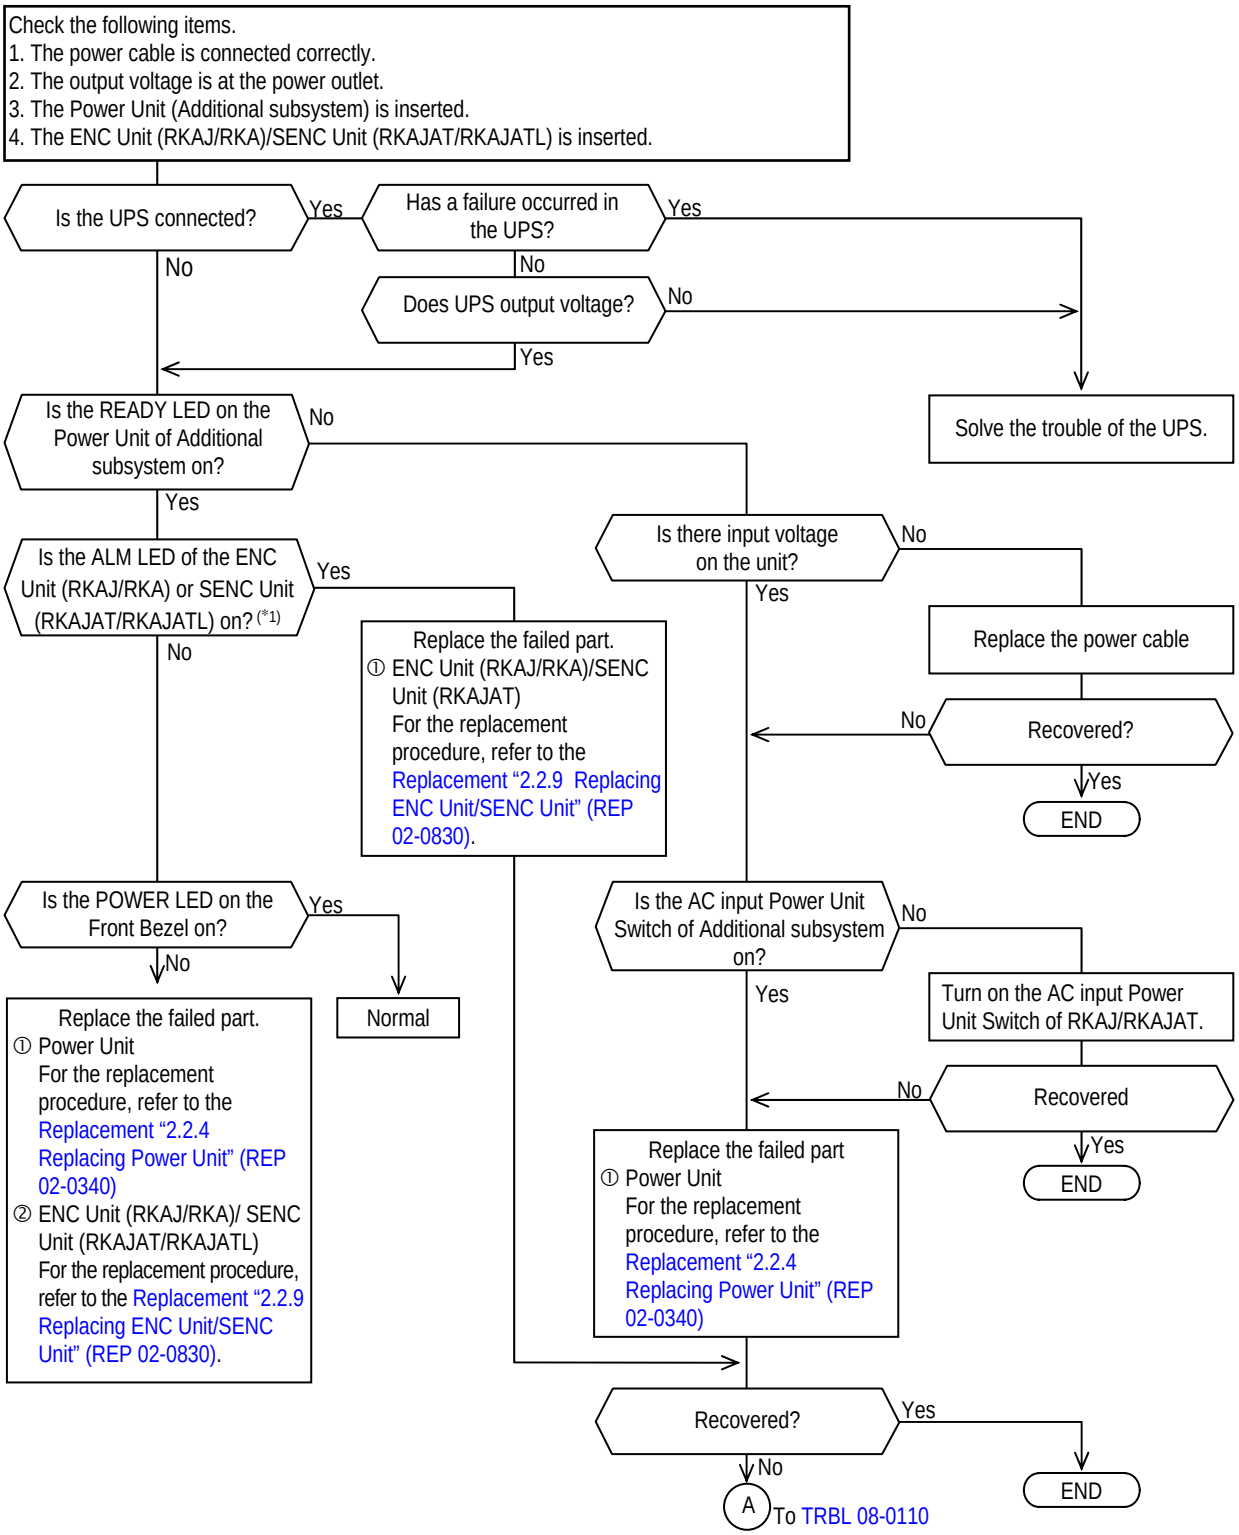
*1 : If leaving it as this part removed for 10 or more minutes, the thermal alarm is detected and the subsystem stops. Check the condition within 10 minutes and turn off the power supply.

Copyright © 2005, Hitachi, Ltd.



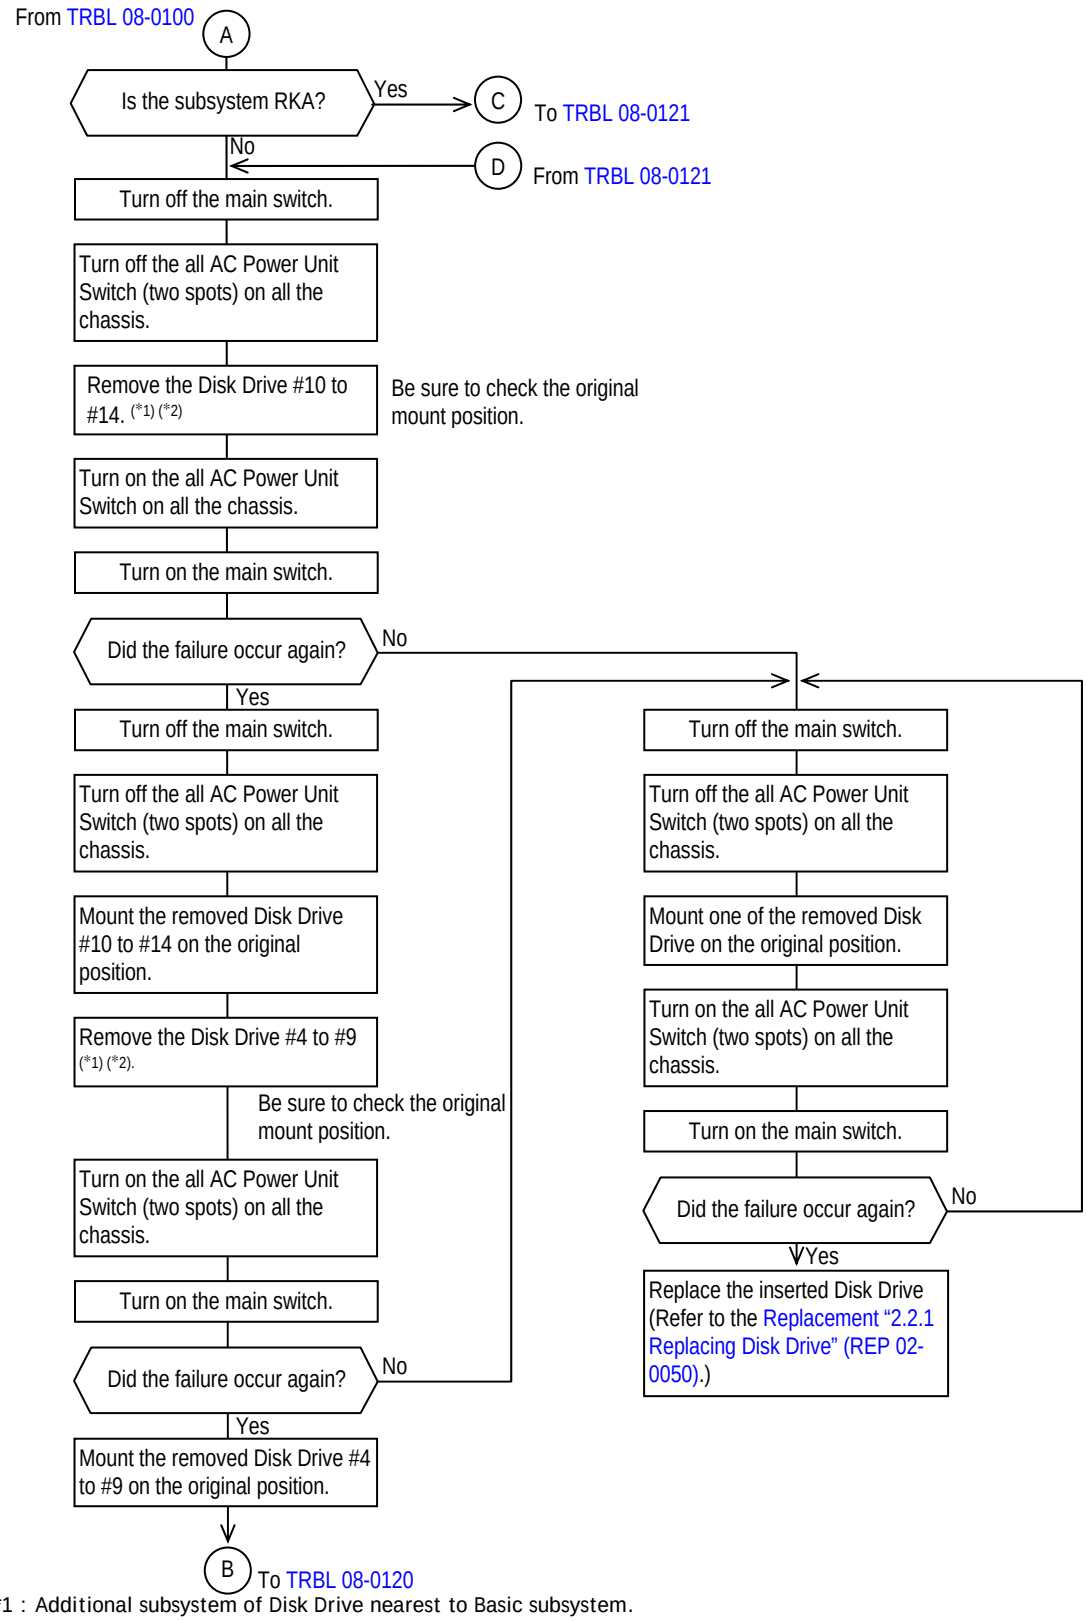
*1 : If leaving it as this part removed for 10 or more minutes, the thermal alarm is detected and the subsystem stops. Check the condition within 10 minutes and turn off the power supply.

Copyright © 2005, Hitachi, Ltd.



*1 : If leaving it as this part removed for 10 or more minutes, the thermal alarm is detected and the subsystem stops. Check the condition within 10 minutes and turn off the power supply.

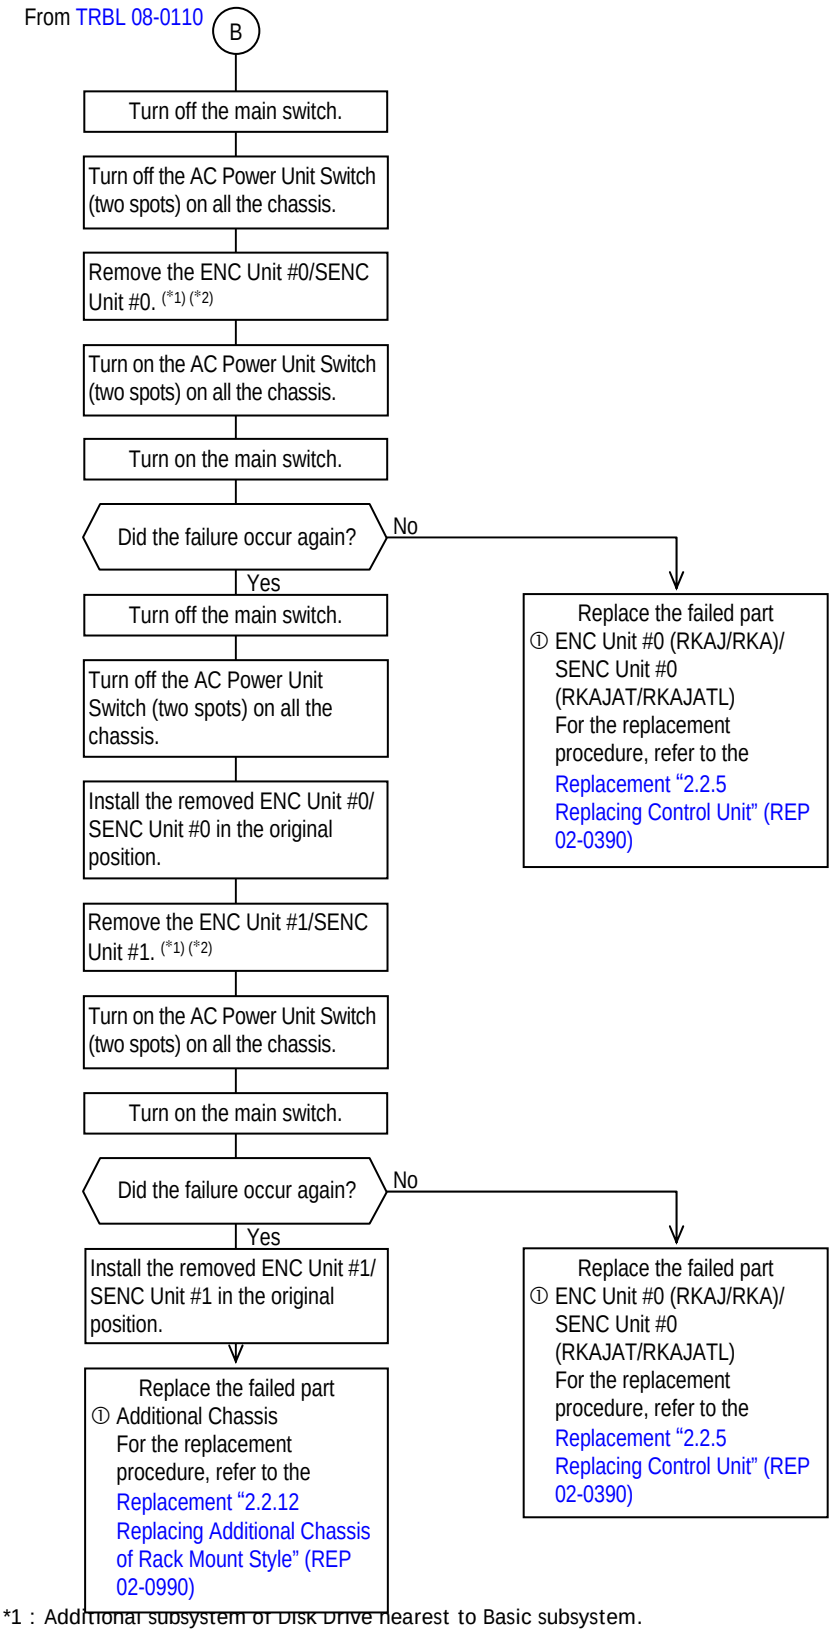
Copyright © 2005, Hitachi, Ltd.



Copyright © 2005, Hitachi, Ltd.

(b) Trouble analysis on the indication on the POWER LED of Additional subsystem. (Not POWER LED on)

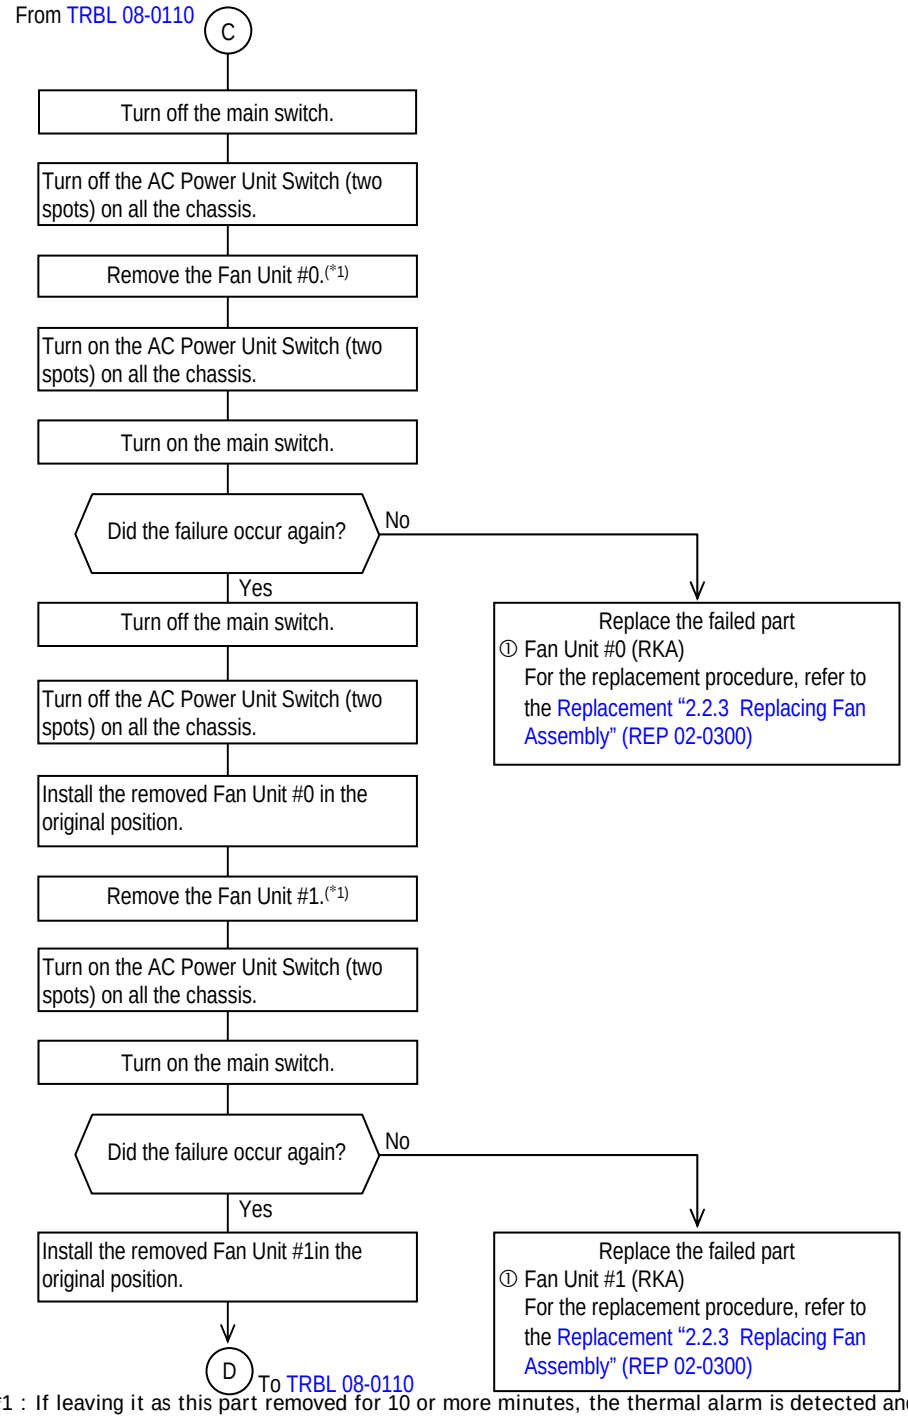
*1 : The ALM LED of the ENC Unit/SENC Unit is on until the subsystem becomes ready, however, this does not mean that the ENC Unit/SENC Unit is faulty. If the ALM LED of the subsystem which has become ready does not go out, replace the ENC Unit/ SENC Unit.



Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Additional subsystem of Disk Drive nearest to Basic subsystem.

*2 : If leaving it as this part removed for 10 or more minutes, the thermal alarm is detected and the subsystem stops. Check the condition within 10 minutes and turn off the power supply.



Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Additional subsystem of Disk Drive nearest to Basic subsystem.

*2 : If leaving it as this part removed for 10 or more minutes, the thermal alarm is detected and the subsystem stops. Check the condition within 10 minutes and turn off the power supply.

(4) Trouble analysis based on the indication of READY LED (When in the Fibre Channel interface)
Analyze the cause of the READY LED failure following the flowchart.

*1 : This operation is not needed when the AC Power Unit Switch and the main switch have already been turned on.
*2 : Refer to "Table 8.2.7 LED Indication Pattern-3 on Control Unit" (TRBL 08-0230) in "8.2 (5-3) LED Indication Patterns on Control Unit (Fibre Channel) (RKS/RKXS)" (TRBL 08-0230).
*3 : When the mode is Remote, change it to Local.
*4 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : Return the Remote/Local setting as it was. It may take three minutes at the longest until the READY LED comes on after the main switch is turned on. For the setting of the Remote/Local mode, refer to the Installation "1.8 Setting the Power Control Mode (Local/Remote Mode)" (INST 01-0380).

*2 : Wait if the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes, or 40 to 60 minutes in case of the RKH), or the WARNING LED (orange) is blinking at high speed (for the maximum of 30 to 85 minutes).

Copyright © 2005, 2006, Hitachi, Ltd.

8.2 Trouble Analysis by LED Indication of Each Part

Check whether a failure has occurred in each part or not.

(1) Trouble analysis based on LED indication of Backup Battery Unit

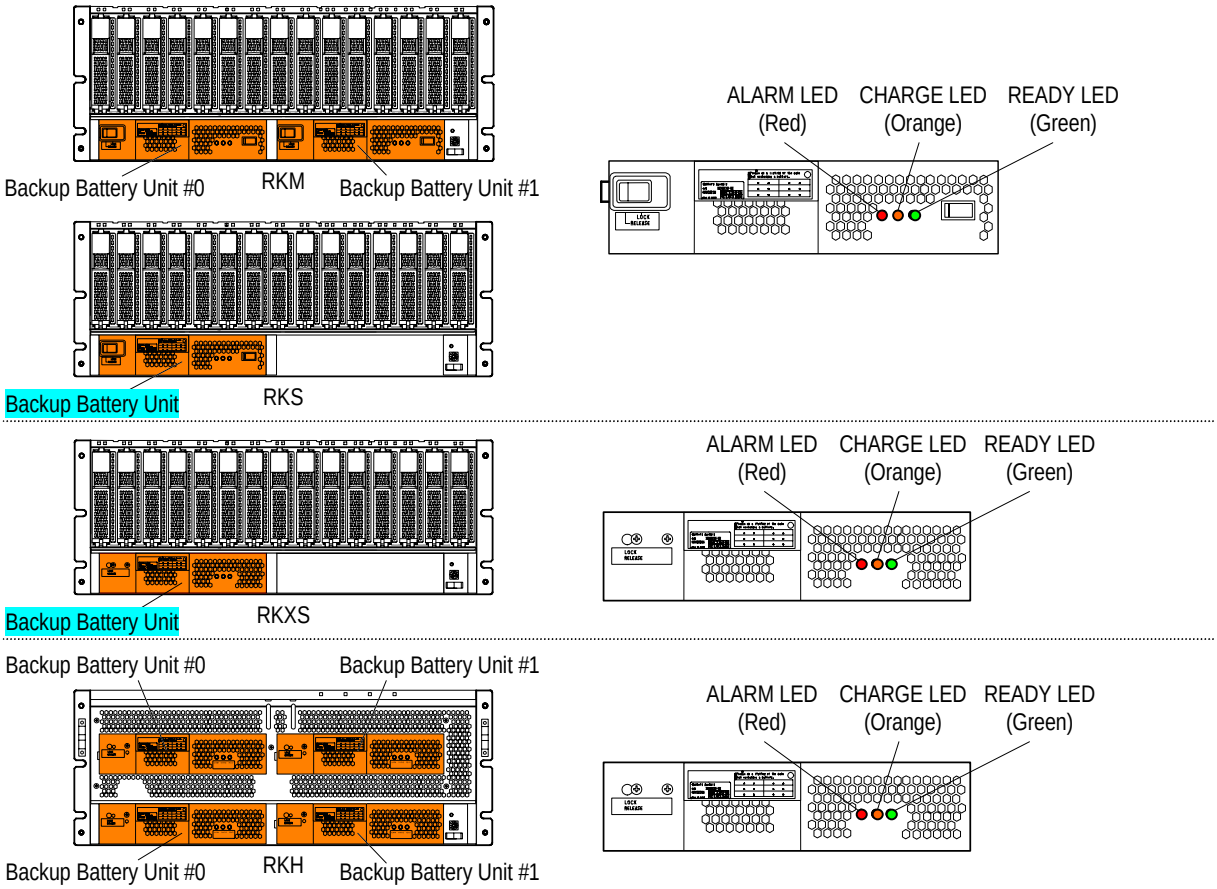

Table 8.2.1 LED Indication Patterns on Backup Battery Unit

(○ : On ✧ : Blinking × : Off —: Not depend)

No.	LEDs			Cause or status	Action(s) to be taken	Reference page
	ALARM (Red)	CHARGE (Orange)	READY (Green)			
1 (*1) (*2)	×	×	○	Normal.	Recovery operation is unnecessary	—
2 (*1) (*2)	×	○	○	Under periodical charge.		
3 (*1)	×	○	✧	Under initial charge. (up to six hours)		

*1 : This is not a failure status.
*2 : Backup time is 24 hours in the state of 1 or 2.

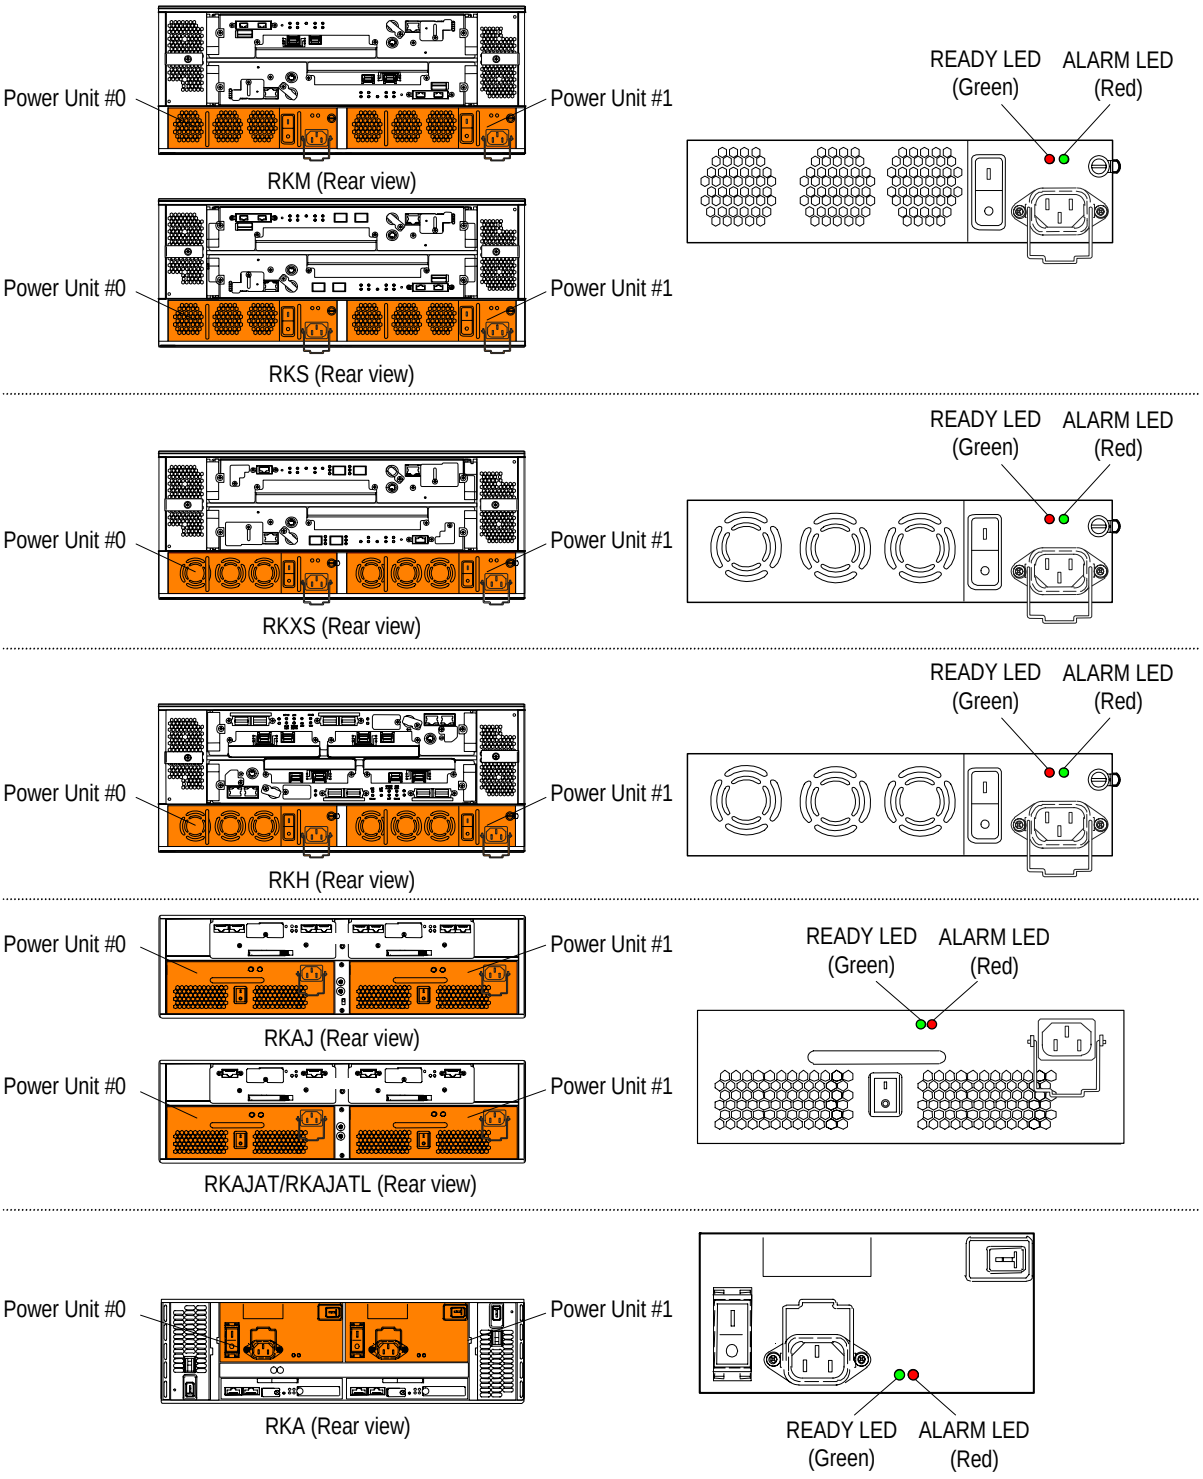
No.	LEDs		Cause or status	Action(s) to be taken	Reference page
	Green (ACTIVE)	Red (ALARM)			
1 (*1)	✧	—	The Disk Drive is being accessed/spun up.	This is not a problem.	—
2 (*1)	○	×	Completed spin up.	This is not a problem.	—
3 (*1)	×	—	Spin down state.	This is not a problem.	—
4	—	○	A failure that makes the Disk Drive of lighting LED unable to operate occurred in it.	1. When the WARN LED of Basic subsystem is blinking, refer to the LOG Message by WEB connection, and check the backup status to the Spare Disk.(*2). 2. Replace the Disk Drive.	Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050)

*1 : This is not a failure status.



*2 : In the case of the recovery failure to the Spare Disk Drive, the recovery failure to the replacement Disk Drive, or the write incomplete recovery, the WARN LED (orange) on the front of the Basic Chassis blinks. The WARN LED (orange) on the front of the Basic Chassis lights up referring to the log message on WEB.

*3 : This is supported in the microprogram revision 0770/A or more.

In the cases of a difficult failure that has a complicated relation with the system configuration, also collect information on configurations of the system and the DF700 and types of program products being used because they may be important.

Copyright © 2005, 2006, Hitachi, Ltd.

9.1.1 When a failure occurs in the DF700 main body

Take recovery actions referring to "Chapter 1. Flowchart for troubleshooting" (TRBL 01-0000) in the Maintenance Manual for Maintenance.

9.1.2 When a failure occurs in a host system server

(1) In the case of RAID Manager

① If a failure has occurred in the DF700, give priority to investigation of it (see "Troubleshooting").

② Getting an error message
In the case where an error occurs when a command is input, an error cord and an error message are output in the following line.
A format of a set of an error cord and message is shown below.
[EX-xxxxxx] error message text
Refer to Section 5.2, "Command Control Interface (CCI) User and Reference Guide".
Refer to an error message and recovery measures given based on the error code.

③ Collecting the SYS log
Check the system log because an error message may be written in it.
Since information on the error code, [HORM-xxx], is related to Command Control Interface (CCI) User and Reference Guide, refer to Section 5.2, "System Log and Command Error Message" and follow instructions given in it.

④ For the log peculiar to the product, refer to Appendix B, "Log File for Maintenance and Trace Function" in the "Command Control Interface (CCI) User and Reference Guide" and collect the information.

Copyright © 2005, Hitachi, Ltd.

9.1.3 When a failure occurs in a server for monitoring and setting

(1) In the case of Storage Navigator Modular

① Taking an action following an error message

Since an error message is displayed when an error occurs in operation of Storage Navigator Modular, take a recovery action following the message.

② Collecting log files

Collect log files of Storage Navigator Modular

Get all files that are subordinate to the log directory under the program installation directory of Storage Navigator Modular together with the log directory.

When no log directory exists under the program installation directory of Storage Navigator Modular, get all files that are subordinate to the log directory under the directory, for which the environmental variable is specified as STONAVM_HOME, together with the log directory.

③ Getting operation environment

Get a version number, operation environment (OS and model) and operation of Storage Navigator Modular.

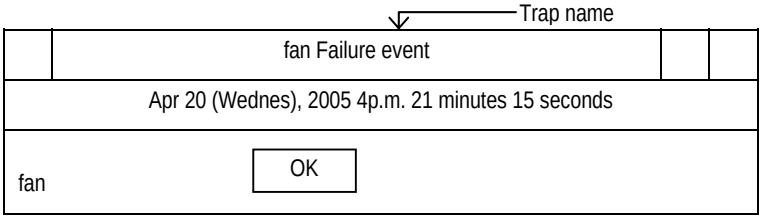
Chapter 10. Trouble Analysis by Failure Monitoring Function

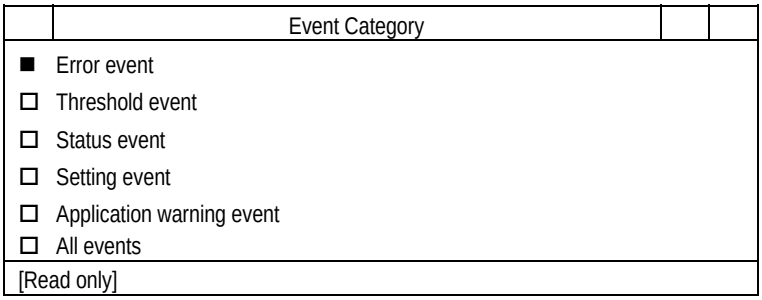
10.1 Trouble Analysis by SNMP Agent Support Function

The SNMP Agent Support Function notifies a network monitoring personal computer or workstation, in which the SNMP manager program is installed, of failures of the disk array subsystem via the SNMP (Simple Network Management Protocol). This section explains the trouble analysis operation to be performed when the SNMP Agent Support Function is used.



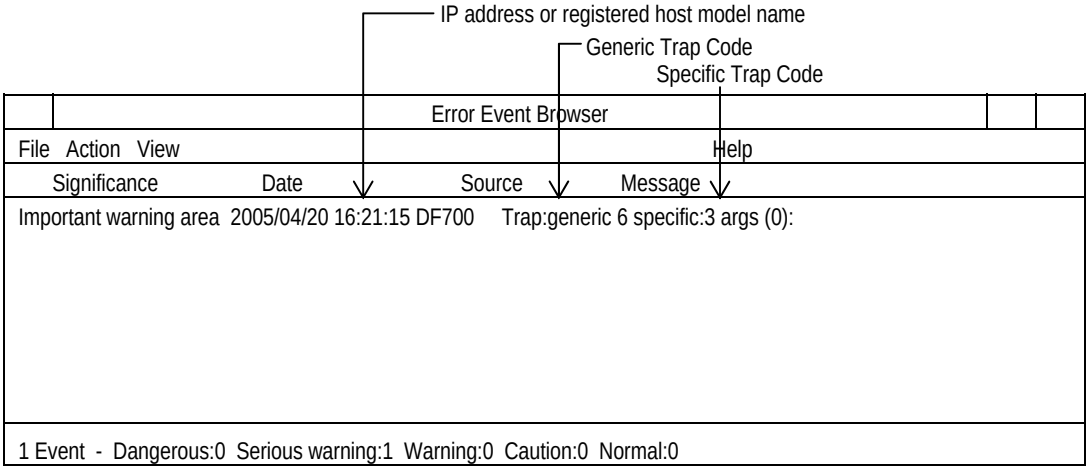
10.1.1 Maintenance with TRAP Codes

(1) Ascertaining failure information

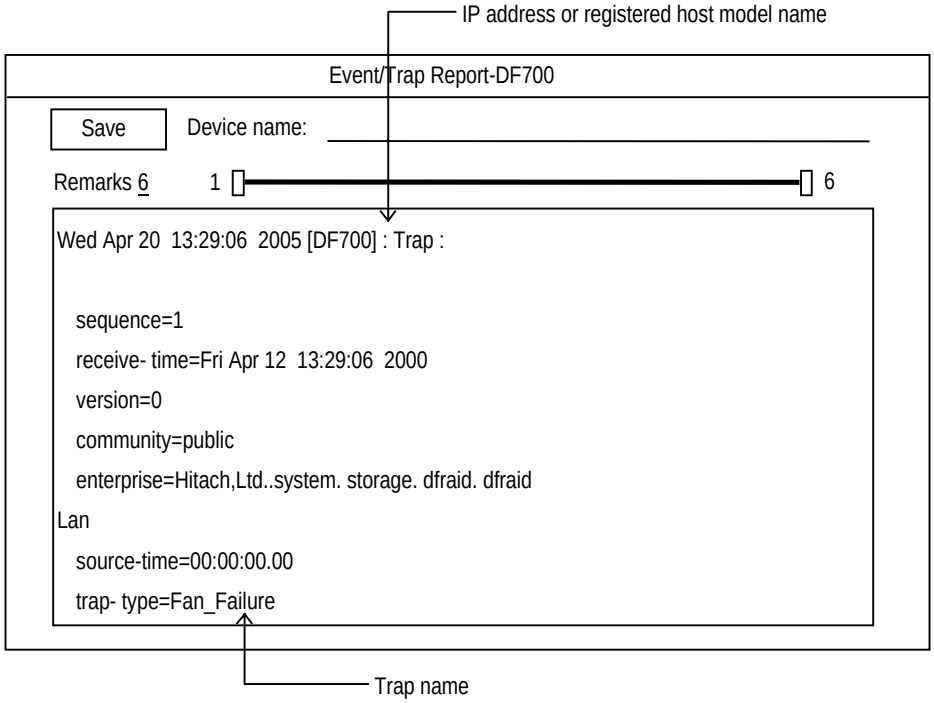


An example of an output bay the TRAP issued by the disk array subsystem. (a) is an example of output by HP OpenView/NetM*COMET. (b) is an example of output by SunNet Manager.

(a) Example of trapped output by HP OpenView/NetM*COMET



If an error occurs, the following screen is popped up.



"Error event" in the "Event Category" box changes to "■". Double-clicking this box displays an Error Event browser. For detailed information refer to the browser.

Copyright © 2005, Hitachi, Ltd.

(b) Example of trapped output by SunNet Manager

Copyright © 2005, Hitachi, Ltd.

(2) Trouble analysis method

Perform maintenance referring to the output examples in (1) and according to Table 10.1.1, "Recovery Method for Each Trap Code". (Refer to Message "Chapter 6. Warning Messages" (MSG 06-0000).)

Table 10.1.1 Recovery Method for Each Trap Code

No.	Generic Trap Code	Specific Trap Code	Trap name	Description	Recovery methods
1	0	0	coldStart	Power-on, Unlocking the SNMP Agent Support Function or changing the setting of the SNMP Agent Support Function by rebooting the subsystem	This is not an error. Recovery operation is not necessary.
2	1	0	warmStart	Changing the setting of the SNMP Agent Support Function in the status that the subsystem power is turned on	This is not an error. Recovery operation is not necessary.
3	4	0	authentication-Failure	Invalid SNMP access (The community name set for the subsystem differs from the community name accessed by the SNMP manager)	Change the community name set for the subsystem or the community name accessed by the SNMP manager so that they match. When changing the community name set for the subsystem, refer to "SNMP Agent Support Function User's Guide". When changing the community name accessed by the SNMP manager, refer to the manual of each manager.
4	6	1	subsystemDown	Controller down	It is shown that a failure occurred and the subsystem stopped. For the detailed failure information, refer to the display of the WEB log message of the subsystem.
5	6	2	driveFailure	Disk shutdown	It is shown that any of the failures occurred. Message code : W060xy, W060HH, W00GG00, W0GH00 The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
6	6	3	fanFailure	Fan failure	It is shown that any of the failures occurred. Message code : W040xy, W04100, W042HH The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Generic Trap Code	Specific Trap Code	Trap name	Description	Recovery methods
7	6	4	powerSupply-Failure	Power supply failure	It is shown that any of the failures occurred. Message code : W050xy, W0G400, W0G600, W0G700, W05100, W05200 The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
8	6	5	batteryFailure	Battery voltage error	It is shown that any of the failures occurred. Message code : W03000, W0300x, W03100, W0310x, W03200, W0320x, W03300, W0330x The information corresponding to x is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
9	6	7	upsFailure	UPS error	Perform the maintenance instructed. Message code : W0C00x The information corresponding to x is not notified regarding the trap.
10	6	9	backupCircuit-Failure	Battery circuit failure	Perform the maintenance instructed. Message code : W0340x The information corresponding to x in the manual is not notified regarding the trap. Refer to the display of the WEB log message of the subsystem.
11	6	10	other-controller-Failure	Another side controller blockade (For dual configuration only)	Perform the maintenance instructed. Message code : W0100x The information corresponding to x in the manual is not notified regarding the trap. Refer to the display of the WEB log message of the subsystem. When this trap is displayed following the No.14 “microprogram Replacement executed”, it does not mean a failure because it is reported owing to the microprogram replacement.
12	6	11	warning	A warning was issued in the disk array subsystem.	It is shown that a failure indicated by a message code with “W” at the top. For the detailed failure information, refer to the display of the WEB log message of the subsystem. Perform the maintenance instructed for message code W#####. “#####” is optional.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Generic Trap Code	Specific Trap Code	Trap name	Description	Recovery methods
13	6	12	spareDrive-Failure	Spare Disk blockade	It is shown that any of the failures occurred. Message code : W061HH, W061xy, W0GJ00, W0GK00 The information corresponding to xy in the manual is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
14	6	13	microprogram-Replacement-executed	A micro program replacement executed (For dual configuration only)	Perform the maintenance instructed. Message code : W4600x Message text : Online Micro-update started (CTL-x) The message is the one informing that the microprogram replacement has been started as shown below, therefore, no maintenance work is necessary.
15	6	14	encFailure	ENC failure	It is shown that any of the failures occurred. Message code : W090xy, W090HH, W0GA00, W0GC00 The information corresponding to xy in the manual is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
16	6	15	loopFailure	Loop failure	Perform the maintenance instructed. Message code : W080xy The information corresponding to xy in the manual is not notified regarding the trap. Refer to the display of the WEB log message of the subsystem.
17	6	16	PathFailure	Path detachment	Perform the maintenance instructed. Message code : W0F0xy The information corresponding to xy in the manual is not notified regarding the trap. Refer to the display of the WEB log message of the subsystem.
18	6	17	sataDriveFailure	SATA Disk Drive blockade	It is shown that any of the failures occurred. Message code : W060xy, W060AT, W060HH The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Generic Trap Code	Specific Trap Code	Trap name	Description	Recovery methods
19	6	18	sataSpareDrive-Failure	SATA Spare Disk Drive blockade	It is shown that any of the failures occurred. Message code : W061xy, W061AT, W061HH The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
20	6	19	sencFailure	SENC failure	It is shown that any of the failures occurred. Message code : W090xy, W090AT, W090HH, W0GD00 The information corresponding to xy is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
21	6	20	hostConnector-Failure	Host connector blockade	Perform the maintenance instructed. Message code : W0G300 Refer to the display of the WEB log message of the subsystem.
22	6	203	nncWarning	NNC warning status	It is shown that any of the failures occurred. Message code : W5000x, W5010x The information corresponding to x in the manual is not notified regarding the trap. Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.

10.1.2 Maintenance with MIB (df Regression) Values

(1) Confirming error information

Examples of output caused by a trap issued by the subsystem are shown below. (a) is an example of output by HP OpenView/NetM*COMET. (b) is an example of output by SunNet Manager.

For MIB values, refer to "Table 10.1.3 dfRegressionStatus Value Corresponding to Each Failure" (TRBL 10-0070).

(a) Example of MIB value output by HP OpenView/NetM*COMET

Copyright © 2005, Hitachi, Ltd.

(b) Example of MIB value output by SunNet Manager

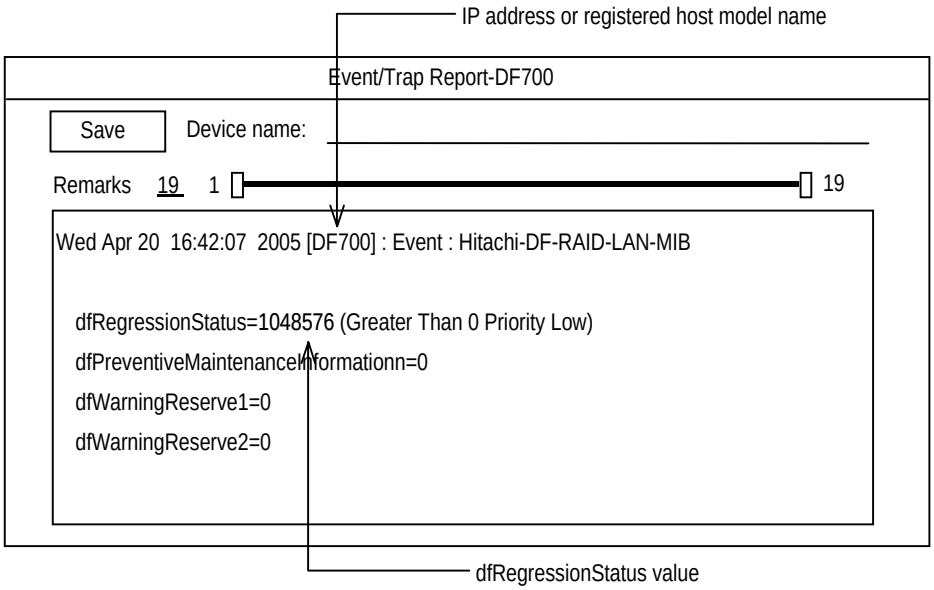

Table 10.1.2 Format of dfRegressionStatus

Byte \ Bit	7	6	5	4	3	2	1	0
0	0	0	NNC Warning	Host Connector	SENC	SATA D-Drive	SATA S-Drive	Cache
1	0	0	0	Fan	BK	A.C.PS	D.C.PS	Battery
2	0	0	NAS UPS	NAS PATH	NAS Server	PATH	Loop	UPS
3	CTL	Warning	0	0	ENC	D-Drive	S-Drive	Drive

When a regression is applied to the part concerned, turn on the corresponding bit. Value of the object corresponding to each failure status is shown in "Table 10.1.3 dfRegressionStatus Value Corresponding to Each Failure" (TRBL 10-0070).

Copyright © 2005, Hitachi, Ltd.

Table 10.1.3 dfRegressionStatus Value Corresponding to Each Failure

No.	Bit location		Object value (in decimal)	Description
	Byte	Bit		
1	—	—	0	The disk array is normal.
2	3	0	1	Disk Drive (data disk or Spare Disk) detachment.
3	3	1	2	Disk Drive (Spare Disk) detachment.
4	3	2	4	Disk Drive (data Disk) detachment.
5	3	3	8	ENC error.
6	3	6	64	Warning is raised in the disk array.
7	3	7	128	Mate controller blockade.
8	2	0	256	UPS error.
9	2	1	512	Loop error.
10	2	2	1024	Path detachment.
11	2	3	2048	NAS server failure.
12	2	4	4096	NAS path failure.
13	2	5	8192	NAS UPS failure.
14	1	0	65536	Battery error.
15	1	1	131072	Power Unit (DC) abnormality.
16	1	2	262144	Power Unit (AC) failure.
17	1	3	524288	Battery circuit error.
18	1	4	1048576	Fan error.
19	0	0	16777216	Cache partial blockade.
20	0	1	33554432	SATA disk drive blockade (spare disk).
21	0	2	67108864	SATA disk drive blockade (data disk).
22	0	3	134217728	SENC failure.
23	0	4	268435456	Host Connector failure.
24	0	5	536870912	NNC warning status.

When two or more failed parts exist, the object value is the sum of each object value.

Example : When failures occur in the battery and the fan, the object value is "1114112 (65536+1048576)".

The object value converted into binary form corresponds to the format shown in "Table 10.1.2 Format of dfRegressionStatus" (TRBL 10-0060).

(2) Troubleshooting procedure

Perform a maintenance by associating the item in the description column in "Table 10.1.3 dfRegressionStatus Value Corresponding to Each Failure" (TRBL 10-0070) with the contents of "Table 10.1.1 Recovery Method for Each Trap Code" (TRBL 10-0020).

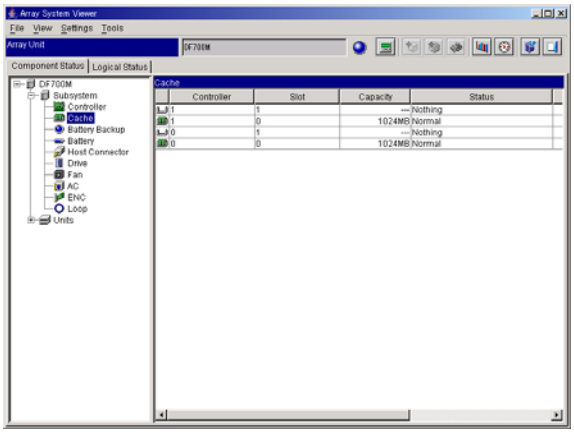
10.2 Trouble Analysis by Storage Navigator Modular

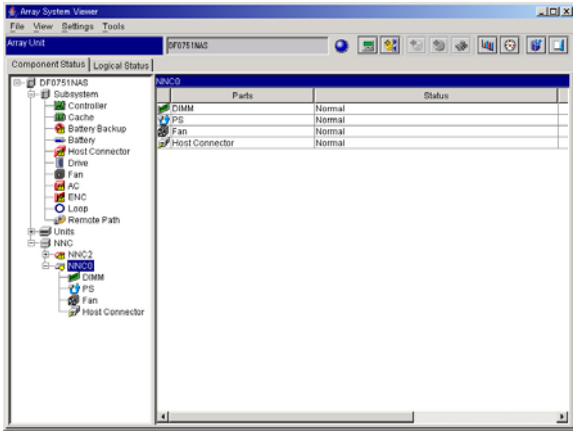
The Storage Navigator Modular notifies of failures of the disk array subsystem by the failure monitoring function.
This section explains the trouble analysis operation to be performed when the Storage Navigator Modular is used.



10.2.1 Maintenance with the Storage Navigator Modular (GUI version)

(1) Display of subsystem status

A screen which indicates the status of components of Array device under Storage Navigator Modular is shown below.



An example of the window for referring to the information on installation and capacities of the Cache Units is shown below.

Copyright © 2005, Hitachi, Ltd.

The example of the status confirmation window of the configuration parts of the NNC is shown below.

When a failure occurs in the array subsystem, the part concerned is displayed by the icon of "Red".

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

(2) Trouble analysis method

Perform maintenance referring to the display examples in (1) and according to Table 10.2.1, "Recovery Method for Each Error Display" (Refer to Message "Message" (MSG 00-0000).).

Table 10.2.1 Recovery Method for Each Error Display (1)

No.	Error Display	Description	Recovery methods
1	 : Red	• Busy or Disk Drive detached for Restoring/Waiting for Restore • Inserted Disk Drive did not spin-up (RAID group defined)	It is shown that any of the failures occurred. Message code : W060xy, W060HH, W0GG00, W0GH00 Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
2	 : Red + Black	• The Disk Drive is blocked and uninstalled	
3	 : Red	• Busy or Spare Disk detached for Restoring/Waiting for Restore	It is shown that any of the failures occurred. Message code : W061xy, W061HH, W0GJ00, W0GK00 Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
4	 : Red + Black	• Though the disk array subsystem is set to use a Spare Disk, but the Spare Disk is not installed	
5	 : Red	• Busy or Disk Drive detached for Restoring/Waiting for Restore • Inserted Disk Drive did not spin-up (RAID group defined)	It is shown that any of the failures occurred. Message code : W060xy, W060AT, W060HH Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
6	 : Red + Black	• The Disk Drive is blocked and uninstalled	
7	 : Red	• Busy or Spare Disk detached for Restoring/Waiting for Restore	It is shown that any of the failures occurred. Message code : W061xy, W061AT, W061HH Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
8	 : Red + Black	• Though the disk array subsystem is set to use a Spare Disk, but the Spare Disk is not installed	
9	 : Yellow	• A cache backup circuit error occurred	Perform the maintenance instructed. Message code : W0340x
10	 : Red	• Controller down	Issuance of this trap indicates that an error beginning with message code "H" occurred. For detailed error information, see the WEB log message display of the subsystem. Perform the maintenance instructed. Message code H#####. "#####" is optional.
11	 : Red	• Fan error	It is shown that any of the failures occurred. Message code : W040xy, W04100, W042HH
12	 : Red	• Power Unit error	It is shown that any of the failures occurred. Message code : W050xy, W0G400, W0G600, W0G700, W05100, W05200 Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.

Copyright © 2005, 2006, Hitachi, Ltd.

No.	Error Display	Description	Recovery methods
13	 : Red	• Battery voltage error	It is shown that any of the failures occurred. Message code : W03000, W0300x, W03100, W0310x, W03200, W0320x, W03300, W0330x Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
14	 : Red	• ENC error	It is shown that any of the failures occurred. Message code : W090xy, W090HH, W0GA00, W0GC00 Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
15	 : Red	• SENC error	It is shown that any of the failures occurred. Message code : W090xy, W090AT, W090HH, W0GD00 Perform the maintenance corresponding to the message code referring to the WEB log message of the subsystem for the details.
16	 : Red	• Loop error	Perform the maintenance instructed. Message code : W080xy
17	 : Red	• Path detachment	Perform the maintenance instructed. Message code : W0F0xy
18	 : Red	• NNC blockade	Perform the maintenance instructed. Message code : W5000x
19	 : Red	• Memory (DIMM) failure	Perform the maintenance corresponding to the message code referring to the WEB information message of the subsystem for the details.
20	 : Gray	• Memory (DIMM) not installed	Perform the maintenance corresponding to the message code referring to the WEB information message of the subsystem for the details.
21	 : Red	• PS failure	Perform the maintenance corresponding to the message code referring to the WEB information message of the subsystem for the details.
22	 : Red	• Fan failure	Perform the maintenance corresponding to the message code referring to the WEB information message of the subsystem for the details.
23	 : Red	• Host connector failure	Perform the maintenance corresponding to the message code referring to the WEB information message of the subsystem for the details.

10.2.2 Storage Navigator Modular Maintenance Function

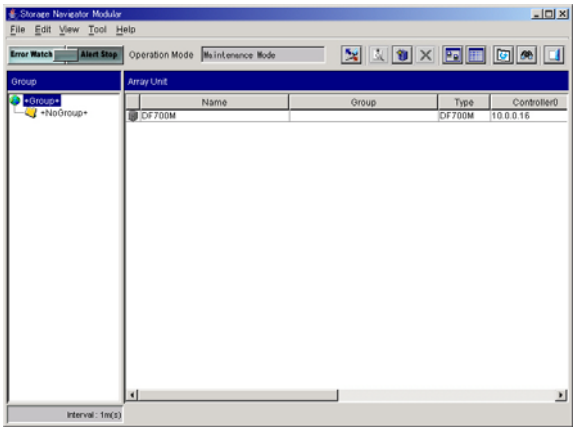
Maintenance functions of the Storage Navigator Modular are listed in Table 10.2.2.

Table 10.2.2 Storage Navigator Modular Maintenance Function List

No	Classification	Function name	Outline of function	Notes
1	Display of statistical information	Display of state of the controller operation	Statistical information is displayed by selecting an item.	An array unit not supported is displayed in half tone and cannot be selected.
		Display of number of host command receptions		
		Display of state of command execution		
		Display of state of the cache load		
		Display number of drive restoration starting		
		Display of cache memory failures statistical information		
		Display of drive failures statistical information		
		Display of drive DMA failures statistical information		
		Display of host DMA failures statistical information		
		Display of DUAL I/F system failures statistical information		
		Display of preventive maintenance failures statistical information		
2	Display of logical unit failure data information	Display of logical unit failure data information	The segments for each logical unit are displayed.	–
3	Setting a prefetch size	Setting prefetch information	It sets a prefetch staging size by the RAID levels, a next starting opportunity and host data transfer access size.	Prefetch information is set at an optimum value on shipment. If the setting is changed unpreparedly, it will affect performance and may interfere with operation:
4	Setting a threshold	Setting a threshold for preventive maintenance	It sets a threshold for the number of failures of a disk controlled by preventive maintenance.	–
5	Drive maintenance	Detach	Blocks a specified drive forcibly.	–
		Data reconstruction	When the drive restoration option was set automatically, reconstruct the data in the Disk Drive by specifying the drive position of the Disk Drive after replacing the failed Disk Drive.	–
		Copyback	Copies data from a spare drive to a specified drive.	–
		Dynamic sparing	Copies data forcibly from a specified drive to a spare drive, and then blocks the specified drive.	–
		System copy	Copies the system area of a system drive from another system drive.	–

Copyright © 2005, 2006, Hitachi, Ltd.

No	Classification	Function name	Outline of function	Notes
6	Setting a mode for reporting to the host	Setting a mode for reporting to the host using an SSB	This setting specifies a mode for reporting an SSB to the host when a trouble such as a failure in a part of the disk array subsystem occurs.	–
7	System Upgrade	System Upgrade	When upgrading a subsystem, with reference to the variety of information of partner equipment, the information is set as self-equipment.	–
8	Setting SATA Drive Options	SATA Drive Options	Refer to or set up the Sweep function and the SMART function, which are the SATA options.	–
9	Setting SATA Drive Restore Options	SATA Drive Restore Options	Refer to or set up the restoration size of the SATA correction copy.	–
10	Replacing the Online ENC/SENC Firmware	Download and replacing of ENC/SENC Firmware.	Download the ENC/SENC firmwareto the array subsystem, and replacce it.	–
11	Drive Performance Delay Diagnostic Function	Drive Performance Delay Diagnostic Function	If it is clear that the performance delay problem is caused by the drive, setting this function notifies the drive number of which caused the problem through the message and executes the dynamic sparing.	–



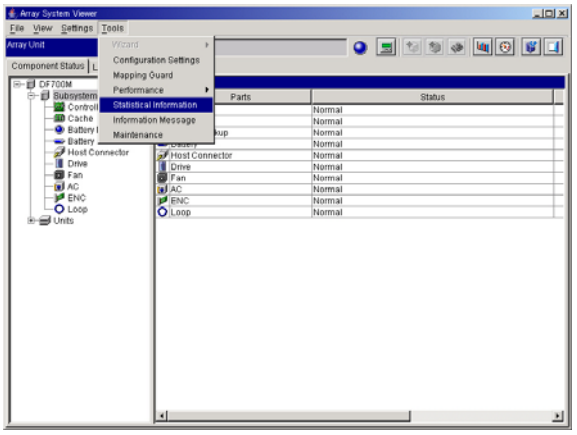
Copyright © 2005, 2006, Hitachi, Ltd.

10.2.3 Displaying Statistical Information

You can display the statistical information in the array unit.

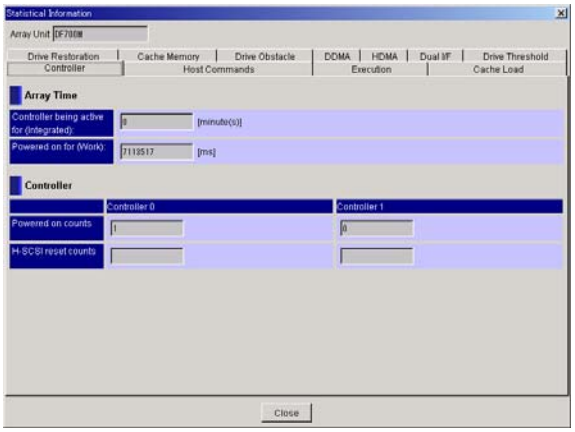
(1) Start the Storage Navigator Modular.

(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.



Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.



NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

(4) On the View menu select [Tools] – [Statistical Information] or click : Statistical Information in the tool bar.

Copyright © 2005, Hitachi, Ltd.

The Statistical Information dialogue box is displayed.

- Statistical Information : Type of statistical information

  Controller : State of the controller operation----------
  "(a) Displaying the Controller Use Condition" (TRBL 10-0170)

  Host Commands : Number of host command receptions----------
  "(b) Displaying the Numbers of Host Commands Received" (TRBL 10-0170)

  Execution : State of command execution----------
  "(c) Displaying the Command Execution Condition" (TRBL 10-0180)

  Cache Load : State of the cache load ----------
  "(d) Displaying the Cache Load Condition" (TRBL 10-0180)

  Drive Restorations : Number of drive restoration starting ----------
  "(e) Displaying Number of Drive Restoration Starting" (TRBL 10-0190)

  Cache Memory : Cache memory failures statistical information----------
  "(f) Displaying Cache Memory Failures Statistical Information" (TRBL 10-0190)

  Drive Obstacle : Drive failures statistical information ----------
  "(g) Displaying Drive Failures Statistical Information" (TRBL 10-0200)

  DDMA : Drive DMA failures statistical information ----------
  "(h) Displaying Drive DMA failures statistical information" (TRBL 10-0210)

  HDMA : Host DMA failures statistical information ----------
  "(i) Displaying Host DMA Failures Statistical Information" (TRBL 10-0210)

  DUAL I/F : DUAL I/F system failures statistical information----------
  "(j) Displaying DUAL I/F System Failures Statistical Information" (TRBL 10-0220)

  Drive Threshold : Preventive maintenance failures statistical information ----------
  "(k) Displaying Preventive Maintenance Failures Statistical Information" (TRBL 10-0230)

Copyright © 2005, Hitachi, Ltd.

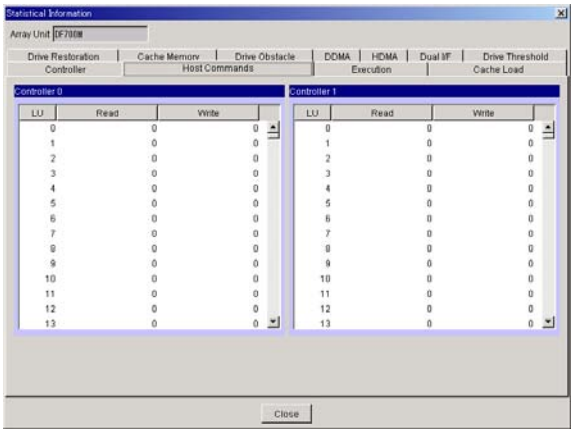
(a) Displaying the Controller Use Condition

Click the Controller tab.

- Array Time:

  Controller being active for (Integrated) : The accumulated power distribution time from turning on the power supply of the array subsystem to doing the planned stop is displayed in minutes. When the planned stop is not executed after the power supply of the array subsystem is turned on, 0 (minute) is displayed.

  Power on for (Work) : The progress time from turning on the power supply of the array subsystem to the present is displayed in milliseconds.



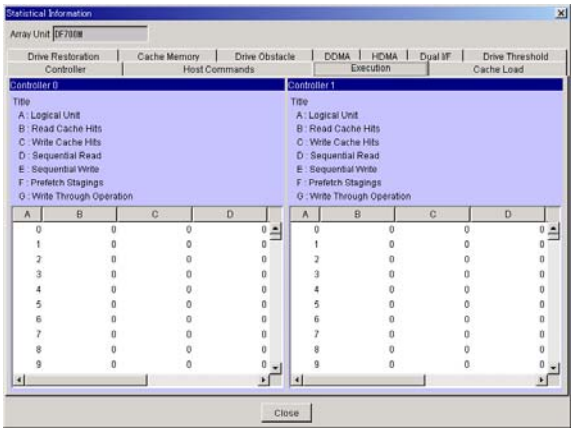
- Controller:

  Powered on counts : Integrated number of power ON times (at interruption) of the controller.

  H-SCSI reset counts : An accumulated number of SCSI bus resets received from a host computer is displayed.

(b) Displaying the Numbers of Host Commands Received

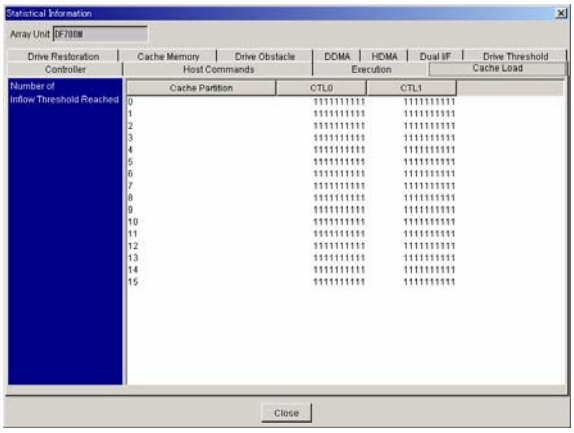
Click the Host Commands tab.



- LU : Logical unit number
- Read : Accumulated number of received read commands in each logical unit
- Write : Accumulated number of received write commands in each logical unit

Copyright © 2005, Hitachi, Ltd.

(c) Displaying the Command Execution Condition

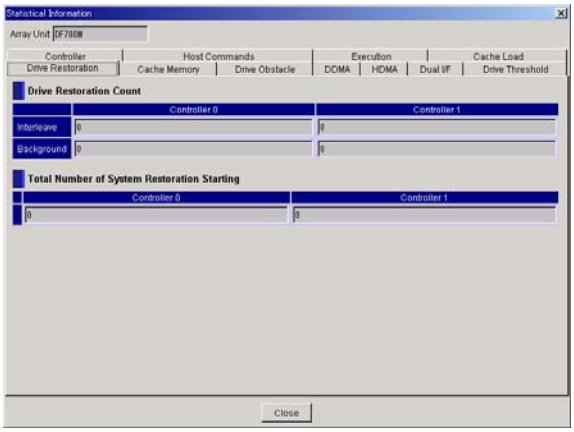


Click the Execution tab.

- A:Logical Unit : Logical unit number
- B:Read Cache Hits : Total of READ commands (hitting cache or partially hitting cache)
- C:Write Cache Hits : Total of WRITE commands (cache read hits)
- D:Sequential Read : Total of READ commands (recognized as sequential reading)
- E:Sequential Write : Total of WRITE commands (recognized as sequential writing)
- F:Prefetch Strings : Total of prefetch jobs executed
- G:Write Through Operation : Total of WRITE or WRITE & VERIFY commands (substituted by Write-Through operations)

(d) Displaying the Cache Load Condition

Click the Cache Load tab.

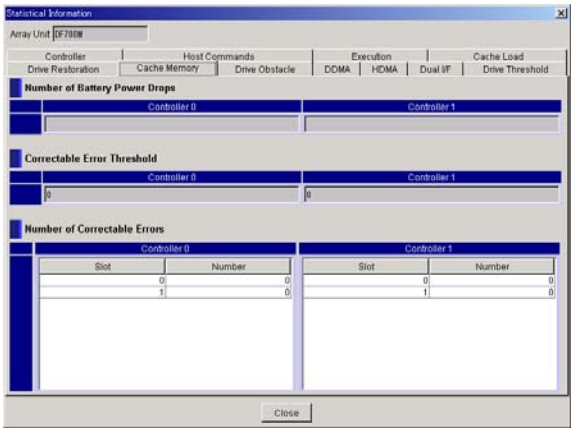


- Number of Inflow Threshold Reached : Total number of occurrences of inflow limitations.

This equipment manages the amount of data in cache as an inflow limit. When the host tries to write data exceeding this limit, an inflow limitation occurs. In this case, the write request from the host waits until part of write data is transferred to the drive.

Copyright © 2005, Hitachi, Ltd.

(e) Displaying Number of Drive Restoration Starting

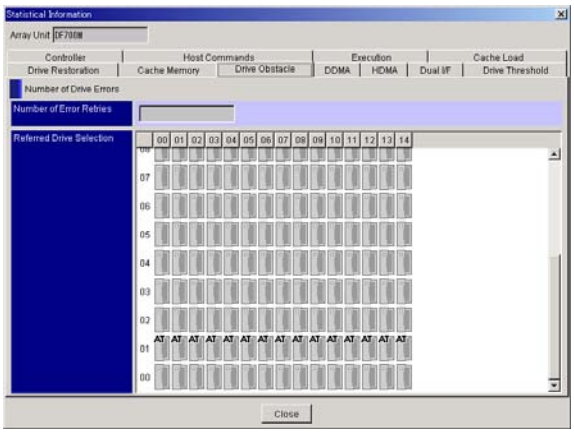


Click the Drive Restoration tab.

- Drive Restoration Count:
  Interleave : Accumulated number of starting of drive restoration using interleave
  Background : Accumulated number of starting of drive restoration performed in the background
- Total Number of System Restoration Starting : Accumulated number of system restoration starts

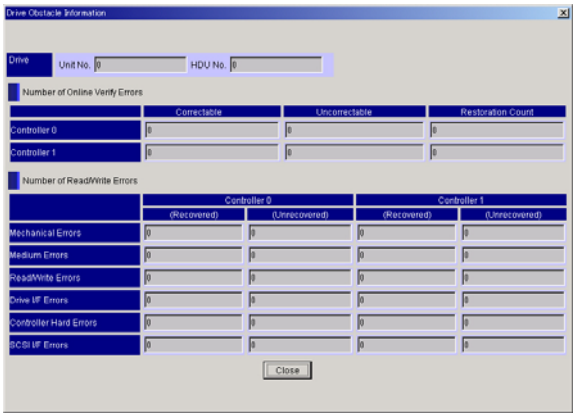
(f) Displaying Cache Memory Failures Statistical Information

Click the Cache Memory tab.



- Number of Battery Power Drops : Accumulated number of cache battery voltage drops
- Correctable Error Threshold : Threshold number of correctable errors
- Number of Correctable Errors : Accumulated number of correctable errors per cache slot

Copyright © 2005, Hitachi, Ltd.



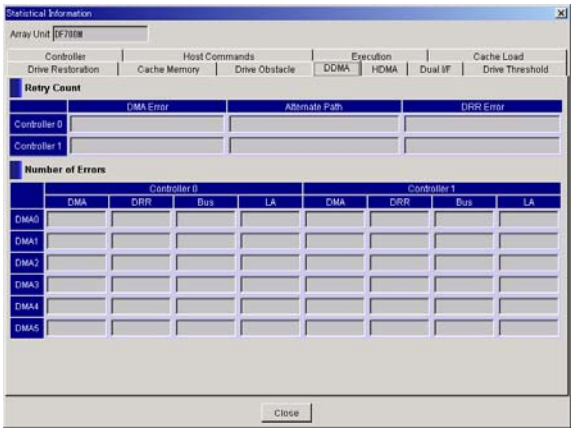
(g) Displaying Drive Failures Statistical Information

Click the Drive Obstacle tab.

Double-click on the drive icon you want to display.

Drive Obstacle information dialogue box is displayed.

- Drive:
  Unit No. : Unit No. of the selected drive.
  HDU No. : HDU No. of the selected drive.
- Number of Online Verify Errors : Accumulated number of errors that occurred when executing the read/write operations.
  The accumulated number of errors is not cleared even if the power supply of the subsystem is turned off (the subsystem performs the planned shutdown).
  Correctable : Accumulated number of correctable errors occurred in on-line verify execution.
  Uncorrectable : Accumulated number of uncorrectable errors occurred in on-line verify execution.
  Restoration Count : Accumulated number of restorations occurred in on-line verify execution
- Number of Read/Write Errors : Accumulated number of errors that occurred when executing the read/write operations.
  Mechanical Errors : Accumulated number of mechanism-related errors.
  Medium Errors : Accumulated number of medium-related errors.

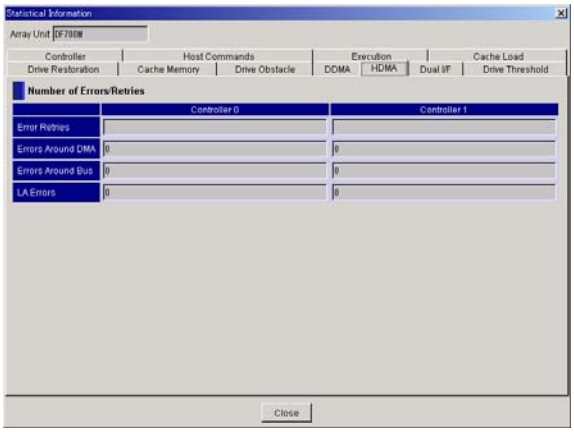


Copyright © 2005, 2006, Hitachi, Ltd.

Read/Write Errors : Accumulated number of read/write-related errors.
Drive I/F Errors : Accumulated number of drive interface errors.
Controller Hard Errors : Accumulated number of controller hardware errors.
SCSI I/F Errors :Accumulated number of SCSI interface errors.

Copyright © 2005, 2006, Hitachi, Ltd.

(h) Displaying Drive DMA failures statistical information

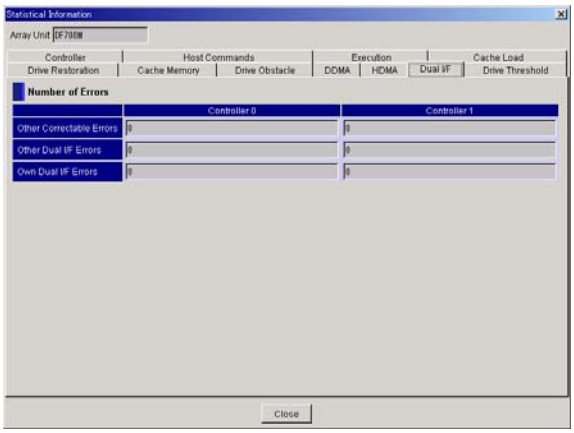


Click the DDMA tab.

- Retry Count:
  DMA Error : Number of DMA error retries
  Alternate Path : Number of alternate path retries against DMA errors
  DRR Error : Number of DRR error retries
- Number of Errors : Number of DMA, DRR, Bus, and LA errors per DMA occurred in the controller 0 and controller 1

(i) Displaying Host DMA Failures Statistical Information

Click the HDMA tab.

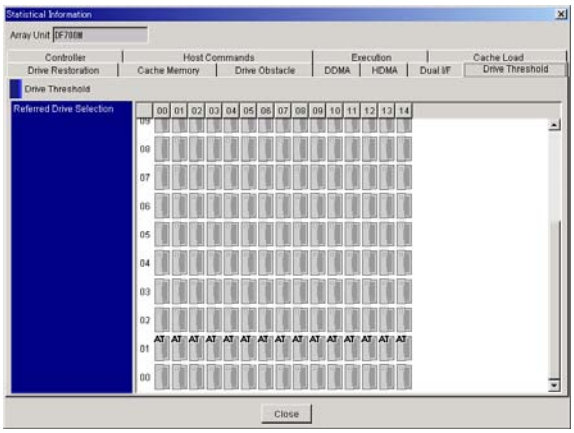


- Error Retries : Number of DMA error retries
- Errors Around DMA : Accumulated number of DMA-related errors
- Errors Around Bus : Accumulated number of bus-related errors
- LA Errors : Accumulated number of LA errors

Copyright © 2005, Hitachi, Ltd.

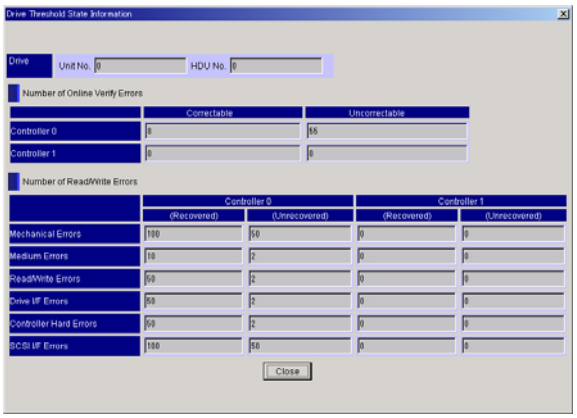
(j) Displaying DUAL I/F System Failures Statistical Information

Click the Dual I/F tab.



- Other Correctable Errors : Accumulated number of correctable errors occurred in the controller of another system
- Other Dual I/F Errors : Accumulated number of Dual I/F errors occurred in the controller of another system
- Own Dual I/F Errors : Accumulated number of Dual I/F errors occurred in the controller of own system

Copyright © 2005, Hitachi, Ltd.



(k) Displaying Preventive Maintenance Failures Statistical Information

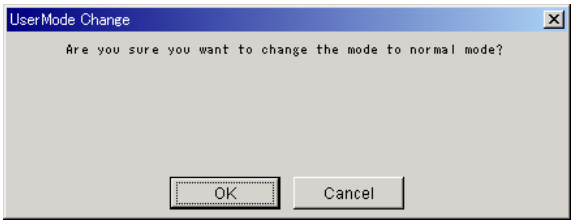
Click the Drive Threshold tab.

Double-click on the drive icon you want to display.

Drive Threshold state information dialog box is displayed.

- Drive:
  Unit No. : Unit No. of the selected drive.
  HDU No. : HDU No. of the selected drive.
- Number of Online Verify Errors : Accumulated number of errors that occurred when executing the read/write operations.
  The accumulated number of errors is not cleared even if the power supply of the subsystem is turned off (the subsystem performs the planned shutdown).
  Correctable : Accumulated number of correctable errors occurred in on-line verify execution.
  Uncorrectable : Accumulated number of uncorrectable errors occurred in on-line verify execution.
  Restoration Count : Accumulated number of restorations occurred in on-line verify execution
- Number of Read/Write Errors : Accumulated number of errors that occurred when executing the read/write operations.
  Mechanical Errors : Accumulated number of mechanism-related errors.
  Medium Errors : Accumulated number of medium-related errors.

Copyright © 2005, 2006, Hitachi, Ltd.



Read/Write Errors : Accumulated number of read/write-related errors.
Drive I/F Errors : Accumulated number of drive interface errors.
Controller Hard Errors : Accumulated number of controller hardware errors.
SCSI I/F Errors : Accumulated number of SCSI interface errors.

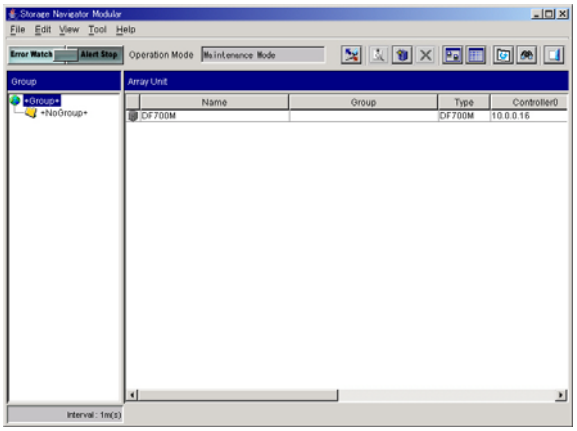
Copyright © 2005, 2006, Hitachi, Ltd.

(5) On the Mode menu, click the Exit. The Main screen is displayed.

(6) Click  : Change Mode in the tool bar on the Main screen.

(7) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

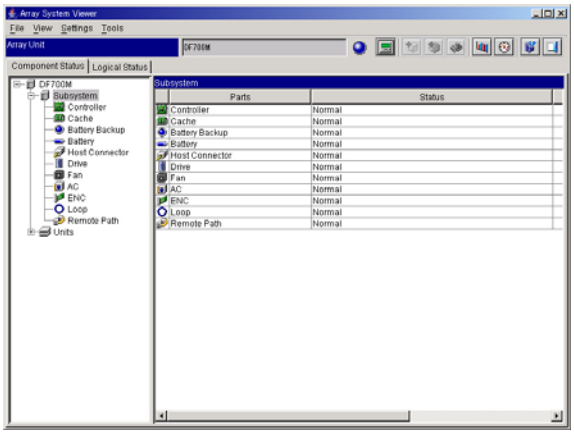


Copyright © 2005, Hitachi, Ltd.

10.2.4 Displaying Logical Unit Failure Data Information

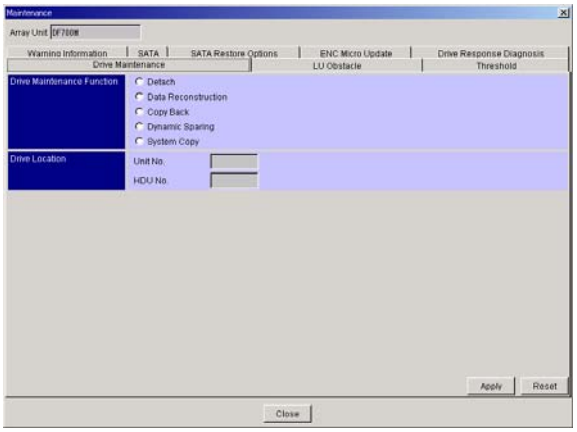
The PIN information of each logical unit is displayed.

(1) Start the Storage Navigator Modular.



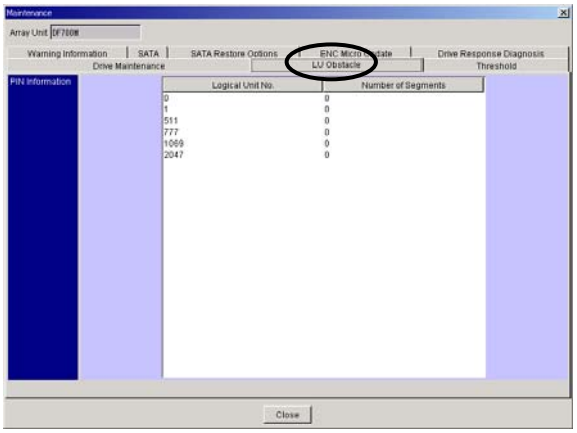
(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

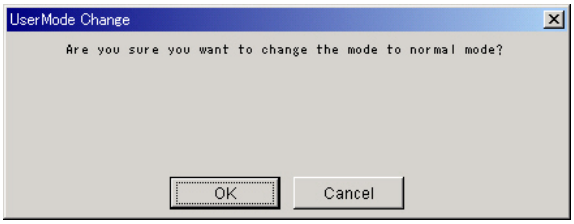
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



Copyright © 2005, Hitachi, Ltd.

(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

(5) Click the LU Obstacle tab on the Maintenance dialogue box.



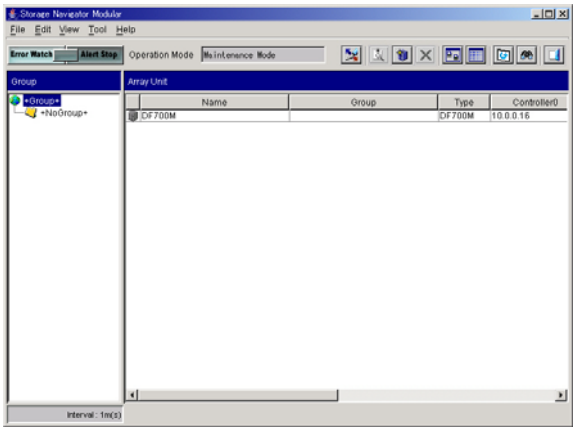
The number of segments, including PIN, in each logical unit is displayed.

(6) On the Mode menu, click the Exit. The Main screen is displayed.

(7) Click  : Change Mode in the tool bar on the Main screen.

(8) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

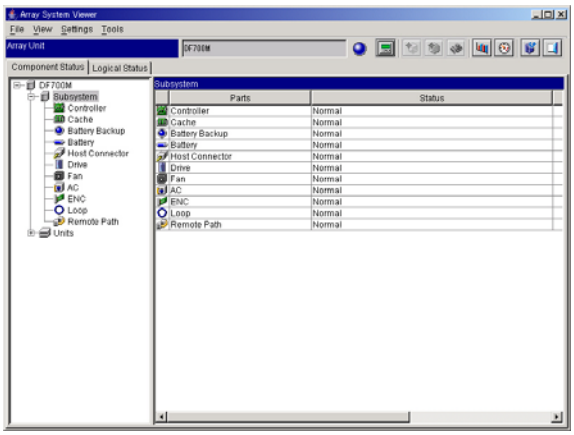


Copyright © 2005, Hitachi, Ltd.

10.2.5 Setting Pre-fetch Information

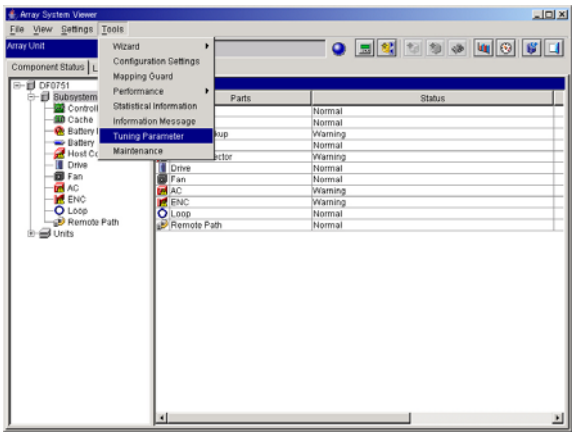
A prefetch staging size for each RAID level, next starting opportunity and host data transfer access size are set.

(1) Start the Storage Navigator Modular.



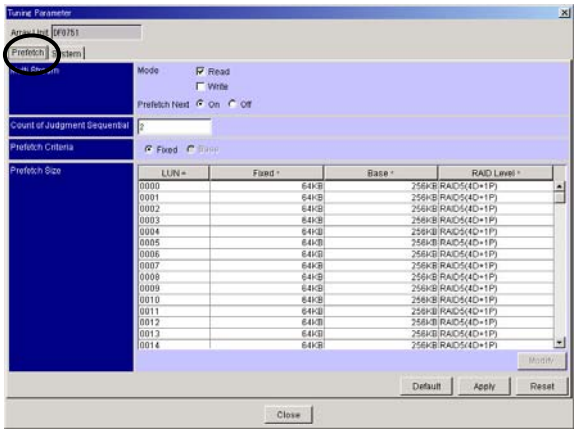
(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



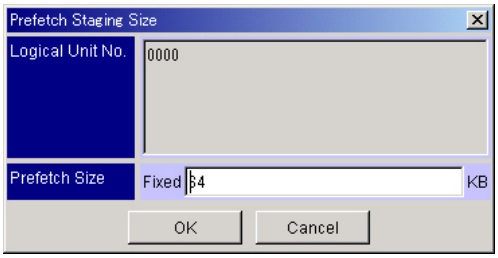
(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



Copyright © 2005, Hitachi, Ltd.

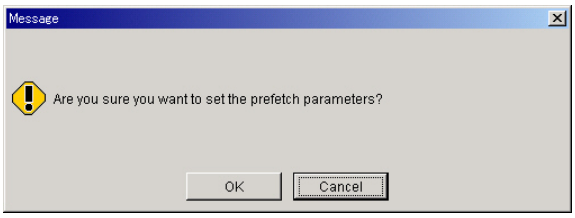
(4) Select [Tools] – [Tuning Parameter] in the unit window.



(5) Click the Prefetch tab on the Tuning Parameter dialogue box.

NOTE : The prefetch staging size, next starting opportunity and host data transfer access size are set at optimum values. If the setting is changed unpreparedly, it will affect performance and may interfere with operation. When changing them, contact the manufacturer in advance.

(6) Select the LUN you want to modify the prefetch size, click the [Modify] button.



(7) Specify the Prefetch Size, click the [OK] button.

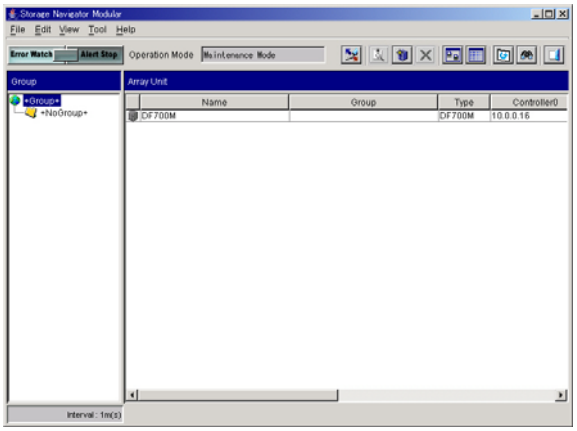
Copyright © 2005, Hitachi, Ltd.

(8) Check if the settings that have been made are correct and click the [Apply] button.

(9) A message asking you to verify the setting is displayed. Click the [OK] button.

(10) When the setting is completed, the following message is displayed. Click the [OK] button.

(11) Click the [Close] button on the Tuning Parameter dialogue box.

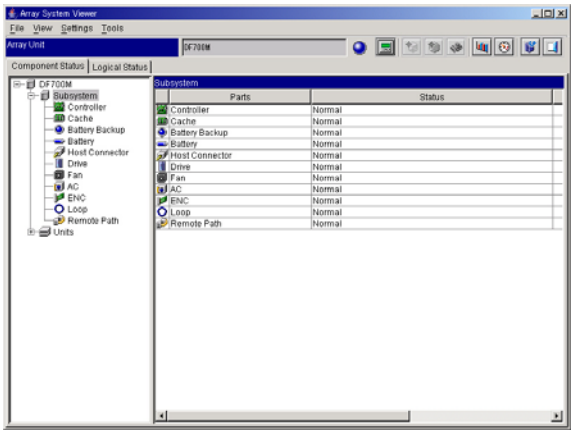


Copyright © 2005, Hitachi, Ltd.

10.2.6 Setting a Threshold for Preventive Maintenance

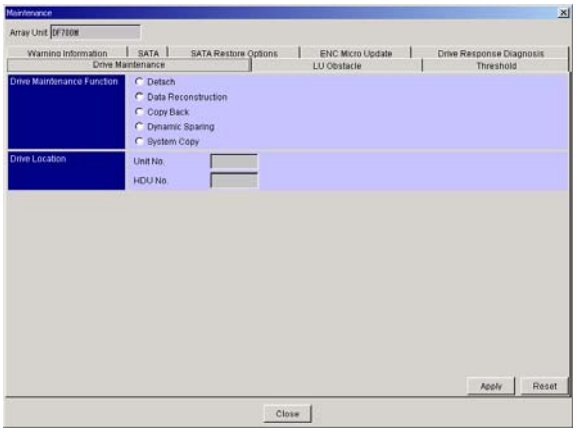
A threshold for the number of drive failure managed in preventive maintenance is set.

(1) Start the Storage Navigator Modular.



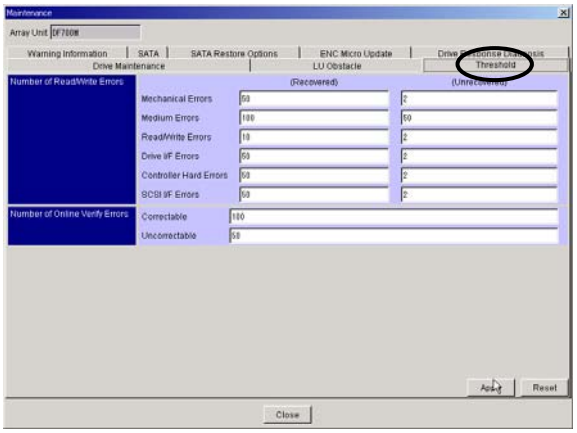
(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

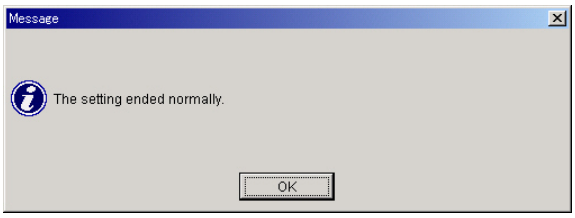


Copyright © 2005, Hitachi, Ltd.

(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

(5) Click the Threshold tab on the Maintenance dialogue box.

- Number of Read/Write Errors :Specifies a threshold of a read/write error.
  Mechanical Errors : Accumulated number of mechanical error occurrences
  Medium Errors : Accumulated number of medium error occurrences
  Read/Write Errors : Accumulated number of read/write error occurrences
  Drive I/F Errors : Accumulated number of drive interface error occurrences
  Controller Hard Errors : Accumulated number of controller hardware error occurrences
  SCSI I/F Errors : Accumulated number of SCSI interface error occurrences
- Number of Online Verify Errors : Specifies a threshold of a read/write error.
  Correctable : Accumulated number of occurrences of correctable error in on-line verify execution
  Uncorrectable : Accumulated number of occurrences of uncorrective error in on-line verify execution

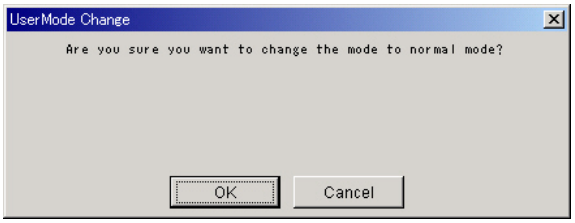


A threshold is specified in the range of 1 to 65,535 with 1 as a unit. If you specify 0, it will not be an object of preventive maintenance.

NOTE : A threshold is set at an optimum value : If the setting is changed unpreparedly, it may perform preventive maintenance operation outside the range of it or may not operate even though there is an object for it: When changing it, contact the manufacturer in advance.

Copyright © 2005, Hitachi, Ltd.

(6) Change the value and click the Apply button.



(7) A confirming message appears. Click the [OK] button.

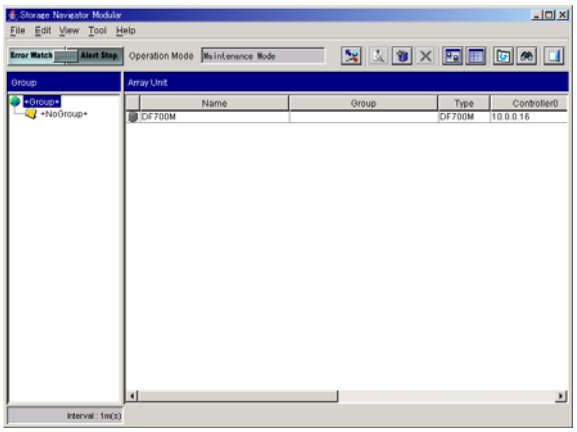
(8) On the Mode menu, click the Exit. The Main screen is displayed.

(9) Click  : Change Mode in the tool bar on the Main screen.

(10) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

Copyright © 2005, Hitachi, Ltd.

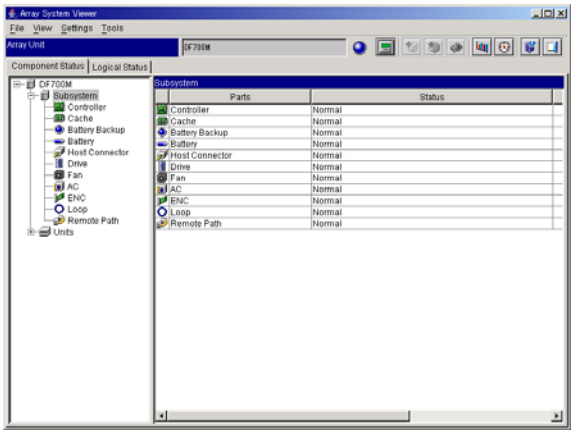


10.2.7 Drive Maintenance

Performs maintenance functions on drives mounted in array units such as blocking a drive forcibly and instructing to restore.

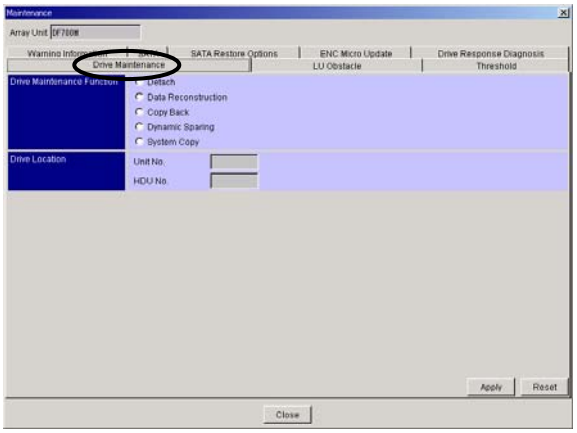
NOTE : The data reconstruction, the copy back and the dynamic sparing are not executed for the Disk Drives in the RAID Group to which the Power Saving function is set.

(1) Start the Storage Navigator Modular.



(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

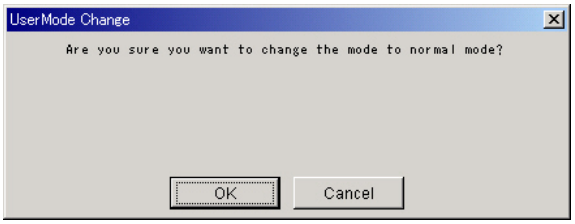
Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

Copyright © 2005, 2006, Hitachi, Ltd.



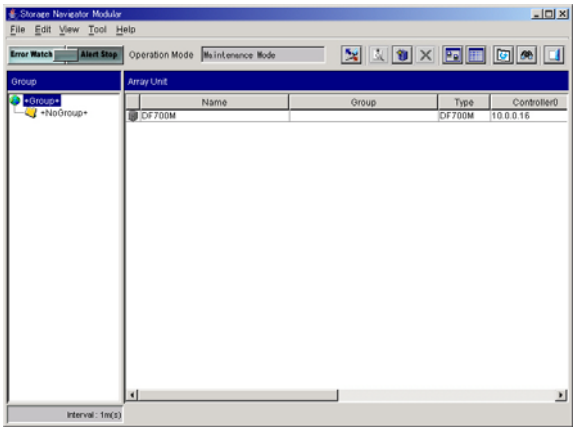
(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed. Click the Drive Maintenance tab on the Maintenance dialogue box.

- Drive Maintenance Function:
  Detach : Blocks a drive specified in the Drive Location box forcibly.
  Data Reconstruction : When the drive restoration option was set automatically, reconstruct the data in the Disk Drive by specifying the drive position of the Disk Drive after replacing the failed Disk Drive. Execute the data reconstruction by specifying the replaced Disk Drive position after replacing the Disk Drive. (refer to the Replacement "2.2.1 Replacing Disk Drive" (REP 02-0050).)
  When executing it without replacing the Disk Drive, the correction copy operates in the Spare Disk Drive where the data is recoverable, and if there is no such Spare Disk Drive, the execution command will become an error, and the data reconstruction cannot be executed. Also, when specifying the Spare Disk Drive or the normal Disk Drive to [Drive Position] or when the correction copy, copy back, dynamic sparing and system copy are already operating, the execution demand becomes an error, and the data reconstruction cannot be executed.
  Copy Back : Copies data from a spare drive to a drive specified in the Drive Location box.
  Dynamic Sparing : Copies data forcibly from a drive specified in the Drive Location box to a spare drive.
  System Copy : Copies the system area from the current system drive to a system drive specified in the Drive Location box.
- Drive Location:
  Unit No. : Unit No. of a drive on which to perform a maintenance function
  HDU No. : HDU No. of a drive on which to perform a maintenance function

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Select the Drive Maintenance Function to perform, and specifies the Drive Location of a drive on which to perform a selected function.
(6) If you click the Apply button, a selected function will be performed.
(7) On the Mode menu, click the Exit. The Main screen is displayed.
(8) Click [ : Change Mode] in the tool bar on the Main screen.
(9) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

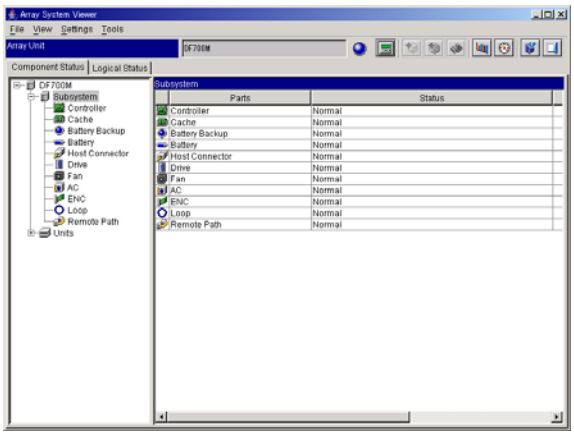


Copyright © 2005, 2006, Hitachi, Ltd.

10.2.8 Setting a Mode for Reporting to the Host Using an SSB

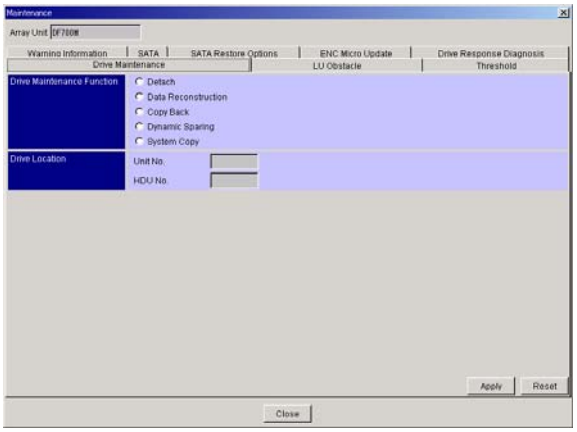
This setting specifies a mode for reporting an SSB to the host when a trouble such as a failure in a part of the disk array subsystem occurs.

(1) Start the Storage Navigator Modular.



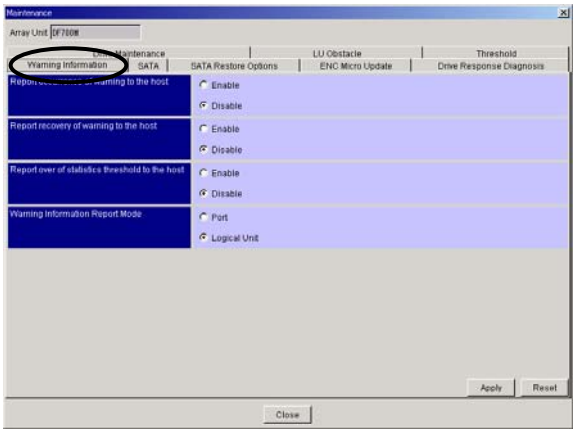
(2) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

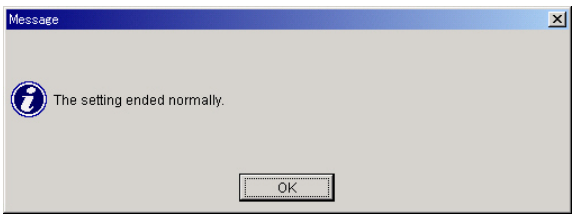
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



Copyright © 2005, Hitachi, Ltd.

(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

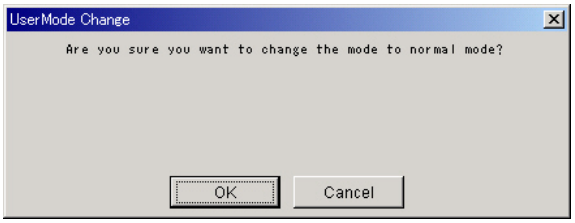
(5) Click the Warning Information tab on the Maintenance dialogue box.



- Report occurrence of warning to the host : Reporting an SSB to the host when a failure that causes a warning occurs.
- Report recovery of warning to the host : Reporting an SSB to the host when the subsystem recovers from a failure which caused a warning.
- Report over of statistics threshold to the host : Reporting an SSB to the host when any of the statistical data exceeds its threshold value.
- Warning Information Report Mode:
  Port : Reports the failure information of the port.
  Logical Unit : Reports the failure information of the port, initiator, and logical unit.

(6) Click on an item you want to set to validate it, and then click the Apply button.

Copyright © 2005, Hitachi, Ltd.



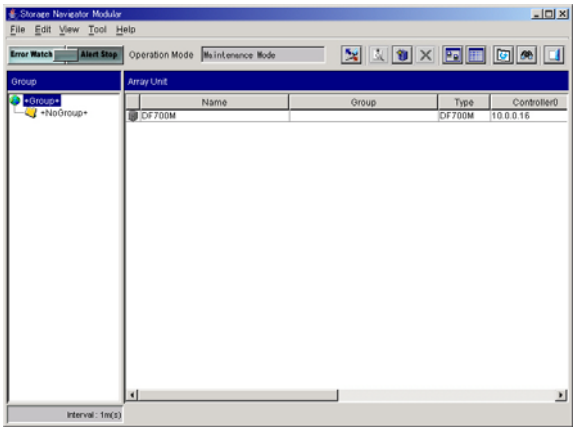
(7) A confirming message appears. Click the [OK] button.

(8) On the Mode menu, click the Exit. The Main screen is displayed.

(9) Click  : Change Mode in the tool bar on the Main screen.

(10) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

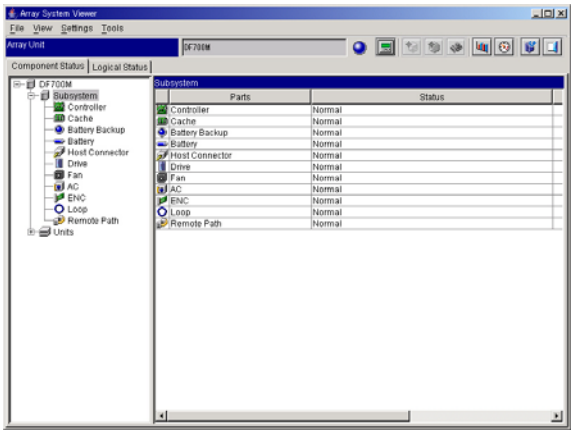


Copyright © 2005, Hitachi, Ltd.

10.2.9 Setting SATA Drive Options

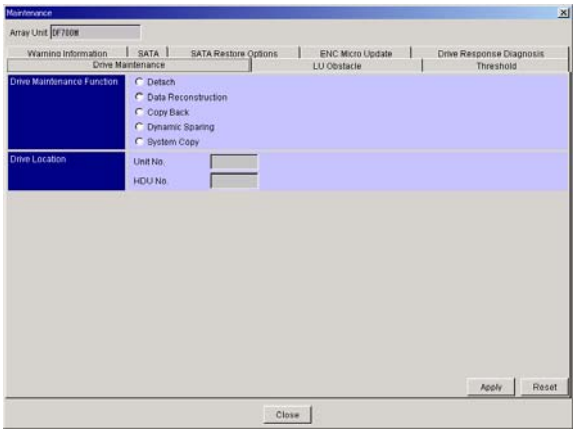
Refer to or set the SATA drive option.

(1) Start the Storage Navigator Modular.



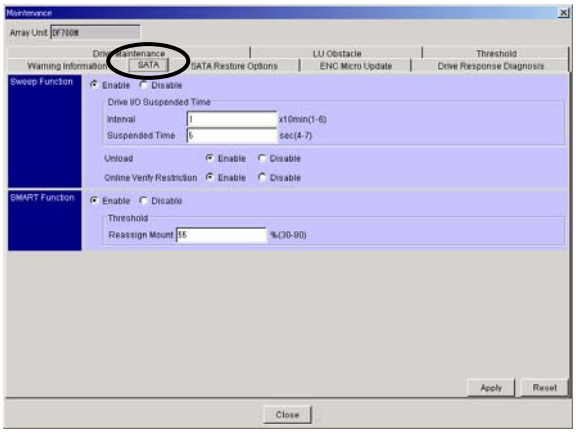
(2) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

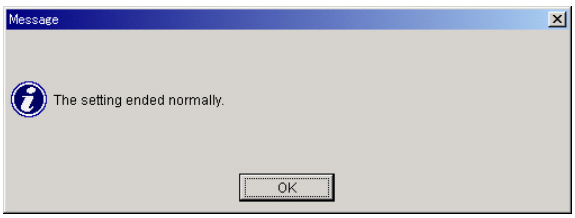
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



Copyright © 2005, Hitachi, Ltd.

(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

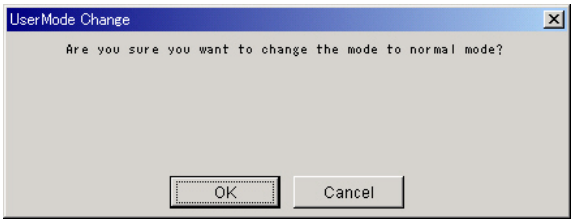
(5) Click the SATA tab on the Maintenance dialogue box.



- Sweep Function:
  Enable/Disable : Make a selection whether to enable or disable the Sweep Function.
  Drive I/O Suspended Time : Specify the drive I/O Suspended Time for the SATA drive with Interval and Suspended Time.
  Unload : Make a selection whether to enable or disable the Unload Function.
  Online Verify Restriction : Make a selection whether to enable or disable the Online Verify Restriction for the SATA drive. When you selected Enable, the operating rate of online verification of a SATA drive will be controlled to 1/6 times of FC drive. When you selected Disable, it will be made the same as FC drive.
- SMART Function:
  Enable/Disable : Make a selection whether to enable or disable the SMART Function.
  Threshold : Specify the threshold value of the Reassign Mount to start the dynamic sparing.

(6) Change the value and click the [Apply] button.

Copyright © 2005, Hitachi, Ltd.



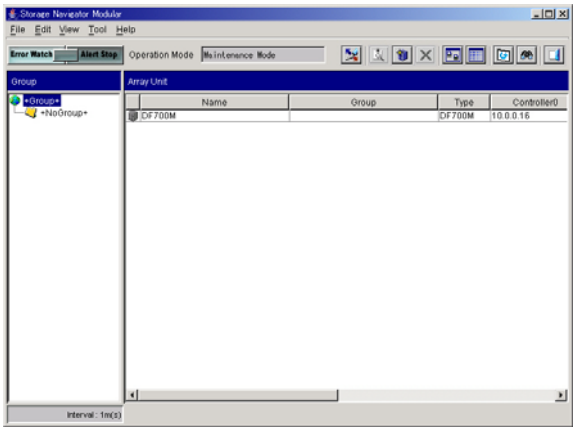
(7) A confirming message appears. Click [OK] button.

(8) On the Mode menu, click the Exit. The Main screen is displayed.

(9) Click  : Change Mode in the tool bar on the Main screen.

(10) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

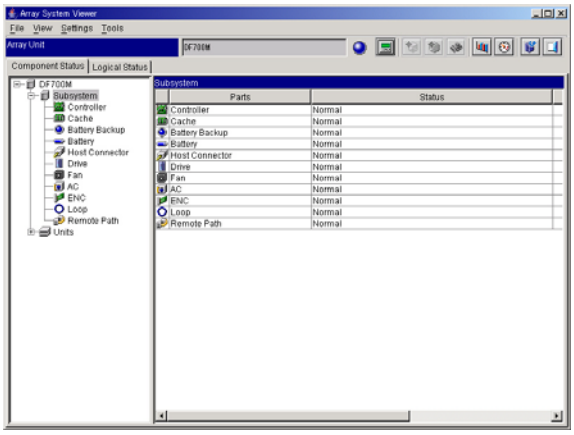


Copyright © 2005, Hitachi, Ltd.

10.2.10 Setting SATA Drive Restore Options

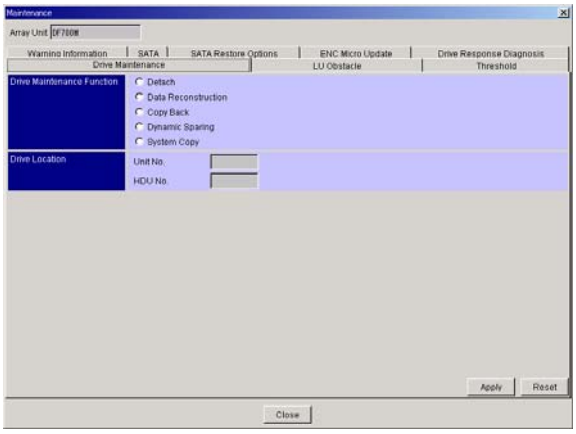
Refer to or set the SATA drive restore option.

(1) Start the Storage Navigator Modular.



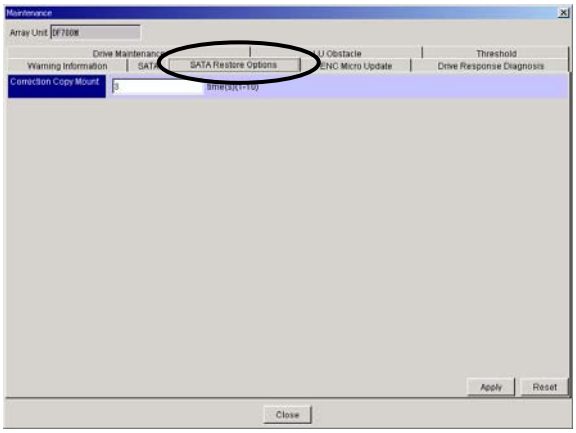
(2) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



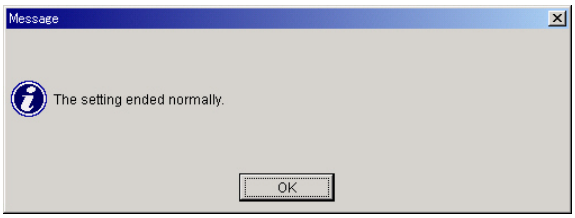
(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



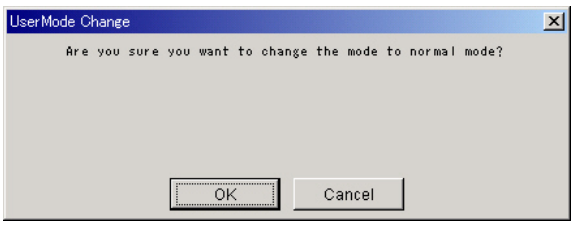
Copyright © 2005, Hitachi, Ltd.

(4) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.



(5) Click the SATA Restore Options tab on the Maintenance dialogue box.

- Correction Copy Mount : Specify the size of data to be restored at a time with by means of a correction copy as a multiple n of the FC drive capacity.



(6) Change the value and click the [Apply] button.
(7) A confirming message appears. Click [OK] button.

(8) On the Mode menu, click the Exit. The Main screen is displayed.
(9) Click  : Change Mode in the tool bar on the Main screen.

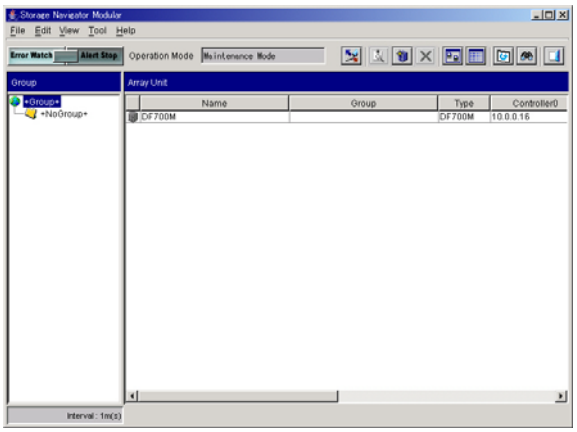
Copyright © 2005, Hitachi, Ltd.

(10) A confirming message appears. Click the [OK] button.

Storage Navigator Modular enters Normal Mode, and Normal Mode appears at Active Mode at the upper of the Main screen.

Copyright © 2005, Hitachi, Ltd.

10.2.11 Replacing the Online ENC/SENC Firmware



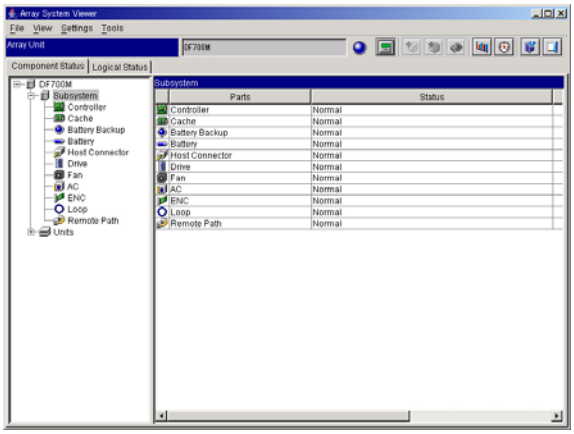
The function downloads and replaces the ENC/SENC Firmware in the array unit. When replacing the ENC/SENC Firmware, download it, and then replace it.

Perform the replacement work of the ENC/SECN firmware referring to the following manual.

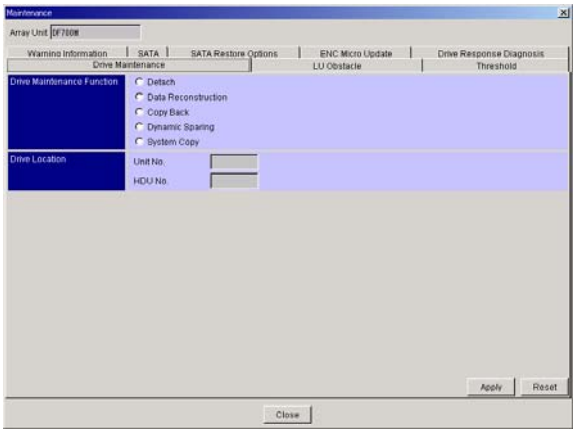
- HT-4064 Disk Array Subsystem Procedure for Online ENC/SENC Firmware Download

(a) Start the Storage Navigator Modular.

(b) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.



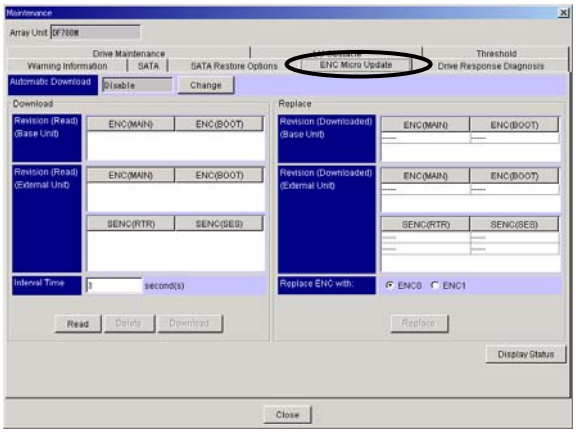
Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



Copyright © 2005, Hitachi, Ltd.

(c) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



(d) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

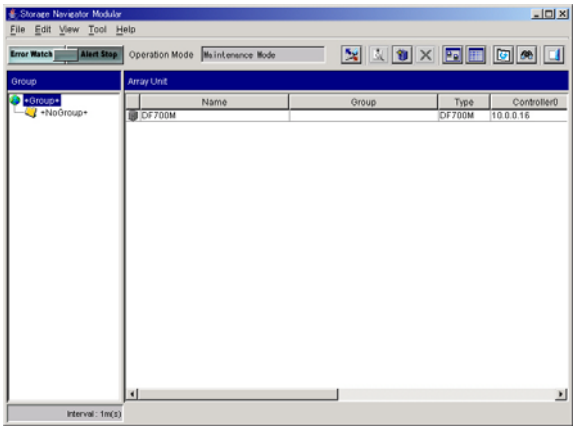
Copyright © 2005, Hitachi, Ltd.

(e) Click the ENC Micro Update tab on the Maintenance dialogue box.

- Automatic Download : Specify whether or not to download the ENC/SENC Firmware automatically. When you replace the ENC/SENC Firmware manually, make the automatic downloading invalid using the changing button.
- Revision (Read) (Base Unit) : A base unit revision stored in the computer in which the Storage Navigator Modular is installed. When the base unit revision is not read, a blank is displayed.
- Revision (Read) (External Unit) : An external unit revision stored in the computer in which the Storage Navigator Modular is installed. When the external unit revision is not read, a blank is displayed.
- Interval Time : Interval time for download. Specify the time between one second and 60 seconds. For the LAN connection, when the interval time is specified as 3 seconds, the download requires approximately 9 minutes. The time required for the execution varies with the network status and depends on the I/Os issued by the host. When the interval time is specified as one second longer, the time required for the download is prolonged by 3 minutes. This function can be used during execution of the I/O instructed by the host. However, when the download function is executed, I/O performance of the host is reduced. To enhance performance, specify a longer interval time.
- Revision (Downloaded) (Base Unit) : A base unit revision downloaded in the subsystem. When the base unit revision is not downloaded, a blank is displayed.
- Revision (Downloaded) (External Unit) : An external unit revision downloaded in the subsystem. When the external unit revision is not downloaded, a blank is displayed.
- Replace ENC with: : Specify the ENC whose firmware is to be replaced.

When no firmware is read, the Delete and Download buttons are displayed in gray and cannot be selected.

Copyright © 2005, Hitachi, Ltd.

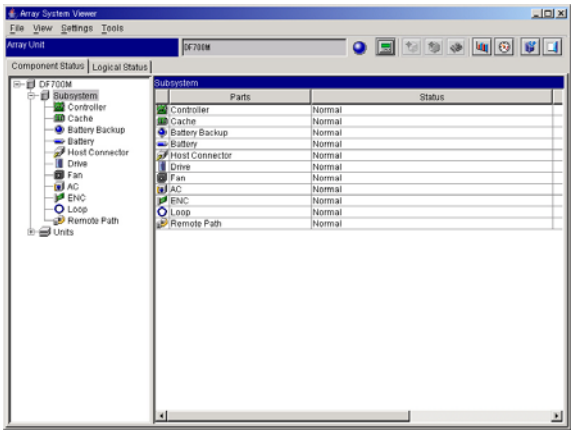


10.2.12 Drive Performance Delay Diagnostic Function

If it is clear that the performance delay problem is caused by the drive, setting this function notifies the drive number of which caused the problem through the message and executes the dynamic sparing.

(1) Setting the drive performance delay diagnostic function in the Storage Navigator Modular.

(a) Start the Storage Navigator Modular.

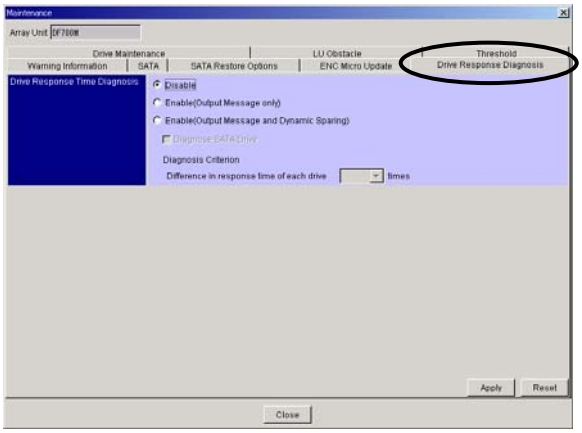


(b) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

(c) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

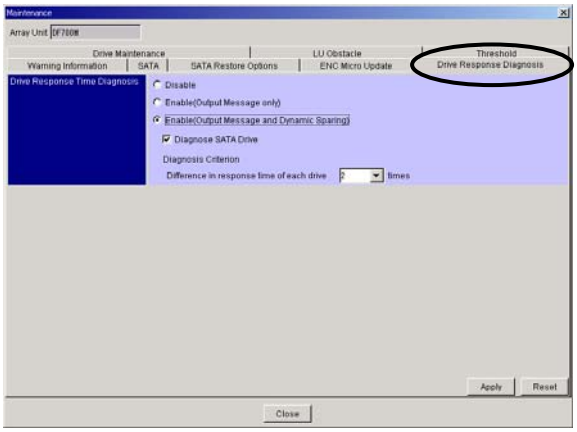
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).



Copyright © 2005, Hitachi, Ltd.

(d) On the Settings menu, click the Maintenance.
Maintenance dialogue box is displayed.

Copyright © 2005, Hitachi, Ltd.



(e) Click the Drive Response Diagnosis tab on the Maintenance dialogue box.

- Disable : The drive response time is not diagnosed.
- Enable (Output Message only):
  The drive response time is diagnosed and a number of the drive that caused the response delay is displayed in a message.
  Diagnose SATA Drive:
  Fill the check box when you want to diagnose the SATA drives.
  Difference in response time of each drive :
  The response time difference of the normal drive and the delay drive to specify the delay drive in the same RAID group.

  NOTE : Specify 2 for the value of Difference in response time of each drive. If setting the value other than 2, contact the Technical Support Center.

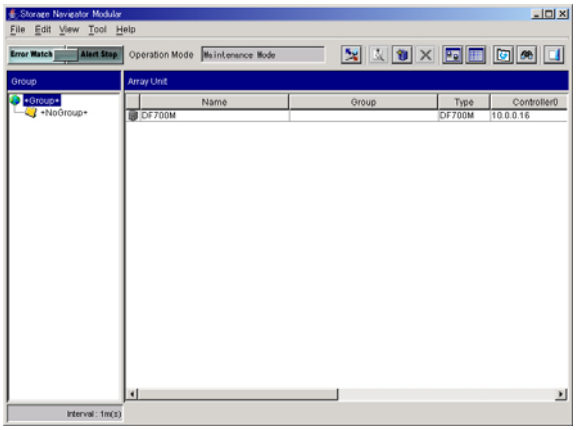
Copyright © 2005, Hitachi, Ltd.

- Enable (Output Message and Dynamic Sparing):
  The drive response time is diagnosed, a number of the drive that caused the response delay is displayed in a message, and the dynamic sparing is executed.
  Diagnose SATA Drive:
    Fill the check box when you want to diagnose the SATA drives.
  Difference in response time of each drive :
    The response time difference of the normal drive and the delay drive to specify the delay drive in the same RAID group.

      NOTE : Specify 2 for the value of Difference in response time of each drive. If setting the value other than 2, contact the Technical Support Center.

(f) Click the [Apply] button.

Copyright © 2005, Hitachi, Ltd.



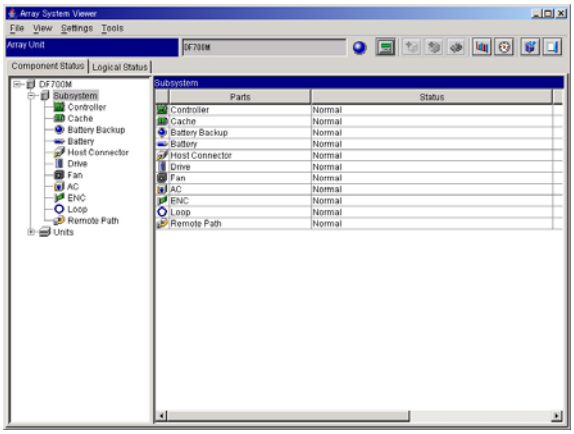
10.2.13 Function to release the pair of Modular Volume Migration

Modular Volume Migration can be executed even if either RAID Manager or Storage Navigator Modular is used, but Modular Volume Migration executed from RAID Manager can only operate it from RAID Manager and Modular Volume Migration executed from Storage Navigator Modular can only operate it from Storage Navigator Modular. However, when the server in which RAID Manager is installed is removed remaining the pair of Modular Volume Migration executed from RAID Manager, it can operate only the pair release by using Storage Navigator Modular made the maintenance mode.

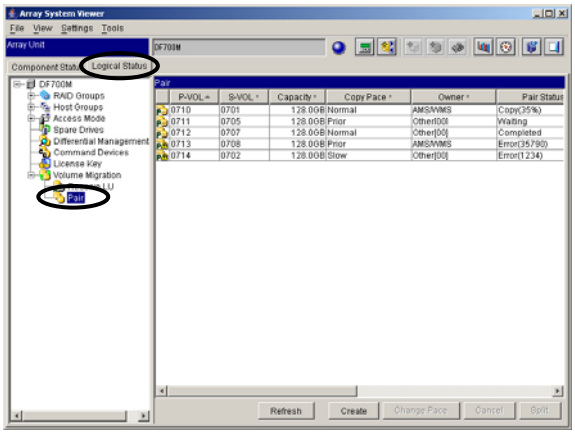
This section explains the method to release the pair of Modular Volume Migration executed from RAID Manager by using Storage Navigator Modular.

(1) Start the Storage Navigator Modular.

(2) In the main window, position the focus ([ ]) on the icon [] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.



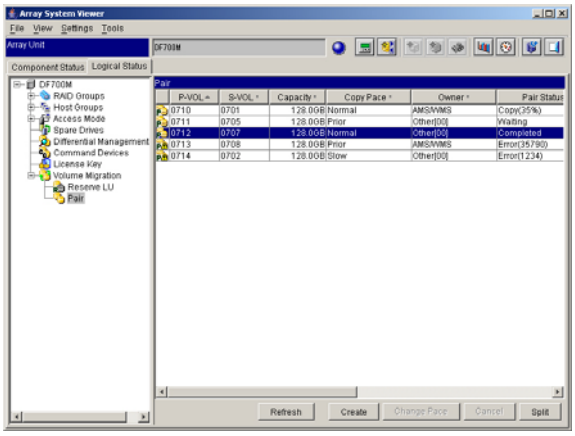
Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



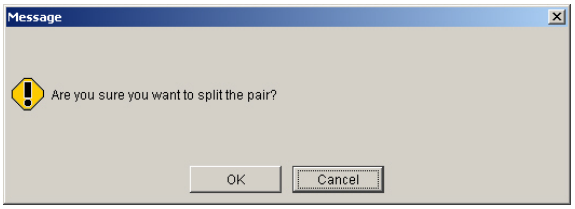
Copyright © 2005, 2006, Hitachi, Ltd.

(3) Double-click the icon of an array unit on the Main screen.
The Unit screen is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again. (refer to System Parameter "1.2 Setting the LAN Port Number" (SYSPR 01-0100)).

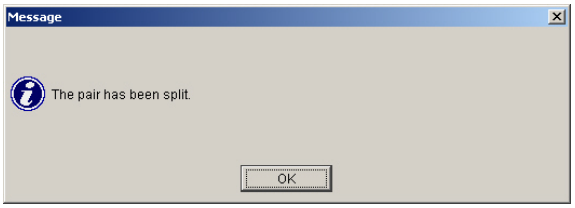


(4) Click the [Logical Status] tab in the unit window, and click the [Pair] icon in the [Volume Migration] icon. The pair of Modular Volume Migration which is currently being executed is displayed.



Copyright © 2006, Hitachi, Ltd.

(5) Specify the pair to be released, and click the [Release] button.



NOTE : The owner is displayed as Other [00] for the pair executed from RAID Manager.
Only the pair whose pair status is error or completed can be released.

(6) A confirming message appears. Click [OK] button.

(7) The message that the pair was released is displayed, so that click the [OK] button.

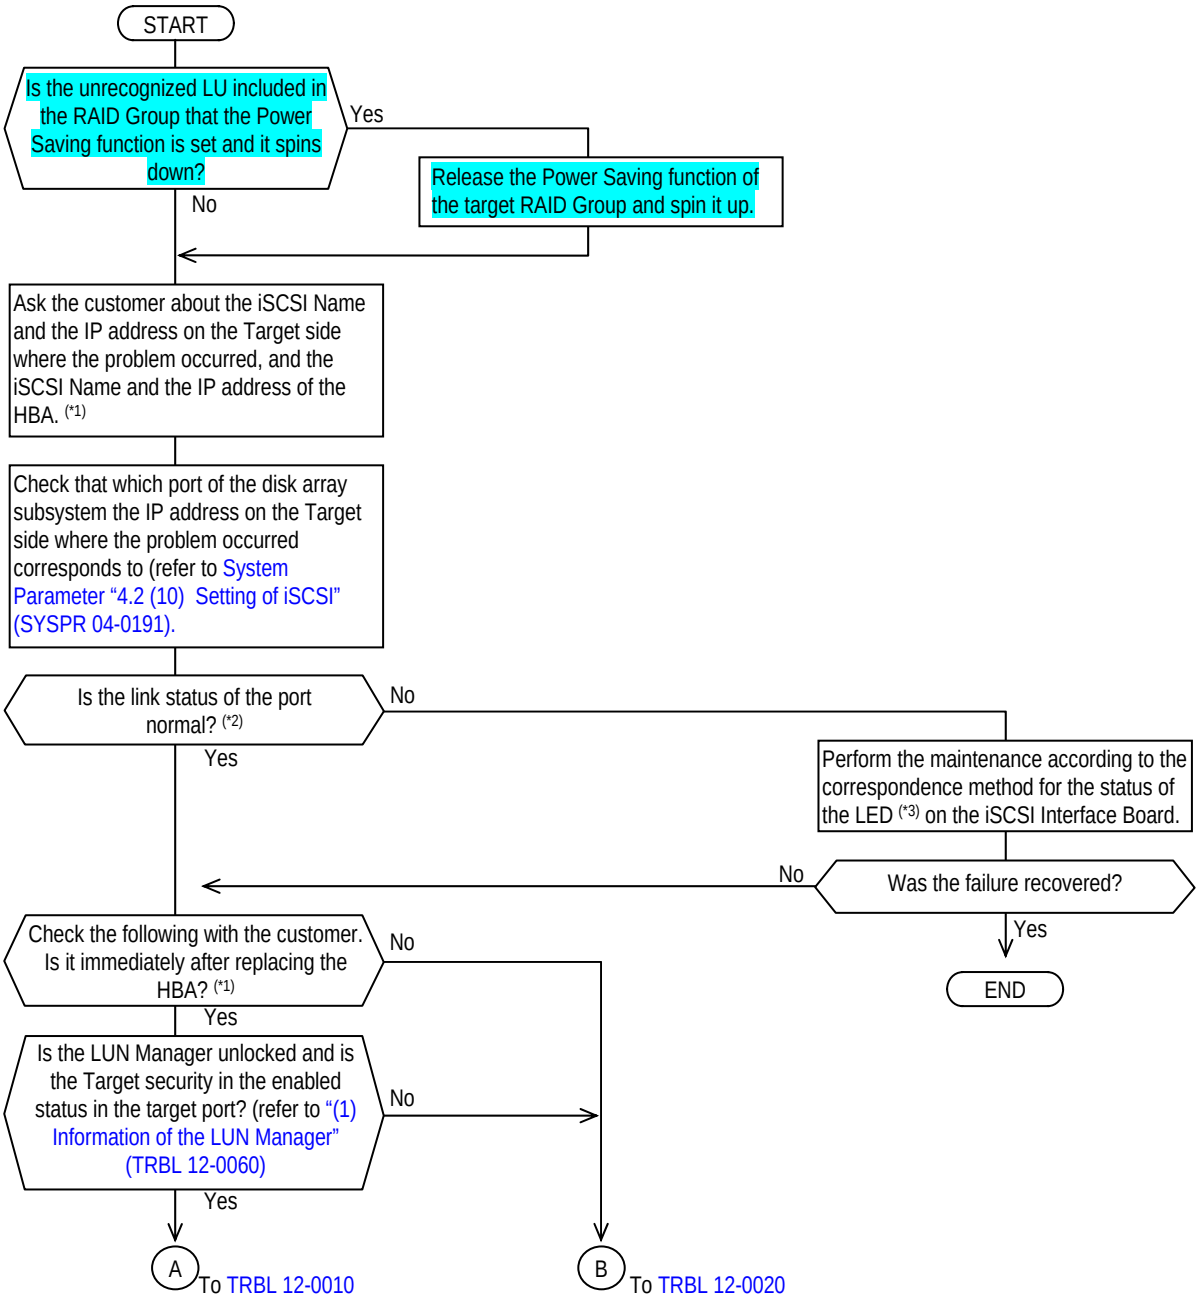
.

Chapter 11. Procedure for Determining Failure of Network Side in NAS System

When a failure occurs in the LAN environment between the host computer and the NAS Modular subsystem, or the NAS Modular subsystem, it is determined whether there is a failure in the NAS Modular subsystem according to the following flow.

Copyright © 2005, Hitachi, Ltd.



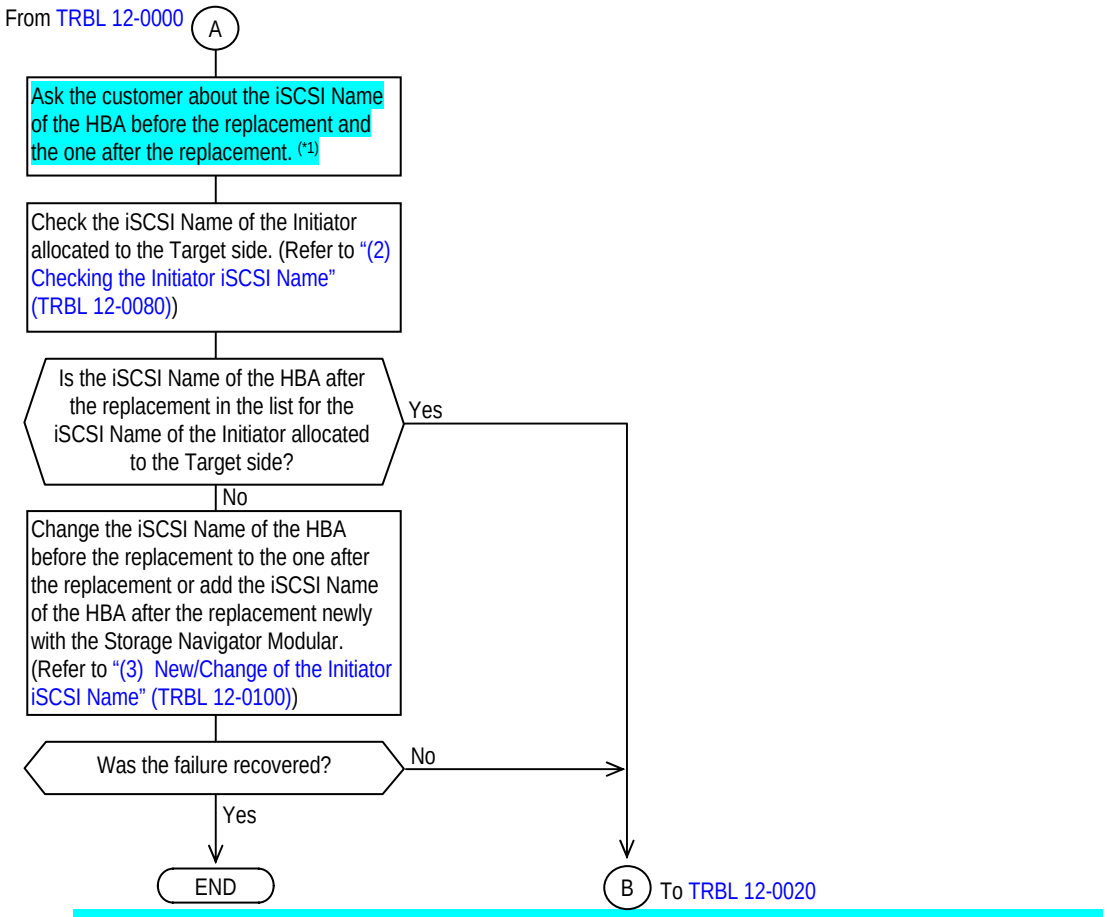
*1 : Work to use NAS Manager Modular becomes charge of the system administrator. The maintenance member must cooperate with the system administrator.

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 12. Procedure for the iSCSI System Failure Determination on the Disk Array Subsystem Side

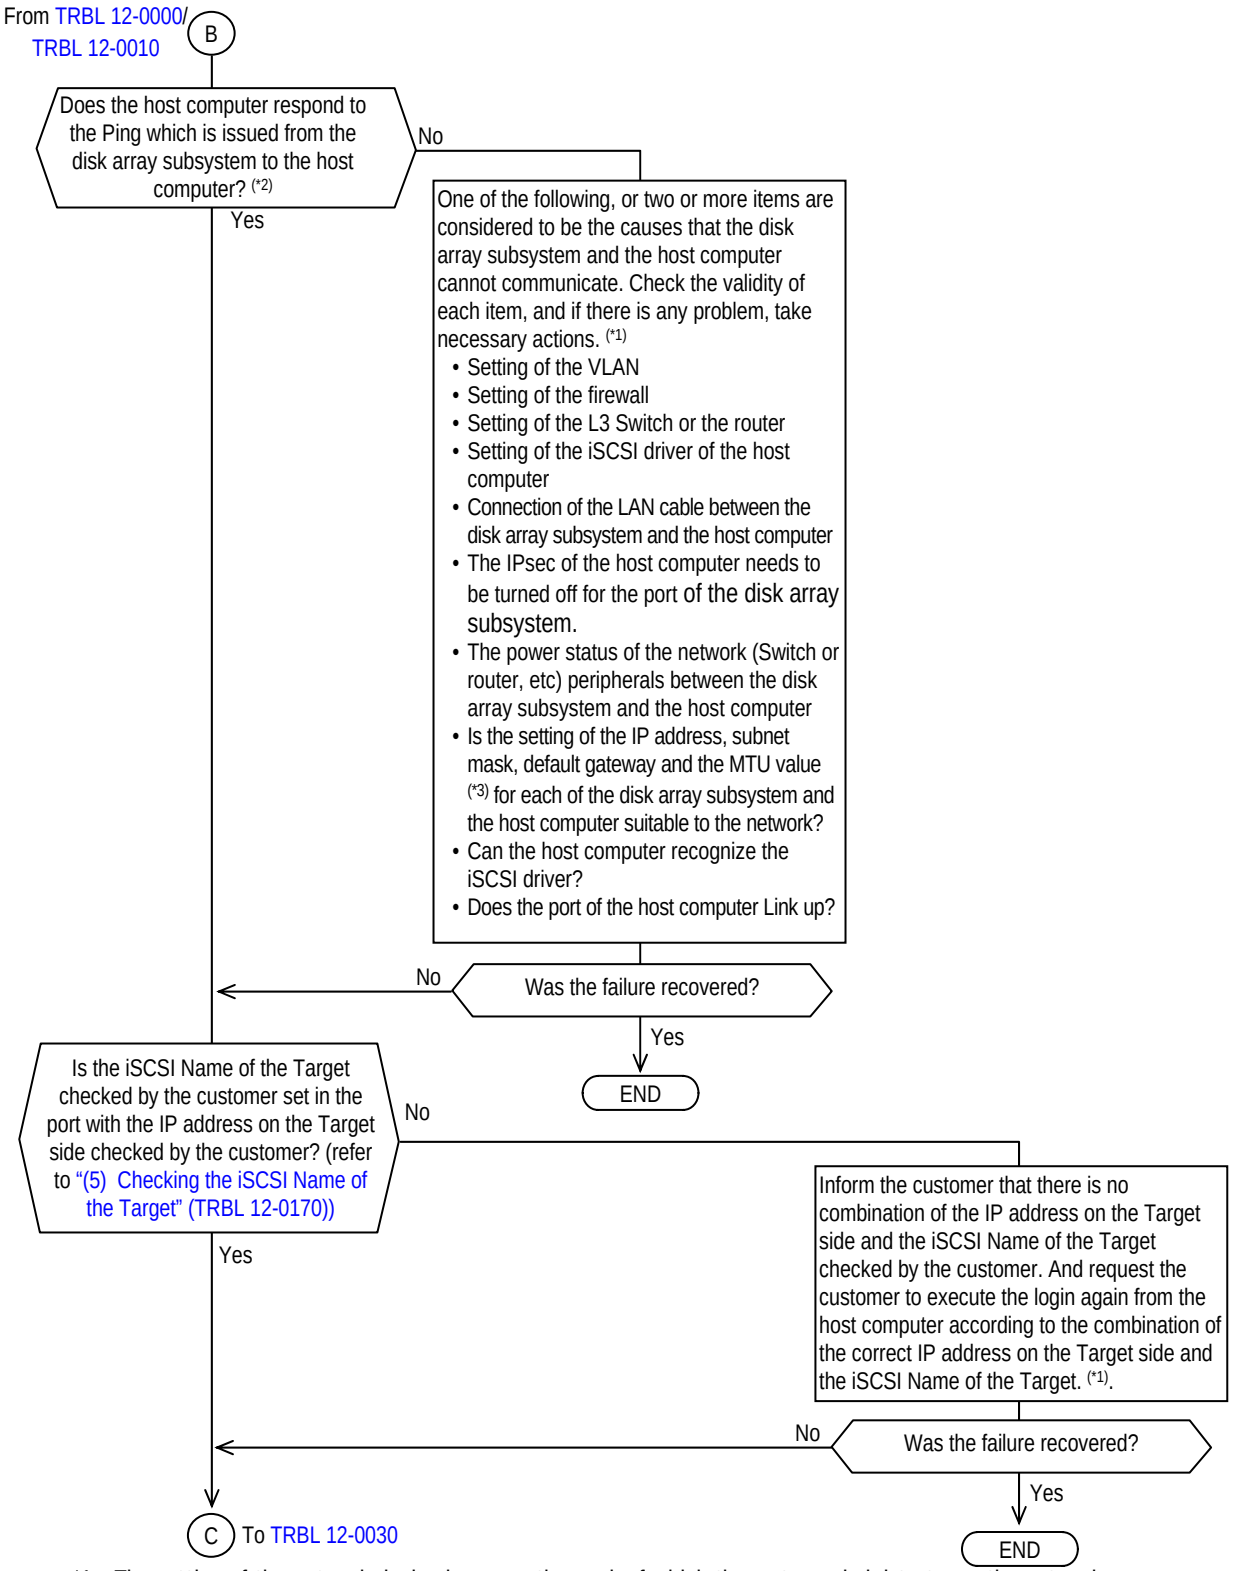
When a failure occurs in the communication by the iSCSI protocol between the host computer and the disk array subsystem, determine if there is a failure in the host interface part of the disk array subsystem according to the following flow.

Use the Storage Navigator Modular of Ver.3.00 or more.



*1 : The setting of the network device becomes the work of which the system administrator or the network administrator takes charge.

*2 : It is in the status of Item 1 on Table 8.2.8.1 in "8.2. (6) (b) iSCSI Interface Board" (TRBL 08-0281).

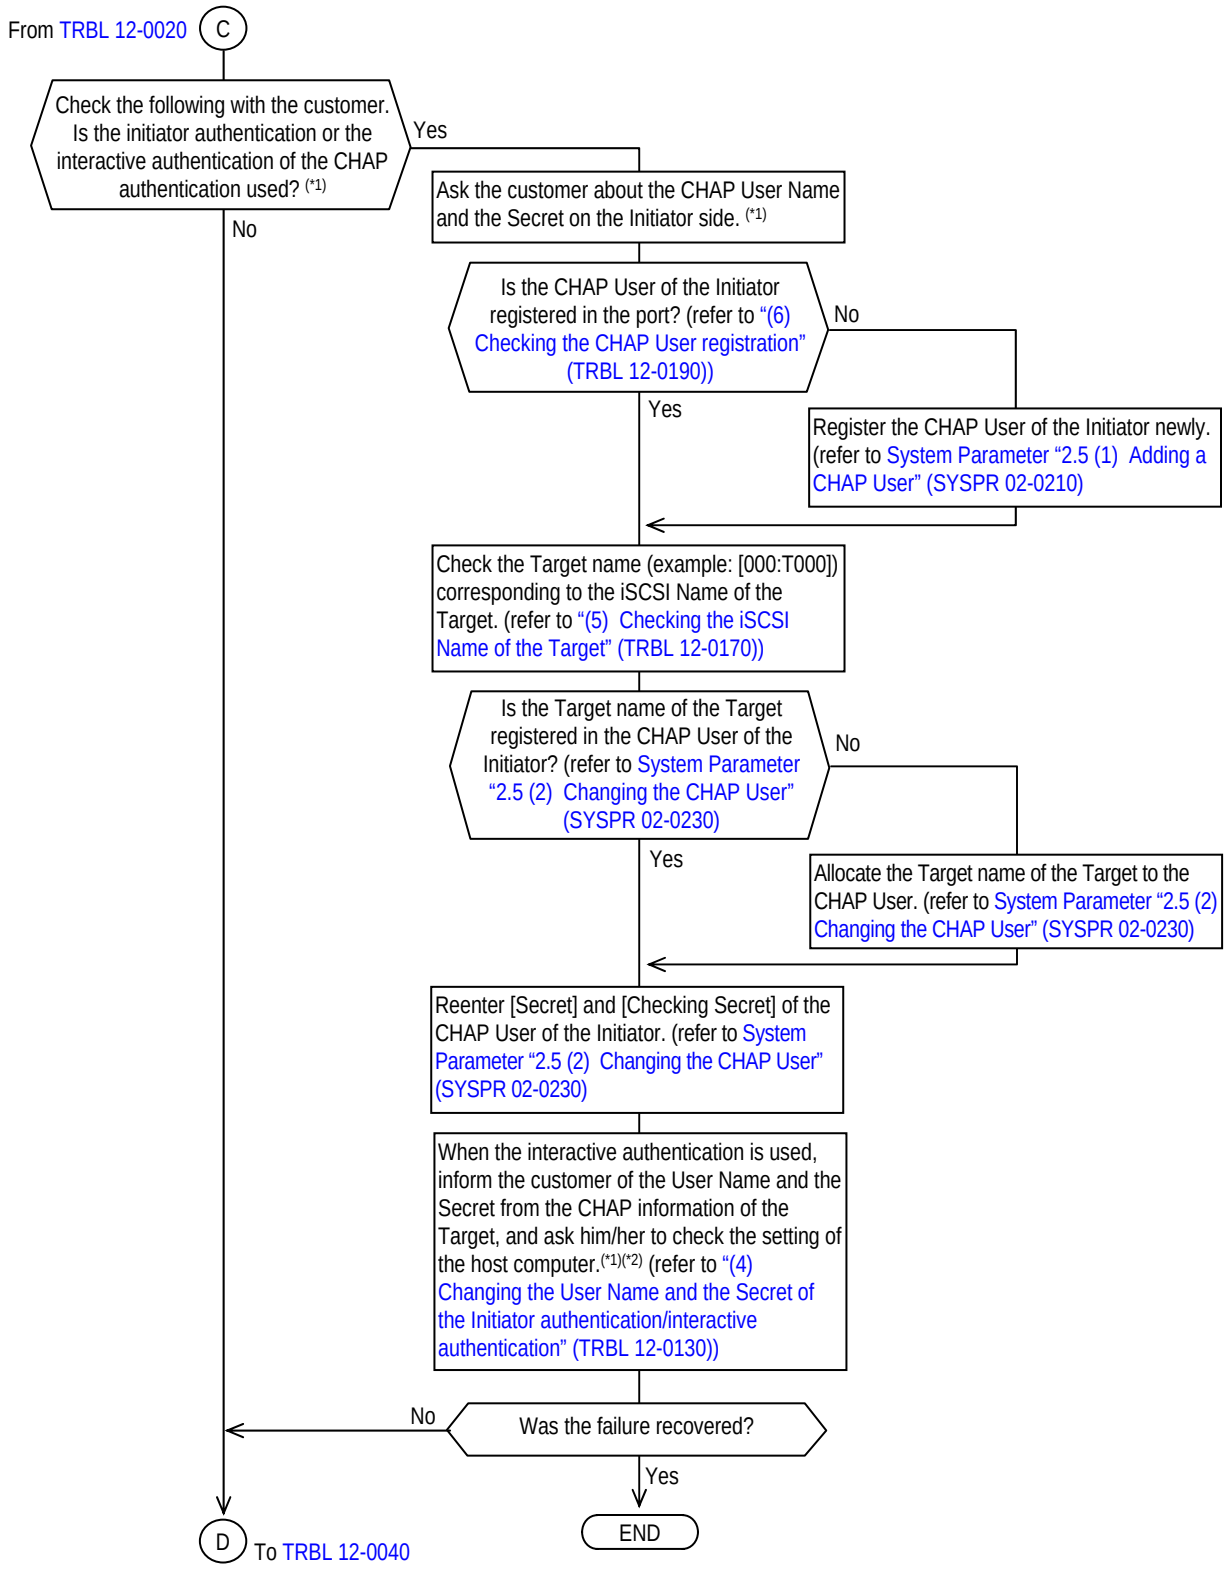


*3 : It is in the status of Item 2 on Table 8.2.8.1 in "8.2. (6) (b) iSCSI Interface Board" (TRBL 08-0281).

Copyright © 2005, 2006, Hitachi, Ltd.

*1 : The setting of the network device becomes the work of which the system administrator or the network administrator takes charge.

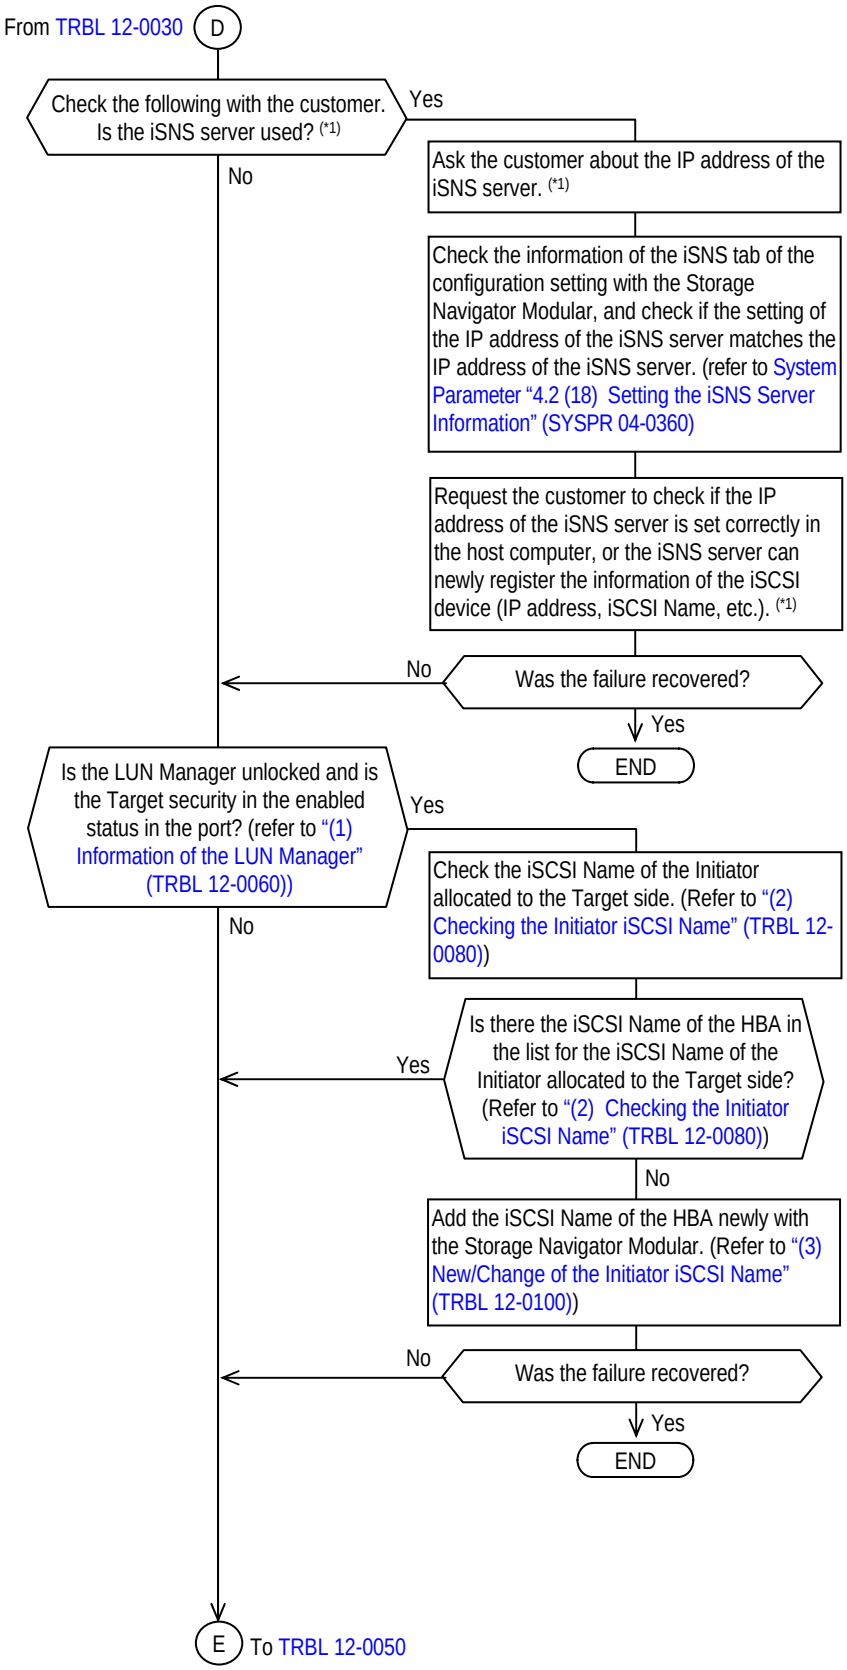
Copyright © 2005, 2006, Hitachi, Ltd.



*1 : The setting of the network device becomes the work of which the system administrator or the network administrator takes charge.

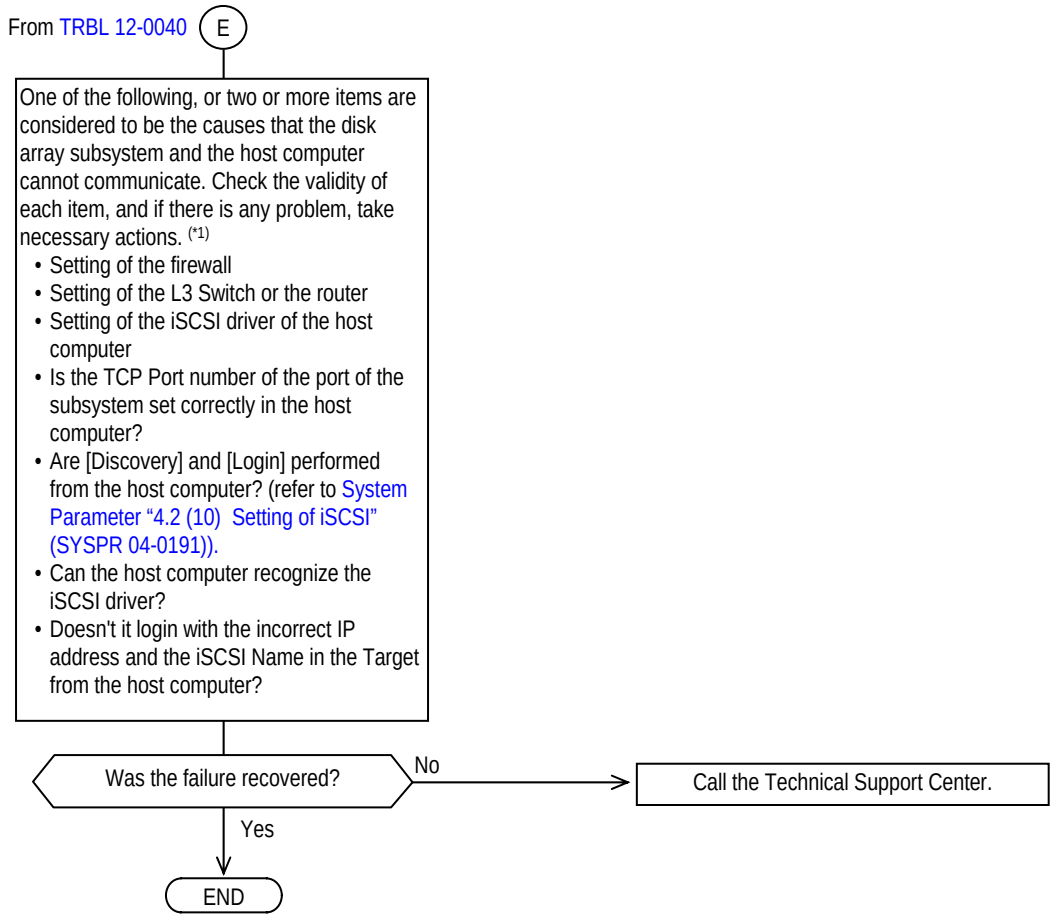
*2 : Refer to System Parameter "4.2 (19) Sending Ping" (SYSPR 04-0370) for the confirmation method of the Ping.

*3 : The MTU value needs to be set as the same value for all the devices (host computer, Switch, disk array subsystem, etc.) in the LAN network environment. However, the DF700 cannot be set. (refer to System Parameter "4.2 (10) Setting of iSCSI" (SYSPR 04-0191).



Copyright © 2005, Hitachi, Ltd.

*1 : The setting of the network device becomes the work of which the system administrator or the network administrator takes charge.



*2 : When the Microsoft iSCSI Software initiator is used, it is not necessary to check the User Name of the Target on the Initiator side.

Copyright © 2005, Hitachi, Ltd.

*1 : The setting of the network device becomes the work of which the system administrator or the network administrator takes charge.

Copyright © 2005, Hitachi, Ltd.

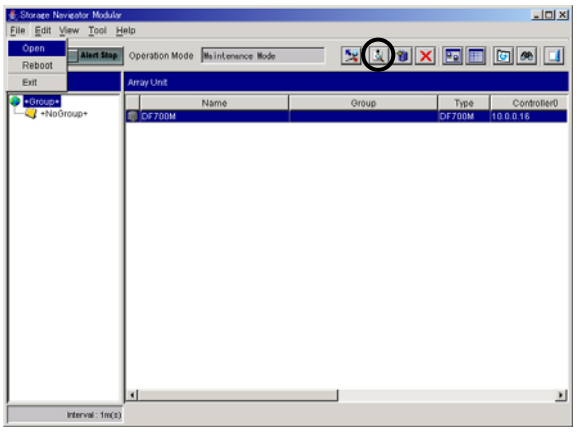
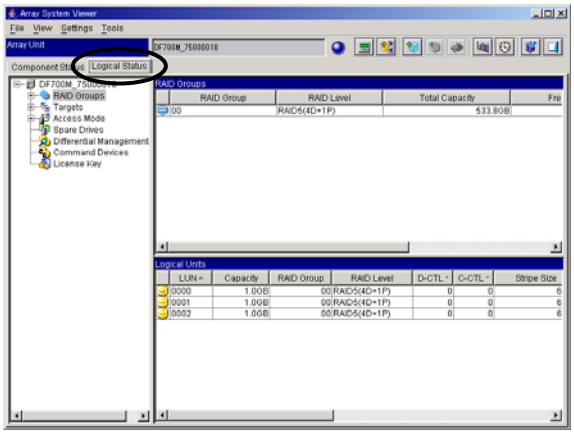
(1) Information of the LUN Manager



(a) Turn on the power supply.

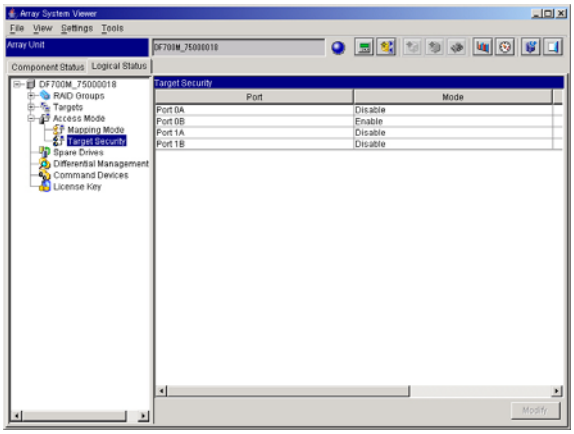
(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



(c) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]



(d) On the unit window, click the [Logical Status] tab.

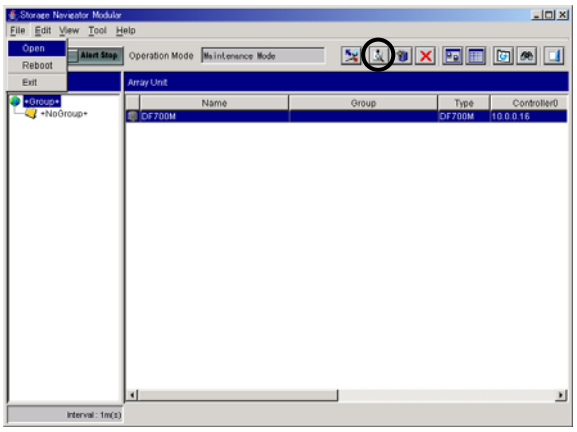
‡1 : For details of the setting method, refer to the System Parameter "1.1 (3) (b) Changing the Maintenance Mode" (SYSPR 01-0050).

Copyright © 2005, Hitachi, Ltd.

(e) Double click [Access Mode] from the tree in the unit window, and select [Target Security]. If the mode of the Target security is enabled, the LUN Manager is unlocked and enabled.

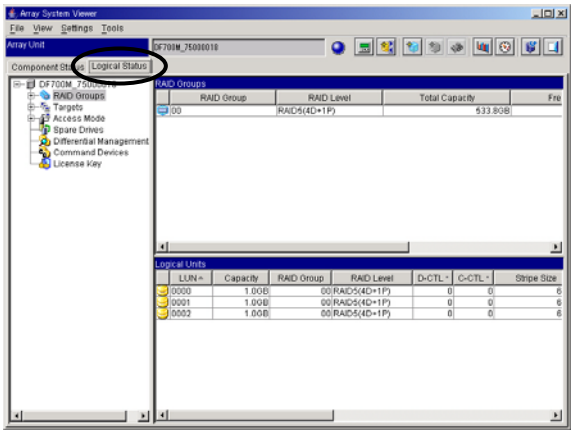
Copyright © 2005, Hitachi, Ltd.

(2) Checking the Initiator iSCSI Name



(a) Turn on the power supply.

(b) Start the Storage Navigator Modular and set the Active Mode in the "Maintenance Mode"(‡1).



(c) Click an icon of the disk array subsystem you want to set in the main window.

There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]
