Chapter 1. Outline

This procedure manual describes the work procedure for upgrading the array subsystem from Hitachi TagmaStore® AMS 200™ to Hitachi TagmaStore® AMS 500™ while the customer data of the disk drive used is maintained.

The procedures about the whole system, such as configuration change of the system, and the procedures of addition/subtraction of option parts and the setting of the priced option are not included.

In this procedures, the basic disk array unit of the Hitachi TagmaStore® AMS 200™ (Model name: DF700-RKS) is described as "RKS". In the same way, the basic disk array unit of the Hitachi TagmaStore® AMS 500™ (Model name: DF700-RKM) and the additional disk array unit (Model name: DF700-RKAJ/RKAJAT/DF600-RKA) are described as "RKM" and "RKAJ/RKAJAT/RKA" respectively.

Chapter 2. Components and Tools Required for Upgrade(Hard)

Model names of components required for the upgrade are shown below.

Table 2.1 Components to Be Ordered for Upgrade

No.	Detail of upgrade	Model	Unit per Assy	Components
1	RKS(Single controller) to RKM(Single controller)	DF-F700-RSUPS(*2)	1	Frame (1), Power unit (RKM) (2), Fan assembly (2), Backup battery unit (2), Control unit (1), Interface board (1) (Host connector (2))(*1), AC cable J2H (2), Microprogram for Hitachi TagmaStore® AMS 500™ of the latest revision (0712/A-M or later) (CD-R), Microprogram for Hitachi TagmaStore® AMS 200™ which is the same revision (0712/A-S or later) with the one for Hitachi TagmaStore® AMS 500™ (CD-R), Upgrade Procedures (1)
2	RKS(Dual controller) to RKM(Dual controller)	DF-F700-RSUPD(*2)	1	Frame (1), Power unit (RKM) (2), Fan assembly (2), Backup battery unit (2), Control unit (2), Interface board (2) (Host connector (4))(*1), AC cable J2H (2), Microprogram for Hitachi TagmaStore® AMS 500™ of the latest revision (0712/A-M or later) (CD-R), Microprogram for Hitachi TagmaStore® AMS 200™ which is the same revision (0712/A-S or later) with the one for Hitachi TagmaStore® AMS 500™ (CD-R), Upgrade Procedures (1)

*1 : When the Hitachi TagmaStore® AMS200 is the system configuration of the iSCSI Interface Board, the FC Interface Board and the host connector become unnecessary.

*2 : It is necessary to arrange the Cache memory additionally depending on the use condition of the priced option. (see "Table 3.3.1 Cache Memory Capacity before and after the upgrade when Cache Residency Manager is usedTable" (SUP 03-0030), and "3.3.2 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used" (SUP 03-0030).)

Note: Transfer the disk drives, cache memories, and Front Bezel, which were used in the RKS, to the RKM that has been upgraded.

The following tools are required for the upgrade procedures.

Table 2.2 Tools Required (for Floor Model)

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
	Phillips screwdriver	No.2	For general works
	Slotted screwdriver	No.1	For Device ID Setting Switch
	Allen wrench	No.3	For installing the floor standing kits (H1J and H2J)
Tool of other	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium Ⅱ (233 MHz or more) is recommended), Memory 40 Mbytes or more (64 Mbytes or more is recommended)
	Wrist strap	-	

Copyright © 2005, 2006, Hitachi, Ltd.

Table 2.3 Tools Required (for Rackmount Model)

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
	Phillips screwdriver	No.2	Installation of skirts and securing the subsystem.
	Slotted screwdriver	No.1	For Device ID Setting Switch
	Allen wrench	No.3	Securing of cable cramps
	Allen wrench	No.4	Securing of rail and connection of power cable.
	Allen wrench	No.6	Opening/closing of doors; removal of stabilizers
	Spanner	No.22	Adjustment of leveling bolts
Tool of other	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium Ⅱ (233 MHz or more) is recommended), Memory 40 Mbytes or more (64 Mbytes or more is recommended)
	Wrist strap	-	

Copyright © 2005, 2006, Hitachi, Ltd.

Chapter 3. Upgrade Work

3.1 Prerequisites

- The upgrade operation is the offline work.
- The Hitachi TagmaStore® AMS 200™ to be upgraded must be in the state in an error free state or condition prior to performing the upgrade.
- Be sure to execute an deliberate shutdown before starting the hardware upgrade.
- Stop host computers from accessing the subsystem before starting the upgrade.
- Use the latest version (Ver.1.00 or later) of Storage Navigator Modular.
- For upgrading, all the Disk Drives mounted on the existing Hitachi TagmaStore® AMS 200™ are transferred.
- When TrueCopy remote replication is enabled and the array subsystem to be upgraded to the Hitachi TagmaStore® AMS 500™ is the remote Disk Drive subsystem, perform it after changing the pair status (S-VOL) of TrueCopy remote replication to PSUS.
  However, if the upgrade operation is performed, the path blockade occurs. This path blockade recovers automatically by turning on the power of the array subsystem after performing the upgrade operation.
  Return the pair status (S-VOL) of TrueCopy remote replication to the original status (PAIR, etc.) after completing the upgrade operation.
  Also, if the upgrade operation is performed, the following phenomenon occurs.
  - Both paths of the TrueCopy remote replication are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  - When the pair status of the TrueCopy remote replication is PAIR or COPY, the pair status changes to PSUE.
- When Hitachi TagmaStore® AMS 200TM is made as Boot disk, or rootdg of VxVM is installed in Hitachi TagmaStore® AMS 200TM, the upgrade cannot be performed because the device file name which the host recognizes is changed in the case of upgrading to Hitachi TagmaStore® AMS 500TM.
- The downgrade from Hitachi TagmaStore® AMS 500TM to Hitachi TagmaStore® AMS 200TM is not supported.
- The upgrade from Hitachi TagmaStore® WMS 100TM to Hitachi TagmaStore® AMS 500TM is not supported.
- The upgrade from Hitachi TagmaStore® AMS 200TM of the NAS system configuration to Hitachi TagmaStore® AMS 500TM is not supported.
- It is required to stop and reboot the host because the setting of the host needs to be changed.

3.2 Before Starting Upgrade Work

(1) Check whether the host interface of the Hitachi TagmaStore® AMS 200™ is the Fibre Channel or the iSCSI, and prepare the Interface Board of the same kind for the Hitachi TagmaStore® AMS 500™ by the day of the upgrade work.

(2) Confirm the customer whether to use the priced option, which was used in the Hitachi TagmaStore® AMS 200™, in the Hitachi TagmaStore® AMS 500™ also. If it is used, prepare the license key of the Hitachi TagmaStore® AMS 500™ by the day of the upgrade work. The license key of the priced-option is issued to the subsystem, so that if the priced option used in the Hitachi TagmaStore® AMS 200™ is also used in the Hitachi TagmaStore® AMS 500™, it is required to purchase the license key as the Hitachi TagmaStore® AMS 500™.

(3) When any of Cache Residency Manager, Copy-on-write SnapShot and Cache Partition Manager is used in the Hitachi TagmaStore® AMS 200™ and it is also continued to be used in the Hitachi TagmaStore® AMS 500™, the Cache Unit may have to be added depending on the setting or the configuration of the Hitachi TagmaStore® AMS 200™.
Refer to "3.3 Notes" (SUP 03-0020) for the details.
When the addition is required, prepare the necessary Cache Unit by the day of the upgrade work.

(4) As for the upgrade work, settings of the subsystem must be changed through operation of a maintenance PC connected via a LAN. Besides, the microprogram must be installed from a CD-ROM. Make the following preparations before starting upgrade work.
- Prepare a PC in which Storage Navigator Modular of the latest revision is installed.
  The PC must fit the LAN environment and have a CD-ROM drive.
- LAN cross cable
- The CD-ROM for installation of the Hitachi TagmaStore® AMS 500™ microprogram of the latest revision (0712/A-M or later).
- Microprogram for Hitachi TagmaStore® AMS 200™ which is the same revision (0712/A-S or later) with the one for Hitachi TagmaStore® AMS 500™.

(5) Back up the user data by the day of the upgrade work to prepare for emergency. Be sure to perform this work.
If you fail to operate the upgrade work, you may lose the user data on the array subsystem. Back up the user data on the array subsystem by the operation on the host computer side.

(6) Check that Hitachi TagmaStore® AMS 200™ to be upgraded is connected as an external storage of SANRISE Universal Storage Platform (USP)/SANRISE Network Storage Controller (NSC). If it is connected as an external storage as a result of the check, perform the upgrade following the procedure for the maintenance manual of SANRISE USP/NSC (refer to EXTERNAL STORAGE MAINTENANCE SECTION "2. Maintenance for External Storage").

Copyright © 2005, 2006, Hitachi, Ltd.

3.3 Notes

- When executing updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.
- When executing updating installation of the microprogram, use the microprogram whose revision is 0712/A-x or later.
- Since configurations of the Hitachi TagmaStore® AMS 200™ and the Hitachi TagmaStore® AMS 500™ are different from each other, works such as an installation of the Control Unit for the Hitachi TagmaStore® AMS 500™ in the RKM, shifts of the Disk Drives and Cache Memory installed in the RKM of the Hitachi TagmaStore® AMS 200™.
- When upgrading the Disk Array subsystem, do not upgrade two or more Disk Array subsystem at the same time to avoid the disk drive replacement operation error.
- When the Hitachi TagmaStore® AMS200 to be upgraded is the Fibre Channel interface system configuration, do not change the port which connects the Fibre Channel interface cable before and after the upgrade.
- When the Hitachi TagmaStore® AMS200 to be upgraded is the Fibre Channel interface system configuration, if the serial number of the array subsystem changes in the upgrade work, the WWN also changes. Therefore, it is necessary to change the setting of the host computer, the peripherals, the application software, etc. depending on the case. For the setting change, refer to "5.1 For Setting Changes in Host Computer and Others" (SUP 05-0000).
- When the Hitachi TagmaStore® AMS 200™ to be upgraded is the system configuration of the iSCSI interface, the Target iSCSI Name of the Hitachi TagmaStore® AMS 500™ succeeds the value before the upgrade. However, when the default iSCSI Name of the Target was used in the array subsystem before the upgrade, it is required to change the Target iSCSI Name of the Hitachi TagmaStore® AMS 500™ to a unique value in the network. If the Hitachi TagmaStore® AMS 500™ is used without changing the Target iSCSI Name and when the array subsystem before the upgrade is configured with the system of the iSCSI interface again after using the Hitachi TagmaStore® AMS 500™ , the iSCSI Name of both array subsystems is duplicated in the network, and trouble is caused to the iSCSI protocol.
- The IP address of the LAN port for the user control or maintenance of the Control Unit succeeds the value before the upgrade. Reset it as occasion demands.
- The license key of the priced-option is issued to the subsystem. When the customer used the priced-option, which was used in the Hitachi TagmaStore® AMS 200™, even after upgrading to the Hitachi TagmaStore® AMS 500™, it is required to purchase the license key of the priced-option of the Hitachi TagmaStore® AMS 500™.
- When using the SNMP Agent Support Function, which is an optional feature, is used, the SNMP environment information file may have to be reviewed.
- When using the Cache Residency Manager, which is an optional feature, there may be a case where the use is not allowed depending on a capacity of the cache memory. Refer to the following Table 3.3.1 and, if the capacity of the cache memory is found to be insufficient, make addition to the cache memory or use the LU as a non-Cache Residency Manager. However, when the Cache Residency Manager is enabled after the upgrade in the case where the LU is used as a non-Cache Residency Manager, the subsystem will be placed in a state in which a warning is kept issued.
  It is necessary to add the Cache memory to be installed at the upgrade work when it is used together with Copy-on-write SnapShot or Cache Partition Manager, so that refer to Table 3.3.2.

Deleted: • When executing a updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.¶

Copyright © 2005, 2006, Hitachi, Ltd.

Table 3.3.1 Cache Memory Capacity before and after the upgrade when Cache Residency Manager is used

Capacity of Turbo LU	Capacity of cache memory installed in Hitachi TagmaStore® AMS 200™ before upgrade (M bytes/controller)	Capacity of cache memory required for Hitachi TagmaStore® AMS 500™ after upgrade (M bytes/controller)	Remark
1 to 302,400	1,024	1,024 or more	-
	2,048	2,048 or more	
302,401 to 463,680	1,024	2,048 or more	It is necessary to add the Cache memory.
	2,048	3,072 or more	
463,681 to 1,048,320	2,048	2,048 or more	-
1,048,321 to 1,370,880		3,072 or more	It is necessary to add the Cache memory.

- When Copy-on-write SnapShot and Cache Partition Manager of the priced options are used continuously after the upgrade, it is necessary to add the Cache memory to be installed as shown below.

Table 3.3.2 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used

Condition of upgrade	Capacity of cache memory installed in Hitachi TagmaStore® AMS 200™ before upgrade (M bytes/controller)	Capacity of cache memory required for Hitachi TagmaStore® AMS 500™ after upgrade (M bytes/controller)
When Copy-on-write SnapShot is used continuously after the upgrade	1,024	2,048 or more
	2,048	3,072 or more
When Cache Partition Manager is used continuously after the upgrade	1,024	2,048 or more
	2,048	3,072 or more

- When the upgrade operation is performed leaving Copy-on-write SnapShot valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When the upgrade operation is performed leaving ShadowImage in-system replication valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When the upgrade operation is performed leaving TrueCopy remote replication valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When making the upgrade leaving Hitachi TrueCopy remote replication enabled, do not upgrade both of the local and remote subsystems at the same time for security. However, if the splits of the pairs on both local side and remote side are confirmed, there is no problem to execute the upgrade at the same time.
- When upgrading one of the two disk array subsystems paired by Hitachi TrueCopy remote replication which is left enabled, the deliberate shutdown must be executed for one of the two disk array subsystems to be upgraded but it is not necessary for the other disk array subsystem not to be upgraded.

Copyright © 2005, 2006, Hitachi, Ltd.

- When performing the upgrade operation with TrueCopy remote replication enabled, it is required to change the management information on the other array subsystem side which becomes a pair (not the array subsystem performing the upgrade but the one used as other pair) because TrueCopy remote replication manages the information of the array subsystem which becomes a pair.
  For example, when the "B" shown in Figure 3.3.1 is upgraded, update of the microprogram and a change of the management information are also required for the "A".

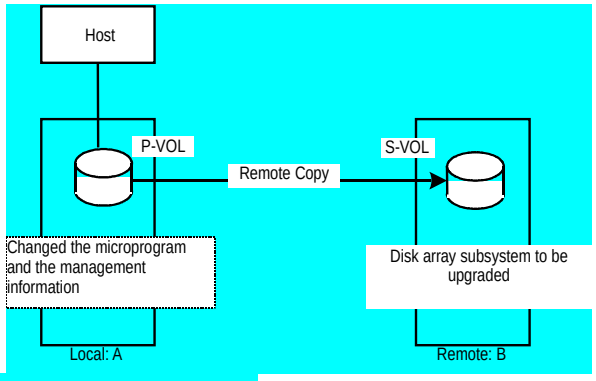

Figure 3.3.1 Paired Disk Array Subsystems

- When the Hitachi TagmaStore® AMS200 to be upgraded is the iSCSI interface system configuration, do not change the port which connects the iSCSI interface cable before and after the upgrade.
- It is required to change the setting of the host computer, the peripherals, the application software and the like in some cases because if the serial number of the array subsystem is changed in the upgrade work, WWN (iSCSI Name in case of iSCSI connection) is also changed at the same time. Refer to "5.1 For Setting Changes in Host Computer and Others" (SUP 05-0000) for the setting changes.
- When Hitachi TagmaStore® AMS 200™ to be upgraded is an external storage of SANRISE Universal Storage Platform (USP)/SANRISE Network Storage Controller (NSC), the serial number of the subsystem and WWN of the Fibre Channel I/F of upgraded Hitachi TagmaStore® AMS 500™ are changed, so that SANRISE USP/NSC cannot recognize the LU of Hitachi TagmaStore® AMS 500™. Therefore, when upgrading Hitachi TagmaStore® AMS 200™, which is an external storage of SANRISE USP/NSC, perform the upgrade work following the procedure for the SANRISE USP/NSC maintenance manual (refer to EXTERNAL STORAGE MAINTENANCE SECTION "2. Maintenance for External Storage") before upgrading.
- When Power Saving of the priced option is used, if you perform the upgrade after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host after replacing the microprogram and starting the array subsystem. Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then perform the upgrade.
  If the spin-down fails, execute the spin-down again.

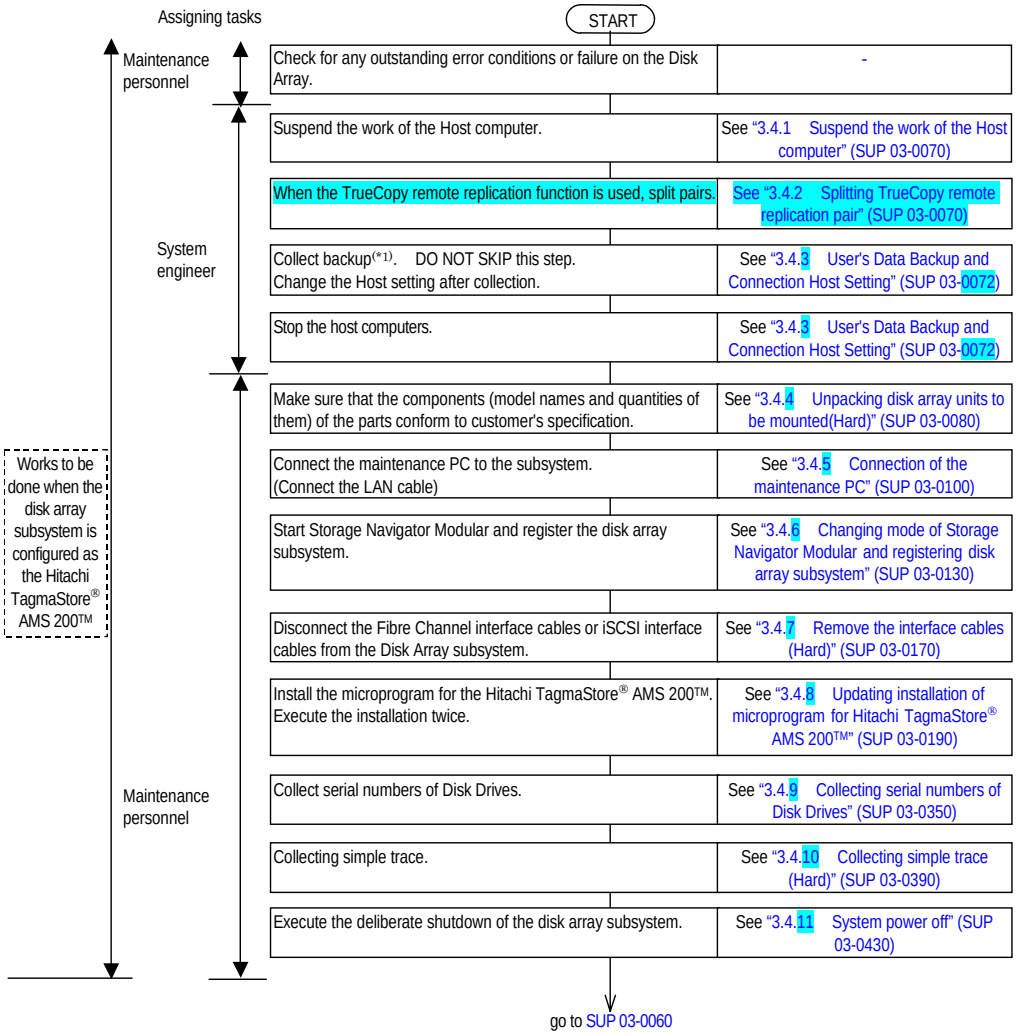
3.4 Upgrade Work

⚠ CAUTION

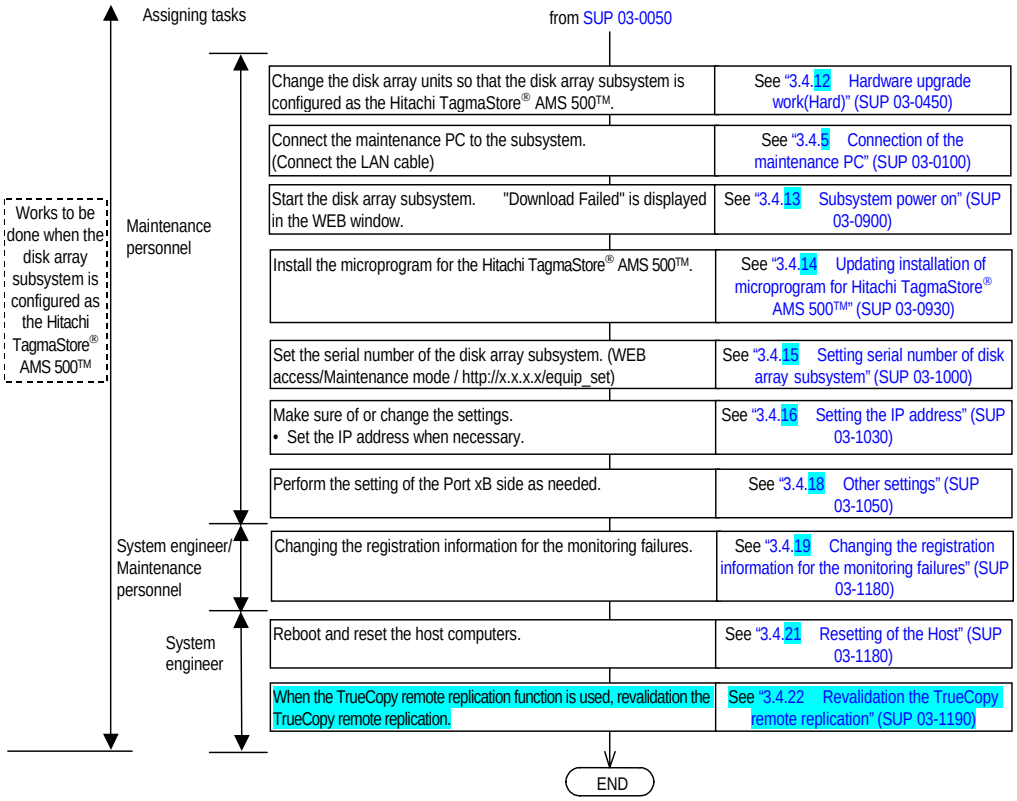
Touching heat sinks or ICs may cause injury. Be sure to handle with care.



CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts. Otherwise, the static electrical charge on your body may damage the parts.

NOTE : Make the upgrade with the power turned off irrespective of whether the system (host computer) is powered on or off.



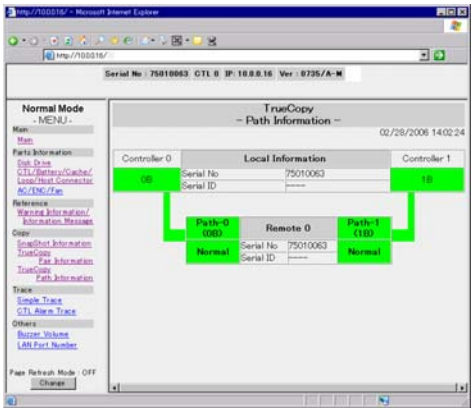
Copyright © 2005, 2006, Hitachi, Ltd.

The procedure for upgrading the Hitachi TagmaStore® AMS 200™ to the Hitachi TagmaStore® AMS 500™ is shown below.
Execute the procedure after making sure of the work to be done in each step.

*1 : Maintenance personnel should check if customer has executed user data backups. Without the backups, the upgrade cannot be executed.

Copyright © 2005, 2006, Hitachi, Ltd.

Copyright © 2005, 2006, Hitachi, Ltd.



3.4.1 Suspend the work of the Host computer

Suspend the work of the Host computer.

3.4.2 Splitting TrueCopy remote replication pair

This operation is not required when Hitachi TrueCopy remote replication is not used.
When making the upgrade leaving TrueCopy remote replication enabled, a pair splitting must be done before executing the deliberate shutdown of the disk array subsystem.
The procedure is shown below.

(1) Check if the path status is normal using the WEB.
Procedure for Confirming Log Messages:
It switched to the following window by clicking the path of [Summary of Exchangeable Part Statuses] on the main window, and the details of the path status are displayed.
It also switches to the following window by clicking [TrueCopy Path Information] of the menu frame on the main window, and the details of the path status are displayed.
For the maintenance operation for replacement and the recovery method, perform the recovery according to (Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170)).

(2) Execute the Pairsplit command, perform the pair split, and check that the change to PSUS/SSUS is completed.
It explains the method to split the pair of TrueCopy remote replication.
(a) Set the group name in the configuration definition file as "vg01." Split the TrueCopy remote replication pair in the PAIR status with the pairsplit command.

```
c:¥horcm¥etc>pairsplit –g vg01
```

Figure 3.4.1 Example of Pairsplit Command Entry

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Make sure of the status and configuration of the pair that has been split by executing the pairsplit command.

```
c:¥horcm¥etc>pairdisplay –g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)      (CL1-A , 1,   1)    174       1..P-VOL PSUS NEVER ,   175       2   -
vg01     oradb1(R)      (CL1-B , 1,   2)    175       2..S-VOL SSUS NEVER ,-----        1   -
```

The pair of TrueCopy remote replication could be split. Refer to Chapter 4 of "RAID Manager System Administrator's Guide (TagmaStore® WMS/AMS series)" for the details of the pairsplit command and the option.

Copyright © 2006, Hitachi, Ltd.

3.4.3 User's Data Backup and Connection Host Setting

There is the possibility of loss of user data if the upgrade procedures fail. To prepare for an emergency, all the Disk Drive data mounted on Hitachi TagmaStore® AMS 200™ should be backed up.

NOTE : Maintenance personnel must check if customers have executed users' data backups.

After the backup is completed, execute the Host setting change.
For notes to set each Host, refer to "5.1 For Setting Changes in Host Computer and Others" (SUP 05-0000).
Please stop the host computers.

Copyright © 2006, Hitachi, Ltd.

3.4.4 Unpacking disk array units to be mounted(Hard)

Unpack the RKM to be mounted to compose the configuration of the Hitachi TagmaStore® AMS 500™. The procedure is shown below.

CAUTION

- The unpacking should be done by two or more personnel to prevent turning over of the subsystem or being caught under the subsystem.
- Work carefully because the weight of the single RKM is about 58 kg.

(1) Unpacking the RKM.

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rain water.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

Figure 3.4.2 shows the subsystem within the outer package.

(a) Remove the outer package and packing materials.
(b) Take the subsystem out of the polyethylene bag.
(c) Remove tapes, etc. applied to the subsystem.
(d) Remove desiccating agent from the lower of the subsystem.
(e) Check the exterior of the subsystem visually for distortion or damage owing to the transport.

Copyright © 2005, 2006, Hitachi, Ltd.

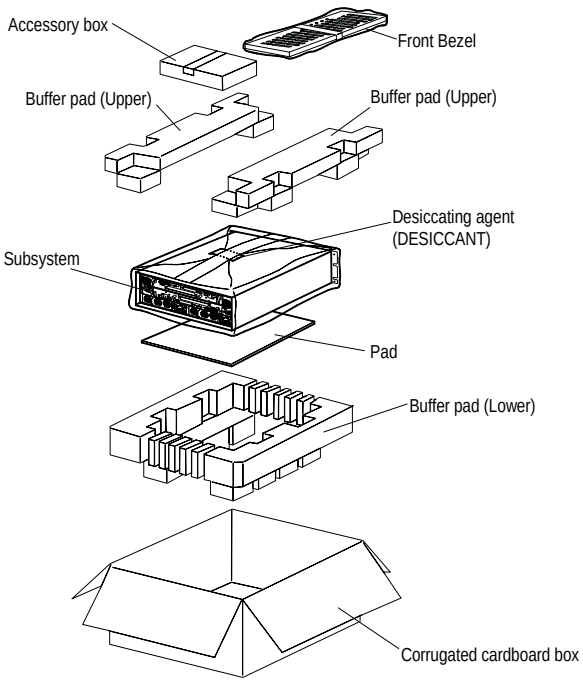


Figure 3.4.2 Packed Subsystem

(2) Check the contents of the package

(a) Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

(b) The key for the front bezel supplied with the subsystem must be kept by service personnel in order to prevent users from maintaining the subsystem. (The key for Front Bezel is used to mount and dismount Front Bezel.)

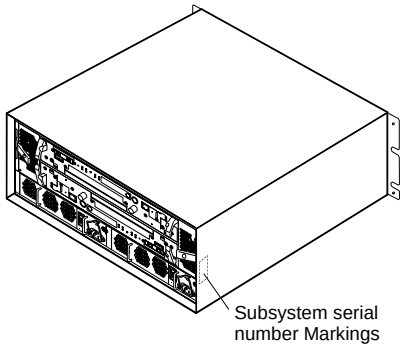

Figure 3.4.3 Locations of Subsystem Serial Number Markings

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.5 Connection of the maintenance PC

Connect the maintenance PC to the disk array subsystem.
The procedure is shown below.

(1) Checking the LAN environment setting

(a) Make sure that the Storage Navigator Modular has been installed. (Make sure that the activation file startsnm.bat exists.)

(b) Check the LAN environment setting for the PC

- Make sure that the following settings have been made, or change the settings to the following.
  For the maintenance PC, set the IP address to 10.0.0.xxx as shown in No. 1.
  If the maintenance PC cannot establish a connection, set the value to 192.168.0.xxx as shown in No.2 to 5.
  If not connected yet, refer to Maintenance Manual Troubleshooting "3.4 Procedure for specifying maintenance port IP address" (TRBL 03-0100).

No.	Subsystem (LAN maintenance port)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 0.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL0 : 192.168.233.16 CTL1 : 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL0 : 172.23.211.16 CTL1 : 172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL0 : 10.197.181.16 CTL1 : 10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0

- Manual change of the network parameter of the Maintenance port
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.

NOTE: However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
The network address set to the maintenance port cannot be used for the LAN device to be connected to the User management port via the Gateway.
Therefore, use a network address other than that set for the maintenance port.

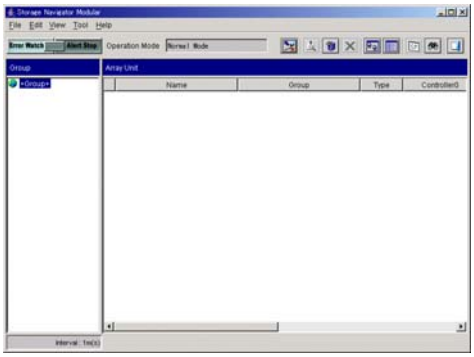
(2) Connecting the LAN cross cable0

Remove the LAN Cover of the Control Unit #0 in the RKS and connect the PC and the subsystem with the LAN cross cable.

*1 : The rackmount model (system configuration of the Fibre Channel interface) is shown as an example.

Figure 3.4.4 Connecting the LAN Cross Cable

Copyright © 2005, 2006, Hitachi, Ltd.



3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem

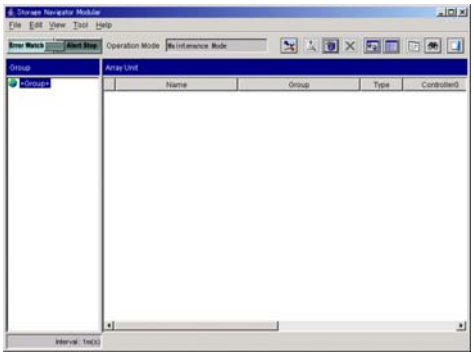
Register the disk array subsystem using Storage Navigator Modular.
The procedure is shown below.

(1) Activating the Storage Navigator Modular

(a) Execute the batch file or shell script for activating the Storage Navigator Modular.
In the case of Windows®, activate the batch file, startsnm.bat.

(b) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed(‡1).

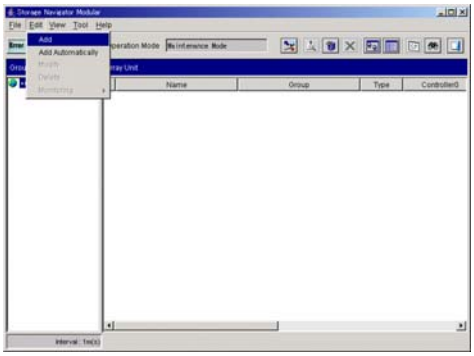
In the case of Windows®, the prompt window is also displayed.
The prompt window has nothing to do with operation of Storage Navigator Modular. But don't close the prompt screen. It is unusually finished.
The icon can be minimized automatically when "Program Quitting" is selected from the properties of the batch file.



‡1 : The mode change cannot be done at the time of the initial activation of the Storage Navigator Modular. A registration of a password validates the mode change.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Change the Operation Mode from the Normal Mode to the Maintenance Mode.

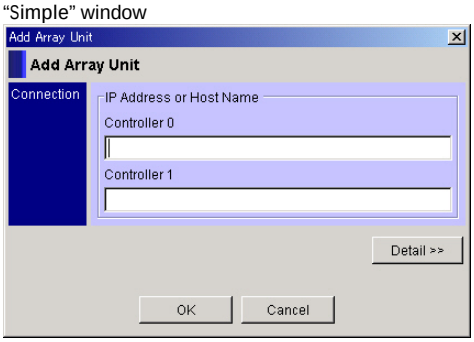


(a) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the Ctrl, Shift, and E keys at the same time.

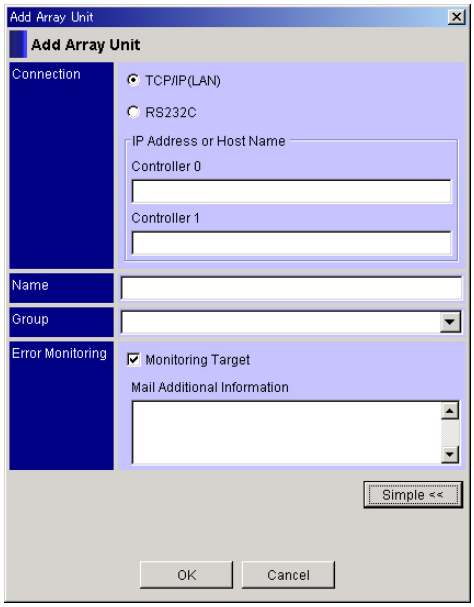
Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

(3) Registering the disk array subsystem

(a) Select [Add] in the main window or click [: Add].



Copyright © 2005, 2006, Hitachi, Ltd.



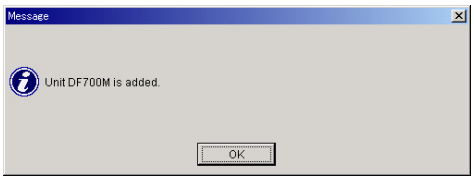
(b) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.

NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.
• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

"Simple" window

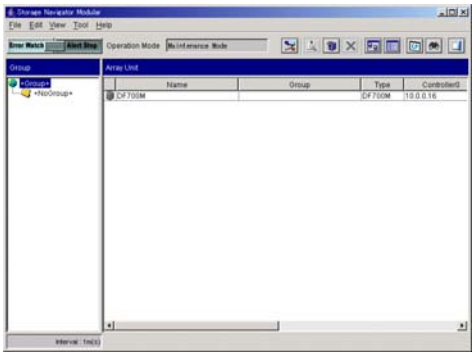
"Detail" window

[Connection] : Select TCP/IP (LAN) connection to be used for the disk array subsystem. RS232C is not supported in DF700.



[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _). The maximum number of the groups allowed to be registered is 200. The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.



[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) When a message informing of a completion of the registration is displayed, click the [OK] button.

(d) The updated main window is displayed.

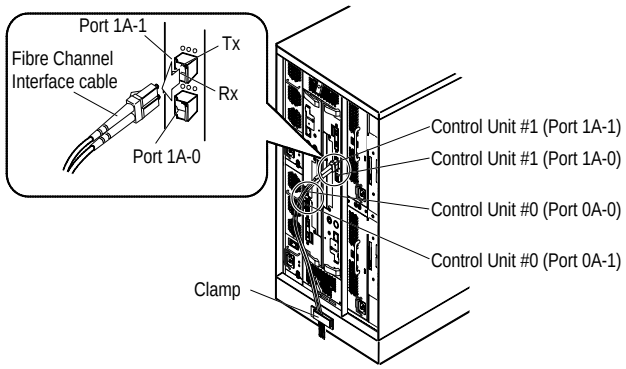
When an entry has been made in [Group Name], the group name is displayed in the tree diagram on the right side of the window. A clicking on the group name displays an icon(s) of the disk array subsystem(s) registered in the group.
There are two types of icon of the disk array subsystem as shown below: an icon for the dual system and that for the single system.

• Icon for the dual system : 

• Icon for the single system : 

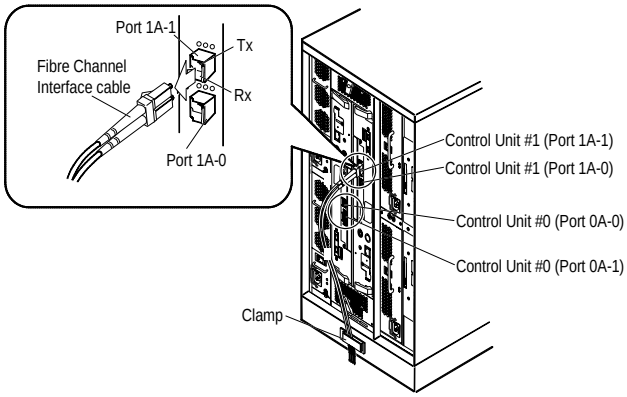
The icons of the disk array subsystem are displayed in the order of the registration of the disk array subsystems.

Copyright © 2005, 2006, Hitachi, Ltd.



3.4.7 Remove the interface cables (Hard)

To execute the subsequent operation, Fibre Channel Interface cables and iSCSI cables should be disconnected. If connected, the other connected devices may be affected whenever the Disk Array subsystem reboots.
Disconnect all the Fibre Channel interface cables and iSCSI cables connected to the Disk Array subsystem (on the side of connecting to the Control Unit only).

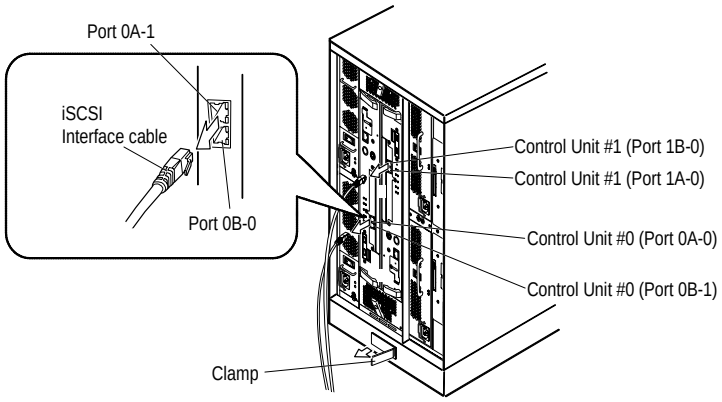


NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

- Floor Model(When the Hitachi TagmaStore® AMS 200™ is the system configuration of the Fibre Channel interface)

(a) Remove the interface cable to the Clamp (Fibre). When removing the Fibre Channel interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

*1 : The figure shows the case where the FC Interface Board is not added in the Control Unit of the RKS.



*1 : The figure shows the case where the FC Interface Board is added in the Control Unit of the RKS.

3.4.8 Updating installation of microprogram for Hitachi TagmaStore® AMS 200™

Install the microprogram for the Hitachi TagmaStore® AMS 200™ (same revision with the one for Hitachi TagmaStore® AMS 500™) using the Storage Navigator Modular.
Check if the microprogram revision is 0712/A-S or later.
The updating installation must be executed twice in order to completely change information of the microprograms of two generations.
The procedure is shown below.

(1) Preparation for update installation of microprogram

(a) Set up the maintenance PC before starting the update installation.

The setting up is completed when the installer stored in the CD-ROM of the microprogram is executed.
Outline of the setting up is shown below.

- Installation of the JRE 1.3.1_03
- Setting of the security policy file
- Copying of the microprogram from the CD-ROM for the microprogram installation to the maintenance PC

(b) Prerequisites for setting up of a maintenance PC

Prerequisites concerning the user ID of Windows® are as follows.

- The user ID of Windows® at the time when the microprogram is installed in the maintenance PC must be identical with that at the time when a maintenance work is done.

A prerequisite of a drive for booting the OS of the maintenance PC

- The drive for booting the OS must be the C drive.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) Hierarchy of Microprogram Storage Directories

The hierarchical structure of Microprogram storage directories is shown below.
The structure of directories of the CD-ROM for installing the Microprogram is the same as that shown below.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:\diskarray-microprogram\microprogram."
When installing the Microprogram, specify the unified version directory.

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	microprogram file	-	-

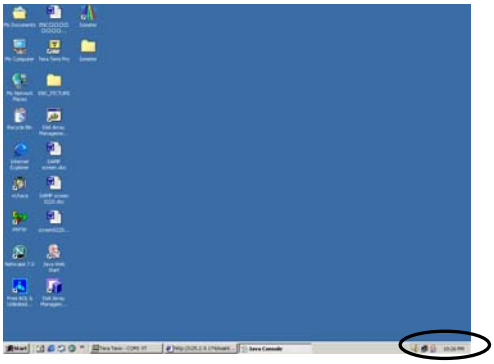
NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The Microprogram becomes unable to be installed if the directory name is changed.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Java error codes displayed at the time of update installation and actions for coping with them.

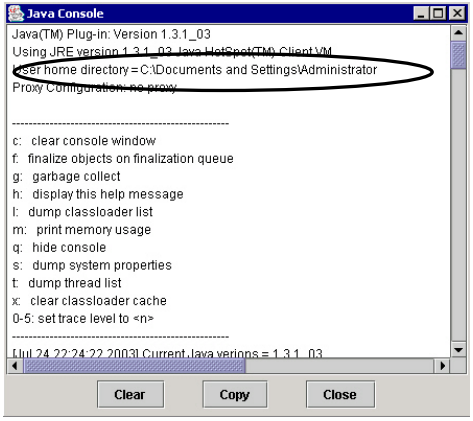
When the PC does not satisfy the prerequisite shown in Item (2)(b), a Java error occurs. Details of the Java errors and actions for coping with them are shown below.

Table 3.4.1 Java error codes



Message code	Message text	Time when the error occurs/ Cause estimated	Action for coping with the error
1216	Access to the property information was rejected. Confirm the setup of the security policy.	Time when the error occurs • The error occurs immediately after the [Select] key is pressed when the microprogram is selected. Cause estimated • A drive for booting the OS is not the c drive. • The user name of Windows® at the time when the microprogram was installed in the maintenance PC is not identical with that at the time when the microprogram is updated, or two-byte characters (full size characters or Japanese characters) are used to define the user name	① Check if the drive for booting the OS is the c drive. (Refer to the (i) of (2) in Subsection 3.4.7) In the case of the dual boot, boot Windows® using the c drive and perform the installation again. ② Check if the user name of Windows® at the time when the microprogram is installed in the maintenance PC is identical with that at the time when the microprogram is updated and if two-byte characters (such as full size characters and Japanese characters) are not used. If an illegal specification has been made, perform the logon over again using an appropriate user name and perform the installation again after connecting the browser.
1219	An error occurred during the communication with the subsystem. Confirm the subsystem status and the LAN environment.	Time when the error occurs • The error occurs when the resource for the LAN cannot be ensured. Cause estimated • The error occurs because the resource (memory) of the maintenance PC is insufficient.	① Reboot the subsystem and the maintenance PC and quit unnecessary application programs. Make sure that the subsystem is in the READY status, place the subsystem in the Maintenance mode, and perform the installation again. ② If the error recurs in spite of the operations above, replace the maintenance PC and perform the installation over again from the beginning. Use a PC whose memory capacity is as large as possible.

Copyright © 2005, 2006, Hitachi, Ltd.



(i) Method for checking the drive for booting the OS

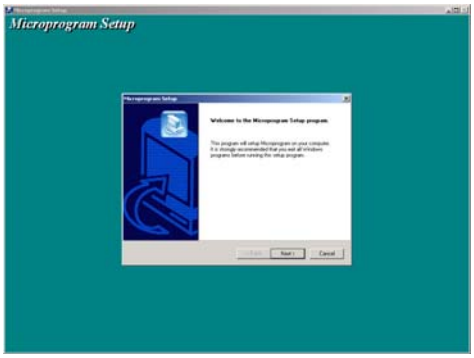
A method for checking the boot drive when the Java message (message code: 1216) is issued is shown below.

① Double click the [: Java icon]on the task tray at the bottom right in the Service PC window.

② Since the JavaConsole window opens, make sure that the [User Home Directory] is the c drive (=C: *****…).

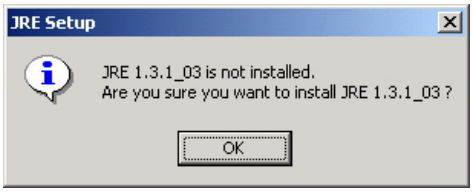
Copyright © 2005, 2006, Hitachi, Ltd.

(d) Procedure for setting up the maintenance PC



(i) Double click the "Program\micro upload\micro setup\Setup.exe" of the CD-ROM for microprogram installation.

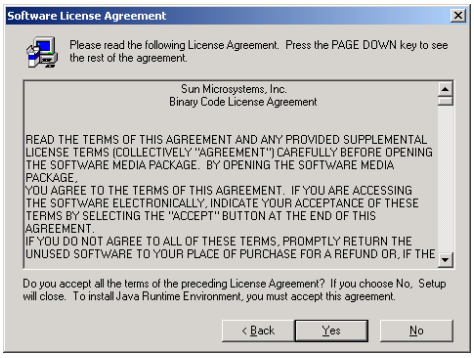
Deleted: ??



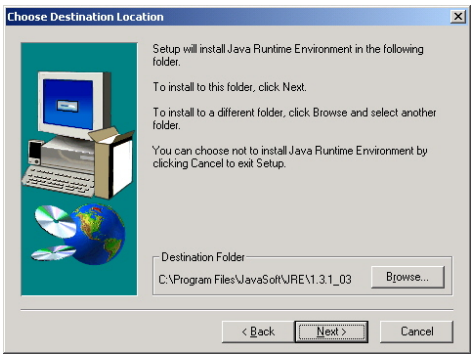
Deleted: ??

Deleted: ??

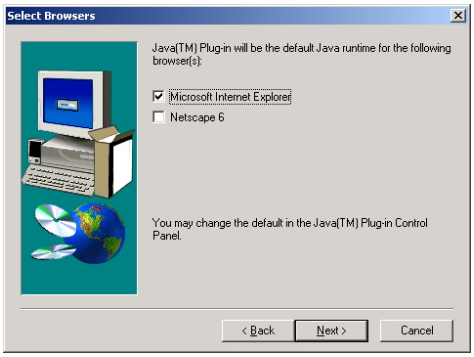
(ii) The initial window of the setting up appears.
When the [Next] button is pressed, the JRE 1.3.1_03 installer is activated in the case where the JRE 1.3.1_03 is not installed yet.
In the case where the JRE 1.3.1_03 has been installed, windows® shown in Steps (iii) to (vii) are not displayed.



(iii) A dialog box for asking confirmation of starting the JRE 1.3.1_03 installer. Click the [OK] button.

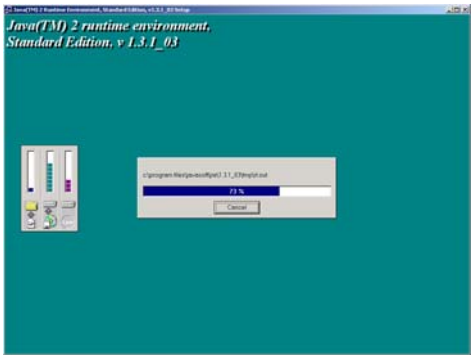


Copyright © 2005, 2006, Hitachi, Ltd.



(iv) A window of product licensing contract is displayed. Click the [Yes] button.

(v) A window for selecting a directory in which the JRE 1.3.1_03 is to be installed. Select the directory for the installation and click the [Next] button.

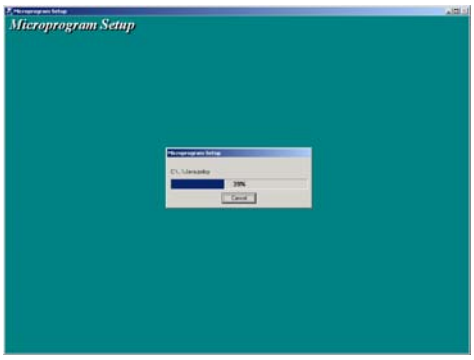


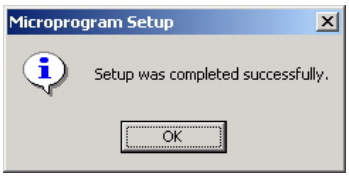
(vi) A window for specifying the Java default browser is displayed. Select the browser being used and click the [Next] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(vii) Installation of the JRE 1.3.1_03 is started.

(viii)After the installation of the JRE 1.3.1_03 is completed, set the security policy file.
When the security policy file (.java.policy) exists in the home directory of the current user, a window for asking confirmation of starting the setting is displayed.
Click the [Yes] button.





Copyright © 2005, 2006, Hitachi, Ltd.

(ix) The microprogram is copied on the maintenance PC.

Create a directory to which the microprogram is to be copied directly under the "C:\diskarray-microprogram\microprogram" for each microprogram revision and copy the microprogram file with the subdirectories (DF700M, DF700S, ENC, ---) into the directory.

(x) The setting up is completed. Press the [OK] button.

NOTE : • Note that the settings of the security policy file is changed when the maintenance PC is set up.
• If the microprogram is transferred to a directory other than "C:\diskarray-microprogram\microprogram" which is a directory copied by the installer, the installation cannot be done. Therefore, care should be taken.
• Do not change a name of the unified version directory(‡1) or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

‡1 : For the unified version directory, refer to "3.4.8 (2) Hierarchy of Microprogram Storage Directories" (SUP 03-0200).

Copyright © 2005, 2006, Hitachi, Ltd.

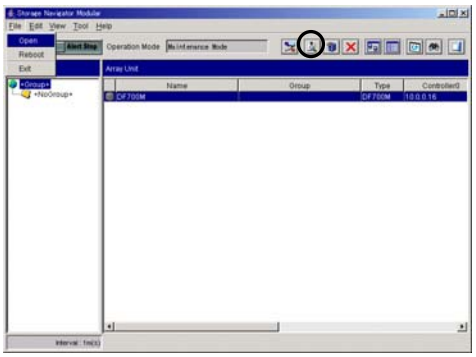
(3) Install the microprogram for the Hitachi TagmaStore® AMS 200™.

(3-1) Procedure for download

(a) Matters to be made sure of before starting update installation.

Make sure of the following before starting the update installation.

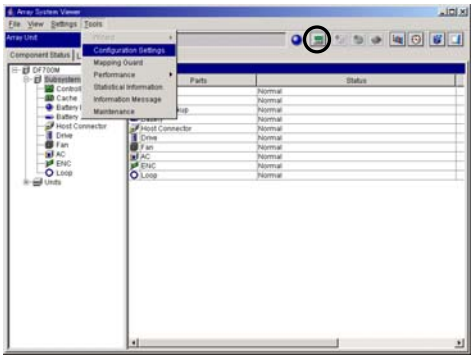
- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem. (refer to Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).)
- Check that the READY LED (green) on the Front Bezel of the Basic Chassis lights up. When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 50 minutes until it lights up because the automatic download of the ENC/SENC firmware is being executed. When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 85 minutes until the READY LED (green) on the front of the Basic Chassis lights up because the automatic download of the ENC/SENC firmware or the update of the flash program is being executed.
  Also, check that the WARNING LED (orange) on the Front Bezel does not light up.
- Also, check that the WARNING LED (yellow) on the Front Bezel does not light up or blink at low-speed. When it lights up or blinks at low-speed, connect it to WEB, and perform the maintenance according to the information message on WEB. After the recovery is made, install the microprogram in order to update it.
- Make sure that the system copy is not being executed through the information message (I140xy System copy started (x: Unit number, y: HDU number)) of the WEB.
  If it is in the middle of system copy, please wait until that is completed and update installation of microprogram.



(b) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

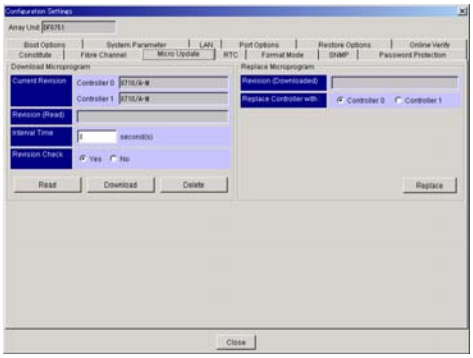
(c) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)

(d) Click an icon of the disk array subsystem you want to set in the main window.



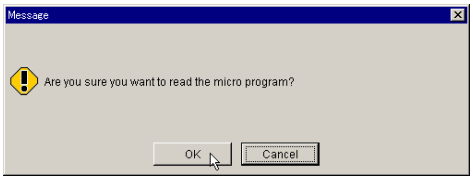
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]



Copyright © 2005, 2006, Hitachi, Ltd.

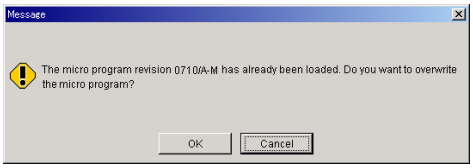
(e) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.



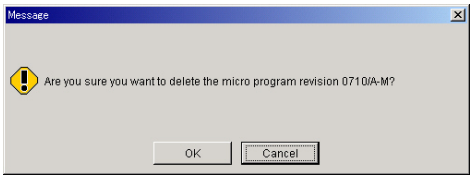
(f) Click the [Micro Update] tab.

(g) Read in the microprogram to the service PC in which Storage Navigator Modular is installed. Click the [Read] button.
When a microprogram revision is displayed in the [Revision(Read)] box, the microprogram has already been read in. When only the Unified version directory(‡1) storing the microprogram is specified, the whole microprogram is read in automatically.

(h) Since a message asking for confirmation whether or not to read in the microprogram, click the [OK] button.



NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the download of the microprogram again from the beginning.



‡1 : For the unified version directory, refer to "3.4.8 (2) Hierarchy of Microprogram Storage Directories" (SUP 03-0200).

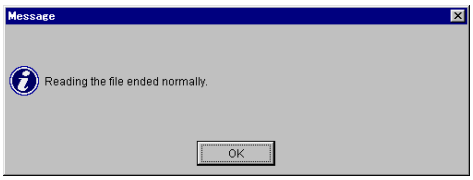
Copyright © 2005, 2006, Hitachi, Ltd.

In the case where the microprogram has already been read in, the message asking for the confirmation is displayed. When you click the [OK] button, the microprogram is overwritten. When you abort the reading in, click the [Cancel] button.

When you eliminate the microprogram that has already been read in to the computer, click the [Delete] button. Since the message asking for confirmation is displayed, click the [OK] button.

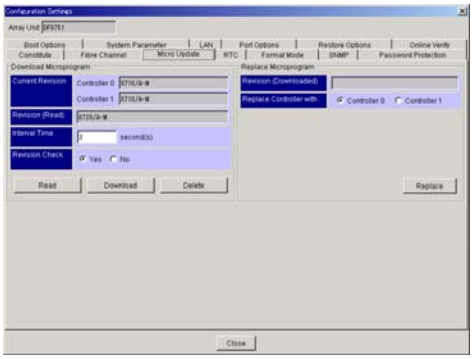
(i) Since a window for specifying the directory in which the microprogram to be read in is stored is displayed, specify the Unified version directory(‡1) . When you click the [OK] button, reading in of the microprogram is started.
Examples of the path entry are shown below.

When using Windows®:



c:/diskarray-microprogram/microprogram/micro/0710A

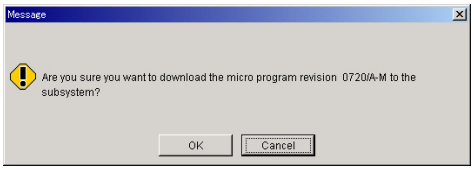
Unified version directory in the hard disk in which the micro program is copied.



‡1 : For the unified version directory, refer to "3.4.8 (2) Hierarchy of Microprogram Storage Directories" (SUP 03-0200).

Copyright © 2005, 2006, Hitachi, Ltd.

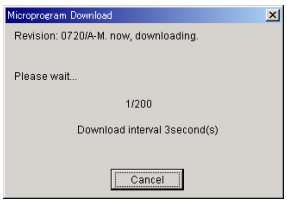
(j) Since a message is displayed when the reading in of the microprogram is completed, click the [OK] button.



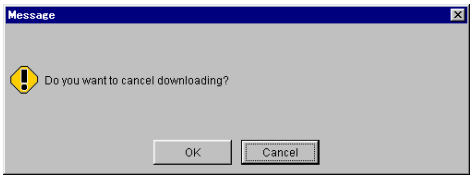
The revision of the microprogram that has been read in is displayed in the [Revision(Read)] box.

(k) Click the [Download] tab.

(l) The confirmation window is display. Click the [OK] button.



The confirmation window is display. Click the [Yes] button.

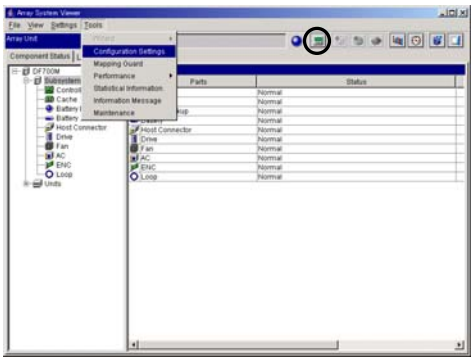


Copyright © 2005, 2006, Hitachi, Ltd.

The download of the microprogram starts by clicking the [Yes] button, and the dialog is displayed.

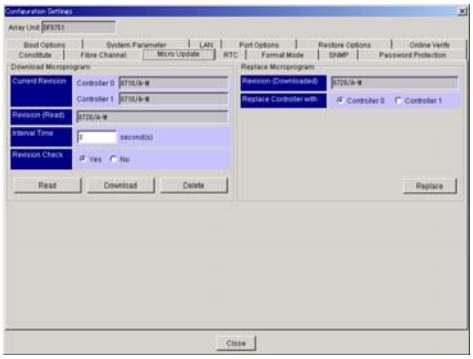
When you abort the downloading, click the [Cancel] button.
A message asking for confirmation is displayed. When you click the [OK] button, the downloading is aborted.
When you click the [Cancel] button, the downloading is continued.

(m) Since a message is displayed when the downloading is completed normally, click the [OK] button.



NOTE : After the microprogram is downloaded, be sure to restart the disk array subsystem or replace the microprogram. If the Control Unit board is replaced in the online mode before restarting the disk array subsystem or replacing the microprogram, the replaced Control Unit may be detached. When the subsystem is burdened with a heavy I/O load by a host at the time of the downloading, the downloading may be terminated abnormally. Perform the downloading again.

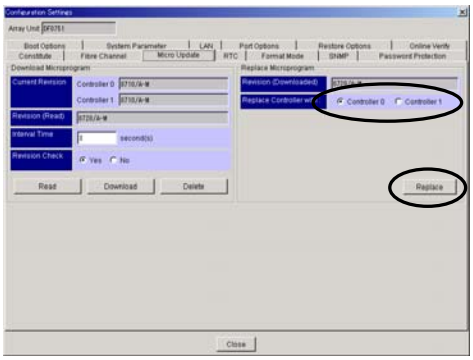
Copyright © 2005, 2006, Hitachi, Ltd.



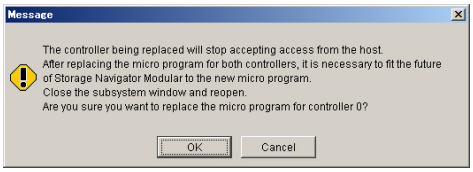
(3-2) Replacing the microprogram

Replace the microprogram that was downloaded to the disk array subsystem with the microprogram installed in the Control Unit. When making replacement, be sure to replace the microprograms of the both Control Units 0 and 1. When the microprogram of one of the Control Units is replaced and the unit window of Storage Navigator Modular is closed, the unit window may be opened no more. When the unit window is not opened, replace the microprogram after changing the subsystem configuration by eliminating the IP address of the Control Unit whose microprogram has been replaced using an IP address of the Control Unit whose microprogram is not replaced yet.

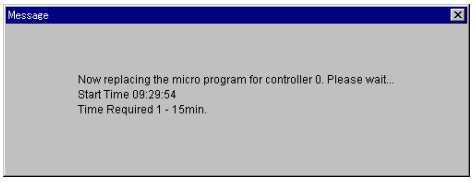
(a) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.



(b) Click the [Micro Update] tab.



Copyright © 2005, 2006, Hitachi, Ltd.



(c) Select the Control Unit whose microprogram is to be replaced and click the [Replace] button.

(d) The confirmation window is display. Check if the selected Control Unit is correctly displayed and click the [OK] button.

NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the replace of the microprogram again from the beginning.

Click the [OK] button according to the dialog message.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) When the replacement of the microprogram terminates normally, a completion message is displayed. When the [OK] button is clicked, the revision of the replaced microprogram is updated and the window is displayed.

NOTE : When making the access from the host accepted by the instruction from Storage Navigator Modular, the following message may be displayed if it is not operated for 20 minutes or more in the case where Account Authentication is valid, and it may not be completed normally. Perform the dummy replacement (‡1) of the Control Unit whose microprogram was replaced to make the access from the host accepted.
If the access from the host is made accepted when the replacement of the microprogram is completed, the dummy replacement (‡1) is unnecessary.

(f) Replace the microprogram in the other Control Unit according to the procedure (c) to (e). When replacement of the both Control Units is terminated normally, the microprogram replacement of the disk array subsystem is completed.

NOTE : When the replacement of the microproram is made for only one of the dual Control Unit, the disk array subsystem is put in the status in which a warning is issued. The warning is called off when the other one of the dual Control Unit is replaced. When you replace the microprogram, be sure to make the replacement for the both Control Units continuously.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2005, 2006, Hitachi, Ltd.

(g) Because the microprogram is managed by two generations, return to the procedure (3) reference place, and perform the update installation of the microprogram again.

NOTE : Because TrueCopy remote replication manages information stored in paired disk array subsystems, the path of the mate disk subsystem (not the subsystem being upgraded but the other one of the paired subsystems) is detached when TrueCopy remote replication is used.
When the subsystem "B" shown in Figure 3.4.6 is upgraded, the path of the subsystem "A" is detached.
The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
This is because the "A" becomes unable to access the "B" as a result that the "B" is placed in the Maintenance mode. Therefore, this is not a problem.
However, when the pair status is changed to PSUE, there may have been a mistake in operations that have been made. Recover the pair from the PSUE status referring to Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).

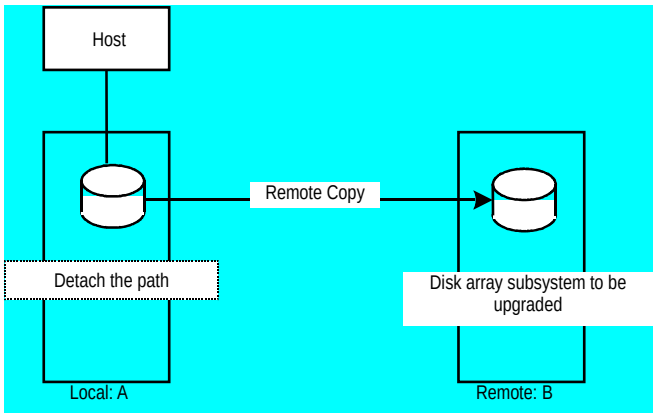


Figure 3.4.6 Paired Disk Array Subsystems (TrueCopy remote replication)

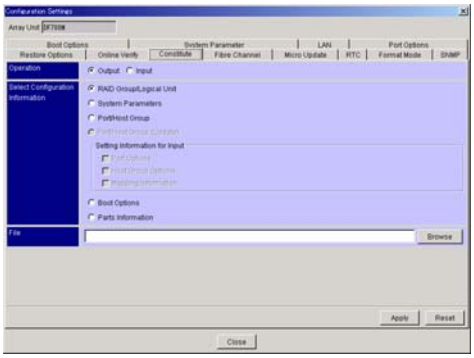
3.4.9 Collecting serial numbers of Disk Drives

A work to reinstall the Disk Drives at the same locations as those in the Hitachi TagmaStore® AMS 200™ is required as one of the hardware upgrade works ("3.4.12 Hardware upgrade work(Hard)" (SUP 03-0450)) included in the procedure for upgrading to the Hitachi TagmaStore® AMS 500™. Therefore, information on installation locations of the Disk Drives in the Hitachi TagmaStore® AMS 200™ must be got and recorded. Collect the serial numbers of the Disk Drives using Storage Navigator Modular.

(1) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular. ("3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120))

(2) Set the operation mode of Storage Navigator Modular as Maintenance mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130))



(3) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.

(4) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Click the [Constitute] tab.

(6) Click the [System Parameter] radio button and [Output] radio button in the [Select Configuration Information] box.
(7) Check the [RAID Group/Logical Unit] radio button in the [Select Configuration Information] box.
(8) Click the [Browse] button, and specify the directory and file name to output the file of the configuration.
(9) Click the [Apply] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) Open the configuration information file that has been got in Step (9) and make sure that the following information is output.

```
Array unit configuration information list.

3.4.10 Collecting simple trace (Hard)

Collect the simple trace and keep it so that in case of failure. It can be investigated.
Collect the simple trace using the WEB.
The procedure is shown below.

(1) Before collecting the simple trace

(a) Items to be prepared

Collection is performed using the normal mode of WEB or Maintenance mode.
For connecting to the WEB, a PC terminal with Browser installed is necessary.
For collecting the simple trace, a Disk Drive with a space of 20 M bytes at least is necessary.

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN-cross-cable.

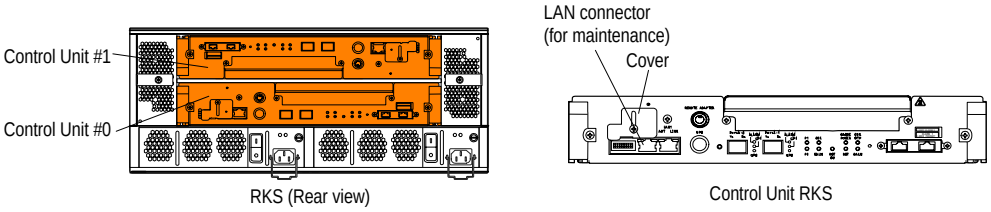

Figure 3.4.7 LAN Connector Position

(c) With Simple Trace Collection, the information of both controllers can be collected from one controller. Therefore, this function does not need to be performed from both Controllers. (As a file name during the collection, "smpl_trc0.dat" is provided for the collection from Control Unit #0, and "simpl_trc1.dat" for the collection from Control Unit #1".)

(d) Make sure that the WARNING LED (orange) on the Front Bezel is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.

- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] - [Cache] - [Clear Cache] in this order.

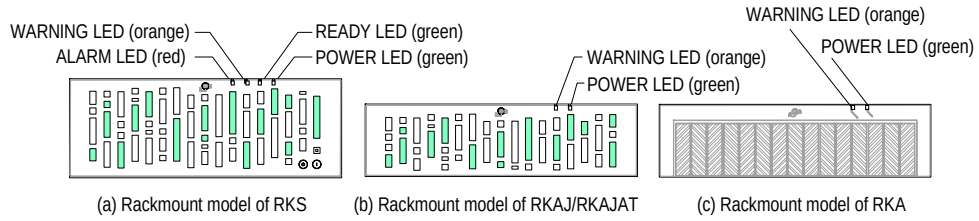

Figure 3.4.8 Indication Locations and Names of LED (Front Bezel)

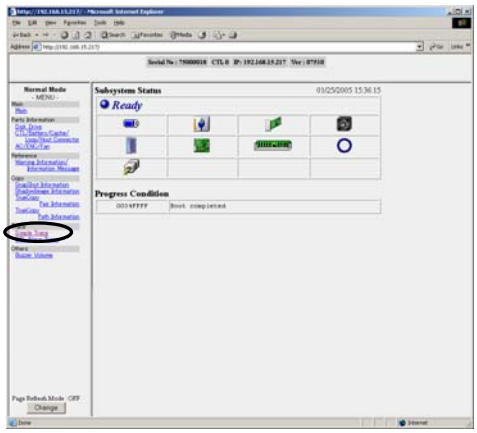


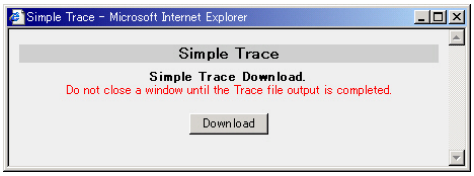
Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for a simple trace collection

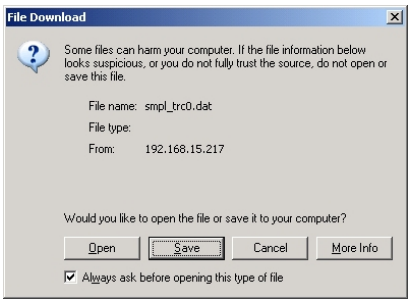
(a) Enter the IP address of the LAN connector for maintenance, to which the maintenance PC is connected, from the browser. When the WEB has already been connected, update the page by pressing the Update button. (For the procedure for connecting the WEB, refer to DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)

(b) Collect the simple trace according to the WEB and the following procedure.
Click "Trace" in the menu frame of "Simple Trace".

Copyright © 2005, 2006, Hitachi, Ltd.

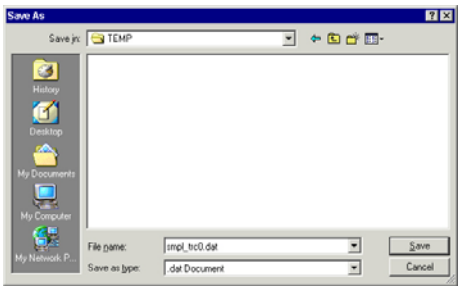


(c) When the “Simple Trace” is clicked, the following window is displayed.

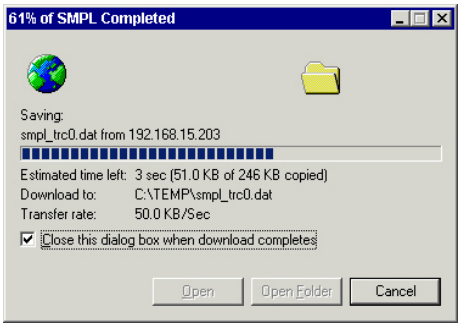


(d) When the [OK] button is clicked, the following window is displayed.

(e) The following window is displayed. Click the [Download] button.

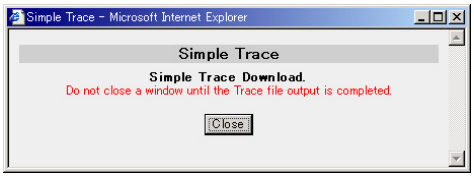


(f) The following dialog is displayed.
Click the [Save] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(g) Select the place to save the file and file name (Default file name: CTL#0:smpl_trc0.dat, CTL#1: smpl_trcl.dat) and click [Save][‡1].



The down-loading is started and the progress indicating message window is displayed.

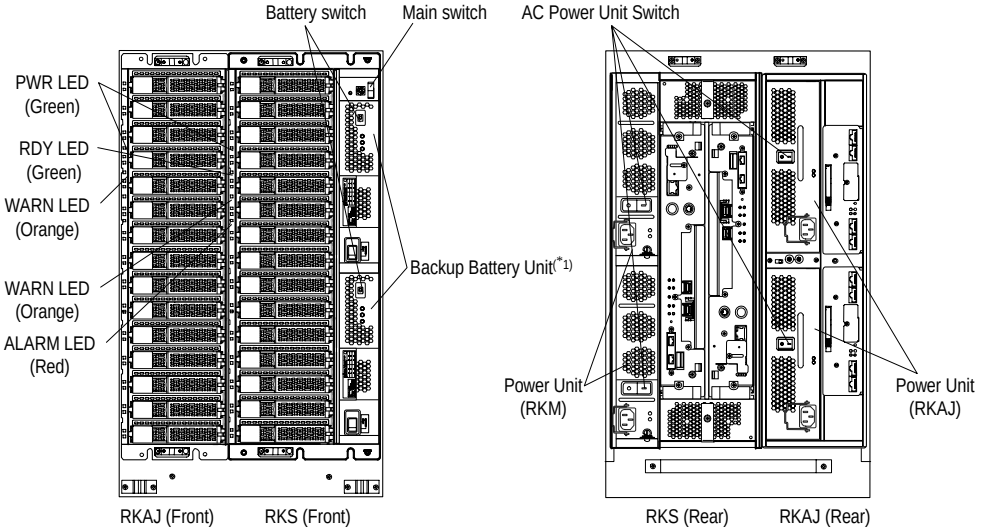
(h) The following window is displayed during execution download.

(i) The [Download] button changes to the [Close] button, so that, click the [Close] button and close the window when the download is completed.

In this procedure Simple trace is collected by WEB Normal mode. Similarly, Simple trace can be collected by WEB Maintenance mode through Menu Frame.
For entering Maintenance mode, refer to the DF700 Disk Array Subsystem Maintenance Manual WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

When the USB memory needs to store the simple trace information, refer to DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "7.6 Storing simple trace information in the USB memory" (TRBL 07-0230).

‡1 : There may be a case where the default file name is given as "ctla_trc0.dat..dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

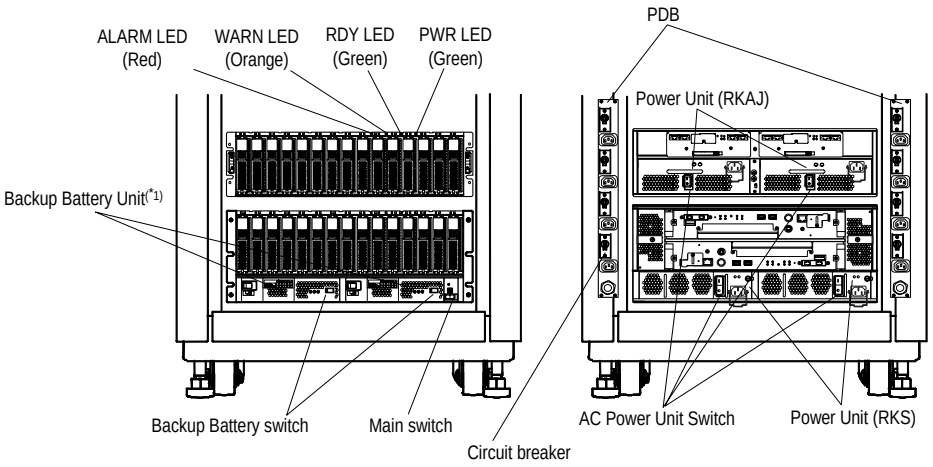


Copyright © 2005, 2006, Hitachi, Ltd.

3.4.11 System power off

Execute the deliberate shutdown of the disk array subsystem.
The procedure is shown below.

NOTE : Do not perform the planned shutdown (power-off) while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes).



(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the front of the subsystem is off.
(3) All turn off the AC Power Unit Switch of the Power Unit.
(4) Turn off the battery switch of the Backup Battery Unit.
(5) All turn off the circuit breaker of the PDB.

*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the lower side of the subsystem.

Figure 3.4.9 Location of Switches for Power On (Floor Model)

Copyright © 2005, 2006, Hitachi, Ltd.

(a) RKS+RKAJ

*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the left side of the subsystem.

Figure 3.4.10 Locations of Switches for Power On (Rackmount Model)

Copyright © 2005, 2006, Hitachi, Ltd.

NOTE : Because TrueCopy remote replication manages information stored in paired disk array subsystems, the path of the mate disk subsystem (not the subsystem being upgraded but the other one of the paired subsystems) is detached when TrueCopy remote replication is used.
When the subsystem "B" shown in Figure 3.4.11 is upgraded, the path of the subsystem "A" is detached.
The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
This is because the "A" becomes unable to access the "B" as a result that the "B" is placed in the Maintenance mode. Therefore, this is not a problem.
However, when the pair status is changed to PSUE, there may have been a mistake in operations that have been made. Recover the pair from the PSUE status referring to Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).

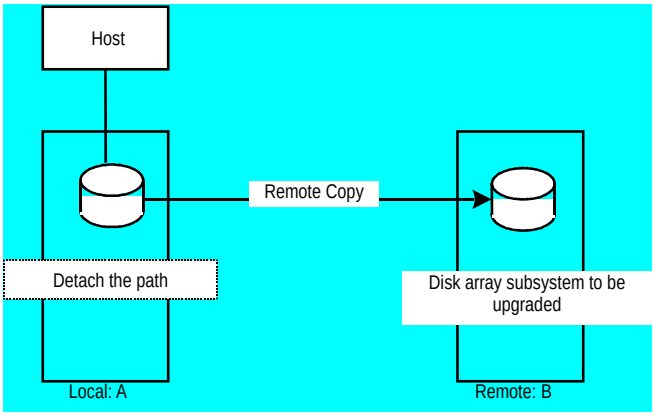


Figure 3.4.11 Paired Disk Array Subsystems (TrueCopy remote replication)

3.4.12 Hardware upgrade work(Hard)

Replace some components with those for upgrading the disk array subsystem to the Hitachi TagmaStore® AMS 500™. Make the replacement above and have the customer keep the components that become unused because they are used in the configuration of the Hitachi TagmaStore® AMS 200™ only.
The procedure is shown below.

(1) Note on hardware upgrade works

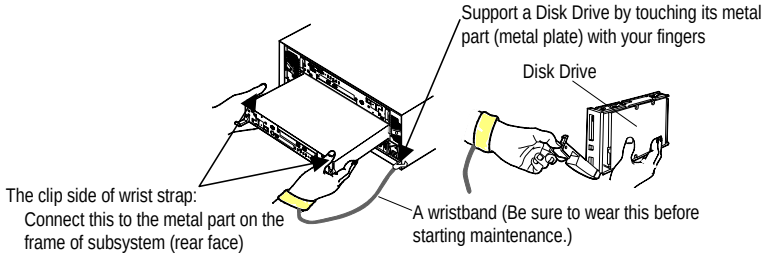
(a) Perform the powering on/off operation correctly.

It is feared that user data is lost if the powering on/off operation is not done following the procedure correctly.
Since the power supplying system is duplicated, operate AC Power Unit Switch of the both systems when turning on/off the Power Unit.

⚠ CAUTION

Hazard exists that can cause an electric shock.
Start the work after making sure that the breaker in the power distribution box has been turned off.

Copyright © 2005, 2006, Hitachi, Ltd.



(b) Notes when Unpacking, Installing or Removing the Parts

For installing or removing the parts, do not apply any shock as the precise parts are installed. Be sure to wear a wrist strap connected to the chassis frame before starting the work and do not take it off until it is finished.

For installing the Disk Drive, Cache Memory, support it as touching the metal part at the side with the fingers of the hand that wears a wrist strap.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting (before removing bezel) and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.
- When you install the Control Unit or a cache memory in the Control Unit, do the installation holding it by its sheet steel part with your hand(s) wearing the ESD grounding wrist band. The electrostatic charge can be discharged through your touch to the sheet steel part.

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Notes on cable routing

(i) Handling of cables placed on the installation floor

- Protect the cables, which cannot be accommodated by the subsystem and thus laid on the floor or cross a passage, with the cable protection duct.
- For cables that relay between the subsystems, lay them on the floor and do not leave them from the floor.

(ii) Handling of under floor cables when the subsystem is installed on the free access floor.

- Give extra lengths to cables routed under the floor and do not make them float in the air.

(iii) Routing method

- Give a room for routing as earthquake and the like are considered.
- Give a room for routing not to disturb the part replacement for maintenance.
- Make the AC cables apart from each other and when they should be adjacent, do not make them in parallel but make them cross at right angle.
- When using a cable protection duct, be careful not to damage or cut cables by catching them.

(iv) Hold the connector to insert or pull out a cable. If the cable part is pulled, it may cause a failure.

(v) For connecting the Fibre Channel interface cable, the FC (ENC) cable, or iSCSI interface cable, bend it with a long radius (not less than 30mm) and do not give the load to the cable and the connector.

(d) Note on completing the work

Close all the external covers when the work is completed.

(The cover is to maintain the performance of the subsystem (radio wave noise suppression and others), so that be sure to keep all the external covers closed to operate the subsystem normally.)

Copyright © 2005, 2006, Hitachi, Ltd.

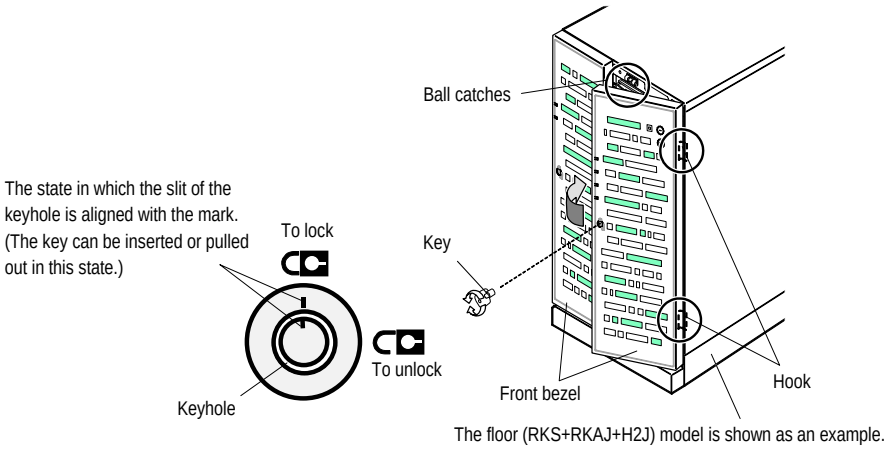
(2) Removing the Front Bezels and rear covers
In the case of the Floor Model, remove all the Front Bezels and rear covers. In the case of the Rackmount Model, remove the Front Bezel of the RKS that is installed only.

• Floor Model (Front Bezel)
A key is necessary to attach or remove the Front Bezel.

CAUTION

Remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.
(b) Pull the Front Bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the Front Bezel from the slots on the subsystem main body by shifting the bezel to the left and remove the bezel.



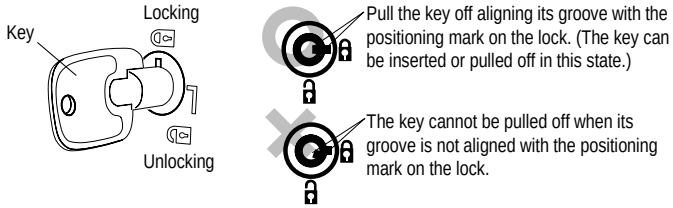


Figure 3.4.12 Procedure for Removing Front Bezel

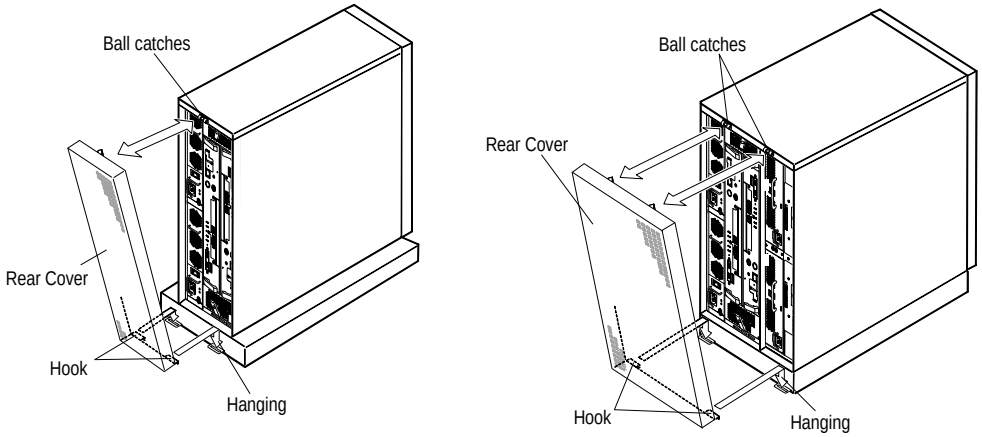
NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.



Copyright © 2005, 2006, Hitachi, Ltd.

- Floor Model (Rear Cover)

CAUTION

Remove the Rear Cover carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(a) Hold the rear cover with your both hands.
(b) When you disengage the rear cover from a ball catch by pulling the upper part of it toward you, you can remove the rear cover.

(a) Floor (RKS+H1J) Model (b) Floor (RKS+RKAJ+H2J) Model

Figure 3.4.13 Procedure for Removing Rear Cover

Copyright © 2005, 2006, Hitachi, Ltd.

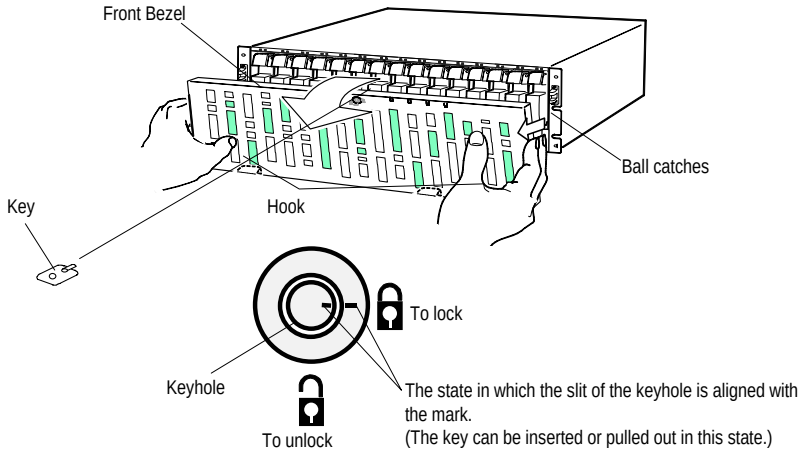
• Rackmount Model (Front Bezel)

A key is necessary to attach or remove the Front Bezel.

CAUTION

Remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.
(b) Pull the front bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the front bezel from the slots on the subsystem main body by shifting the bezel to the right and remove the bezel.



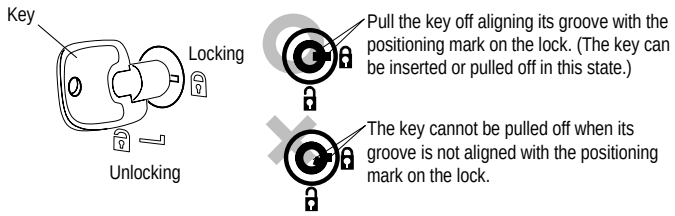


Figure 3.4.14 Procedure for Removing Front Bezel

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

Copyright © 2005, 2006, Hitachi, Ltd.

(3) Open the Rear Door of U7 rack frame. (This work is required for the Rackmount Model only)

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

(a) Fit an Allen wrench in the key socket on the rear door, turn the Allen wrench in the direction shown by the arrow (⟶), and open the rear door slowly leaving the wrench as it is.

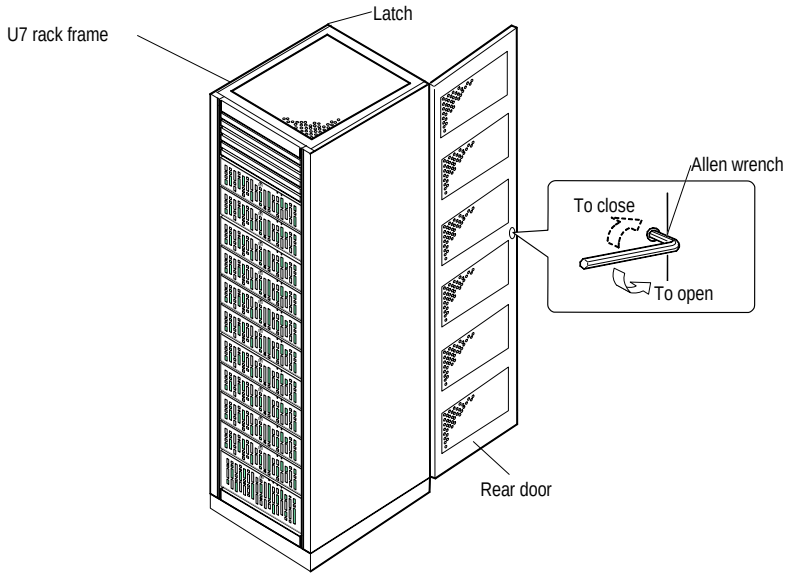

Figure 3.4.15 Procedure for Opening Rear Door

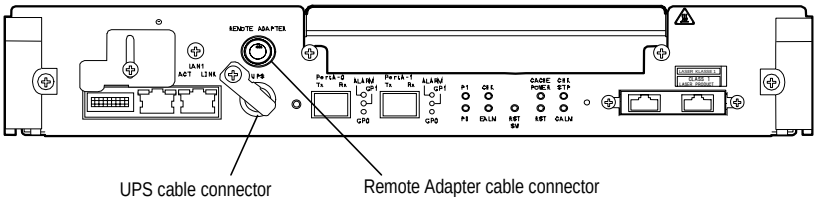
Copyright © 2005, 2006, Hitachi, Ltd.



This page is for editorial purpose only.

Copyright © 2005, 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, 2006, Hitachi, Ltd.

(4) When the Remote Adapter is connected, remove all of them.
When the UPS is connected, remote all of them.

(5) In the case of the Floor Model, remove all the power cables connected to the RKS's. In the case of the Rackmount Model, disconnect only the connector, which is connected to the AC/DC Power Unit (RKS), of the power cable connected to the RKS.

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Disconnect the power cable connected to the RKS.

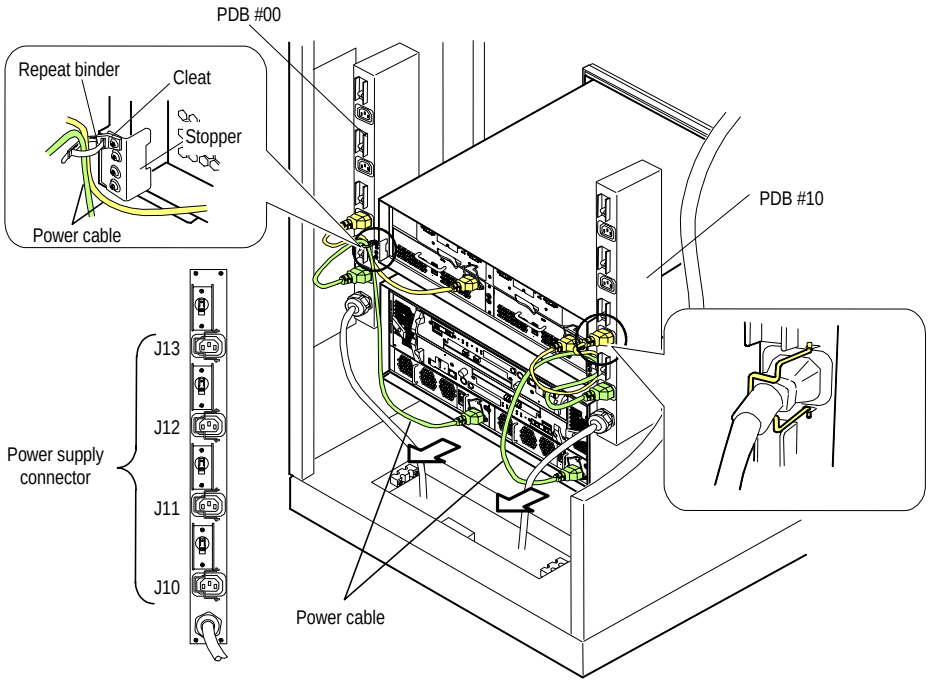


Figure 3.4.16 Disconnecting Power Cables

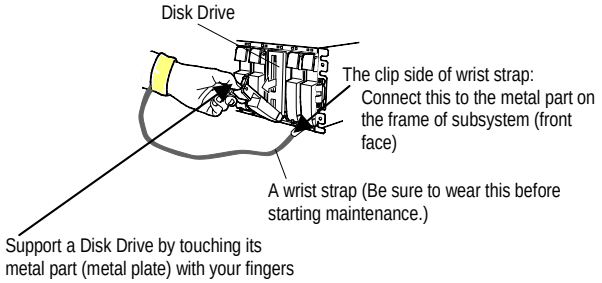
Copyright © 2005, 2006, Hitachi, Ltd.

(6) Remove the ENC cables connected to the RKS.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.



(a) Remove Repeat Binders securing the ENC cable to the stopper.
(b) Remove all the ENC cables connecting the RKS.

(7) Remove the disk drives installed in the RKS.

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.

NOTE : Before replacing, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

(a) Affix labels with the HDD numbers to all the Disk Drives that were installed in the RKS.

Deleted:

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive by pulling it out taking care not to apply a shock to it.
Store a removed Disk Drive or a dummy (Disk Drive) safekeeping box at the same position of address label.
Keep it in custody with its handle returned to its original state (locked by the stopper) taking care not to apply a shock to it.

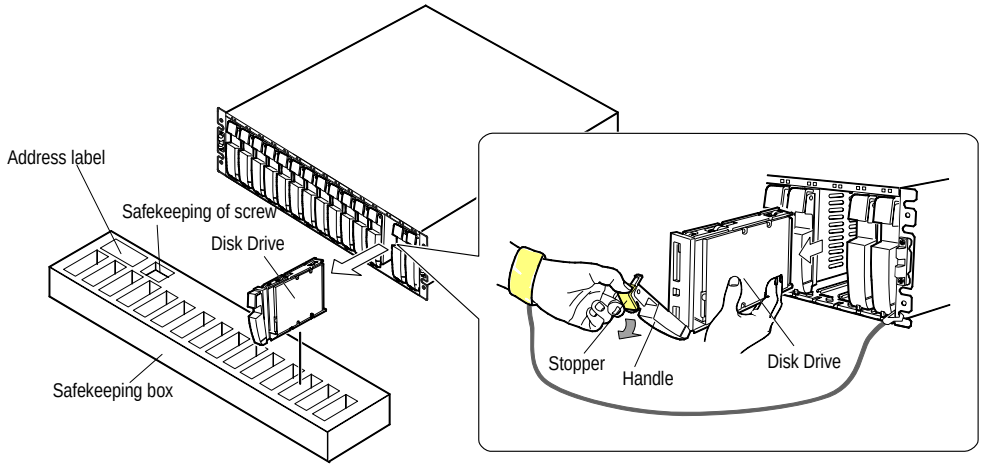


Figure 3.4.17 Remove the Disk Drive

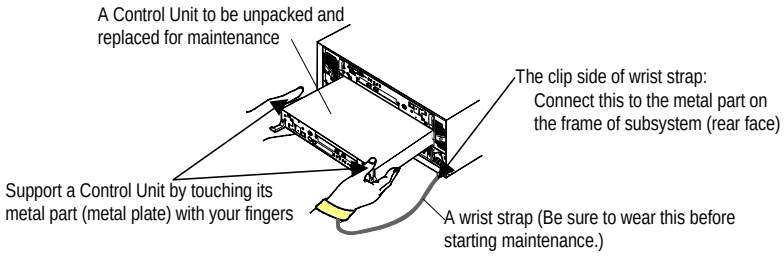
Copyright © 2005, 2006, Hitachi, Ltd.

(8) Remove the cache memory from the Control Unit installed in the RKS.
In the case of the dual controller configuration, remove all the cache memories from the both Control Units.

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

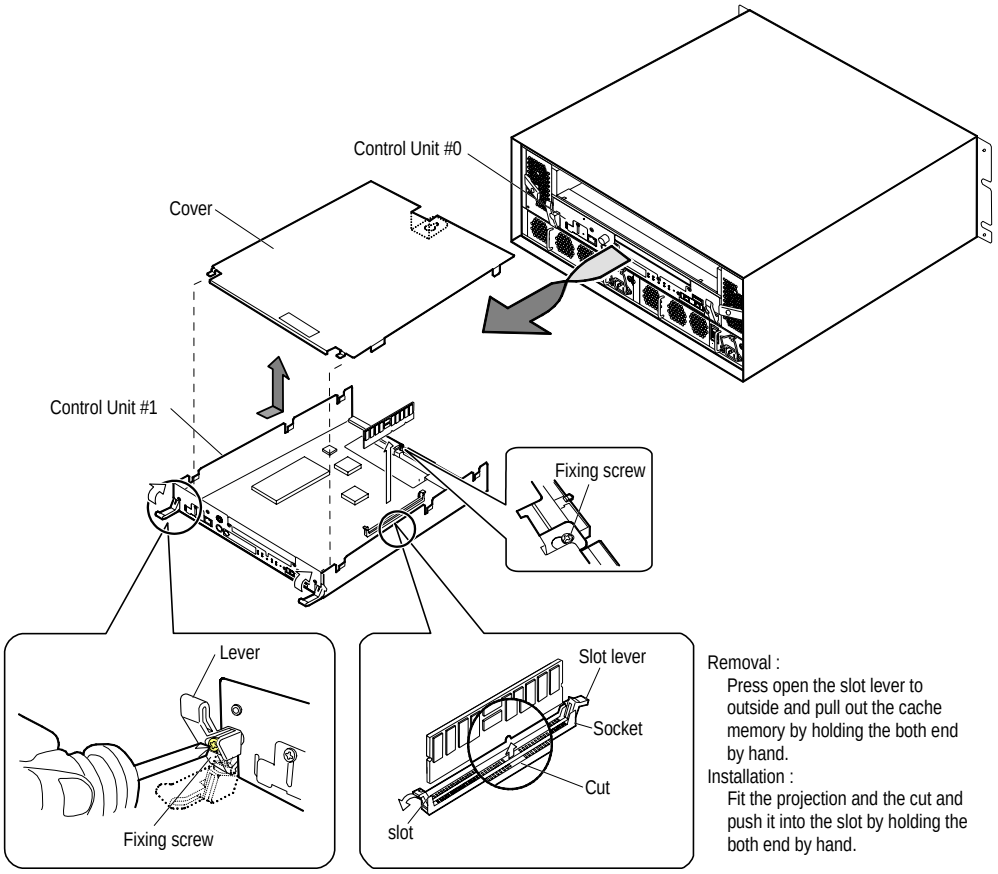
When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, 2006, Hitachi, Ltd.

- When the Hitachi TagmaStore® AMS 200™ is the system configuration of the Fibre Channel interface

(a) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.



⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(b) Remove the Control Unit by pulling it out toward you.
(c) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.
(d) Replace the Cache Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(e) In the case of the dual controller configuration, remove the cache memories from the other Control Unit by repeating Steps (a) to (d).

*1 : The figure shows the case where the FC Interface Board is not added in the Control Unit of the RKS.

Figure 3.4.18 Cache Memory Replacement and LED Locations

Copyright © 2005, 2006, Hitachi, Ltd.

- When the Hitachi TagmaStore® AMS 200™ is the system configuration of the iSCSI interface

(a) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(b) Remove the Control Unit by pulling it out toward you.
(c) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.
(d) Replace the Cache Unit. (refer to "Figure 3.4.18 Cache Memory Replacement and LED Locations (1)" (SUP 03-0580))

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(e) In the case of the dual controller configuration, remove the cache memories from the other Control Unit by repeating Steps (a) to (d).

Copyright © 2005, 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, 2006, Hitachi, Ltd.

(9) Replace the RKS with the RKM. (This work is for the Floor Model only. In the case of the Rackmount Model, go to Step (10).)

(a) Remove the skirt.

Remove the front skirt by pulling it out toward you. Then, pull the side skirt forward and remove it.

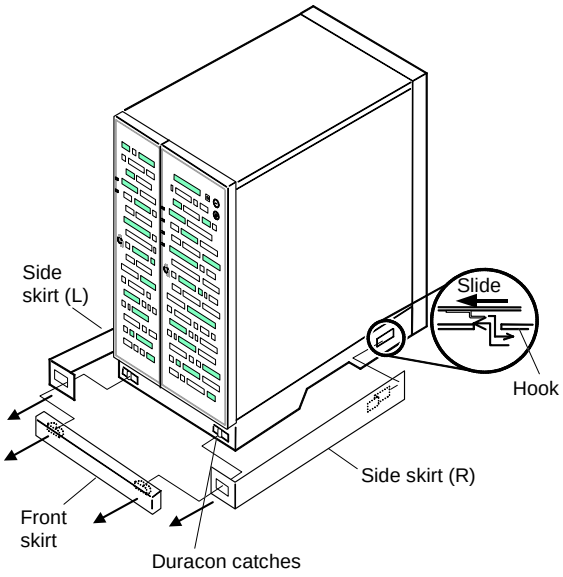


Figure 3.4.19 Removing Skirt

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Detach the top cover

Remove the washer and hexagonal socket head bolts on the front side (six places) and the rear side (two places), and remove the top cover.

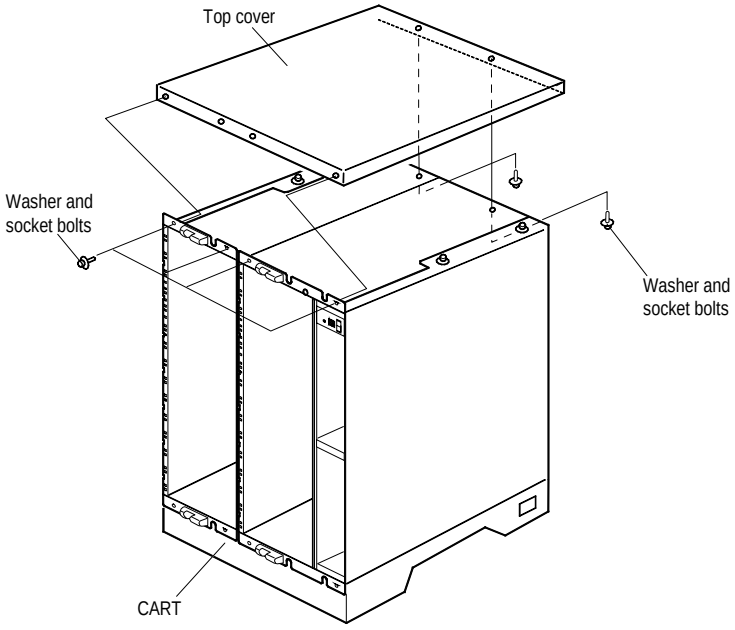

Figure 3.4.20 Detach the Top Cover

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Detach the side cover

(i) Remove the washer and hexagonal socket head bolts ① at two places.

(ii) Pull out the side cover (R) from the slots for receiving the claws, and remove it.

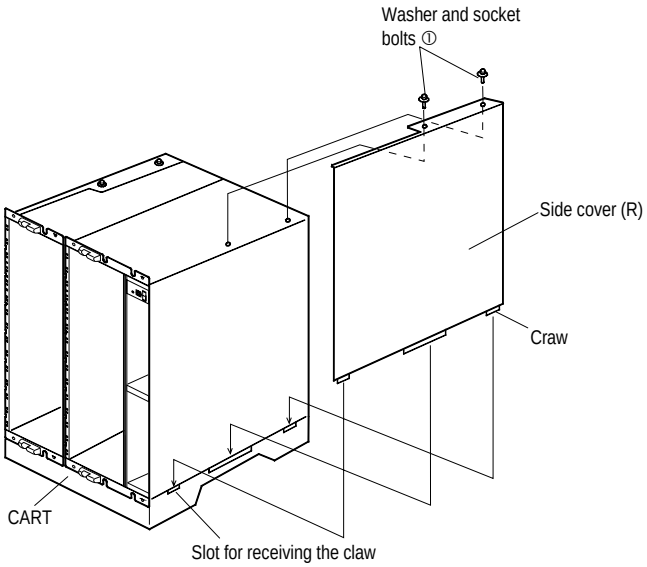

Figure 3.4.21 Detach the Side Cover

Copyright © 2005, 2006, Hitachi, Ltd.

(d) Detach the CART

CAUTION

- Masses of RKM is approximately 58 kg , RKS is approximately 56 kg. When raising or pull down each of them, take measures to prevent it from slipping because the slipping may cause a personnel injury owing to a pinching.
- When raising or pull down the subsystem, it is dangerous to do it by using the handles. Be sure to raise the subsystem by holding its front and rear portions made of sheet metal.

(i) Remove the washer and hexagonal socket head bolts (four places) on the front and rear sides of RKS.

(ii) Hold the handle, and pull it down from the CART so that the upper surface of RKS becomes the right side, by taking care not to give any shocks.

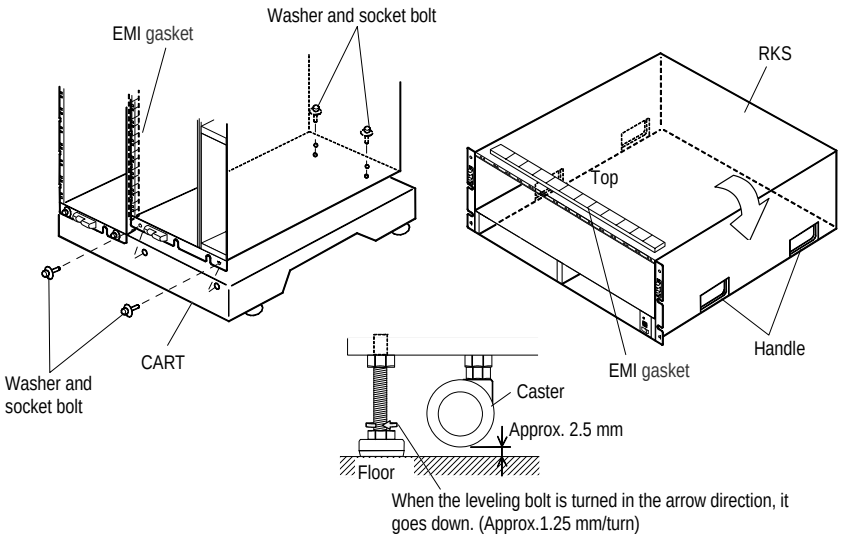

Figure 3.4.22 Un-mounting the RKS

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) Lock the cart to the floor.
Turn the leveling bolts in the direction shown by the arrow so that each clearance between the caster and the floor becomes about 2.5 mm.
(iv) Stick the EMI gasket on the front side surface of the RKM.
(v) Fix the left side handle of RKM with the label (handle).
(vi) Raise the RKM making its upside turn to the left using its handle and place it on a cart.
(vii) Fasten front and rear sides of the RKM to the CART each with four washer and socket bolts.

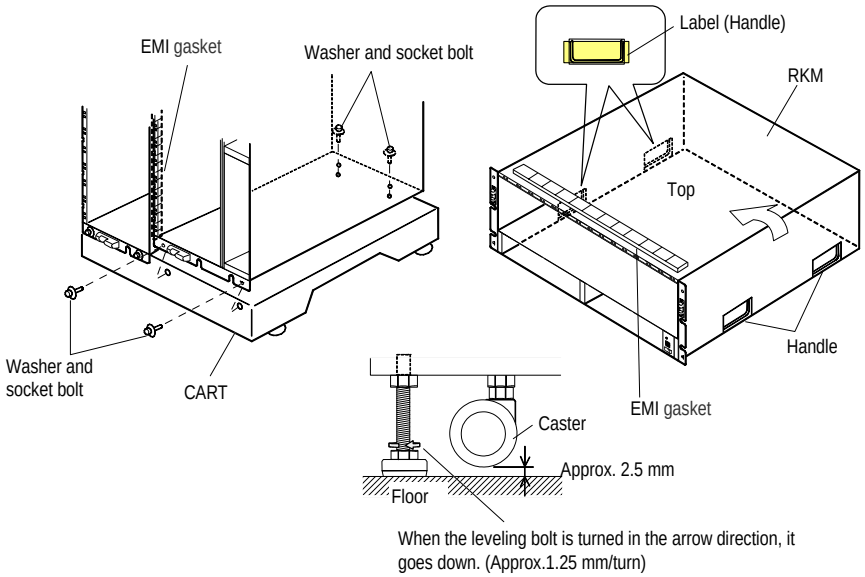

Figure 3.4.23 Mounting the RKM

(e) Attach the side cover (R) to the subsystem by executing the procedure "3.4.12 (9) (c) Detach the side cover" (SUP 03-0610) in reverse order.

(f) Attach the top cover to the subsystem by executing the procedure "3.4.12 (9) (b) Detach the top cover" (SUP 03-0600) in reverse order.

(g) Attach the skirts to the subsystem by executing the procedure "3.4.12 (9) (a) Remove the skirt" (SUP 03-0590) in reverse order.

Copyright © 2005, 2006, Hitachi, Ltd.

(10) Replace the RKS with the RKM. (This work is for the Rackmount Model only)

(a) External appearance of the external lifter.

Figure 3.4.24 shows external appearance of the external lifter.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Be sure to perform the operation with two or more workers.

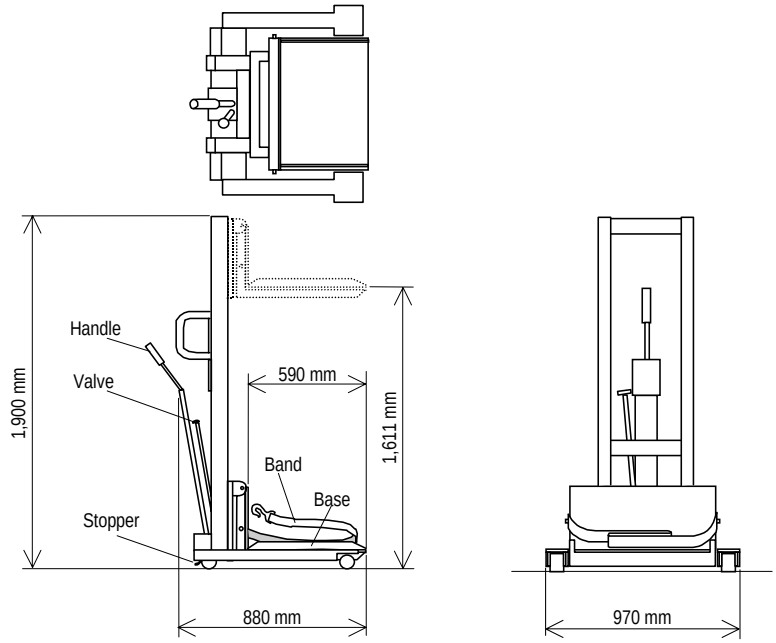

Figure 3.4.24 External Lifter

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Remove the front side of the RKS

(i) Remove the RKS to the rack frame with the four M5×10 binding screws.

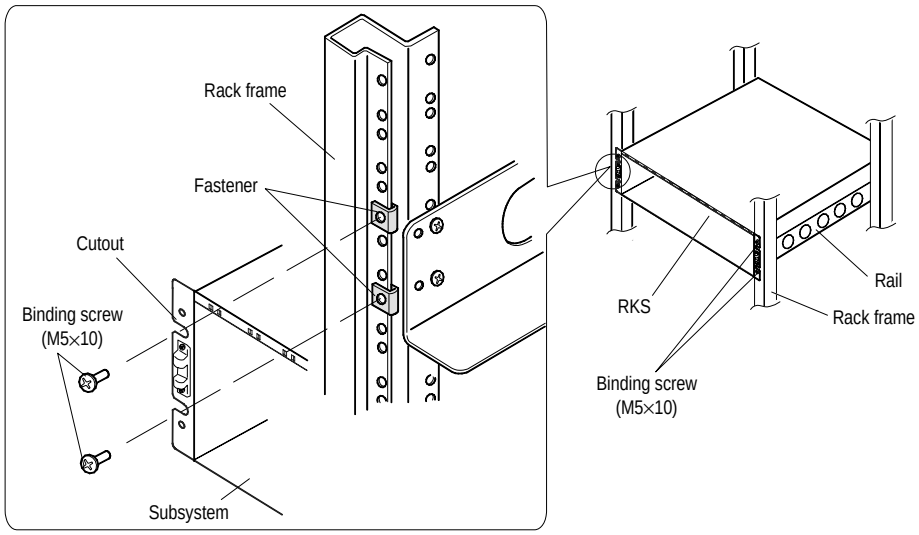

Figure 3.4.25 Fastening Front Side of the Subsystem

(c) Remove rear side of the subsystem

(i) Remove the binding screws.

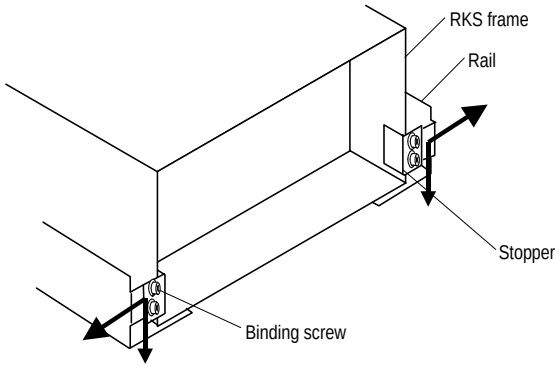

Figure 3.4.26 Securing Rear Side of the Subsystem

Copyright © 2005, 2006, Hitachi, Ltd.

(d) Demount the RKS from the U7 rack frame.

(i) Adjust the position of the rack frame, and apply the brake to the lifter.

(ii) Move the pumping handle of the external lifter to the right and left repeatedly to lift the RKS up to the height suitable for the unloading.

WARNING

If the RKS falls when the elevator of the lifter is at a high position, a personal injury will be caused.
Perform the positioning, fastening, or other handlings very carefully.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Operate the valve slowly when opening it. If it is opened quickly, the elevator of the lifter descends rapidly and may cause personal injury.
- Work carefully because the mass of the single RKM is about 58 kg, RKS is about 56 kg.

Copyright © 2005, 2006, Hitachi, Ltd.

(iii) Shift the RKS onto the elevating base of the external lifter. Shift the RKS gently until it hits the backboard of the elevating base.

⚠ CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKS enters the base across the end of it.
Otherwise, falling of the RKS may be caused.

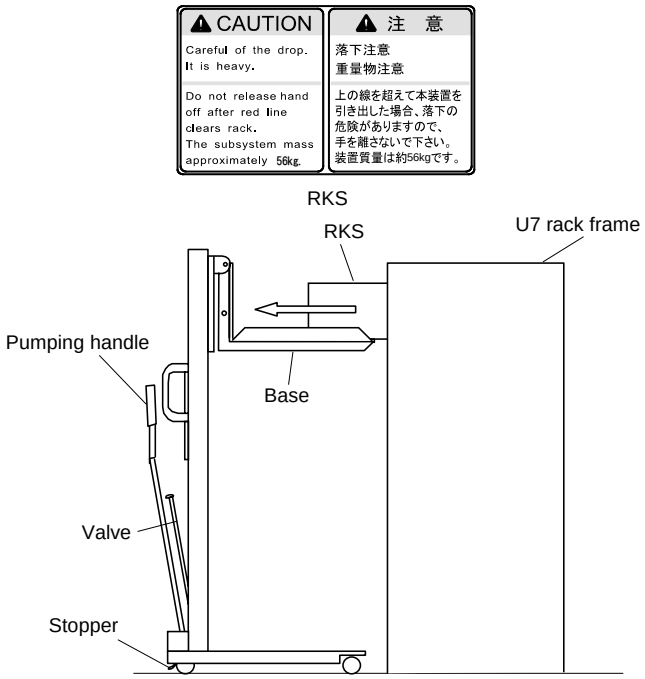

Figure 3.4.27 Mounting RKS on Eternal Lifter

Copyright © 2005, 2006, Hitachi, Ltd.

(iv) Secure the RKS to the lifter with a band of the lifter.
Bind the RKS with the band tightly by fitting the length of the belt to the RKS.

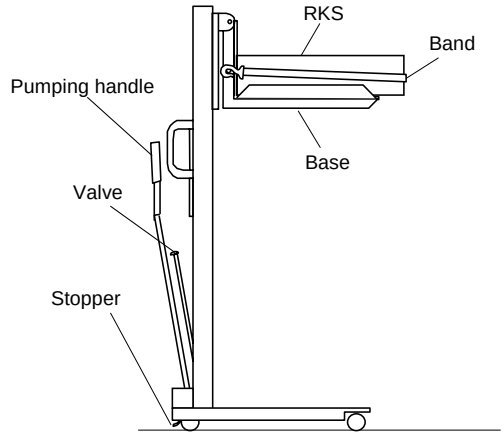

Figure 3.4.28 Secure the RKS

(v) After securing the RKS to the elevating base, open the up/down valve of the external lifter gently and lower the elevating base to the lowermost position.
(vi) Take off the brake of the external lifter, move the lifter away from the U7 rack frame, and take down the RKS after loosening the belt.
(vii) Move the external lifter to the place where the lifter does not disturb the following works.
(viii) Packing the RKS. (See "Export Packing Specifications")

(e) Sticking EMI gasket
Stick the EMI gasket supplied with the rack rail on the top of the RKM frame.
(i) Peel off the anti-adhesion sheet from the bottom surface of the EMI gasket.
(ii) Stick the EMI gasket by aligning it with the front end of the top of the frame.
(iii) Stick the EMI gasket by aligning it with the back end of the top of the frame.

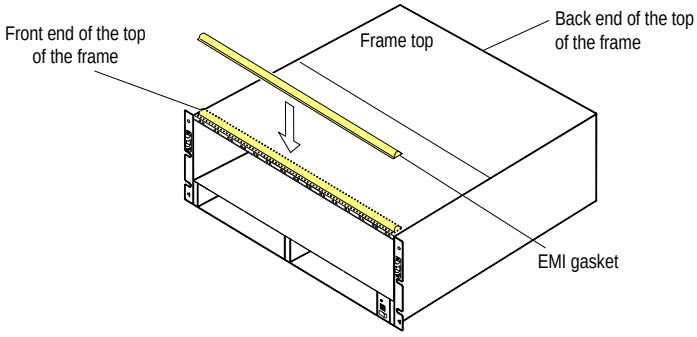

Figure 3.4.29 Position for Sticking EMI Gasket

Copyright © 2005, 2006, Hitachi, Ltd.

(f) Mounting lifter on rack frame

(i) Bring the lifter close to the subsystem to be mounted and apply the brake to the lifter.

NOTE : When putting the subsystem on the lifter, be sure to remove the front bezel beforehand.

(ii) Put the RKM on the lifter.
Put the RKM with its front bezel removed on the lifter.

(iii) Secure the RKM to the lifter with a band of the lifter.
Bind the RKM with the band tightly by fitting the length of the belt to the RKM.

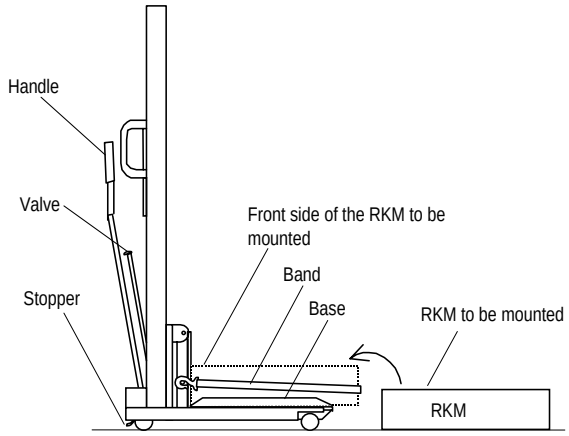

Figure 3.4.30 Putting the RKM on Lifter

(iv) Take off the brake of the lifter on which the RKM has been put, and move the lifter close to the rack frame.

(v) Adjust the position of the RKM so that it is seated in the center of the rack frame.

(vi) Move the pumping handle of the lifter to the right and left repeatedly to lift the RKM up to the height suitable for the mounting.
Be careful not to lift the elevating base too high. If you lift it too high, lower it by opening the up/down valve gently.

(vii) Remove the band and adjust the position of the RKM so that the RKM comes in the center in front of the rack frame. If the RKM is positioned off-centered, a screw contacts the front bezel preventing the bezel from being opened or closed.

Copyright © 2005, 2006, Hitachi, Ltd.

(viii) Shift the RKM onto the rails in the rack frame. When shifting the RKM, push it in to the end gently.

CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKM enters the rack frame across the end of it. Otherwise, falling of the RKM may be caused.

RKM

(ix) After mounting the RKM on the rack frame, lower the elevating base to the lowermost position by gently opening the up/down valve of the external lifter and take off the brake of the lifter.

(x) Move the lifter to the place where the lifter does not disturb the following works.

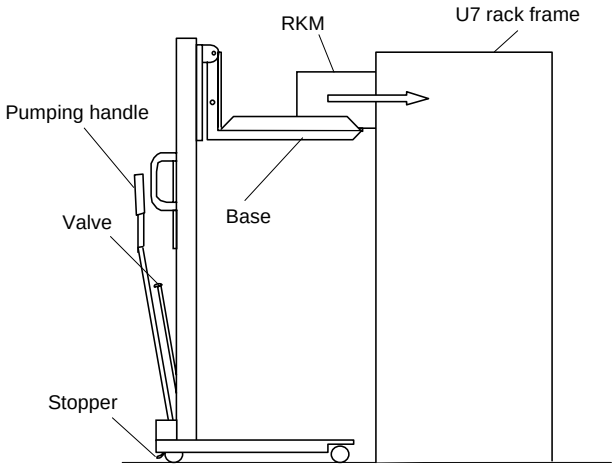

Figure 3.4.31 Mounting RKM on Rack Frame

Copyright © 2005, 2006, Hitachi, Ltd.

(g) Fastening the front side of the RKM

(i) Fasten the RKM to the rack frame with the four M5×10 binding screws.

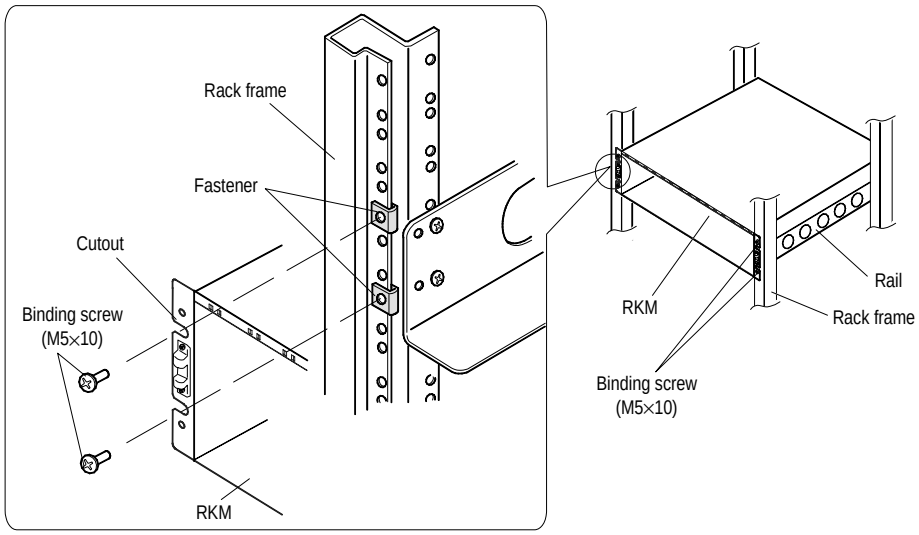

Figure 3.4.32 Fastening Front Side of the RKM

(h) Fastening rear side of the RKM

(i) Shift each of the two stoppers in the direction shown by the arrow and make it contact the frame.

(ii) Tighten the binding screws.

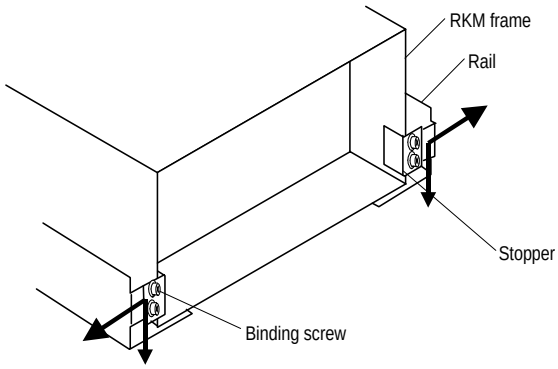

Figure 3.4.33 Securing Rear Side of the RKM

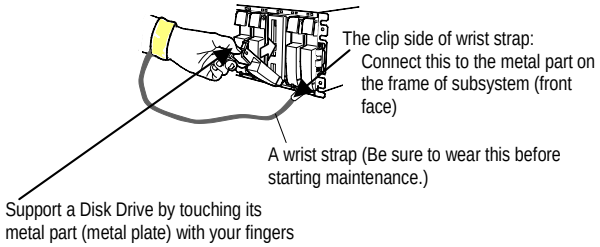
Copyright © 2005, 2006, Hitachi, Ltd.



(11) Install the disk drives, which were removed from the RKS, in the RKM.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting (before removing bezel) and do not take it off until you finish.
  Please be sure to keep a wrist strap near the subsystem.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

NOTE : • The Disk Drive is a precision machine. Never apply a shock or vibration to it.

• Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Pull the parts out of the Disk Drives safekeeping of component.
Be sure to install the removed Disk Drive to the original bay.
(b) Insert the Disk Drive into the position (address) where it was by holding it with the handle.
(i) Fit the Disk Drive in the guide rail of the RKM and slide it in the direction shown by the arrow.
(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the RKM.
(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) Pull the handle lightly to make sure that the Disk Drive cannot be pulled out.
(d) Attach the dummy (Disk Drive) to the each Disk Drive slot in which no Disk Drive is installed.

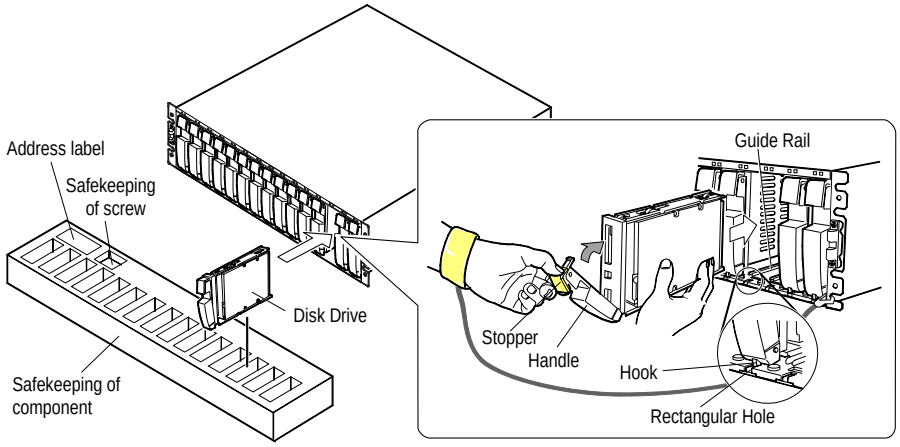


Figure 3.4.34 Installing of Disk Drive

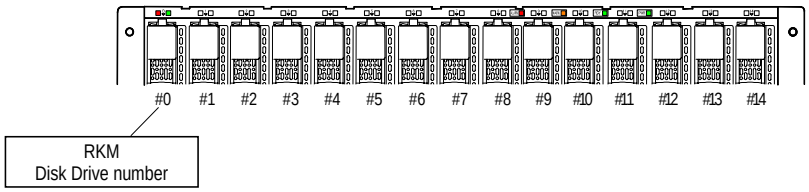

Figure 3.4.35 Disk Drive Mounting Location

Copyright © 2005, 2006, Hitachi, Ltd.

(12) When the RKAJ is connected to the RKM, make the setting of the device identification switches of all the RKAJs.
Set only the RKAJ.
Since the basic device to be connected is the RKM, set the each switch to the M position.

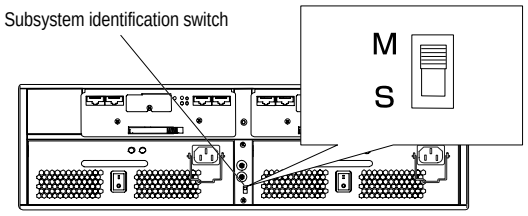

Figure 3.4.36 Position of Switch for Device ID Setting

(13) Install the Cache Memory, which were removed from the RKS, in the RKM.
In the case of the dual controller configuration, install the cache memories in the both Control Units.
When using Copy-on-write SnapShot, Cache Partition Manager and Cache Residency Manager with the Hitachi TagmaStore® AMS 200™ and using them continuously even after upgrading it to the Hitachi TagmaStore® AMS 500™, install the Cache memory for the necessary capacity referring to "3.3 Notes" (SUP 03-0020).

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 500™

(a) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.
(b) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • For the dual Control Unit, install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Insert the Cache Units in the cache slots in regular order starting from the slot #0.
• Insert the dust cover in the Cache slot in which the Cache memory is not installed.

(c) Make sure that the Cache Unit is firmly installed.
(d) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.
(e) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
In the case of dual Control Unit, Insert it into the position in the Control Unit #1 too.

NOTE : The installation direction is different in the Control Unit #0 and #1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(f) In the case of the dual controller configuration, Install the cache memories from the other Control Unit by repeating Steps (a) to (e).

Copyright © 2005, 2006, Hitachi, Ltd.

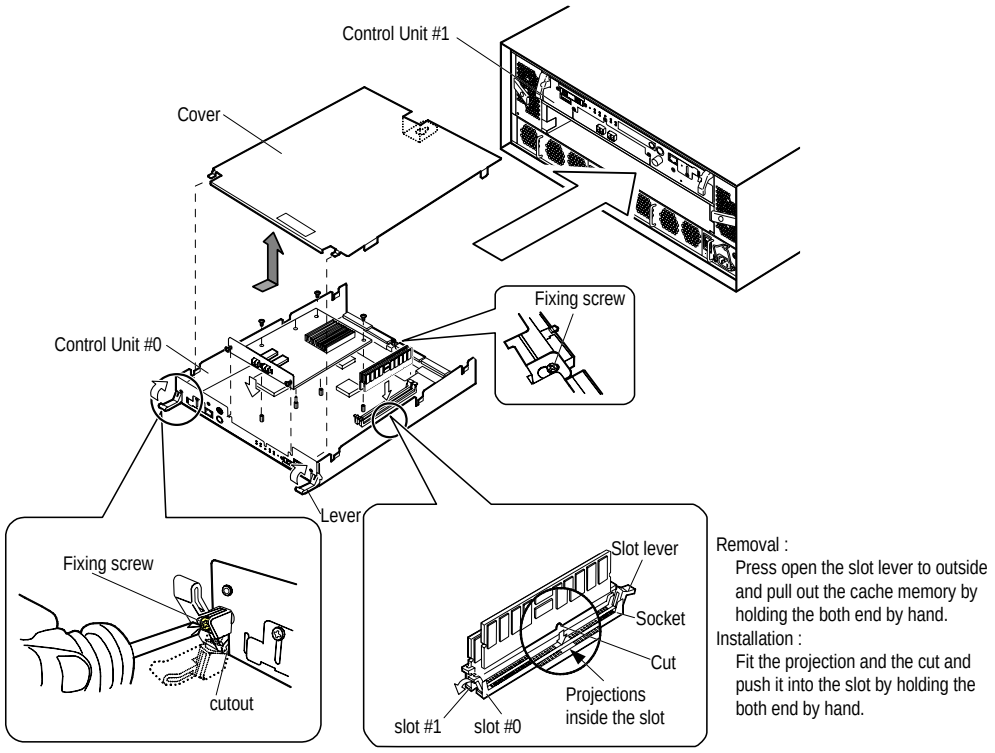

Figure 3.4.37 Installing Cache Memory

Copyright © 2005, 2006, Hitachi, Ltd.

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 500™

(a) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(b) Be sure to install the removed Cache memory in the position with the same slot number as before in the new Control Unit. (refer to "Figure 3.4.37 Installing Cache Memory (1)" (SUP 03-0750))

(c) Make sure that the Cache Unit is firmly installed.

(d) Slide the cover in the opposite direction of which it was removed, attach it, and tighten the fixing screw for the cover at the back of the cover.

(e) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.

NOTE : The installation direction is different in the Control Unit #0 and #1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(f) In the case of the dual controller configuration, Install the cache memories from the other Control Unit by repeating Steps (a) to (e).

(14) Connecting Cables

- Floor Model

CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "3.4.12 (1) (c) Notes on cable routing" (SUP 03-0470).

The figures in this chapter are drawn for the procedure of Floor model (RKM/RKS+RKAJ+H2J). The cable connection procedure of other Floor model is similar to the case shown in the figures here.

(a) Connecting ENC cables

In the case of the Floor (RKM+RKAJ+H2J) model with both of the RKM/RKAJ, it is required to connect the Control Unit (RKM) and the ENC Unit (RKAJ) with the ENC cables.

NOTE :
- When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses .
- Connect the two (Loop #0 and Loop #1) systems of each of the Control Unit and the ENC Unit with the ENC cables.
  Parts of the Loop #0 and Loop #1 systems are discriminated from each other by means of color markings in milk white and yellow respectively.
  When connecting the left and right sets of the Control Unit and ENC Unit with the ENC cables, be sure to connect each of the cables to the sets of adjacent connectors of the same kind, that is, the PATH #0 (marked in milk white) and the PATH #1 (marked in yellow) of the ENC Unit and the Control Unit.

Copyright © 2005, 2006, Hitachi, Ltd.

(i) Remove the rubber cap on the Control Unit.
(ii) Connect the ENC cable to the Control Unit.
① To the PATH #0 (marked in milky white on the RKM side), connect the ENC cable marked in milky white.
② To the PATH #1 (marked in yellow on the RKM side), connect the ENC cable marked in yellow.
(iii) Connect the ENC cable to the ENC Unit.
① To the PATH #0 (on the ENC Unit) side and marked in milk white), connect the ENC cable (marked in milk white) led from the PATH #0 (on the Control Unit) side and marked in milk white).
② To the PATH #1 (on the ENC Unit side and marked in yellow), connect the ENC cable (marked in yellow) led from the PATH #1 (on the Control Unit) side and marked in yellow).
(iv) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder, and put it inside the subsystem.

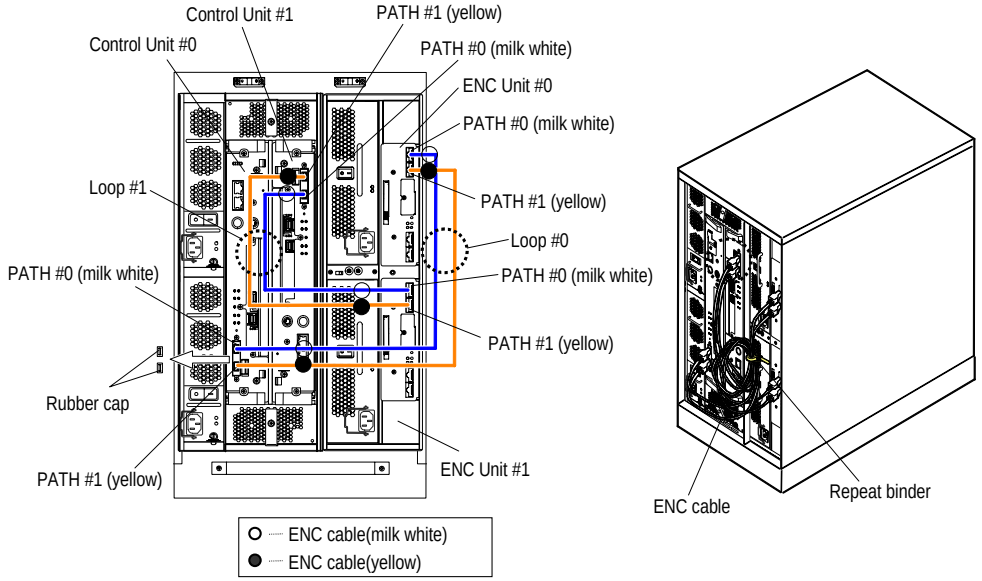

Figure 3.4.38 ENC Cable Connection

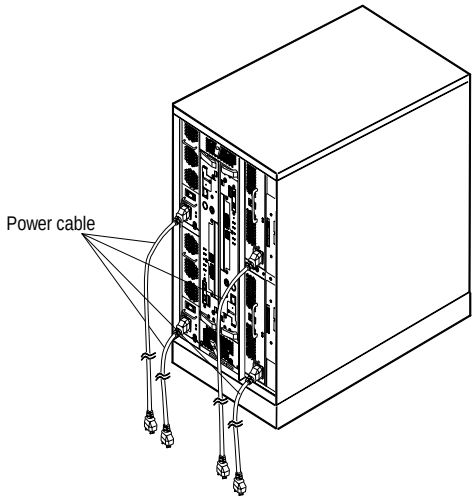
Copyright © 2005, 2006, Hitachi, Ltd.



(b) Connecting the power cables of Power Unit

CAUTION

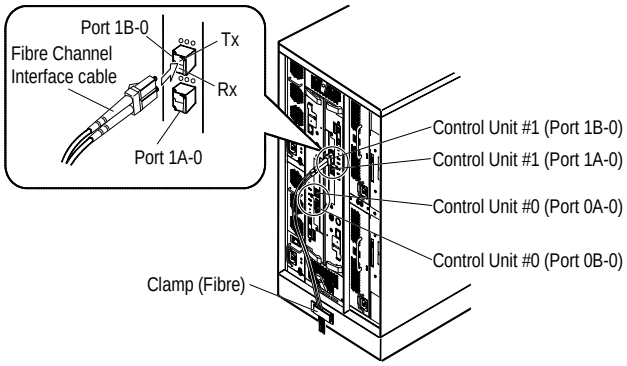
Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : • Connect the power cable to the two systems, Power Unit #0 and Power Unit #1.
• Although the subsystem has a dual power-system, each Power Unit is required to have capacity for the whole subsystem to cope with one power-system failure. Accordingly the facility power source for each Power Unit is also required to have capacity for the whole subsystem.

(i) Make sure that all the Power Unit AC Power Unit switches are turned off.
(ii) Connect the connectors (Power Unit side) of the power cables (white, yellow) to the receptacle of the Power Unit.
(iii) Connect the power cable to the power outlet.

*1 : The Floor (RKM+RKAJ+H2J) Model is shown as an example.

Figure 3.4.39 Power Cable Connection



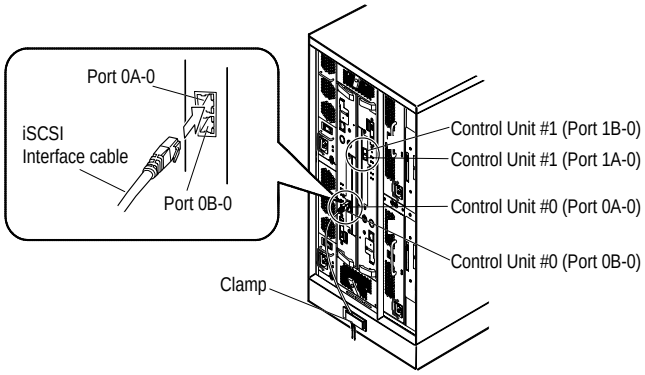
Copyright © 2005, 2006, Hitachi, Ltd.

(c) Connecting Fibre Channel interface cables

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 500™

Connect the Fibre Channel interface cables after making sure of the ports to be connected the label. Route the Fibre Channel interface cable to the Clamp (Fibre).
When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

NOTE : When bending the Fibre Channel interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.



*1 : The Floor (RKM+RKAJ+H2J) Model is shown as an example.

Figure 3.4.40 Port Layout of Fibre Channel (1)

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 500™

Connect the Fibre Channel interface cables after making sure of the ports to be connected the label. Route the Fibre Channel interface cable to the Clamp.

NOTE : When bending the iSCSI interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

*1 : The Floor (RKM+RKAJ+H2J) Model is shown as an example.

Figure 3.4.40 Port Layout of Fibre Channel (2)

Copyright © 2005, 2006, Hitachi, Ltd.

- Rackmount Model

CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "3.4.12 (1) (c) Notes on cable routing" (SUP 03-0470).

NOTE : Power supply system of the RKM/RKAJ/RKAJAT/RKA is duplicated.
It is recommended to connect each system to outlet of one of the two power sources independent of each other.

The cable routing for the subsystem which is mounted on the rack frame is shown in Figure 3.4.41, Figure 3.4.42, Figure 3.4.43.

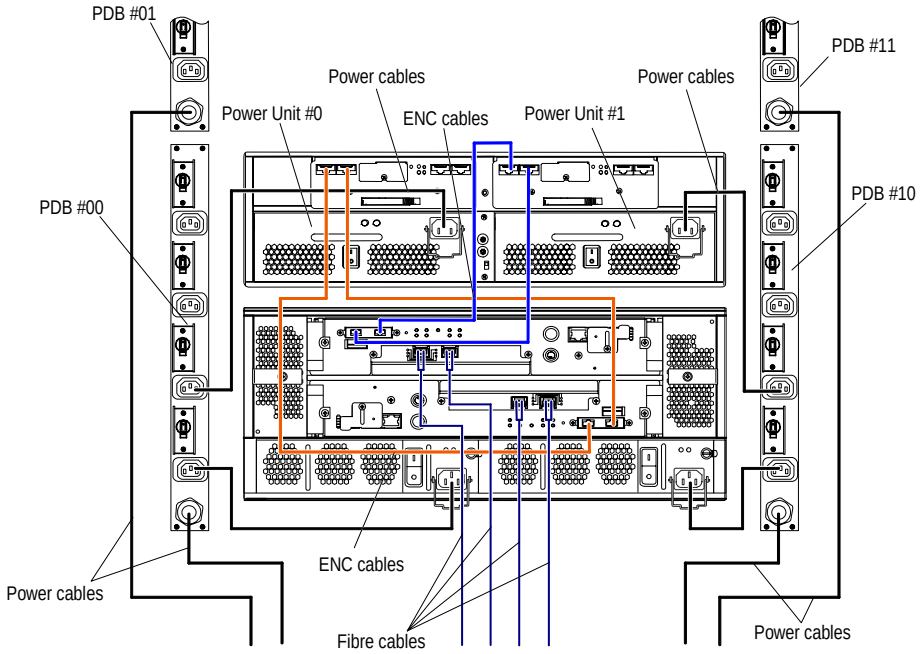


Figure 3.4.41 Cable Routing for the Subsystem (RKM/RKAJ)

Copyright © 2005, 2006, Hitachi, Ltd.

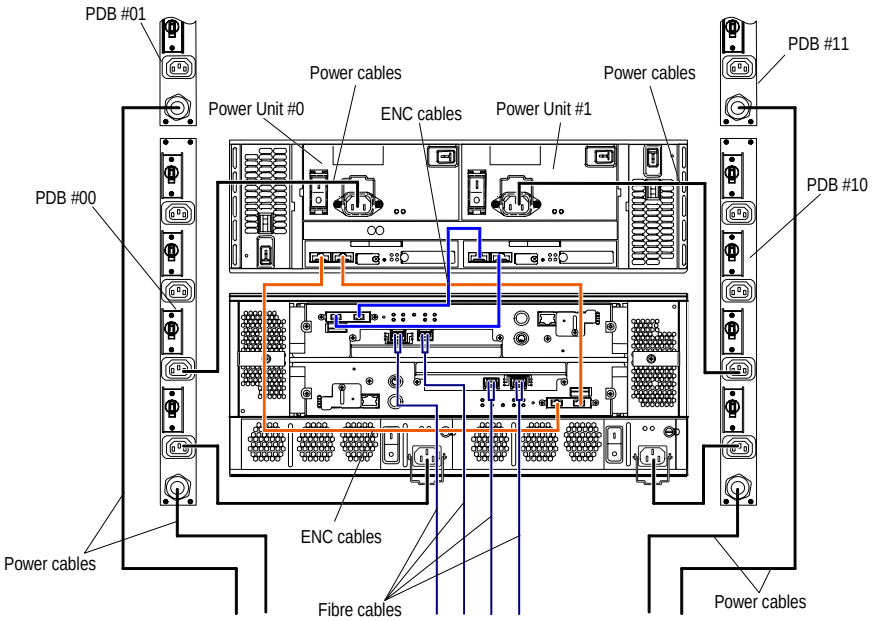

Figure 3.4.42 Cable Routing for the Subsystem (RKM/RKA)

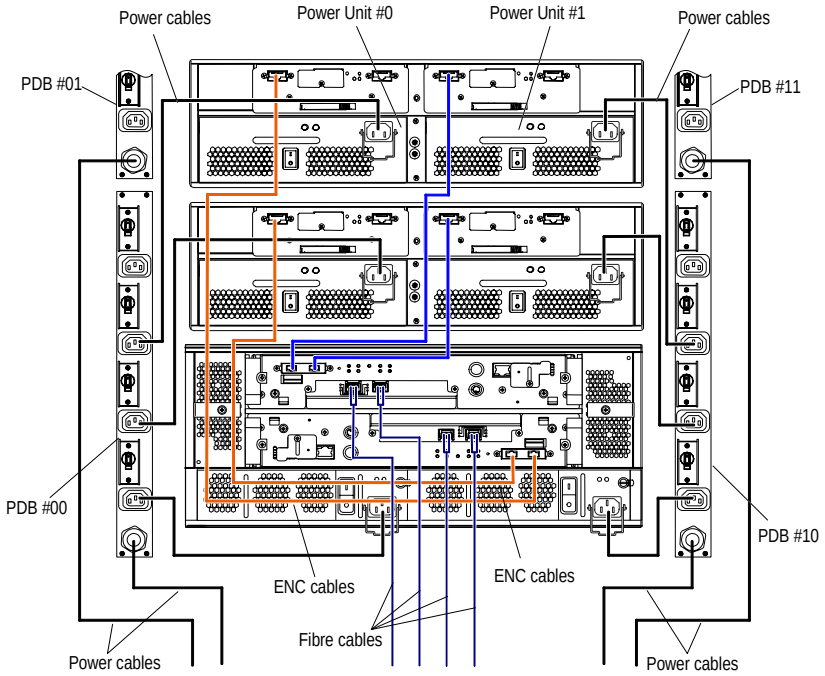

Figure 3.4.43 Cable Routing for the Subsystem (RKM/RKAJAT)

Copyright © 2005, 2006, Hitachi, Ltd.

(a) Connecting ENC cables

- When connecting the RKM and RKAJ/RKA

In the case of the RKAJ/RKA with both of the Control Unit of RKM/RKAJ/RKA, it is required to connect the Control Unit (RKM) and the ENC Unit with the ENC cables.

NOTE : When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

Execute the following referring to Figure 3.4.44, Figure 3.4.45.

(i) Remove the rubber cap on the Control Unit.

(ii) Connect the ENC cable to the Control Unit.

(iii) Connect the ENC cable to the ENC Unit of the RKAJ/RKA.

NOTE : Connect the Control Unit #0 of the RKM with the ENC Unit #0 of the RKAJ/RKA and the Control Unit #1 of the RKM with the ENC Unit 1 of the RKAJ/RKA. Connect two Path #0 connectors (with milk white indication) using the ENC cable and also connect two Path #1 connectors (with yellow indication) using another ENC cable.

① To the PATH #0 (marked in milky white on the RKM side), connect the ENC cable marked in milky white.

② To the PATH #1 (marked in yellow on the RKM side), connect the ENC cable marked in yellow.

(iv) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

NOTE : Do not fix the ENC cable and the power cable together.

Copyright © 2005, 2006, Hitachi, Ltd.

- When connecting the RKM and RKAJ/RKAJAT

  In the case of the RKAJ/RKAJAT with both of the Control Unit of RKM, it is required to connect the Control Unit (RKM) and the ENC Unit/SENC Unit with the ENC cables.

  NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.
  • The IN and OUT connectors of the SENC unit of the RKAJAT have indications by means of blue and green labels respectively.

Execute the following referring to Figure 3.4.46.

(i) Attach milk white or yellow Mini-Binders to the ENC cable.

(ii) Remove the rubber cap on the Control Unit.

(iii) Connect the ENC cable to the Control Unit.

(iv) Connect the ENC cable to the ENC Unit/SENC Unit of the RKAJ/RKAJAT.

NOTE : Connect the Control Unit #0 of the RKM with the ENC Unit #0/SENC Unit #0 of the RKAJ/RKAJAT and the Control Unit #1 of the RKM with the ENC Unit #1/SENC Unit #1 of the RKAJ/RKAJAT.

① Connect the cable marked in milky white from PATH #0 (marked in milky white) of RKM to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID #1).

② Connect the cable marked in yellow from PATH #1 (marked in yellow) of RKM to the IN side (Blue Label) of the SENC Unit of RKAJAT (Unit ID #2).

(v) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

NOTE : Do not fix the ENC cable and the power cable together.

Copyright © 2005, 2006, Hitachi, Ltd.

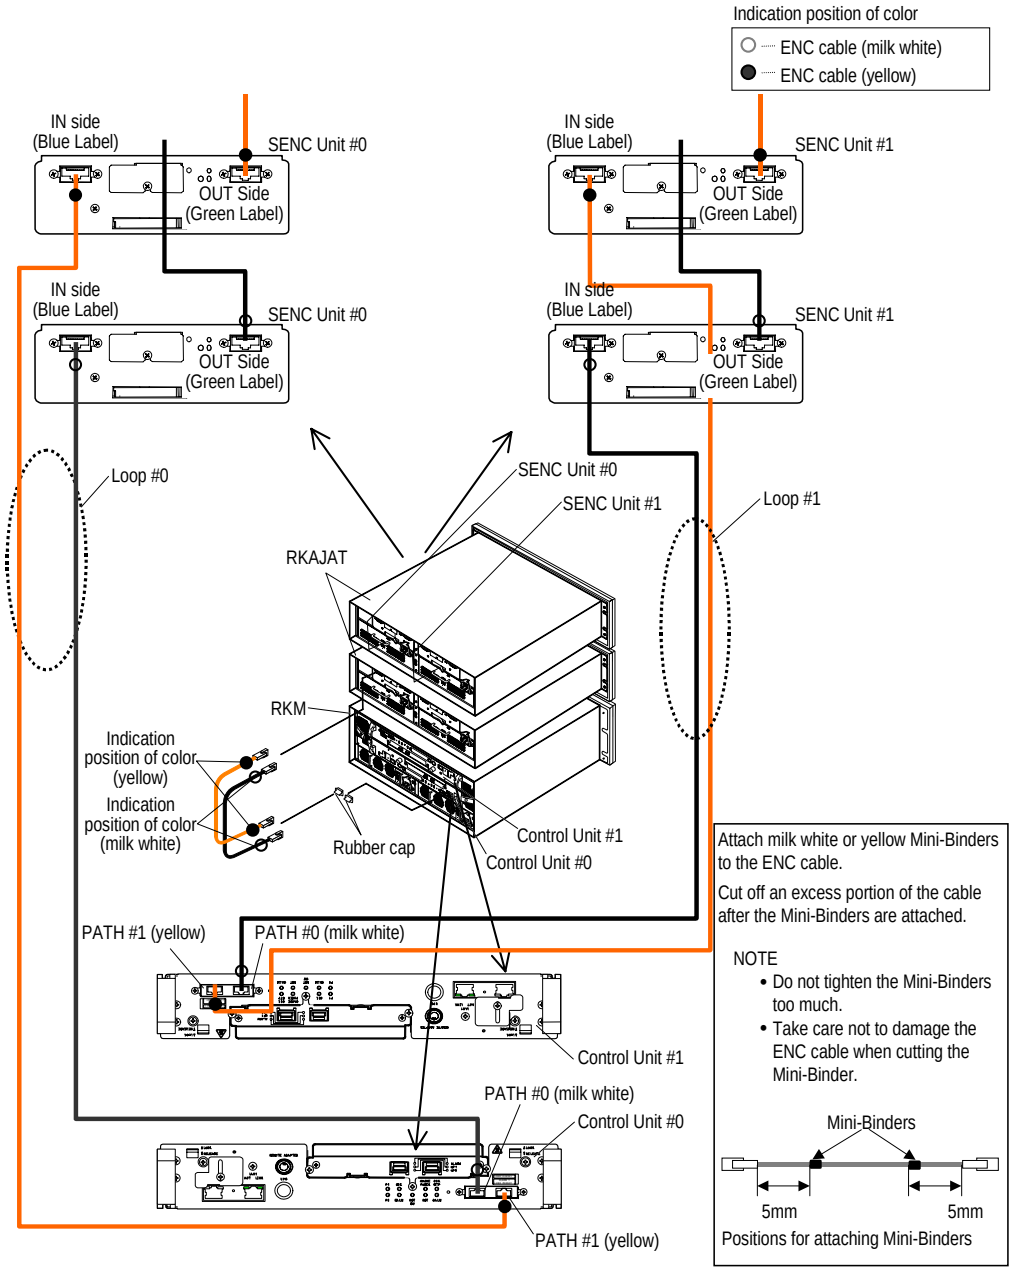

Figure 3.4.46 Connecting ENC Cables (RKM+RKAJAT)

Copyright © 2005, 2006, Hitachi, Ltd.

(b) Connecting the power cables of Power Unit

CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

(i) Make sure that the breaker of the each PDB has been turned off.
(ii) Make sure that the AC Power Unit Switch of the each Power Unit has been turned off.
(iii) Insert the power cable plug into the receptacle on the each Power Unit.

NOTE : Limit the total current output from the outlets J10 to J13 so that it does not exceed 20 amperes.

(iv) Route the power cables.
(v) Push in the plug of the power cable which has been inserted into the PDB again. It may be loosened owing to a routing.

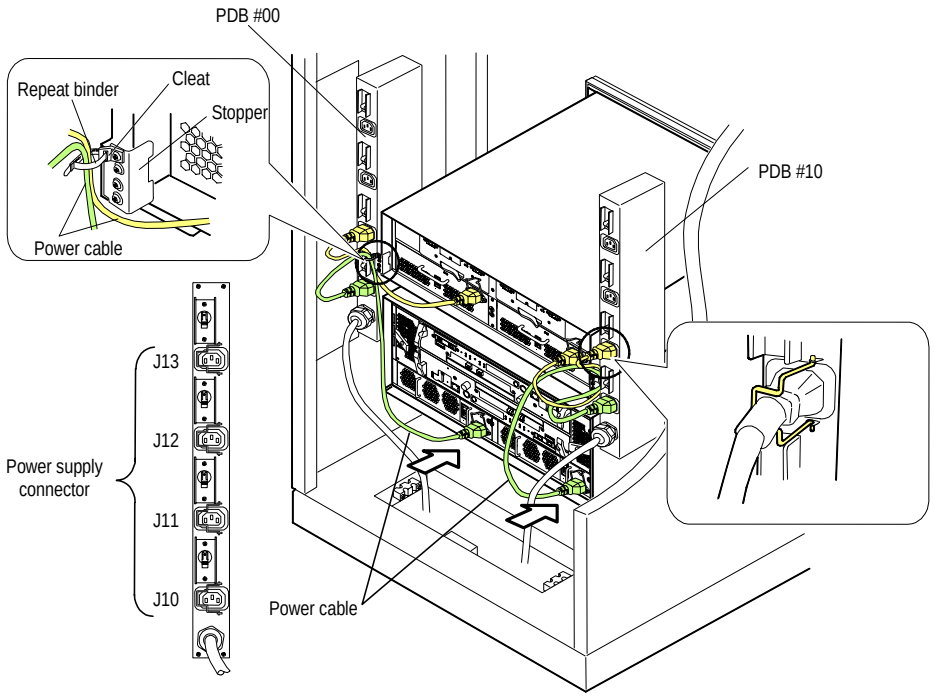

Figure 3.4.47 Routing Power Cables to the Mounted Subsystem

Copyright © 2005, 2006, Hitachi, Ltd.

(c) Connecting interface cables

(i) Connect the interface cables after making sure of the ports to be connected the label. (Refer to Figure 3.4.48.)

NOTE : When bending the interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(ii) Pull all the interface cables into the rack frame passing them through an opening for cables on the bottom plate of the rack frame.

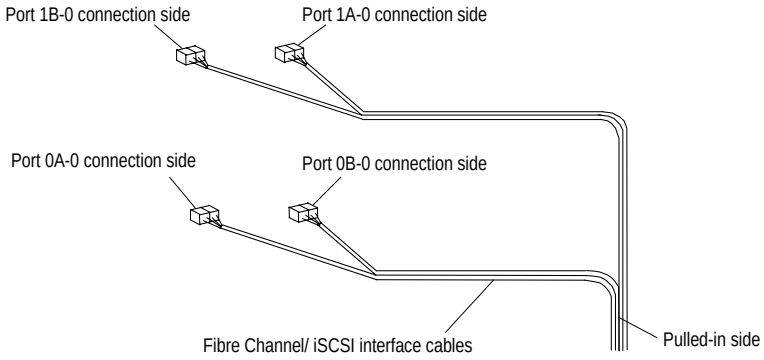

Figure 3.4.48 Binding Interface Cables

Copyright © 2005, 2006, Hitachi, Ltd.

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 500™

(iii) Fasten the Fibre Channel interface cables to the rack frame at the cable passing opening on the he bottom plate giving them excessive lengths so that they will not be pulled. When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

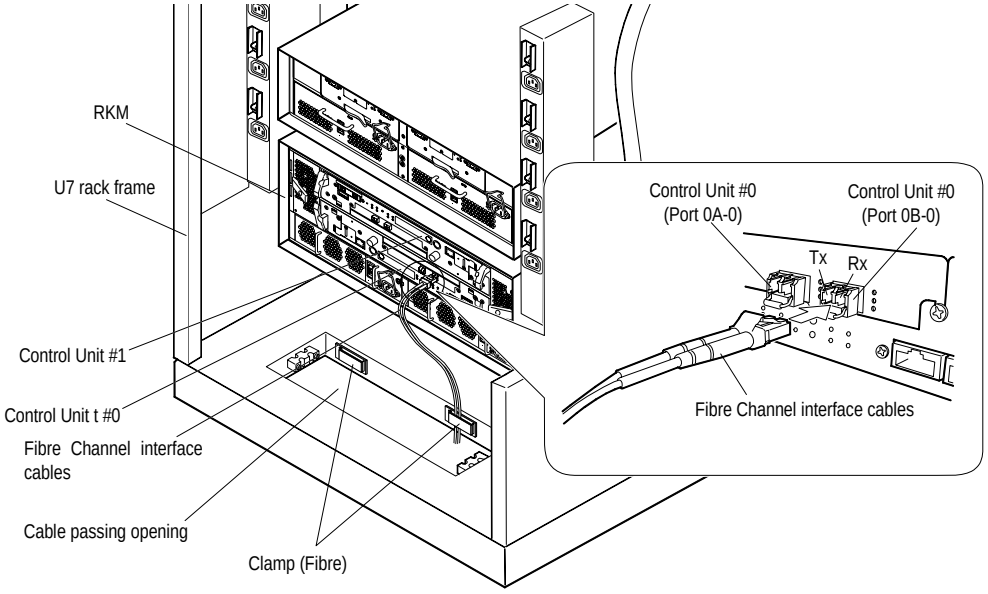

Figure 3.4.49 Routing Interface Cables (1)

Copyright © 2005, 2006, Hitachi, Ltd.

- When upgrading the Hitachi TagmaStore® AMS 200™, which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 500™

(iii) Fasten the iSCSI interface cables to the rack frame at the cable passing opening on the he bottom plate giving them excessive lengths so that they will not be pulled.

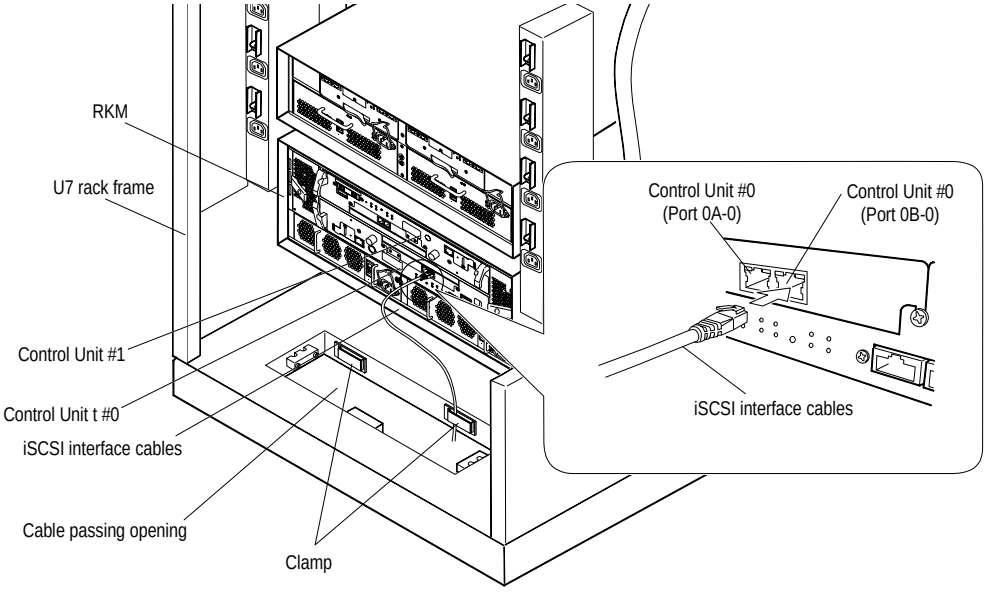

Figure 3.4.50 Routing Interface Cables (2)

(15) Connecting the Remote adapter/UPS

(a) When connecting the Remote adapter/UPS to the RKM, connect the Connector in the Control Unit.

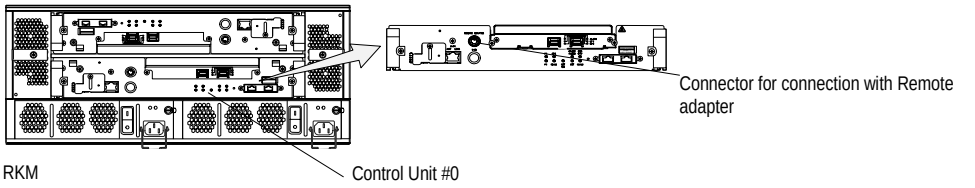

Figure 3.4.51 Physical Location of Connector on Subsystems for Remote Adapter/UPS Connection

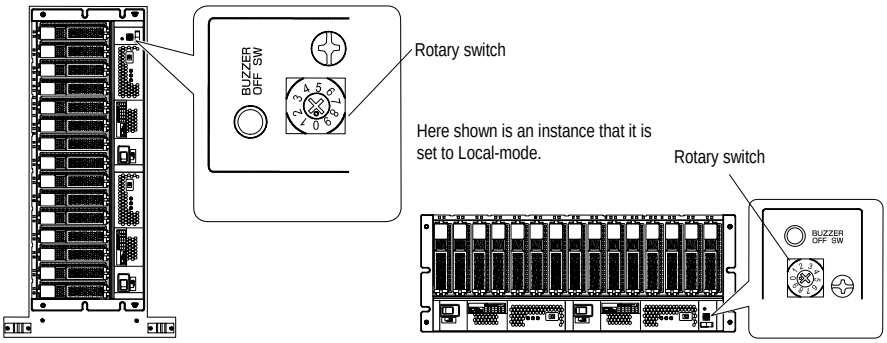
(b) Setting the Rotary switch.



Set the mode of power control. Either Local mode or Remote mode is set by the Rotary switch. Local/Remote mode settings and corresponding operation modes are shown below.

Rotary switch	Operation mode name	Operation mode
0	LOCAL	Local mode (Before shipment. When the remote adaptor is not used.)
1	—	—
2	REMOTE	Remote mode by means of the HOST AC (using a remote adapter)
3	—	—
4	UPS Interlock mode 1	Interlock mode 1 with an UPS exclusive for the subsystem To set the mode, connect AC#0 and AC#1 to the UPS and an external and an external AC power supply or the PDB of the U7 rack frame respectively.
5	UPS Interlock mode 2	Interlocking mode 2 with an UPS exclusive for the subsystem To set the mode connect AC#0 and AC#1 to the one UPS.(*1)
6	UPS Interlock mode 3	Interlocking mode 3 with an UPS exclusive for the subsystem To set the mode, connect each of AC#0 and AC#1 to the different UPSs.(*2)
7	—	—
8	—	—
9	—	—

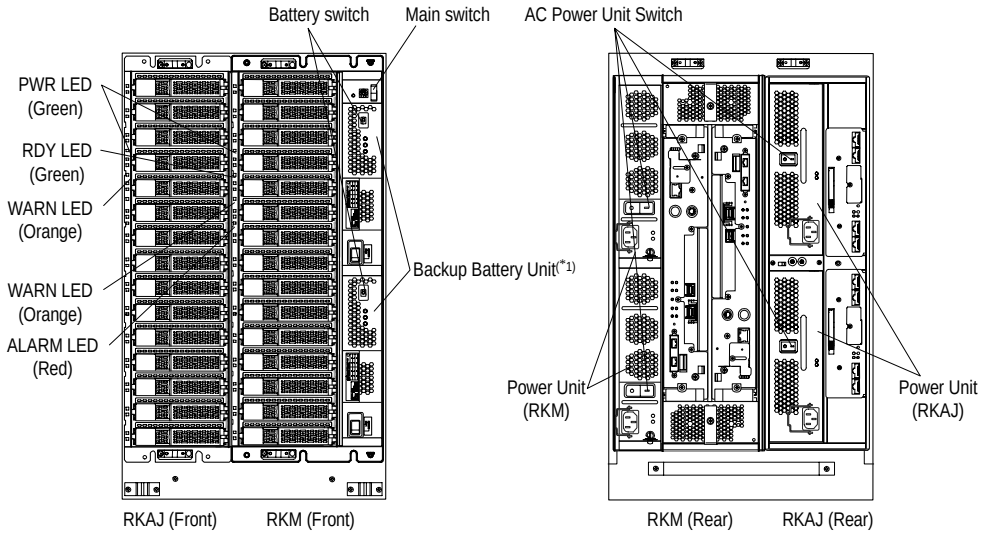
: Do not make this setting when the UPS is not connected.

*1 : The duplication of the power supply system becomes unable to be done.

*2 : This cannot be used in the case of the single controller configuration.

(a) Floor Model (b) Rackmount Model

Figure 3.4.52 Location of Rotary Switch for Setting Power Control Mode



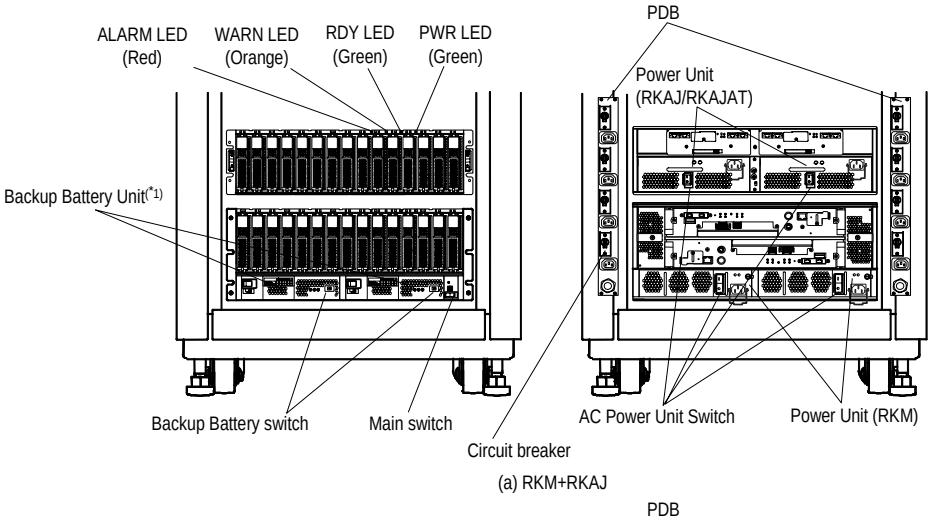
(16) Connect the maintenance PC to the disk array subsystem.

Connect the maintenance PC to the RKM referring to Step "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.13 Subsystem power on

(1) In the case of Floor model, make sure that the AC Power Unit Switch of the Power Unit is turned off.
In the case of Rackmount model, make sure that the circuit breaker is turned off.
(2) Make sure that the main switch is turned off.
(3) All turn on the battery switch of the Backup Battery Unit on the front of the subsystem.
(4) In the case of Rackmount model, turn on the circuit breaker of the PDB.
(5) Turn on the AC Power Unit Switch of the Power Unit. (‡1)
(6) Turn on the main switch.
(7) Make sure that the ALARM LED (red) on the Front Bezel of the RKM comes on.
At this time, the Disk Drive, which was spun down due to the power saving of the priced option, also spins up in SANRISE AMS200. When the array subsystem finally becomes a ready status as SANRISE AMS500, the Disk Drive set tot the power saving spins down.
(8) Check if the CALM LEDs (red) on the both Control Units light on.



*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the lower side of the subsystem.

Figure 3.4.53 Location of Switches for Power On (Floor Model)

‡1 : When Disk Drives are not installed on the additional Disk Drive, shut off the power to the Power Unit (RKAJ).

Copyright © 2005, 2006, Hitachi, Ltd.

(a) RKM+RKAJ

*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the left side of the subsystem.

Figure 3.4.54 Locations of Switches for Power On (Rackmount Model)

(9) Connect the WEB by connecting the LAN cross cable to the LAN connector for maintenance on the disk array subsystem. (“3.4.5 (2) Connecting the LAN cross cable” (SUP 03-0120))

(10) Select the [Information Message].

(11) Check that [RB8400 Download failed] message is displayed in [Information Message], and move on to the next operation.

NOTE : When the checked contents in the operation (7), (8) , (11) are not shown as above, the operation so far may have errors. Refer to “Chapter 4. Trouble Shooting” (SUP 04-0000) to solve the problem.

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.14 Updating installation of microprogram for Hitachi TagmaStore® AMS 500™

Install the microprogram for the Hitachi TagmaStore® AMS 500™ (latest revision) using the WEB.

Check if the microprogram revision is 0710/A-M or later.

(1) The point to be checked before installation

Make sure of the following before starting installation

- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem. (refer to Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).)

(2) Procedure for installation

(a) Press the RST SW of the Control Unit #0. (While pressing RST SW, the RST LED is on.)

Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

(b) Press the RST SW of the Control Unit #1 immediately (within ten seconds) checking the CALM LED (red) of the Control Unit#0 comes on.

(Sometimes the buzzer may beeps when the RST SW is pressed, however, you do not have to stop it until these operations are completed.)

When the CALM LED on the Control Unit #0 does not go out after that, turn off the subsystem power and then turn it on without pulling out and inserting the Control Unit. Then, return to Step (1) and do all the works over again.

NOTE : Because the Control Unit is shutdown status for the Maintenance Mode, the command from the host is impossible execution.

When CALM LED on Control Unit #0 turns off and READY LED on Front Bezel turns off, it transfers to Maintenance mode.

Copyright © 2005, 2006, Hitachi, Ltd.

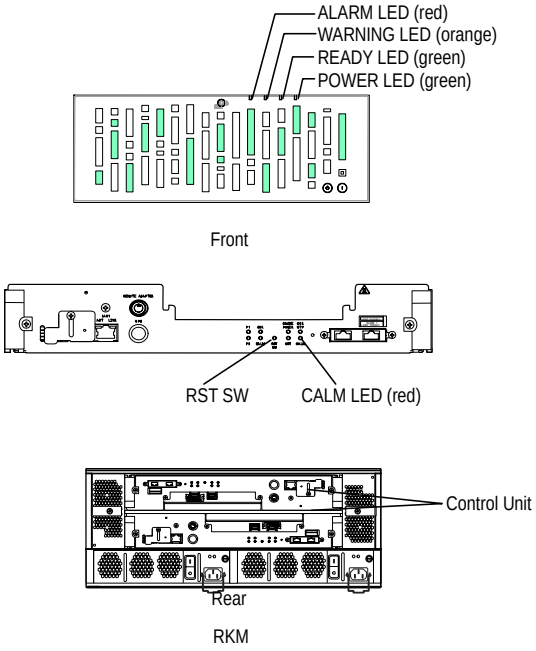

Figure 3.4.56 Indication Position

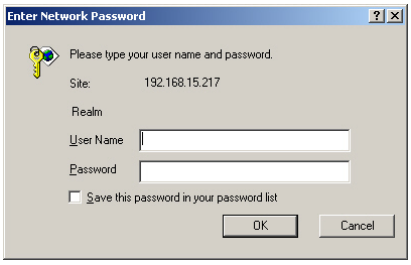
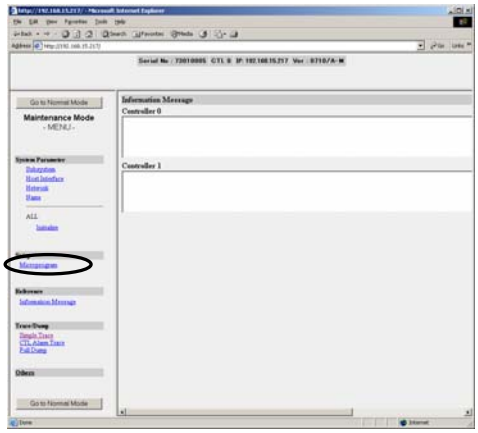
Illustrations in Figure 3.4.56 show cases of the rackmount model. They are the same for the floor model.

NOTE : • Set the TCP/IP to "Disable DNS" because the connection takes a long time when the TCP/IP of the network is set to the condition in which the DNS is used. For the setting procedure, refer to the instruction manual of the PC to be used.
• Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used. To make sure the setting, refer to the instruction manual of the browser to be used.



Copyright © 2005, 2006, Hitachi, Ltd.

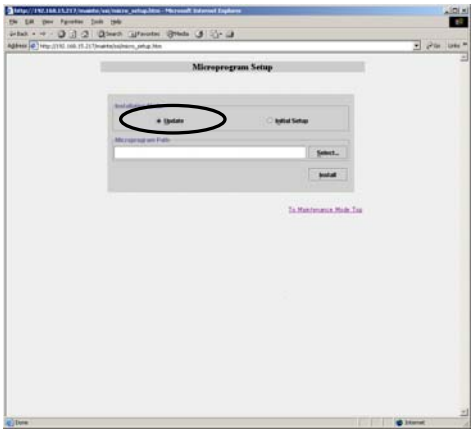
(c) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the Web.



(d) Please input the IP Address of the Control Unit where it was connected with the network to the browser. Please input the page by the update button of the browser if it has already been connected with WEB.

NOTE : The contents that were set up with "System Parameter" and the Microprogram that was installed with "Setup" come into effect after the rebooting of the Control Unit.

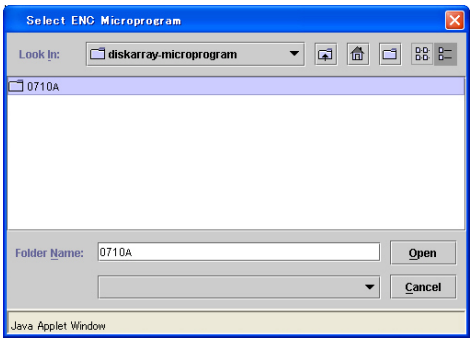
A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].



(e) Click "Maintenance", "Setup", and "Microprogram" in this order in the Web window.

Copyright © 2005, 2006, Hitachi, Ltd.

(f) When the Microprogram Setup window is displayed, check the "Update" radio button of the "Installation Mode."

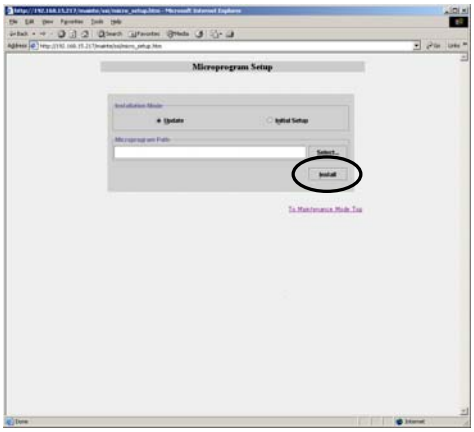


(g) Set the microprogram path.

Specify the Unified version directory(‡1) in which the microprogram that has been copied to the service PC is stored.

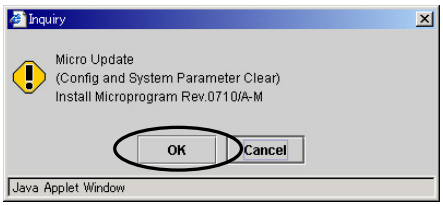
When the "Select" button is clicked, the "Select Microprogram" window is displayed.

Select the Unified version directory in which the microprogram is stored and click the "Open" button.

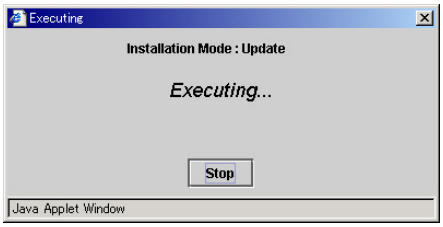


NOTE : If the window is not displayed, the JRE 1.3.1 03 may have not been installed or the installation of it may have failed.
Perform the installation of the JRE 1.3.1 03 (See Refer to the (i) of (3) in Subsection 3.4.7) again.

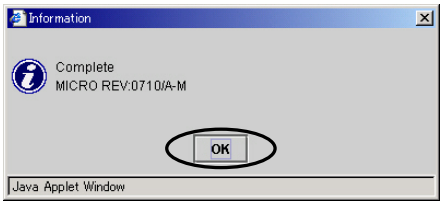
‡1 : For the unified version directory, refer to "3.4.8 (2) Hierarchy of Microprogram Storage Directories" (SUP 03-0200).



Copyright © 2005, 2006, Hitachi, Ltd.

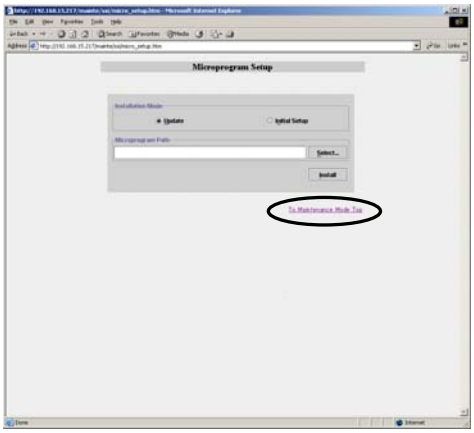


(h) Click the [Install] button to install the microprogram.

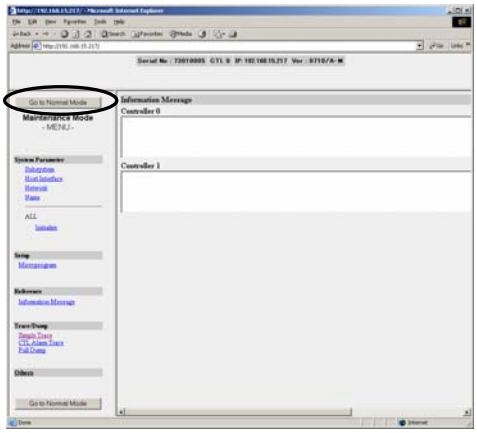


(i) The following window that asks for confirmation is displayed. When the [OK] button in the window is clicked, the installation is started.

NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the window in the procedure (j) was displayed, execute the update installation procedure again from the beginning.

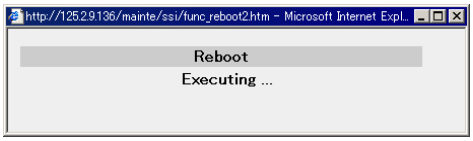


(j) When the installation is completed, the completion window is displayed. Click the [OK] button.

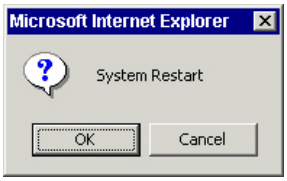


Copyright © 2005, 2006, Hitachi, Ltd.

(k) Go to the "Maintenance Mode" window by clicking "To Maintenance Mode Top" in the Microprogram Setup" window.



(l) Change the mode from Maintenance to Normal by clicking the [Go to Normal Mode] button.



(m) When the [Go to Normal Mode] button is clicked, the following window is displayed.

NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the display of the following window disappears, click [View] – [Refresh] of the menu bar or the [Refresh] button of the tool bar, and then update the page of WEB.
After that, click the [Go to Normal Mode] button when the main window is displayed.

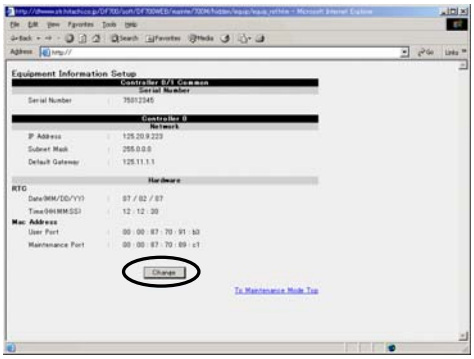
Copyright © 2005, 2006, Hitachi, Ltd.

(n) Click the [OK] button.

(o) The subsystem becomes ready in about four minutes.
Make sure that the READY LED of the front bezel is on.
If the READY LED does not come on, the installation may have failed. Perform the installation over again.

NOTE : • When [Abnormal End Empty System Retry Full Install] is displayed, refer to the recovery procedure, "4.2 When Abnormal End Empty System Retry Full Install occurs" (SUP 04-0050).
• After the updating installation is executed, the configuration of the disk array subsystem becomes unable to be returned to that of the Hitachi TagmaStore® AMS 200™ at the time when the subsystem enters the Ready status.

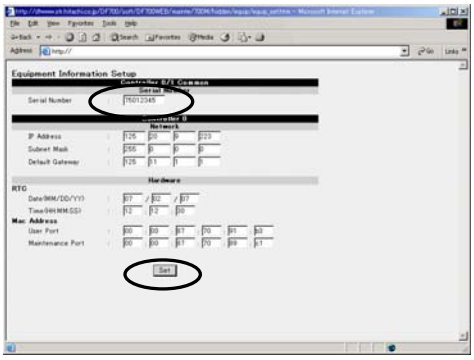
Copyright © 2005, 2006, Hitachi, Ltd.



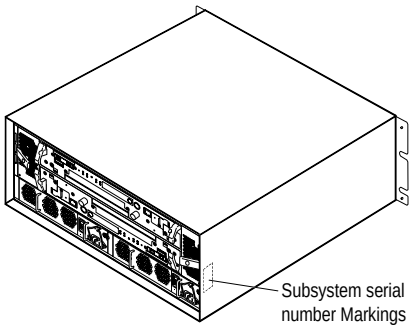
3.4.15 Setting serial number of disk array subsystem

Change the serial number of the disk array subsystem through the hidden WEB window using the serial number setting up function.
The procedure is shown below.

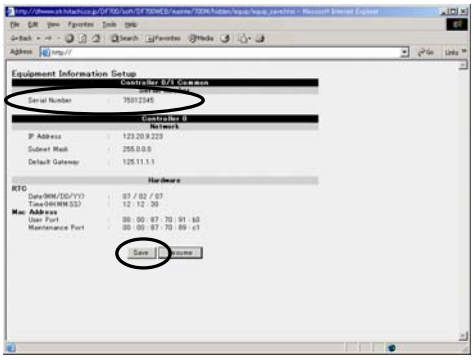
(1) Set the operation mode in the Maintenance Mode. (“3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem” (SUP 03-0130))



(2) Enter “http://(IP address of the disk array subsystem)/equip_set” in the [Address].
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input “maintenance” for the [User Name] and “hosyu9500” for the [Password].



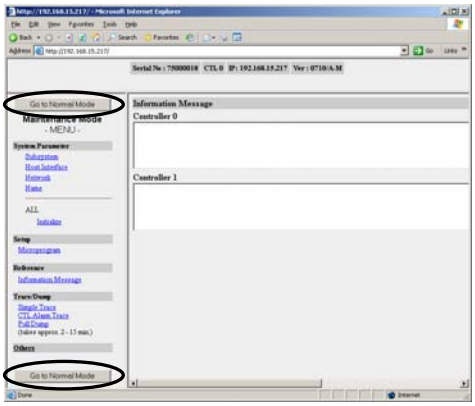
(3) Displayed the [Equipment Information Setup].
Click the [Change] button.



Copyright © 2005, 2006, Hitachi, Ltd.

(4) Enter a serial number in the [Serial Number] box and click the [Set] button.
The serial number is an eight figure number indicated in the section for the serial number in Figure.

(5) After making sure that the change to be made is correct, click the [Save] button.



The subsystem serial number is changed.

Copyright © 2005, 2006, Hitachi, Ltd.

(6) Enter "http://(IP address of the disk array subsystem)/" in the [Address].

(7) Change the mode from Maintenance to Normal by clicking the [Go to Normal Mode] button.

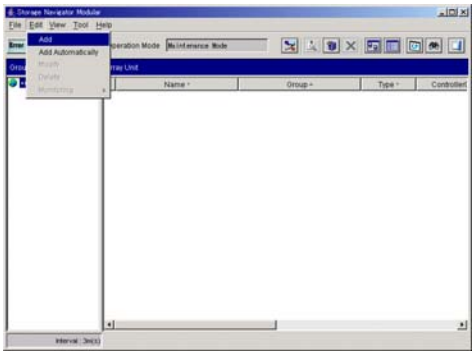
When the [Go to Normal Mode] button is clicked, the following window is displayed.

(8) Click the [OK] button.

(9) The subsystem becomes ready in about 4 to 15 minutes.
Make sure that the RDY LED of the RKM is on.

(10) Quit the WEB.

Copyright © 2005, 2006, Hitachi, Ltd.



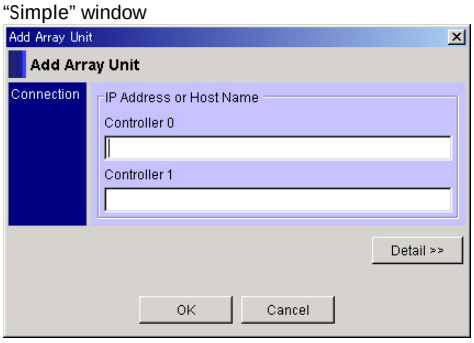
3.4.16 Registration of Hitachi TagmaStore® AMS 500™

Register the Hitachi TagmaStore® AMS 500™ that does the up-grade to Storage Navigator Modular.
The procedure is shown below.

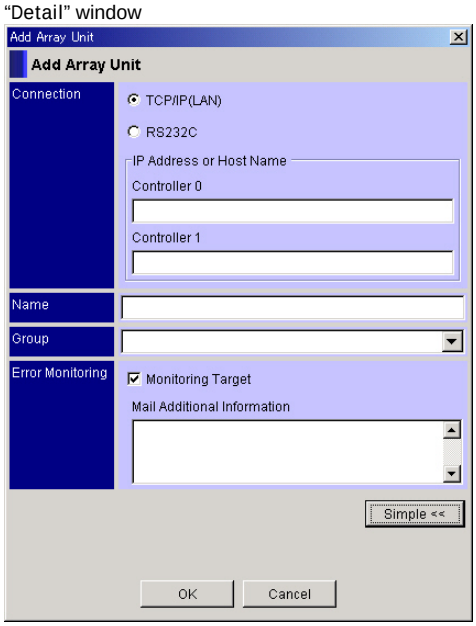
(1) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular. ("3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120))

(2) Set the operation mode of Storage Navigator Modular as Maintenance mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130))

(3) Click the icon of an array unit on the Main screen. On the [Edit] menu, click [Add].



Copyright © 2005, 2006, Hitachi, Ltd.



(4) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.

NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. [Array Unit Type] is used to select a type of the subsystem to be connected. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.
• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

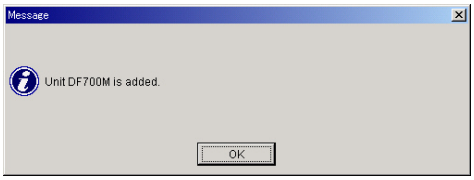
"Simple" window

"Detail" window

[Connection] : Select TCP/IP (LAN) connection to be used for the disk array subsystem.
When connecting the LAN, select the [TCP/IP (LAN)], and then specify the [IP Address], [Host Name], and [IP Address] or [Host Name] of controller 0 and 1.

[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).
The maximum number of the groups allowed to be registered is 200. The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.



Copyright © 2006, Hitachi, Ltd.

This page is for editorial purpose only.

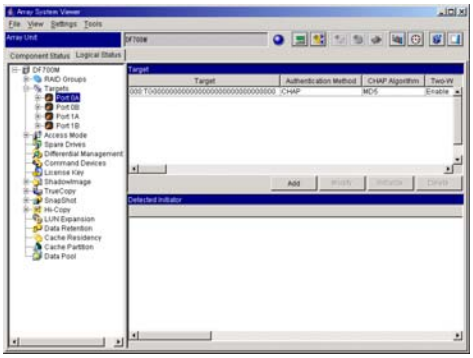
Copyright © 2006, Hitachi, Ltd.

[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

(5) When a registration completion message appears, click the [OK] button.

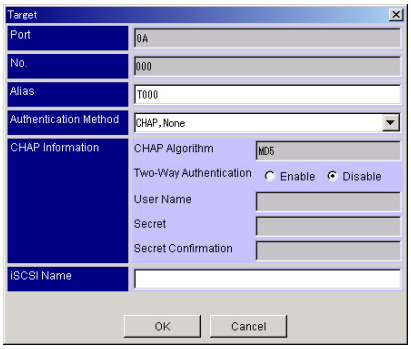
The Main screen is updated and then displayed.

(6) When the property window is open, click the [Close] button.
(7) Close the unit window. Quit Storage Navigator Modular by selecting [File] and [Exit] in this order in the main window or clicking the [: Exit] button.



Copyright © 2005, 2006, Hitachi, Ltd.

3.4.17 iSCSI Name change of Target

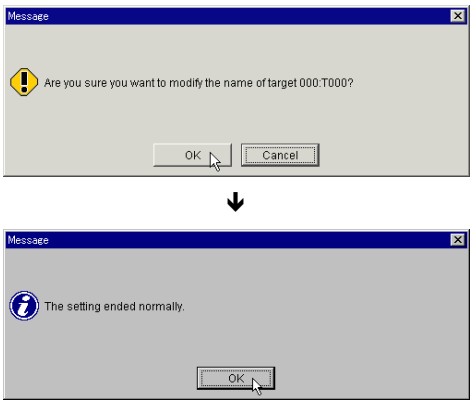


The procedure to upgrade the Hitachi TagmaStore® AMS 200™, which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 500™ is shown.
For Targets, only the "000:T000" is supported.

NOTE : Up to 128 targets can be set when the LUN Manager, which is an extra cost optional feature, is used.
In that case, change all the Target iSCSI Names.

(1) Click the [Logical Status] tab in the unit screen.
(2) Double-click the port which changes the information on the two-way authentication, select [000:T000], and click the [Modify] button.

(3) The "Target" dialog is displayed.
Change the "iSCSI Name".



① [iSCSI Name] : Enter the name of the iSCSI Name with 233 or less alphanumeric character. A period (.), hyphen (-), and colon (:) can be used.

(4) Click the [OK] button.

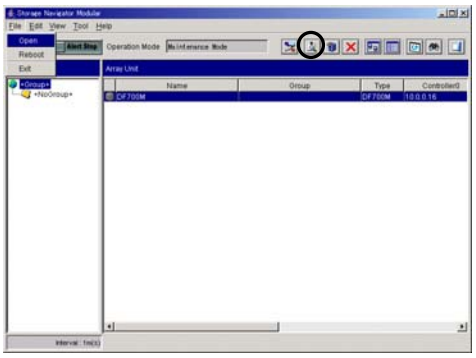
Copyright © 2006, Hitachi, Ltd.

(5) The confirmation message is displayed. Select the [OK] button.

Copyright © 2006, Hitachi, Ltd.

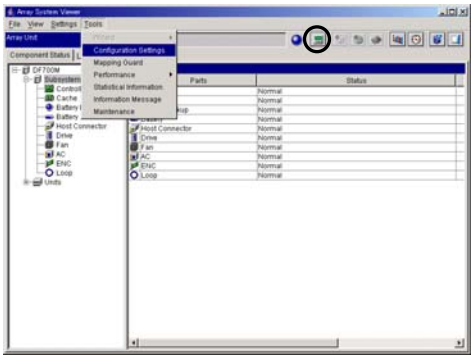
3.4.18 Other settings

The procedure to upgrade the Hitachi TagmaStore® AMS 200™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 500™ is shown. When the RKS, which was using the Mini-HUB, was upgraded to the RKM, perform the following settings of (1) to (5) as needed.



(1) Setting the Port Options

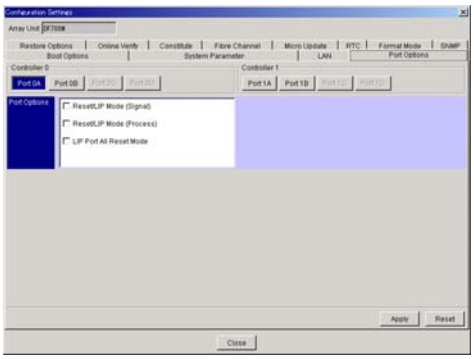
(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).



(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)

(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

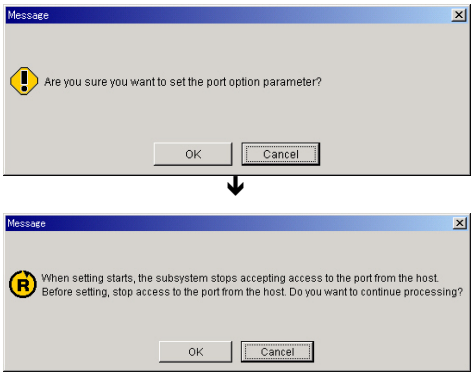


(d) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

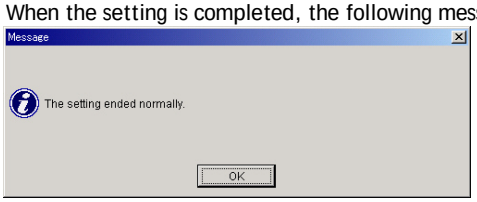
Copyright © 2005, 2006, Hitachi, Ltd.

(e) Click the [Port Options] tab. The window for setting the "Port Options" is displayed.

(f) Click the [Port 0A] button.



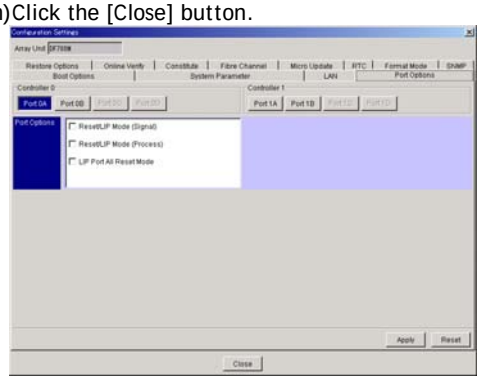
(g) Check the set contents.



(h) Specify a port options. Select an option you want to set by clicking its check box.

(i) When the setting is completed, click the [Apply] button at lower right corner of the window.

(j) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



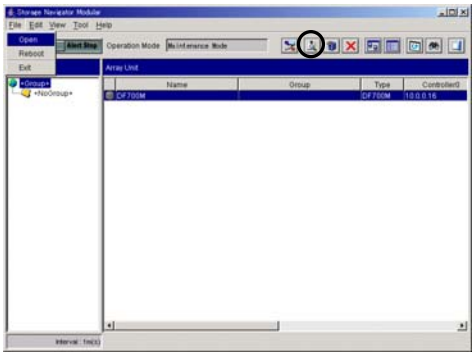
(k) When the setting is completed, the following message is displayed. Click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(l) The setting/verification of the port 0A is completed. Do the same for the other ports.

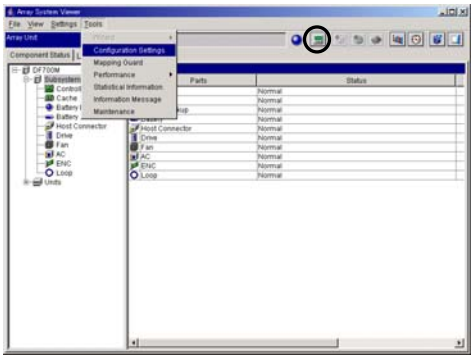
(m) Click the [Close] button.

Copyright © 2005, 2006, Hitachi, Ltd.



(2) Setting the Fibre Channel

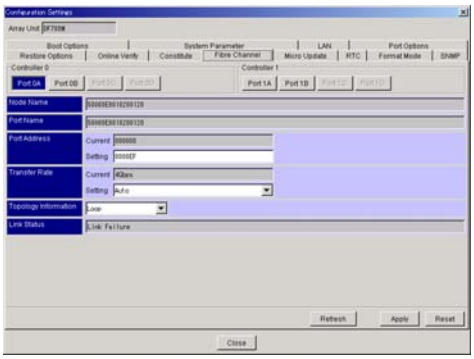
(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).



(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)

(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

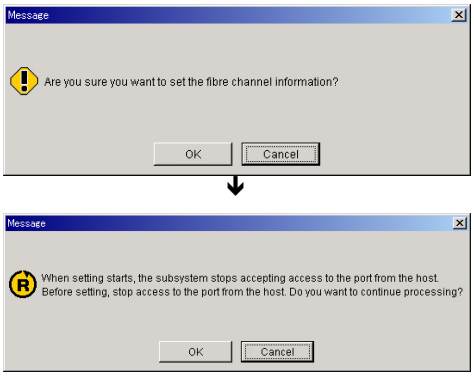


(d) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

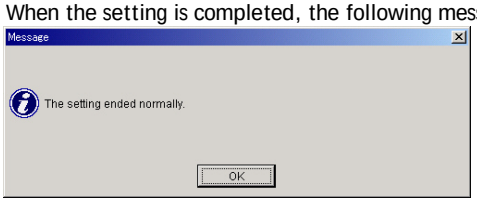
Copyright © 2005, 2006, Hitachi, Ltd.

(e) Click the [Fibre Channel] tab. The window for setting the "Fibre Channel" is displayed.

(f) Click the [Port 0A] button.



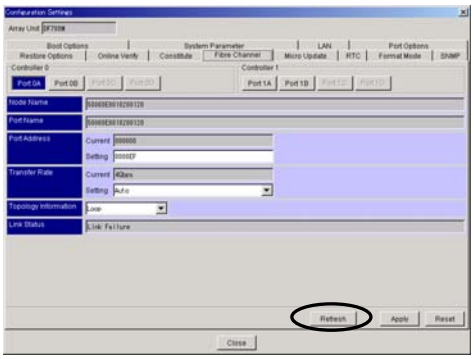
(g) Check the set contents.



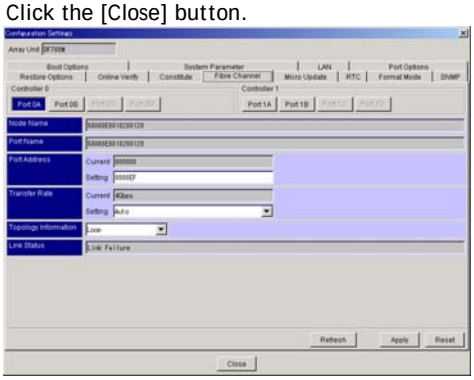
(h) Setting value of [Port Address], [Transfer Rate] and [Topology Information].

(i) When the setting is completed, click the [Apply] button at lower right corner of the window.

(j) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



(k) When the setting is completed, the following message is displayed. Click the [OK] button.



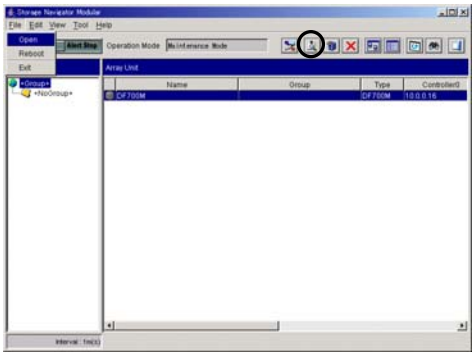
Copyright © 2005, 2006, Hitachi, Ltd.

(l) Click the [Refresh] button at the lower right part of the window to check if the setting is reflected on the display.

(m) The setting /verification for the Port 0A is completed. Do the same for the other ports.

(n) Click the [Close] button.

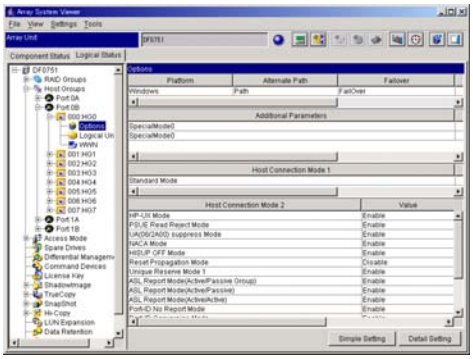
Copyright © 2005, 2006, Hitachi, Ltd.



(3) Setting the Host Group Options

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

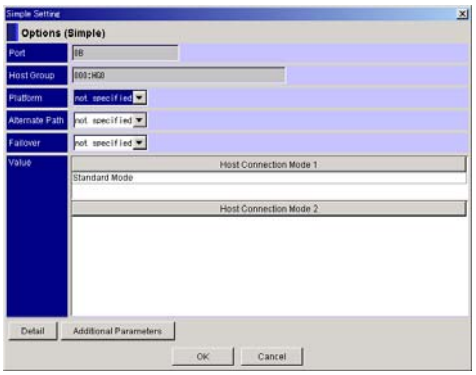
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)



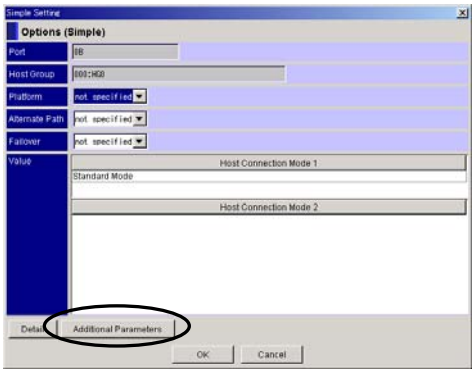
(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.

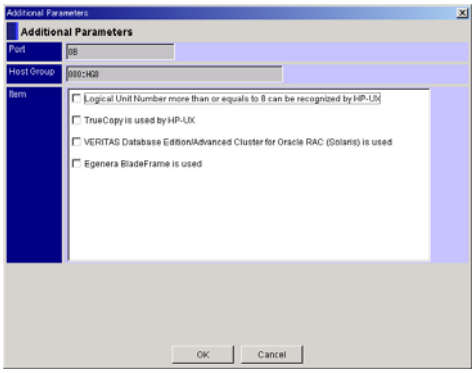


(e) Display the [000: G000] by double clicking the [Port XX] for which you want to set the mode for connecting a host after double clicking the [Host Groups].
Display the option and logical unit by double clicking the [000: G000], and then click the [Options].



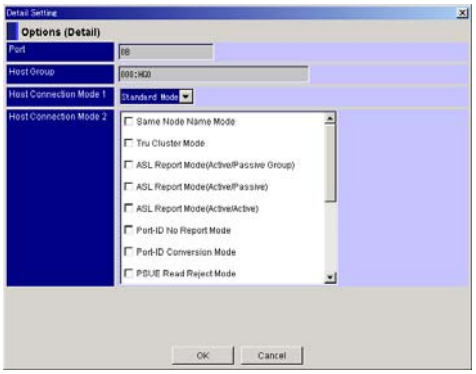
Copyright © 2005, 2006, Hitachi, Ltd.

(f) Click the [Simple Setting] button that is displayed at the lower right part of the window.



(g) "Option (Simple)"Property window is opened.
Select [Platform], [Alternative Path], and [Failover] that conform to the environment of a host to be connected.

(h) Click the [Additional Parameters] button.



(i) The "Additional Parameters" window is opened. Select the [Item] as occasion demands and click the [OK] button.

Copyright © 2005, 2006, Hitachi, Ltd.

(j) Click the [Detail] button as occasion demands.

(k) Select [Host Connection Mode 1] and [Host Connection Mode 2] and click the [OK] button.

(l) Click the [OK] button in the "Option (Simple)" window.

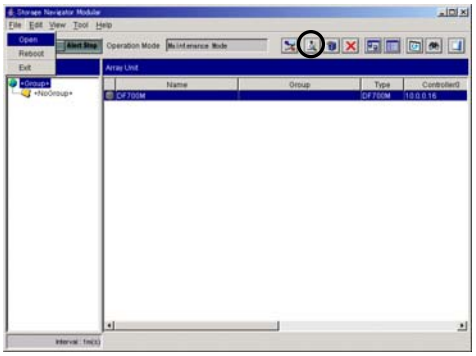
(m) The setting that has been made is displayed.

Make sure that the selected host environment (platform, alternate path, and failover) and the Additional Parameter are reflected in the display. Besides, when you have set the host connection mode 1 and 2 directly, make sure that the mode that has been set is reflected in the display.

(n) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

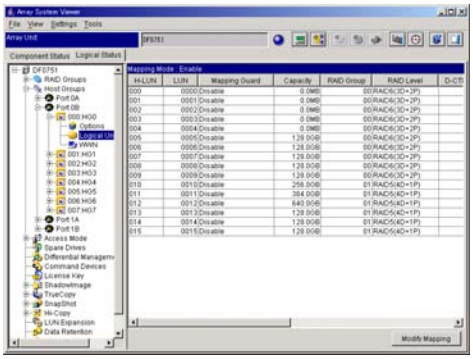
Copyright © 2005, 2006, Hitachi, Ltd.



(4) Setting the LU mapping

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

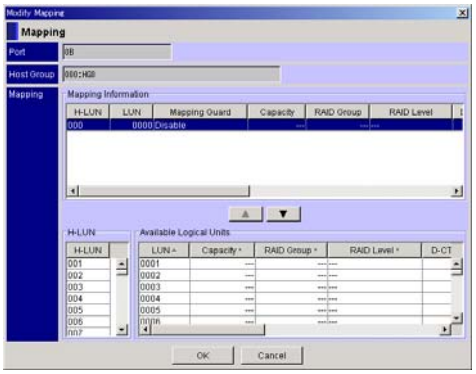
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)



(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

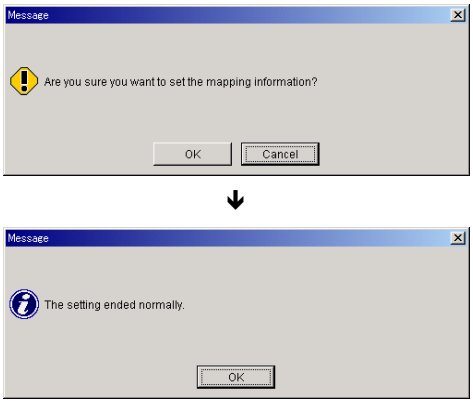
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.



(e) In the unit window, display [000: G000] by double clicking the [Port XX] to be specified after double clicking the [Host Groups].
Display the [Option] and [Logical Unit] by clicking the [000:G000], and then click the [Option].

(f) Click the [Modify Mapping] button that is displayed at the lower right part of the window.



Copyright © 2005, 2006, Hitachi, Ltd.

(g) Select one H-LUN from the [H-LUN] list of the mapping. Then select one LUN you want to map on the H-LUN from the list of the [Available Logical Units] and click the [▲] button.

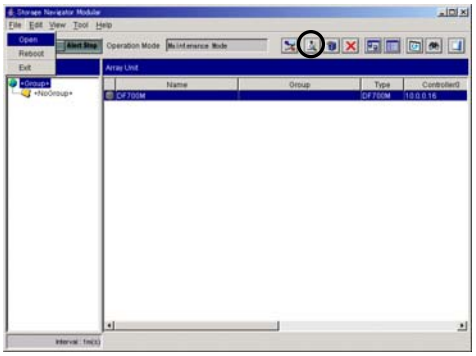
The H-LUN and LUN that were selected are moved to the [Mapping Information] list.
Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

(i) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

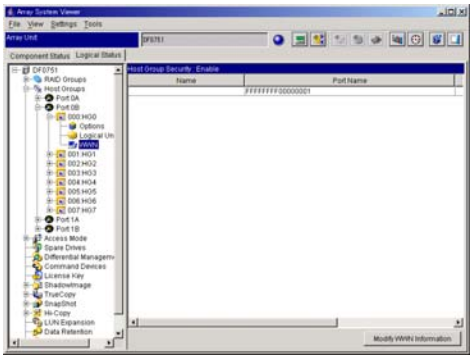
Copyright © 2005, 2006, Hitachi, Ltd.



(5) Setting the Host Group Security

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

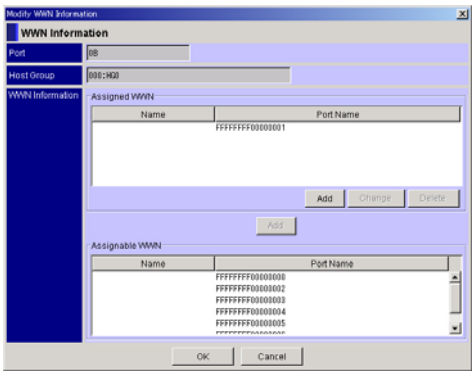
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130).)



(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

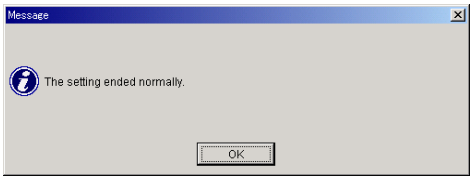
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.



(e) Double click the [Host Groups] in the tree, and then double click the port for which you have validated the host group security. Select [WWN] by clicking the [000:G000].

(f) Click the [Modify WWN Information] button that is displayed at the lower right part of the window.



Copyright © 2005, 2006, Hitachi, Ltd.

(g) Select WWN Information in the [Assignable WWN] list and select the [Add] button.
The WWN moves from the [Assignable WWN] list to the [Assigned WWN] list.
When the WWN to be assigned to a Host Group is not listed in the [Assignable WWN] list, input and add the WWN.

Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

(i) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.19 Changing the registration information for the monitoring failures

Change the device model name of the SNMP Agent Support Function from the RKS to the RKM.

3.4.20 Works to be done after the upgrade is completed

When all the upgrade works are completed, do the works such as removal of the maintenance PC.
The procedure is shown below.

(1) Disconnect the maintenance PC from the disk array subsystem referring to the instruction given in Step "3.4.5 (2) Connecting the LAN cross cable" (SUP 03-0120).

(2) Attach the Front Bezels to the RKM by executing the procedure "3.4.12 (2) Removing the Front Bezels and rear covers" (SUP 03-0480) in reverse order.

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

(3) Close the rear door referring to the instruction given in Step "3.4.12 (3) Open the Rear Door of U7 rack frame" (SUP 03-0510).
Make sure that the rear door is latched and cannot be opened.

3.4.21 Resetting of the Host

Reboot the connecting Host and execute the setting.
For notes, refer to "5.1 For Setting Changes in Host Computer and Others" (SUP 05-0000).

Copyright © 2005, 2006, Hitachi, Ltd.

3.4.22 Revalidation the TrueCopy remote replication

This operation is not required when TrueCopy remote replication is not used.
Perform the revalidation
For example, even when the remote disk array subsystem is upgraded as shown in Figure 3.4.57, the microprogram of the local disk array subsystem must be updated.

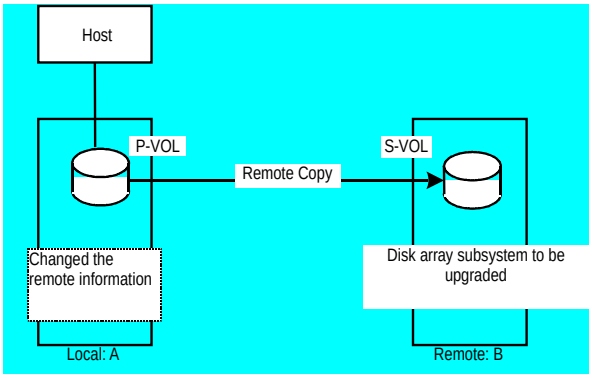


Figure 3.4.57 Change the Remote Information

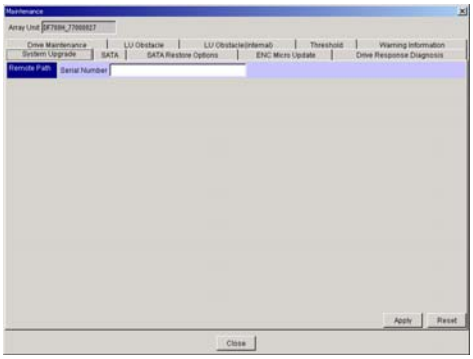
The procedure is shown below.

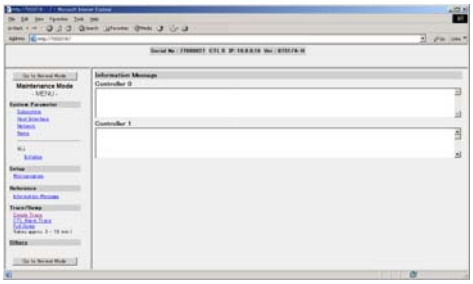


(1) Connect the service PC to the other one of the two subsystems paired by TrueCopy remote replication.
(2) Start Storage Navigator Modular and register the other one of the two subsystems paired by TrueCopy remote replication.
(3) Changing settings of the disk array subsystem
It is required to change remote information of the disk array subsystem that has not been upgraded. Make the change as shown below.
(a) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular.
(b) Set the operation mode of Storage Navigator Modular as Maintenance mode.
(c) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.
(d) Select [Tools] and [Maintenance] in this order in the unit window.
(e) Click the [System Upgrade] tab.
Take down notes of the displayed serial number in the following blank lines.

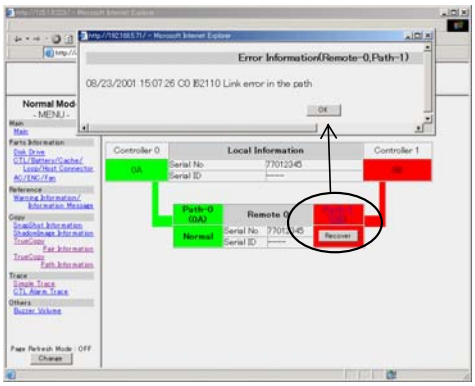
Serial Number: _____

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Change the serial number.



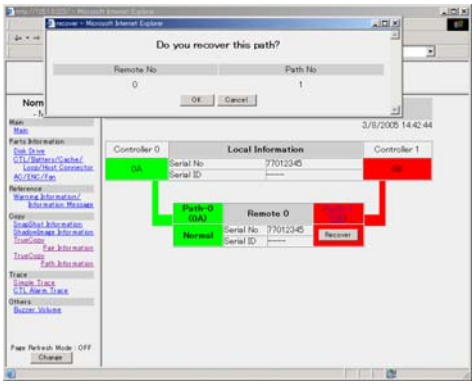
Enter the serial number of the disk array subsystem that has been upgraded.



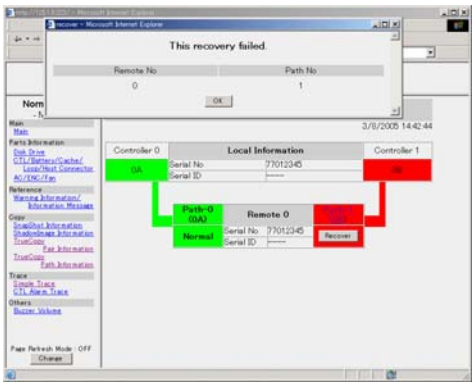
(4) Revalidate the path using the Web.

Perform the revalidation through the "TrueCopy Path Information" window.

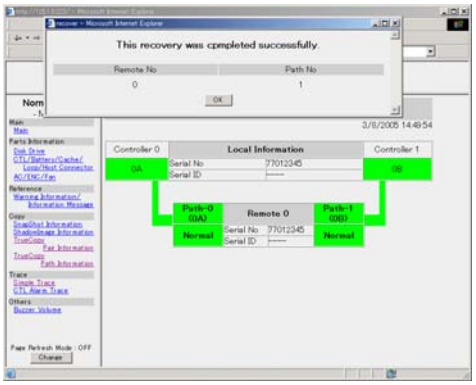
Screen 1: Image of the "Information Message" window



Screen 2: Image of the "Path Detachment Factors" window



Copyright © 2006, Hitachi, Ltd.



Screen 3: Image of the "Revalidation Instruction" window

Screen 4: Image of the "Revalidation Result" window (for the case where the operation terminated abnormally)

Screen 5: Image of the "Revalidation Result" window (for the case where the operation terminated normally)

Copyright © 2006, Hitachi, Ltd.

(5) Restart RAID Manager. Start the HORCM using the "horcmstart" command.
It is necessary to set an environmental variable (for TrueCopy) of the environment in which the command is executed. This example of the setting is premised on a configuration in which two instances in the same server (Windows NT®/Windows® 2000) use the same command device.

(a) Set an environmental variable that shows the each instance number. Enter the following via the command prompt window.

```
c:¥horcm¥etc>set HORCMINST=0
```

(b) Execute the horcm starting script, and then make sure of the configuration by executing the pairdisplay command.

```
c:¥horcm¥etc>horcmstart 0 1
starting HORCM inst 0
HORCM inst 0 starts successfully.
starting HORCM inst 1
HORCM inst 1 starts successfully.

Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)    (CL1-A , 1,   1)    174      1..P-VOL PSUS NEVER ,   175      2   -
vg01     oradb1(R)    (CL1-B , 1,   2)    175      2..S-VOL SSUS NEVER ,-----       1   -
```

A preparation for starting TrueCopy has been completed.

(6) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
The method for resynchronizing a TrueCopy remote replication pair is explained below.

(a) Set the group name in the configuration definition file as "vg01".
Resynchronize a TrueCopy remote replication pair, which has been split, using the pairresync command. When doing this, be sure to set the value of the -c option, which specifies the copy speed, as 15. Furthermore, make sure that the status of each volume becomes PAIR by executing the pairevtwait command.

```
c:¥horcm¥etc>pairresync –g vg01 –c 15
c:¥horcm¥etc>pairevtwait –g vg01 –s pair –t 300 10
pairevtwait : Wait status done.
```

Figure 3.4.58 Examples of Input and Output Results of Pairresync Command

(b) Make sure of the status and configuration of the resynchronized pair by executing the pairdisplay command.

```
c:¥horcm¥etc>pairdisplay -g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)    (CL1-A , 1,   1)    174      1..P-VOL PAIR NEVER , 174        2   -
vg01     oradb1(R)    (CL1-B , 2,   2)    175      2..S-VOL PAIR NEVER ,-----       1   -
```

The TrueCopy remote replication pair has been resynchronize. For details of the pairsplit command and its options, refer to Chapter 4 in the "RAID Manager System Administrator's Guide (Hitachi TagmaStore® AMS Series)".

4.1.2 Failure messages

Message code	Message text	Description	Collect the error			Recovery measures
			Simple Trace	CTL Trace	Full Dump	
HH13B0	System change failed [PIN]	The upgrade cannot be made because the system change has not been made normally and a pinned segment exists.		Gather		① Return the Disk Drives to the lower grade model, restart the subsystem, clear the pinned segment, and then make the upgrade again.
HH13B1	System change failed [PSOFF]	The upgrade cannot be made because the system change has not been made normally.		Gather		① Return the Disk Drives to the lower grade model, restart the subsystem, execute the deliberate shutdown, and then make the upgrade again.
HH2B00	Upgrade failed [PSOFF]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the deliberate shutdown had not been executed.	Gather			① Set the downgrade check as Disable, and then install the lower grade model microprogram to update it. ② After the updating installation is completed, turn off the AC Power Unit Switches of all the disk array units and return the hardware configuration of the disk array unit concerned to that of the lower grade model. ③ Turn on the AC Power Unit Switches of all the disk array units and execute the deliberate shutdown after the disk array units become ready. ④ Make the upgrade from the lower grade model to the higher grade model again.
HH2C00	Upgrade failed [Single]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the System Startup Attribute was set as the Single mode.	Gather			① Do the upgrading installation of the microprogram for the lower grade model after disabling the installation guard. ② Power off the subsystem after the updating installation is completed. ③ Return the hardware configuration to that of the lower grade model. ④ Change the mode to the Maintenance mode after booting the subsystem while it is the lower grade model. ⑤ Execute the “Go to Normal Mode” after setting the “System Setup Attribute” as the “Dual Active Mode”. ⑥ Boot the subsystem. ⑦ Execute the procedure for the upgrade from the lower grade model to the higher grade model.
HH2D00	Upgrade failed [microprogram revision]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the microprogram revisions of the lower grade model and higher grade model were not the same.	Gather			① Install the higher grade model microproram revision, which is the same as the lower grade model microprogram revision in the drive.

Copyright © 2005, 2006, Hitachi, Ltd.

Message code	Message text	Description	Collect the error			Recovery measures
			Simple Trace	CTL Trace	Full Dump	
HH2F00	Downgrade failed [Subsystem can not take over the user data]	The subsystem start-up of the lower model failed because it tried to downgrade from the upper model to the lower model.	Gather			① Execute the initial setup to the subsystem that is the hardware configuration of the lower model, and start up the subsystem when operating the subsystem as a lower model. ② Turn on all the AC input power supply switches of the subsystem after returning the hardware configuration of the subsystem to the status that is upgraded to the upper model, and start up the subsystem of the upper model when operating the subsystem as an upper model.
HZ0300	Not enough Cache memory to use QuickShadow function	The capacity of the cache memory is not sufficient to use the Copy-on write SnapShot function.		Gather		① Increase the cache memory capacity to 2 Gbytes per controller.
HZ0S00	Not enough Cache memory to use Cache Partition Manager	The Cache capacity to use Cache Partition Manager was insufficient due to the upgrade of the model.	Gather			① Add the Cache memory in the capacity to be able to upgrade the model.

Copyright © 2005, 2006, Hitachi, Ltd.

4.1.3 WEB error messages

Message code	Message text	Description	Recovery measures
—	Abnormal End Empty System Retry Full Install	The updating installation of the microprogram cannot be done because the old microprogram does not exist in the system disk drive.	① In the case where this message is displayed when the microprogram is installed in the subsystem of the higher grade model for the purpose of update during the upgrade from the lower grade model to the higher grade model, take recovery actions according to Section "4.2 When Abnormal End Empty System Retry Full Install occurs" (SUP 04-0050). ② When it is evident that the old microprogram does not exist in the system disk drive, install the microprogram newly. ③ When this message is displayed in a case other than the case ① or ②, execute the updating installation again after making sure that the system copy has been completed through the Information Message of the Web. In either of the following cases, the system copy has been completed. • "I140xy (or I140HH) System copy started" is not displayed. • "I140xy (or I140HH) System copy started" and "I141xy (or I141HH) System copy completed" are displayed consecutively. When the system copy is being made, turn off the main switch and then turn it on again later than 20 seconds. In the following case, the system copy is being made. (refer to Maintenance Manual Installation "1.7.2 Subsystem power off (Sequential shutdown)" (INST 01-0310), Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).) • While "I140xy (or I140HH) System copy started" is displayed, "I141xy (or I141HH) System copy completed" is not displayed successively. Execute the updating installation again after making sure that the RDY LED (green) comes on and then the system copy is completed.
1204	A specified file doesn't exist. Confirm elements of designation.	The specified file does not exist.	① Make sure that the path to the directory of the microprogram to be installed is specified correctly.
—	Abnormal End Down Grade Check NG	Though a version down of the microprogram was attempted, the updating installation terminated abnormally because the Down Grade Check was not disabled.	① Change the mode of the Down Grade Check to Disable. (Refer to "4.4.2 Procedure for removing downgrade check" (SUP 04-0100)) Then execute the updating installation again.

4.1.4 Error messages issued during upgrade made when TrueCopy remote replication is enabled

This operation is not required when TrueCopy remote replication is not used.

Message code	Message text	Description	Recovery measures
I62300	Path not connected	<In the case of the direct connection> The remote DF that attempted to log in to the set path is not connected, or the LoopMap of the LILP is not connected one-to-one. <In the case of the connection via SW> A serial number (WWN) of the remote DF that attempted to log in to the set path is not registered in the name server of the SW.	① Refer to Maintenance Manual Troubleshooting Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).
		A serial number that does not exist was entered.	① Enter a correct serial number referring to "4.5.2 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 500™" (SUP 04-0130).
I62D00	Remote option disable [TrueCopy Basic]	A path detachment occurred because the TrueCopy remote replication of the remote DF was locked.	① Refer to Maintenance Manual Troubleshooting Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).
		A serial number of another subsystem was entered by mistake. The onerous option of the TrueCopy remote replication in the subsystem was invalid.	① Enter a correct serial number referring to "4.5.2 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 500™" (SUP 04-0130).

Copyright © 2006, Hitachi, Ltd.

NOTE : During the upgrade made when Hitachi TrueCopy remote replication is left enabled, one of the following messages is sure to be displayed even in the normal state.

Message code	Message text	Recovery measures
I6220x	Link down time-out (Port-x)	① A state in which no link up is done has kept on longer than the regulated time at the port for which a path has been set. x: Port #
I62300	Path not connected	① <In the case of the direct connection> The remote DF that attempted to log in to the set path is not connected, or the LoopMap of the LILP is not connected one-to-one. <In the case of the connection via SW> A serial number (WWN) of the remote DF that attempted to log in to the set path is not registered in the name server of the SW.
I6250x	Path login failed	① The sending and response of FLOGI, PLOGI, RSCN, etc. to the SW terminated abnormally when a log-in to the set path was done in the case of the connection via the SW. x : Port #
I62600	Fabric connection failed (Port-x)	① Sending and response of PLOGI and PRLI done at the time of a log-in to the set path terminated abnormally.

4.1.5 Other messages

When a message other than the above is displayed, be sure to check the configuration first. Check whether the Disk Drive locations are correct, whether the settings of the unit ID and device ID are correct, whether the cable connections are correct, and so on following the procedure.
To check the Disk Drive locations, refer to Section "4.3 When a Disk Drive was inserted in a wrong location" (SUP 04-0060).

Example)

- RA7900 System HDU spin up failed:
  Spin-up of the system drive failed.
- HE05HH Backend down [Unit# ERR] (Unit-01):
  The back end was blocked : Abnormality was detected in the connection order of the array subsystem, the setting of the device ID, or the setting of the subsystem identification switch.
- HH1Q00 SES error inf. [SES-HDU error]:
  The Control Unit was detached because both of the two SES drives could not access the ENC.
- W080xy Loop alarm (Path-x, Loop-y):
  Since the Fibre Channel loop failed, the operation is continued with the alternative loop.

When one of the following messages is displayed, there may be a mistake in the Disk Drive location, the unit ID, or some other matter. Check if the configuration is correct.

When a problem is found in the configuration related to the upgrade, correct the configuration. When no problem is found in the configuration and the operation, take some recovery action referring to the Maintenance Manual.

4.1.6 Collecting CTL Alarm Trace

Through the CTL Alarm Trace collection, detailed information (the CTL Alarm Trace) on the immediately previous Controller blockage stored in the Controller is collected.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

Since the above-mentioned CTL Alarm Trace information is taken over from the blocked Control Unit to the replaced Control Unit, it can be collected after the Control Unit is recovered from the failure. If the Control Unit is blocked while collecting the CTL ALARM TRACE may not be collected normally. Therefore, in this case, collect the CTL ALARM TRACE again.

The method of collecting the CTL ALARM TRACE is shown below.

(1) Before collecting the CTL ALARM TRACE

(a) Items to be prepared

The CTL Alarm Trace is collected in the normal mode or the maintenance mode of the WEB.
For connecting to the WEB, a PC terminal with Browser installed is necessary.
For collecting the CTL Alarm Trace, a Disk Drive with a space of 10 M bytes at least is necessary.

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN cross cable.

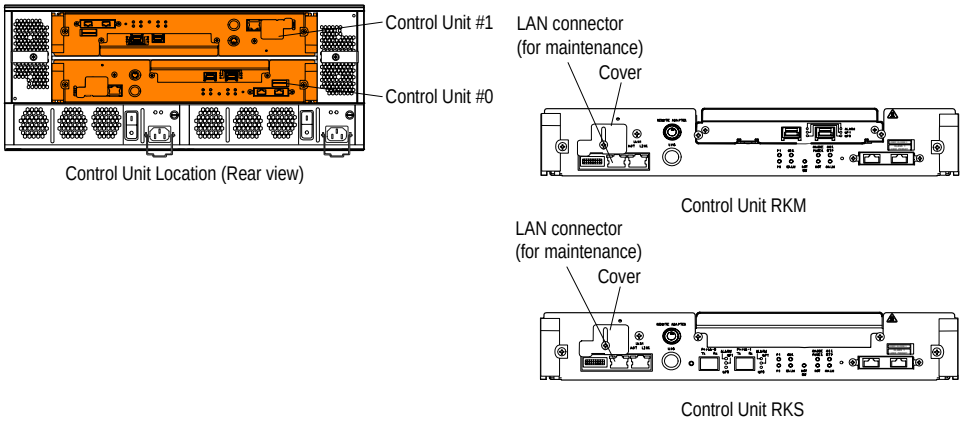

Figure 4.1.1 LAN Connector Position

(c) Collect the CTL Alarm Trace information from each Control Unit.

Save the files collected from different controllers into different directories or put different names to them so that you will see from which controller they were collected.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) Make sure that the WARNING LED (orange) on the Front Bezel of RKM/RKS is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

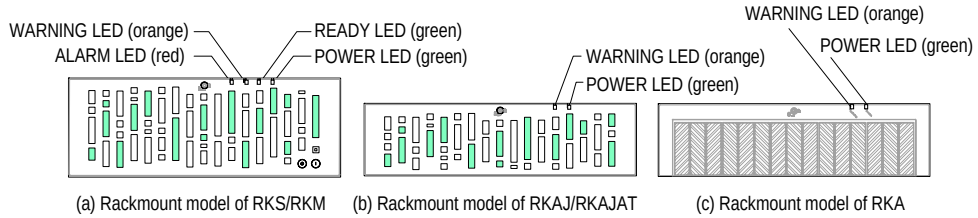

Figure 4.1.2 Indication Locations and Names of LED (Front Bezel)

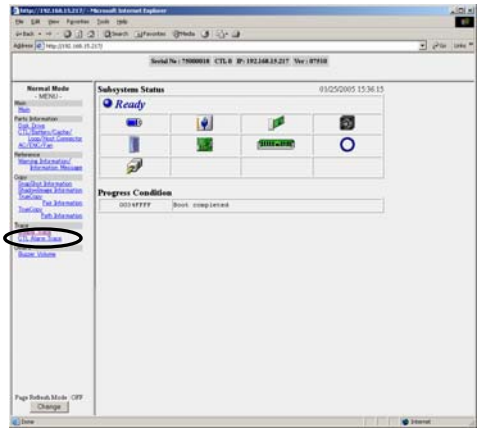
(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.

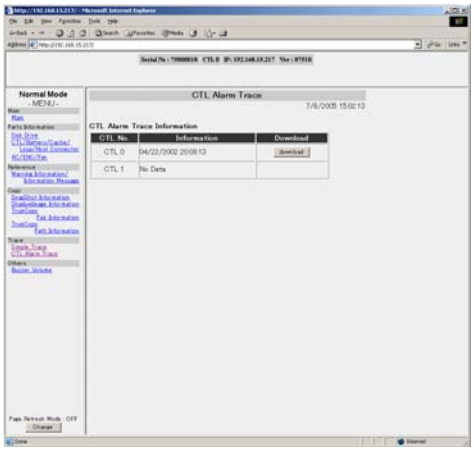
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.



Copyright © 2005, 2006, Hitachi, Ltd.

(2) Procedure for collecting a CTL Alarm Trace

(a) Enter the IP address of the LAN connector for maintenance, to which the maintenance PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button.



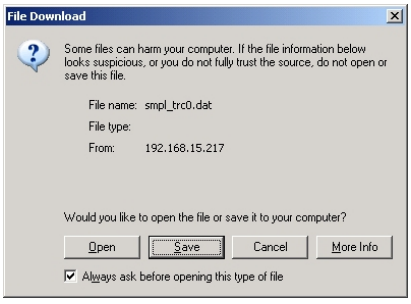
(b) Collect the memory dump according to the WEB and the following procedure.
Click “CTL Alarm Trace” in the menu frame of “Trace”.

Copyright © 2005, 2006, Hitachi, Ltd.

If CTL Alarm Trace exists, the CTL Alarm Trace information window is displayed.

Description of information

"Not Ready" ····· Indicates the situation where the trace area is not established in the device.

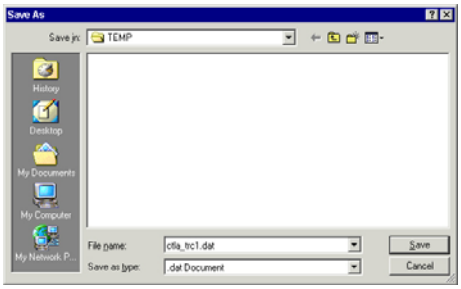


"No Data" ····· CTL Alarm Trace information does not exist or while information is being created.

"MM/DD/20YY hh:mm:ss" ····· CTL Alarm Trace information exists.

NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL Alarm Trace may not be collected normally. Therefore, collect the Simple Trace.
If Simple Trace cannot be obtained through detached Control Unit, connect the Maintenance PC to the Control Unit at the opposite side, and collect the Simple Trace.

(c) Press the "Download" button on the Control Unit side to be collected in "CTL Alarm Trace information".(‡1)



(d) The following dialog is displayed. Click the [Save] button.

‡1 : An error message may be displayed. If it is displayed, click [OK], and collect the CTL Alarm Trace again after waiting for a while.

Copyright © 2005, 2006, Hitachi, Ltd.

(e) Select the place to save the file and file name (Default file name: ctla_trc0.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed. When the down-loading completes, the progress indicating message window is closed.

In this procedure is collected by WEB Normal mode. Similarly, CTL Alarm Trace can be collected by WEB Maintenance mode through Menu Frame.

‡1 : There may be a case where the default file name is given as "ctla_trc0.dat.dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

4.2 When Abnormal End Empty System Retry Full Install occurs

The procedure for troubleshooting and actions to be taken when the Abnormal End Empty System Retry Full Install occurs are shown below.

Make a recovery from the failure following the procedure for troubleshooting.

Copyright © 2005, 2006, Hitachi, Ltd.

4.3 When a Disk Drive was inserted in a wrong location

The recovery procedure to be used when a Disk Drive was inserted in a wrong location is shown below.

(1) Check the following information referring to the configuration information collected according to Subsection "3.4.9 Collecting serial numbers of Disk Drives" (SUP 03-0350).

```
Array unit configuration information list.

DF Name : 174-175
Date : 2003/12/02 21:12:31
Micro Program Revision : 0710/A-S
Array Unit Type : DF700S
Serial Number : 73010055

---- RAID Configuration ----
RAID    RAID    Start Location          Number of HDU     Number of       Free Capacity

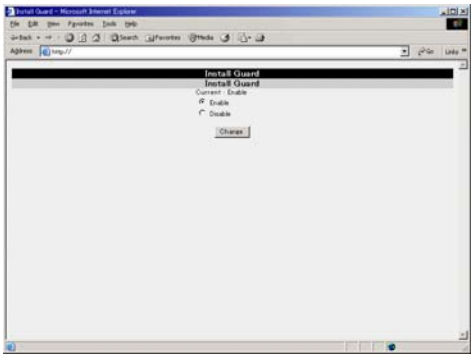
4.4 When Returning Configuration of the Hitachi TagmaStore® AMS 500™ to that of the Hitachi TagmaStore® AMS 200™

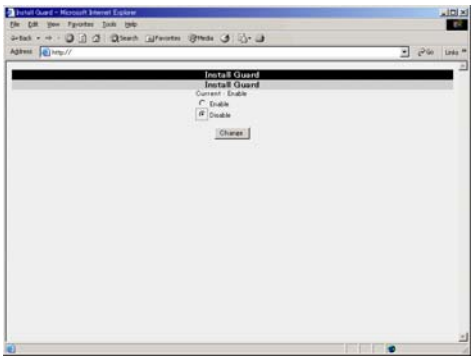
The procedure to be used in case the upgrade fails is explained below. In the procedure, the upgrade is made again after the configuration of the disk array subsystem is returned to that of the Hitachi TagmaStore® AMS 200™ once.

NOTE : The configuration of the disk array subsystem cannot be returned to that of the Hitachi TagmaStore® AMS 200™ after the updating installation of the microprogram for the Hitachi TagmaStore® AMS 500™ is executed according to the procedure described in Subsection "3.4.14 Updating installation of microprogram for Hitachi TagmaStore® AMS 500™" (SUP 03-0930) and the subsystem enters the READY status.



NOTE : Be sure to review all the settings and operations that have been made before making the upgrade again.

Copyright © 2005, 2006, Hitachi, Ltd.



4.4.1 Procedure for removing guard check against installation of the microprogram for the Hitachi TagmaStore® AMS 200™

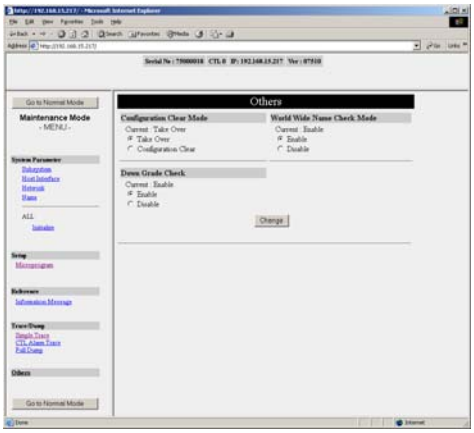
The procedure for removing the microprogram installation guard check is shown below.

(1) Enter "http://(IP address of the disk array subsystem)/instlgrd" in the [Address].
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(2) Select the [Disable] radio button of the [Install Guard] in the "Install Guard" window and click the [Change] button.

Copyright © 2005, 2006, Hitachi, Ltd.

4.4.2 Procedure for removing downgrade check



The procedure for removing the downgrade check is shown below.

(1) Set the operation mode in the Maintenance Mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SUP 03-0130))

(2) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. ("3.4.5 Connection of the maintenance PC" (SUP 03-0100))
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(3) Click [Others] in the menu tree.

(4) Select the [Disable] radio button of the [Down Grade Check].
Click the [Change] button.

Copyright © 2005, 2006, Hitachi, Ltd.

4.4.3 System power off

Because a message, "Download Failed" is displayed and the disk array subsystem is in the Alarm status, the RKAJ/RKAJAT/RKA cannot be powered off although the main switch on the front side of the RKM is turned off. The power of the RKAJ/RKAJAT/RKA must be turned off by the other means.

(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the Front Bezel is off.
(3) Turn off the AC Power Unit Switches of the AC/DC power supplies installed in the RKM and all the RKAJ/RKAJAT/RKAs.
(4) Turn off the battery switch of the Battery Unit on the front side of the disk array subsystem.
(5) All turn off the circuit breaker of the PDB.

Copyright © 2005, 2006, Hitachi, Ltd.

4.5 Procedure for Recovery from Path Detachment and PSUE Status Occur during Upgrade Made when TrueCopy remote replication is Enabled

The procedure for recovery, which is to be used when the pair status is changed to PSUE during the upgrade made when TrueCopy remote replication is enabled, is explained below.
The recovery procedure varies depending on which configuration, the Hitachi TagmaStore® AMS 500™ or the Hitachi TagmaStore® AMS 200™, the disk array subsystem has when the PSUE status occurs.

4.5.1 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 200™

When a path detachment and the PSUE status occur in the case where the disk array subsystem is configured as the Hitachi TagmaStore® AMS 200™, make a recovery from the PSUE status first, split the pair again, and then make the ordinary upgrade.
The procedure for resynchronizing a TrueCopy remote replication pair is shown below. The resynchronization must be done using the pairresync command issued by RAID Manager.

(1) Restart RAID Manager. Start the HORCM using the "horcmstart" command.
(2) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
(3) Splitting a pair
Split a pair by executing the pairsplit command and make sure that pair status has been changed to PSUS/SSUS.
(4) Return to the ordinary upgrade operation.
Revalidate the path when necessary, return to the ordinary upgrade, and make the operations over again from the step in which the PSUE status occurred.

Copyright © 2006, Hitachi, Ltd.

4.5.2 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 500™

When a path detachment and the PSUE status occur in the case where the disk array subsystem is configured as the Hitachi TagmaStore® AMS 500™ , a wrong setting may have been made in the operation that has been made according to Item "3.4.22 (3) Changing settings of the disk array subsystem" (SUP 03-1190).
The recovery procedure is explained below.

(1) Checking/changing settings of the disk array subsystem
Check the remote information of the disk array subsystem that has not been upgraded.
(a) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular.
(b) Set the operation mode of Storage Navigator Modular as Maintenance mode.
(c) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.
(d) Select [Tools] and [Maintenance] in this order in the unit window.
(e) Click the [System Upgrade] tab.
Verification of the displayed serial number.
If an error is found, enter the value of the disk array subsystem that has been upgraded.

If the information setting has been made for a disk array subsystem belonging to another pair by mistake, return the status of the subsystem taken for a target subsystem as it was before by setting the serial number that were noted down in Step "3.4.22 (3) Changing settings of the disk array subsystem" (SUP 03-1190) and by revalidating the path. Then make the settings for the target disk array subsystem.

(2) Revalidate the path using the WEB.
(3) Restart RAID Manager. Start the HORCM using the “horcmstart” command.
(4) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
(5) Make sure that recovery from the path detachment and the PSUE status has been made referring to the "Information MSG" window of the WEB.

Copyright © 2006, Hitachi, Ltd.

Chapter 5. Appendix

5.1 For Setting Changes in Host Computer and Others

When upgraded from Hitachi TagmaStore® AMS 200™ to Hitachi TagmaStore® AMS 500™, the Disk Array subsystem shows the following changes.

No.	Name of Items	Hitachi TagmaStore® AMS 200™	Hitachi TagmaStore® AMS 500™	Existence of Limits
1	Subsystem Product Serial Number	730xxxxx	750xxxxx	The following contents may be changed depending on the subsystem product serial number changes. As occasion demands, the changing operation for upper host device information or various application setting may be needed. ・World Wide Name ・Product Serial Number of Inquiry
2	World Wide Name	-	-	By registering the subsystem product serial number to Hitachi TagmaStore® AMS 500™ in the Subsystem Maintenance Mode and rebooting the subsystem, WWN on Front End Fibre Channel is changed to the different value from Hitachi TagmaStore® AMS 200™ after Hitachi TagmaStore® AMS 500™ Ready, Front End Fibre Channel can be used, and the LU recognition from the upper Host enables.
3	Target iSCSI Name	-	-	When the Hitachi TagmaStore® AMS 200™ to be upgraded is the system configuration of the iSCSI interface, the Target iSCSI Name of the Hitachi TagmaStore® AMS 500™ succeeds the value before the upgrade. However, when the default iSCSI Name of the Target was used in the array subsystem before the upgrade, it is required to change the Target iSCSI Name of the Hitachi TagmaStore® AMS 500™ to a unique value in the network. If the Hitachi TagmaStore® AMS 500™ is used without changing the Target iSCSI Name and when the array subsystem before the upgrade is configured with the system of the iSCSI interface again after using the Hitachi TagmaStore® AMS 500™ , the iSCSI Name of both array subsystems is duplicated in the network, and trouble is caused to the iSCSI protocol.
4	Inquiry	730xxxxx	750xxxxx	Product Serial Number After upgrading from Hitachi TagmaStore® AMS 200™ to Hitachi TagmaStore® AMS 500™, Hitachi TagmaStore® AMS 500™ responds to 750xxxxx.

(1) When the Disk Array subsystem is the system configuration of the iSCSI interface
You will set new iSCSI name for all targets of the Hitachi TagmaStore® AMS 500™.
And you will follow proper setting procedures to set the information of CHAP authentication, Two-way autentication and digest with new target iSCSI name on the host computer if needed.
Then you will login to the target of Hitachi TagmaStore® AMS 500™ with new target iSCSI name which you set in the upgrade.
The host computer may continue to execute login process to the target of old iSCSI name if the target iSCSI name or the IP address for the iSCSI interface of Hitachi TagmaStore® AMS 500™ are changed.
If it happens, you will logout from the target of old iSCSI name.

Copyright © 2005, 2006, Hitachi, Ltd.

(2) When the Disk Array subsystem is the system configuration of the Fibre Channel interface
The device file name changes due to World Wide Name change. Following the change, OS reconstruction is needed.
The setting review is also needed in the application software using the device file name.

If you use the WWN binding in the Driver setting file, it is necessary to change the setting. And the Host needs rebooting after the setting change.

When Fabric Switch is used and WWN executes zoning, it is necessary to execute the zoning setting review since WWN is changed.

The upgrading operation from Hitachi TagmaStore® AMS 200™ to Hitachi TagmaStore® AMS 500™ is new device addition image for OS. However, as different from the ordinary new device addition, the user's data is maintained when installed. Therefore, great care is needed for setting the Host computer and peripherals.

For each platform, the points of which special care is needed are shown below.

- When HP-UX is used.
  It is necessary to export the Volume Group before upgrading and import the Volume Group after upgrading.
  When MC/service guard is used, it is necessary to suspend the MC/service guard before upgrading and reboot the MC/service guard after upgrading.
- When AIX + HDLM is used.
  It is necessary to export the Volume Group before upgrading and note the disk property such as queue depth for the physical disk and the HDLM device. It is also necessary to import the Volume Group after remaking the HDLM device when the upgrade is completed.

Deleted: que

Examples of the HDLM device file remake

1. deletion of the HDLM device file # rmdev
2. reset of the device configuration information # chdev
3. remake of the HDLM device file # dlmcfgmgr

Copyright © 2005, 2006, Hitachi, Ltd.

- When Solaris + VxVM is used.
  It is necessary to boot the Host with option "r" after upgrading and boot VxVM.

  NOTE : • When HBA: Sun genuine, rebooting is necessary since the driver setting is changed at the time of the device recognition.
  • When SunCluster is used, it is necessary to exclude the wide area device from the definition (excluding "quorum device" in the wide area device from the definition). The correspondence between the disk ID instance number in the wide area device and the disk device (cXtYdZ) is also changed due to the LU serial number change after upgrading. Therefore, check the correspondence between the disk ID instance number and the local and remote path. If the correspondence is illegal, it is necessary to redefine. Then, redefine the wide area device as SunCluster (redefine quorum device from the optional wide area device).

- When IRIX is used.
  It is necessary to execute the device recognition and mapping file making again after upgrading and reboot the Host.

- When Windows®-related system is used.
  Rebooting is necessary after upgrading.

- When Linux + VxVM is used.
  It is necessary to deport the Disk Group before upgrading and import the Disk Group after upgrading.

- When Tru64 is used.
  For UFS: It is necessary to mount with the new device.
  For AdvFS: It is necessary to link again with the new device as the registered device.

  1. device recognition check # scu show edt
  2. device file check # hwmgr –view devices
  3. transfer to domain directory # cd /etc/fdmns/[domain name]
  4. domain directory contents check # ls
  5. allocation to domain directory # ln –fs /dev/disk/dskzzzc dskxxxc
     - dskxxxc: Registered device
     - /dev/disk/dskzzzc: New device file name

  For LSM, the data must be restored at the time of the LSM configuration since the disk group cannot be imported.

Chapter 1. Outline

This procedure manual describes the work procedure for upgrading the array subsystem from Hitachi TagmaStore® AMS 200™/AMS 500™ to Hitachi TagmaStore® AMS 1000™ while the customer data of the disk drive used is maintained.
The procedures about the whole system, such as configuration change of the system, and the procedures of addition/subtraction of option parts and the setting of the priced option are not included.
The upgrade procedure of the floor model is not described.
In this procedures, the basic disk array unit of the Hitachi TagmaStore® AMS 200™ (Model name: DF700-RKS) is described as "RKS". In the same way, the basic disk array unit of the Hitachi TagmaStore® AMS 500™/AMS 1000™ (Model name: DF700-RKM/RKH) and the additional disk array unit (Model name: DF700-RKAJ/RKAJAT, DF600-RKA) are described as "RKM/RKH" and "RKAJ/RKAJAT/RKA" respectively.

Chapter 2. Components and Tools Required for Upgrade(Hard)

Model names of components required for the upgrade are shown below.

Table 2.1 Components to Be Ordered for Upgrade

No.	Detail of upgrade	Model	Unit per ASSY	Components
1	RKH	DF700-RKH	1	Frame (1), Control unit (1), Panel (1), Backup battery unit (4), Fan assembly (2), AC cable J2H (2), Power unit (RKH) (2)
2	RKAJ	DF700-RKAJ	1	Frame (1), AC cable J2H (2), Power unit (RKAJ) (2), ENC unit (2), ENC cable (4), Fan unit (2)
3	Cache memory(*1)(*5)	DF-F700-C1GJ	8	Cache memory of 1,024 M bytes
		DF-F700-C2GJ	8	Cache memory of 2,048 M bytes
4	Interface Board(*3)	DF-F700-DJ4G2H	4	4 G bps Fibre Channel Interface Board (two ports) (1)
		DF-F700-DJSC2H	2	1 G bps iSCSI Interface Board (two ports) (1)
5	ENC cable	DF-F700-K5B	1(*2)	FC cable 5 m (2)
6	Rack rail (for Chassis)	DF-F700-URHTN7	1	Rail Kit for U7 and HA8000/8500
7	Rack frame	DF-F700-U7	1(*2)	Rack frame

*1 : Select the model with the same capacity as that of the cache memory installed in the disk array unit that used to be the Hitachi TagmaStore® AMS 500™ .
When each of the Cache memory of 1G and 2G is installed at the Hitachi TagmaStore® AMS 500™ configuration, make the arrangement so that the Cache memory of the same capacity is installed in the Cache slot #0 and #2, or #1 and #3 according to the customer's use.

*2 : This is required when the disk array unit had the maximum configuration mountable on the U7 rack frame when it was the Hitachi TagmaStore® AMS 500™ .

*3 : Select the Interface Board for the RKH of the same type with the interface which was installed at the Hitachi TagmaStore® AMS 200™/AMS 500™ .

*4 : It is necessary to arrange the Cache memory additionally depending on the use condition of the priced option. (see "Table 3.3.1 Cache Memory Capacity before and after the upgrade when Cache Residency Manager is used (Hitachi TagmaStore® AMS 200™)" (SMUP 03-0030), "Table 3.3.2 Cache Memory Capacity before and after the upgrade when Cache Residency Manager is used (Hitachi TagmaStore® AMS 500™)" (SMUP 03-0030), "3.3.3 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used (Hitachi TagmaStore® AMS 200™)" (SMUP 03-0040), and "3.3.4 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used (Hitachi TagmaStore® AMS 500™)" (SMUP 03-0040).)

*5 : The Hitachi TagmaStore® AMS 1000™ is a dual controller system, and it is necessary to install at least two Cache memories of the same capacity per Control Unit and at least four per whole subsystem. Therefore, it is required to arrange the Cache memory surely by the addition in the following conditions.
- When upgrading it from the Hitachi TagmaStore® AMS 200™
- When upgrading it from the Hitachi TagmaStore® AMS 500™ which is installing only one Cache memory per Control Unit
- When upgrading it from the Hitachi TagmaStore® AMS 500™ of the single controller system

Note: Move the Cache Unit and the Front Bezel used in the RKS/RKM to the RKH and the Disk Drive used in the RKS/RKM to the RKAJ which is added at the time of the upgrade.

Copyright © 2006, Hitachi, Ltd.

The following tools are required for the upgrade procedures.

Table 2.2 Tools Required

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.1	For Local/Remote Mode Setting Switch (rotary switch)
	Phillips screwdriver	No.2	Installation of skirts and securing the subsystem.
	Slotted screwdriver	No.1	For Device ID Setting Switch
	Allen wrench	No.3	Securing of cable cramps
	Allen wrench	No.4	Securing of rail and connection of power cable.
	Allen wrench	No.6	Opening/closing of doors; removal of stabilizers
	Spanner	No.22	Adjustment of leveling bolts
Tool of other	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium Ⅱ (233 M Hz or more) is recommended), Memory 40 M bytes or more (64 M bytes or more is recommended)
	Wrist strap	-

Chapter 3. Upgrade Work

3.1 Prerequisites

- The upgrade operation is the offline work.
- The Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded must be in the state in an error free state or condition prior to performing the upgrade.
- Be sure to execute an deliberate shutdown before starting the hardware upgrade.
- Stop host computers from accessing the subsystem before starting the upgrade.
- Use the latest version (Ver.3.10 or later) of Storage Navigator Modular.
- For upgrading, all the Disk Drives mounted on the existing Hitachi TagmaStore® AMS 200™/AMS 500™ are transferred.
- The controllers that are used to upgrade to the Hitachi TagmaStore® AMS 1000™ need to 0731 or later flash program installed prior to performing any upgrade work.
- When TrueCopy remote replication/TrueCopy Extended Distance is enabled and the array subsystem to be upgraded to the Hitachi TagmaStore® AMS 1000™ is the remote Disk Drive subsystem, perform it after changing the pair status (S-VOL) of TrueCopy remote replication/TrueCopy Extended Distance to PSUS.
  However, if the upgrade operation is performed, the path blockade occurs. This path blockade recovers automatically by turning on the power of the array subsystem after performing the upgrade operation.
  Return the pair status (S-VOL) of TrueCopy remote replication/TrueCopy Extended Distance to the original status (PAIR, etc.) after completing the upgrade operation.
  Also, if the upgrade operation is performed, the following phenomenon occurs.
  - Both paths of the TrueCopy remote replication/TrueCopy Extended Distance are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  - When the pair status of the TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair status changes to PSUE.
- When Hitachi TagmaStore® AMS 200™/AMS 500™ is made as Boot disk, or rootdg of VxVM is installed in Hitachi TagmaStore® AMS 200™/AMS 500™, the upgrade cannot be performed because the device file name which the host recognizes is changed in the case of upgrading to Hitachi TagmaStore® AMS 1000™.
- The downgrade from Hitachi TagmaStore® AMS 1000™ to Hitachi TagmaStore® WMS 100™ or AMS 200™/AMS 500™ is not supported.
- The upgrade from Hitachi TagmaStore® WMS 100™ to Hitachi TagmaStore® AMS 1000™ is not supported.
- The upgrade from Hitachi TagmaStore® AMS 200™/AMS 500™ of the NAS system configuration to Hitachi TagmaStore® AMS 1000™ is not supported.
- It is required to stop and reboot the host because the setting of the host needs to be changed.

3.2 Before Starting Upgrade Work

(1) Check whether the host interface of the Hitachi TagmaStore® AMS 200™/AMS 500™ is the Fibre Channel or the iSCSI, and prepare the Interface Board of the same kind for the Hitachi TagmaStore® AMS 1000™ by the day of the upgrade work.

(2) Confirm the customer whether to use the priced option, which was used in the Hitachi TagmaStore® AMS 200™/AMS 500™, in the Hitachi TagmaStore® AMS 1000™ also. If it is used, prepare the license key of the Hitachi TagmaStore® AMS 1000™ by the day of the upgrade work. The license key of the priced-option is issued to the subsystem, so that if the priced option used in the Hitachi TagmaStore® AMS 200™/AMS 500™ is also used in the Hitachi TagmaStore® AMS 1000™, it is required to purchase the license key as the Hitachi TagmaStore® AMS 1000™.

(3) When any of Cache Residency Manager, Copy-on-write SnapShot and Cache Partition Manager is used in the Hitachi TagmaStore® AMS 200™/AMS 500™ and it is also continued to be used in the Hitachi TagmaStore® AMS 1000™, the Cache Unit may have to be added depending on the setting or the configuration of the Hitachi TagmaStore® AMS 200™/AMS 500™.
Refer to "3.3 Notes" (SMUP 03-0020) for the details.
When the addition is required, prepare the necessary Cache Unit by the day of the upgrade work.

(4) As for the upgrade work, settings of the subsystem must be changed through operation of a maintenance PC connected via a LAN. Besides, the microprogram must be installed from a CD-ROM. Make the following preparations before starting upgrade work.
- Prepare a PC in which Storage Navigator Modular of the latest revision is installed. The PC must fit the LAN environment and have a CD-ROM drive.
- LAN cross cable
- The CD-ROM for installation of the Hitachi TagmaStore® AMS 1000™ microprogram of the latest revision (0731/A-H or later).
- The Hitachi TagmaStore® AMS 200™ or Hitachi TagmaStore® AMS 500™ microprogram installation CD-ROM of the same revision (0731/A-S or 0731/A-M or later) as the Hitachi TagmaStore® AMS 1000™ microprogram.

(5) Back up the user data by the day of the upgrade work to prepare for emergency. Be sure to perform this work.
If you fail to operate the upgrade work, you may lose the user data on the array subsystem. Back up the user data on the array subsystem by the operation on the host computer side.

(6) Check that Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded is connected as an external storage of SANRISE Universal Storage Platform (USP)/SANRISE Network Storage Controller (NSC). If it is connected as an external storage as a result of the check, perform the upgrade following the procedure for the maintenance manual of SANRISE USP/NSC (refer to EXTERNAL STORAGE MAINTENANCE SECTION "2. Maintenance for External Storage").

Copyright © 2006, Hitachi, Ltd.

3.3 Notes

- When executing updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.
- When executing updating installation of the microprogram, use the microprogram whose revision is 0731/A-x or later.
- Since configurations of the Hitachi TagmaStore® AMS 200™/AMS 500™ and the Hitachi TagmaStore® AMS 1000™ are different from each other, works such as an installation of the Control Unit for the Hitachi Hitachi TagmaStore® AMS 1000™ in the RKH, shifts of the Disk Drives and Cache Memory installed in the RKS/RKM of the Hitachi TagmaStore® AMS 200™/AMS 500™ .
- When upgrading the Disk Array subsystem, do not upgrade two or more Disk Array subsystem at the same time to avoid the disk drive replacement operation error.
- When Hitachi TagmaStore® AMS 200™/AMS 500™ is used in the Single Mode, change the mode to the Dual Active Mode before starting the upgrade operation.
- When the Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded is the Fibre Channel/iSCSI interface system configuration, do not change the port which connects the Fibre Channel/iSCSI interface cable before and after the upgrade.
- When the Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded, if the serial number of the array subsystem changes in the upgrade work, the WWN (iSCSI Name) also changes. Therefore, it is necessary to change the setting of the host computer, the peripherals, the application software, etc. depending on the case. For the setting change, refer to "5.1 For Setting Changes in Host Computer and Others" (SMUP 05-0000).
- When the Hitachi TagmaStore® AMS 200™ or Hitachi TagmaStore® AMS 500™ to be upgraded is the system configuration of the iSCSI interface, the Target iSCSI Name of the Hitachi TagmaStore® AMS 1000™ succeeds the value before the upgrade. However, when the default iSCSI Name of the Target was used in the array subsystem before the upgrade, it is required to change the Target iSCSI Name of the Hitachi TagmaStore® AMS 1000™ to a unique value in the network. If the Hitachi TagmaStore® AMS 1000™ is used without changing the Target iSCSI Name and when the array subsystem before the upgrade is configured with the system of the iSCSI interface again after using the Hitachi TagmaStore® AMS 1000™ , the iSCSI Name of both array subsystems is duplicated in the network, and trouble is caused to the iSCSI protocol.
- The IP address of the LAN port for the user control or maintenance of the Control Unit succeeds the value before the upgrade. Reset it as occasion demands.
- The license key of the priced-option is issued to the subsystem. When the customer used the priced-option, which was used in the Hitachi TagmaStore® AMS 200™/AMS 500™, even after upgrading to the Hitachi TagmaStore® AMS 1000™, it is required to purchase the license key of the priced-option of the Hitachi TagmaStore® AMS 1000™.
- When using the SNMP Agent Support Function, which is an optional feature, is used, the SNMP environment information file may have to be reviewed.
- When using the Cache Residency Manager, which is an optional feature, there may be a case where the use is not allowed depending on a capacity of the cache memory. Refer to the following Table 3.3.1/3.3.2 and, if the capacity of the cache memory is found to be insufficient, make addition to the cache memory or use the LU as a non-Cache Residency Manager.
  However, when the Cache Residency Manager is enabled after the upgrade in the case where the LU is used as a non-Cache Residency Manager, the subsystem will be placed in a state in which a warning is kept issued.
  It is necessary to add the Cache memory to be installed at the upgrade work when it is used together with Copy-on-write SnapShot or Cache Partition Manager, so that refer to Table 3.3.3/3.3.4.

Deleted: • . When executing a updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.¶

1,995,841 to 2,741,760	4,096	4,096 or more	-
2,741,761 to 2,903,040	4,096	6,144 or more	It is necessary to add the Cache memory.

- When Copy-on-write SnapShot and Cache Partition Manager of the priced options are used continuously after the upgrade, it is necessary to add the Cache memory to be installed as shown below.

Copyright © 2006, Hitachi, Ltd.

Table 3.3.3 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used (Hitachi TagmaStore® AMS 200™)

Condition of upgrade	Capacity of cache memory installed in Hitachi TagmaStore® AMS 200™ before upgrade (M bytes/controller)	Capacity of cache memory required for Hitachi TagmaStore® AMS 1000™ after upgrade (M bytes/controller)	Remark
When Copy-on-write SnapShot is used continuously after the upgrade	1,024	2,048 or more	It is necessary to add the Cache memory.
	2,048	4,096 or more	
When Cache Partition Manager is used continuously after the upgrade	1,024	2,048 or more	It is necessary to add the Cache memory.
	2,048	4,096 or more	

Table 3.3.4 Cache Memory Capacity before and after the upgrade when Copy-on-write SnapShot or Cache Partition Manager is used (Hitachi TagmaStore® AMS 500™)

Condition of upgrade	Capacity of cache memory installed in Hitachi TagmaStore® AMS 500™ before upgrade (M bytes/controller)	Capacity of cache memory required for Hitachi TagmaStore® AMS 1000™ after upgrade (M bytes/controller)	Remark
When Copy-on-write SnapShot is used continuously after the upgrade	1,024	2,048 or more	It is necessary to add the Cache memory.
	2,048	2,048 or more	-
	3,096	4,096 or more	It is necessary to add the Cache memory.
	4,096	4,096 or more	-
When Cache Partition Manager is used continuously after the upgrade	1,024	2,048 or more	It is necessary to add the Cache memory.
	2,048	4,096 or more	
	3,096	4,096 or more	
	4,096	6,144 or more	

- When the upgrade operation is performed leaving Copy-on-write SnapShot valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When the upgrade operation is performed leaving ShadowImage in-system replication valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When the Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded is the iSCSI interface system configuration, do not change the port which connects the iSCSI interface cable before and after the upgrade.
- When the upgrade operation is performed leaving TrueCopy remote replication/TrueCopy Extended Distance valid, restart of RAID Manager (restart of the HORCM) is required after the upgrade is completed.
- When making the upgrade leaving Hitachi TrueCopy remote replication/TrueCopy Extended Distance enabled, do not upgrade both of the local and remote subsystems at the same time for security. However, if the splits of the pairs on both local side and remote side are confirmed, there is no problem to execute the upgrade at the same time.

Copyright © 2006, Hitachi, Ltd.

- When upgrading one of the two disk array subsystems paired by Hitachi TrueCopy remote replication/TrueCopy Extended Distance which is left enabled, the deliberate shutdown must be executed for one of the two disk array subsystems to be upgraded but it is not necessary for the other disk array subsystem not to be upgraded.
- When performing the upgrade operation with TrueCopy remote replication/TrueCopy Extended Distance enabled, it is required to change the management information on the other array subsystem side which becomes a pair (not the array subsystem performing the upgrade but the one used as other pair) because TrueCopy remote replication/TrueCopy Extended Distance manages the information of the array subsystem which becomes a pair. For example, when the "B" shown in Figure 3.3.1 is upgraded, update of the microprogram and a change of the management information are also required for the "A".

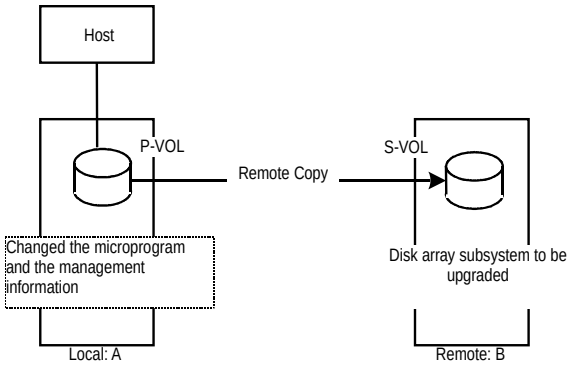

Figure 3.3.1 Paired Disk Array Subsystems

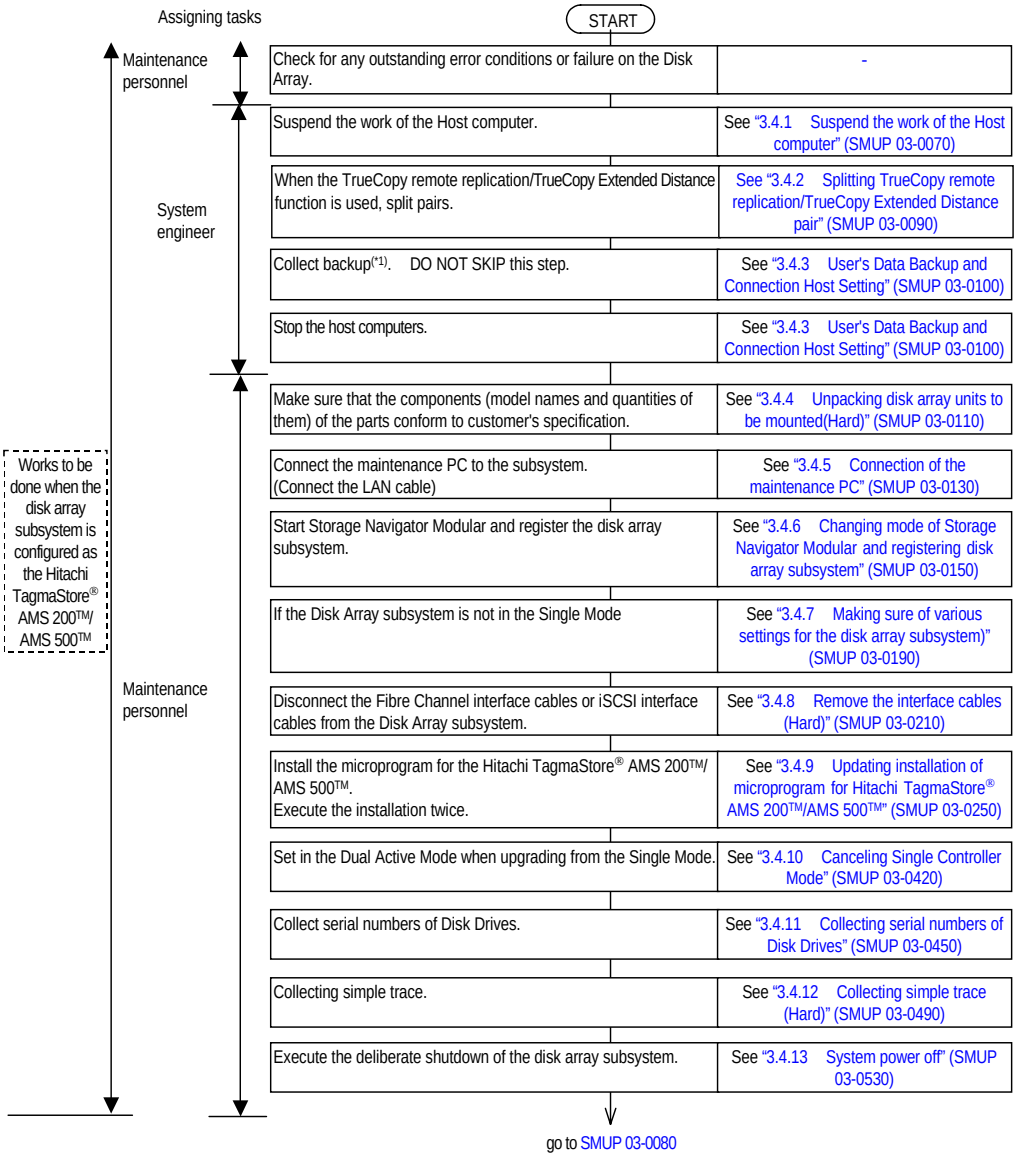
- It is required to change the setting of the host computer, the peripherals, the application software and the like in some cases because if the serial number of the array subsystem is changed in the upgrade work, WWN (iSCSI Name in case of iSCSI connection) is also changed at the same time. Refer to "5.1 For Setting Changes in Host Computer and Others" (SMUP 05-0000) for the setting changes.
- When Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded is an external storage of SANRISE Universal Storage Platform (USP)/SANRISE Network Storage Controller (NSC), the serial number of the subsystem and WWN of the Fibre Channel I/F of upgraded Hitachi TagmaStore® AMS 1000™ are changed, so that SANRISE USP/NSC cannot recognize the LU of Hitachi TagmaStore® AMS 1000™. Therefore, when upgrading Hitachi TagmaStore® AMS 200™/AMS 500™, which is an external storage of SANRISE USP/NSC, perform the upgrade work following the procedure for the SANRISE USP/NSC maintenance manual (refer to EXTERNAL STORAGE MAINTENANCE SECTION "2. Maintenance for External Storage") before upgrading.
- When Power Saving of the priced option is used, if you perform the upgrade after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host after replacing the microprogram and starting the array subsystem. Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then perform the upgrade.
  If the spin-down fails, execute the spin-down again.

Copyright © 2006, Hitachi, Ltd.

3.4 Upgrade Work

⚠ CAUTION

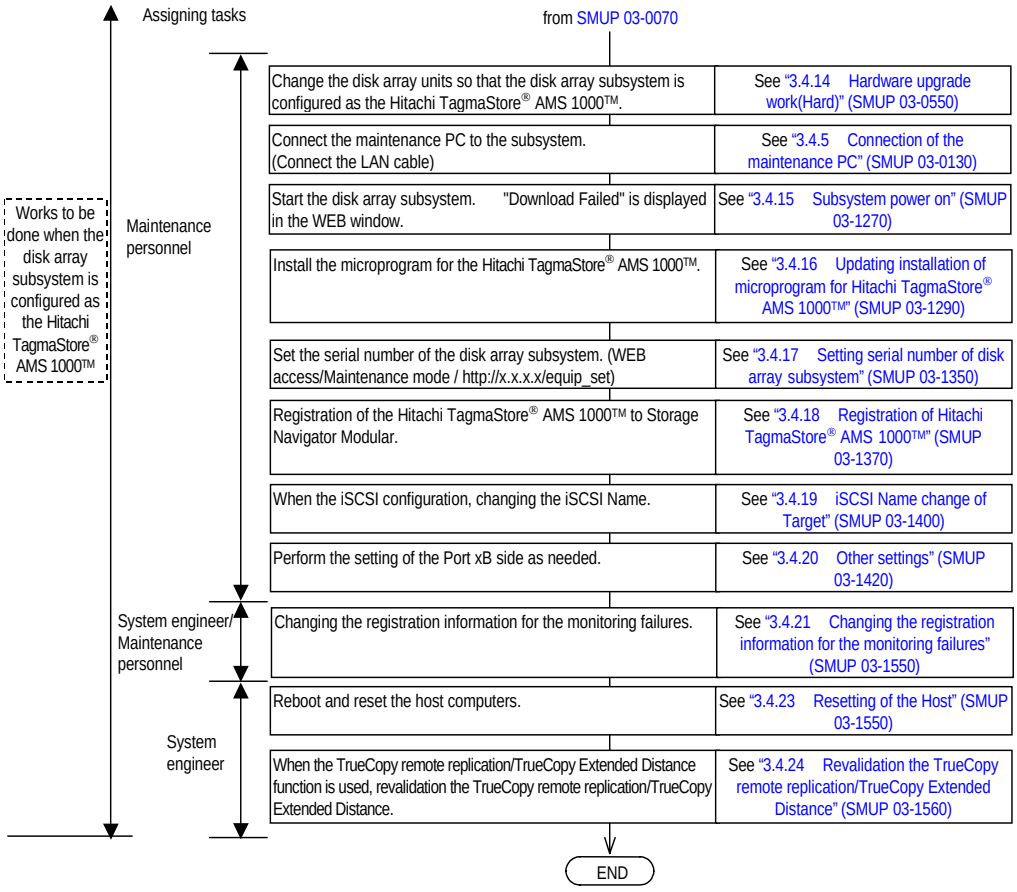
Touching heat sinks or ICs may cause injury. Be sure to handle with care.



CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts. Otherwise, the static electrical charge on your body may damage the parts.

NOTE : Make the upgrade with the power turned off irrespective of whether the system (host computer) is powered on or off.



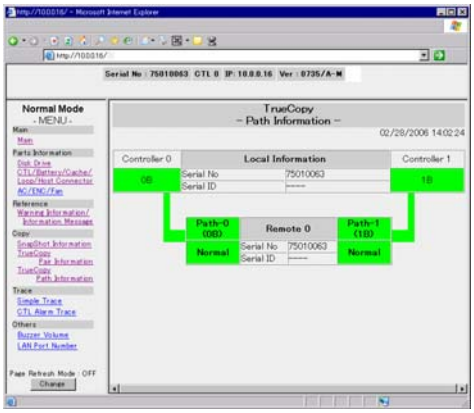
Copyright © 2006, Hitachi, Ltd.

The procedure for upgrading the Hitachi TagmaStore® AMS 200™/AMS 500™ to the Hitachi TagmaStore® AMS 1000™ is shown below.
Execute the procedure after making sure of the work to be done in each step.

*1 : Maintenance personnel should check if customer has executed user data backups. Without the backups, the upgrade cannot be executed.

Copyright © 2006, Hitachi, Ltd.

Copyright © 2006, Hitachi, Ltd.



3.4.1 Suspend the work of the Host computer

Suspend the work of the Host computer.

3.4.2 Splitting TrueCopy remote replication/TrueCopy Extended Distance pair

This operation is not required when Hitachi TrueCopy remote replication/TrueCopy Extended Distance is not used.
When making the upgrade leaving TrueCopy remote replication/TrueCopy Extended Distance enabled, a pair splitting must be done before executing the deliberate shutdown of the disk array subsystem.
The procedure is shown below.

(1) Check if the path status is normal using the WEB.
Procedure for Confirming Log Messages:
It switched to the following window by clicking the path of [Summary of Exchangeable Part Statuses] on the main window, and the details of the path status are displayed.
It also switches to the following window by clicking [TrueCopy Path Information] of the menu frame on the main window, and the details of the path status are displayed.
For the maintenance operation for replacement and the recovery method, perform the recovery according to (Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170)).

Copyright © 2006, Hitachi, Ltd.

(2) Execute the Pairsplit command, perform the pair split, and check that the change to PSUS/SSUS is completed.
It explains the method to split the pair of TrueCopy remote replication/TrueCopy Extended Distance.

(a) Set the group name in the configuration definition file as "vg01." Split the TrueCopy remote replication/TrueCopy Extended Distance pair in the PAIR status with the pairsplit command.

```
c:¥horcm¥etc>pairsplit –g vg01
```

Figure 3.4.1 Example of Pairsplit Command Entry

(b) Make sure of the status and configuration of the pair that has been split by executing the pairsplit command.

```
c:¥horcm¥etc>pairdisplay –g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)      (CL1-A , 1,   1)    174       1..P-VOL PSUS NEVER ,   175       2   -
vg01     oradb1(R)      (CL1-B , 1,   2)    175       2..S-VOL SSUS NEVER ,-----        1   -
```

The pair of TrueCopy remote replication/TrueCopy Extended Distance could be split. Refer to Chapter 4 of "RAID Manager System Administrator's Guide (TagmaStore® WMS/AMS series)" for the details of the pairsplit command and the option.

3.4.3 User's Data Backup and Connection Host Setting

There is the possibility of loss of user data if the upgrade procedures fail. To prepare for an emergency, all the Disk Drive data mounted on Hitachi TagmaStore® AMS 200™/AMS 500™ should be backed up.

NOTE : Maintenance personnel must check if customers have executed users' data backups.

Please stop the host computers.

Copyright © 2006, Hitachi, Ltd.

3.4.4 Unpacking disk array units to be mounted (Hard)

Unpack the RKH and RKAJ to be mounted to compose the configuration of the Hitachi TagmaStore® AMS 1000™. The procedure is shown below.

⚠ CAUTION

- The unpacking should be done by two or more personnel to prevent turning over of the subsystem or being caught under the subsystem.
- Work carefully because the weight of the single RKH is about 47 kg, RKAJ is about 40 kg.

(1) Unpacking the RKH, RKAJ.

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rain water.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

Figure 3.4.2 shows the subsystem within the outer package.

(a) Remove the outer package and packing materials.
(b) Take the subsystem out of the polyethylene bag.
(c) Remove tapes, etc. applied to the subsystem.
(d) Remove desiccating agent from the lower of the subsystem.
(e) Check the exterior of the subsystem visually for distortion or damage owing to the transport.

Copyright © 2006, Hitachi, Ltd.

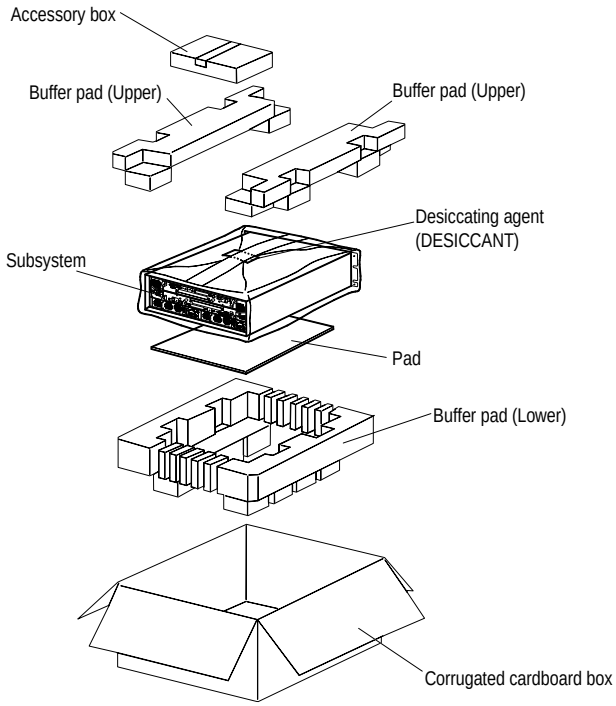


Figure 3.4.2 Packed Subsystem

(2) Check the contents of the package

(a) Check if the contents of the package (their model names, product serial numbers, and quantities) agree with those in the packing list shipped with the subsystem.

(b) The key for the front bezel supplied with the subsystem must be kept by service personnel in order to prevent users from maintaining the subsystem. (The key for Front Bezel is used to mount and dismount Front Bezel.)

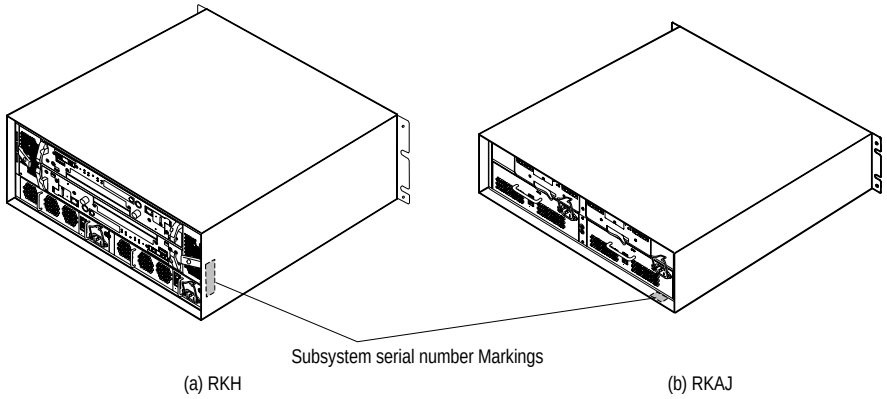

Figure 3.4.3 Locations of Subsystem Serial Number Markings

Copyright © 2006, Hitachi, Ltd.

3.4.5 Connection of the maintenance PC

Connect the maintenance PC to the disk array subsystem.
The procedure is shown below.

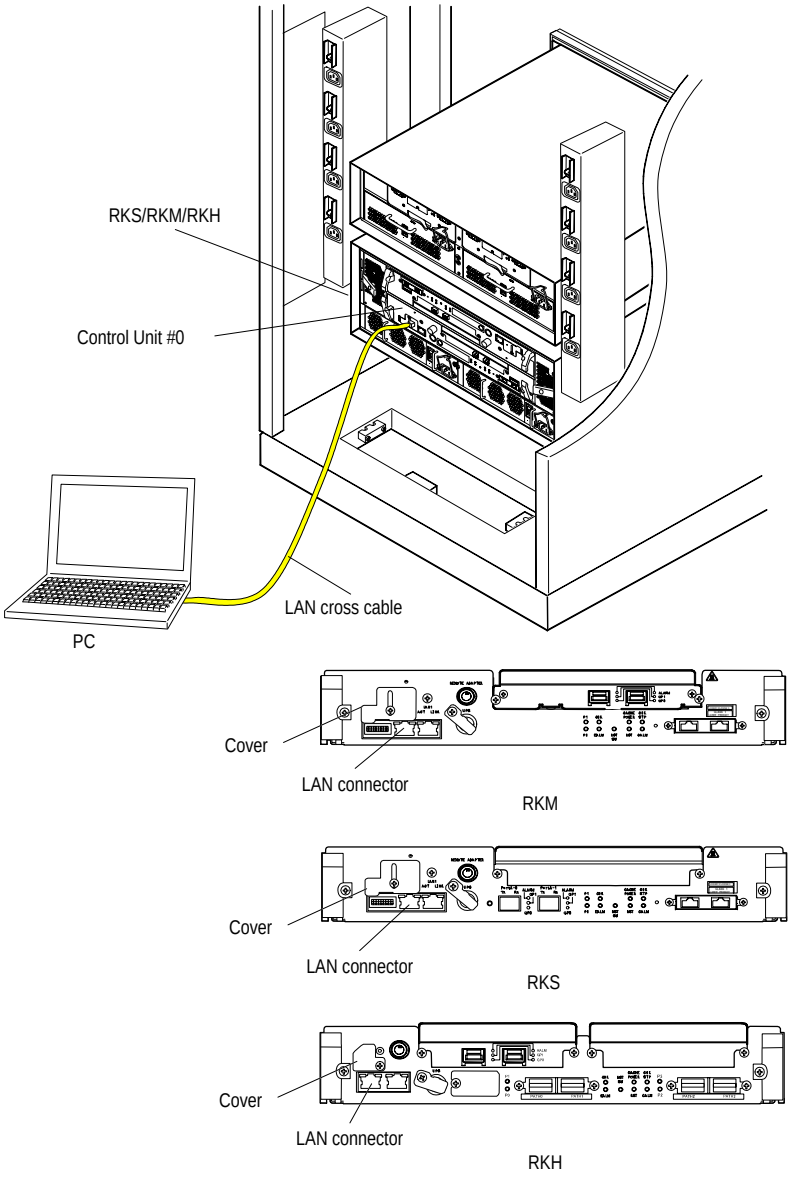
(1) Checking the LAN environment setting

(a) Make sure that the Storage Navigator Modular has been installed. (Make sure that the activation file startsnm.bat exists.)

(b) Check the LAN environment setting for the PC

- Make sure that the following settings have been made, or change the settings to the following.
  For the maintenance PC, set the IP address to 10.0.0.xxx as shown in No. 1.
  If the maintenance PC cannot establish a connection, set the value to shown in No.2 to 5.
  If not connected yet, refer to Maintenance Manual Troubleshooting "3.4 Procedure for specifying maintenance port IP address" (TRBL 03-0100).

No.	Subsystem (LAN maintenance port)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 10.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL0 : 192.168.233.16 CTL1 : 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL0 : 172.23.211.16 CTL1 : 172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL0 : 10.197.181.16 CTL1 : 10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0



- Manual change of the network parameter of the Maintenance port
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.

NOTE: However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
The network address set to the maintenance port cannot be used for the LAN device to be connected to the User management port via the Gateway.
Therefore, use a network address other than that set for the maintenance port.

Copyright © 2006, Hitachi, Ltd.

(2) Connecting the LAN cross cable0

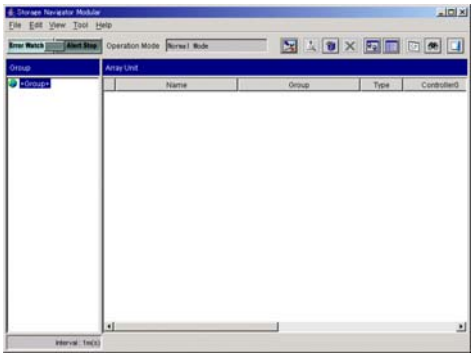
Remove the LAN Cover of the Control Unit #0 and connect the PC and the subsystem with the LAN cross cable.

*1 : The rackmount model (system configuration of the Fibre Channel interface) is shown as an example.

*2 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.4 Connecting the LAN Cross Cable

Copyright © 2006, Hitachi, Ltd.



3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem

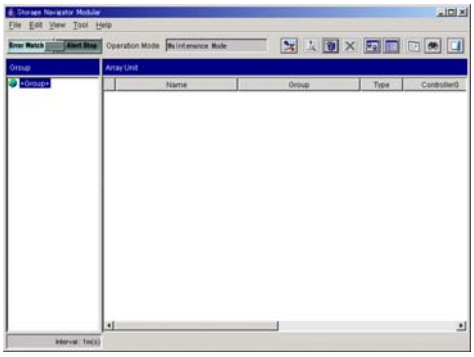
Register the disk array subsystem using Storage Navigator Modular.
The procedure is shown below.

(1) Activating the Storage Navigator Modular

(a) Execute the batch file or shell script for activating the Storage Navigator Modular.
In the case of Windows®, activate the batch file, startsnm.bat.

(b) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed(‡1).

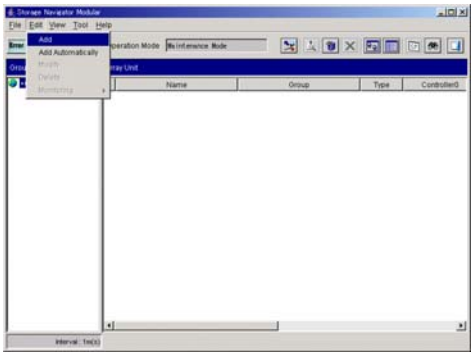
In the case of Windows®, the prompt window is also displayed.
The prompt window has nothing to do with operation of Storage Navigator Modular. But don't close the prompt screen. It is unusually finished.
The icon can be minimized automatically when "Program Quitting" is selected from the properties of the batch file.



‡1 : The mode change cannot be done at the time of the initial activation of the Storage Navigator Modular. A registration of a password validates the mode change.

Copyright © 2006, Hitachi, Ltd.

(2) Change the Operation Mode from the Normal Mode to the Maintenance Mode.

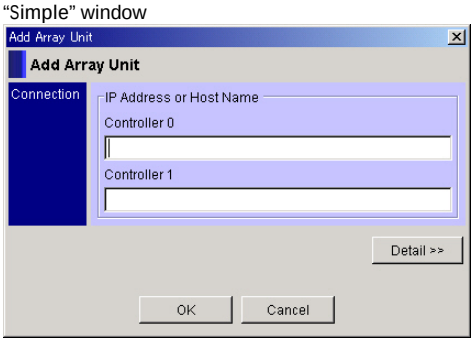


(a) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the [Ctrl], [Shift], and [E] keys at the same time.

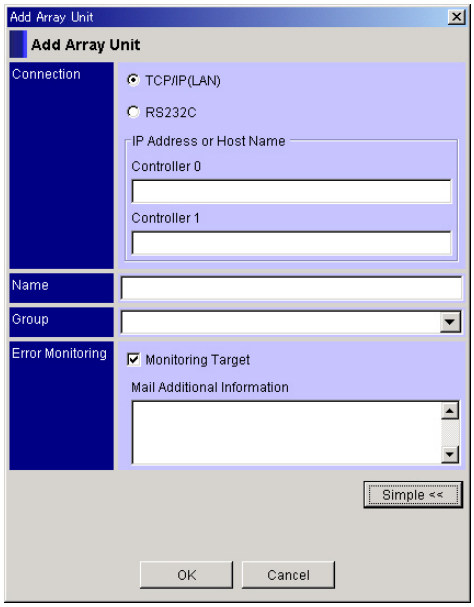
Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

(3) Registering the disk array subsystem

(a) Select [Add] in the main window or click [: Add].



Copyright © 2006, Hitachi, Ltd.



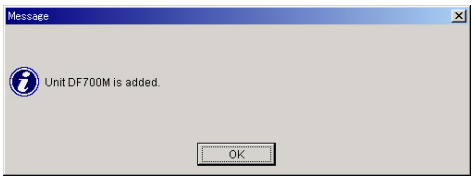
(b) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.

NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.
• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

"Simple" window

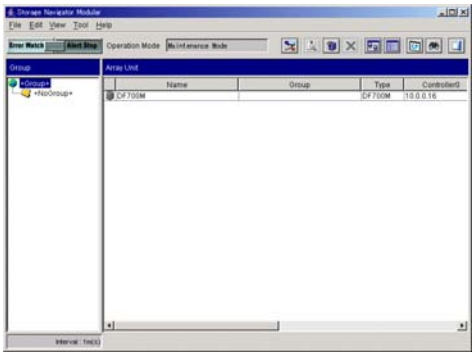
"Detail" window

[Connection] : Select "TCP/IP (LAN)" connection to be used for the disk array subsystem.



[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _). The maximum number of the groups allowed to be registered is 200. The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.



[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

Copyright © 2006, Hitachi, Ltd.

(c) When a message informing of a completion of the registration is displayed, click the [OK] button.

(d) The updated main window is displayed.

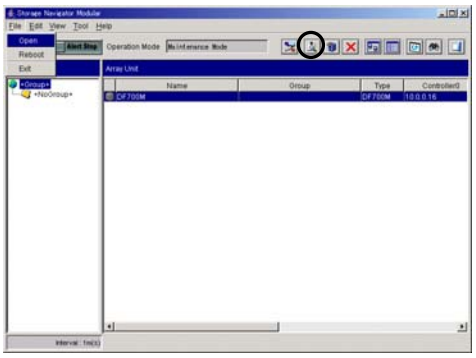
When an entry has been made in [Group Name], the group name is displayed in the tree diagram on the right side of the window. A clicking on the group name displays an icon(s) of the disk array subsystem(s) registered in the group.
There are two types of icon of the disk array subsystem as shown below: an icon for the dual system and that for the single system.

• Icon for the dual system : 

• Icon for the single system : 

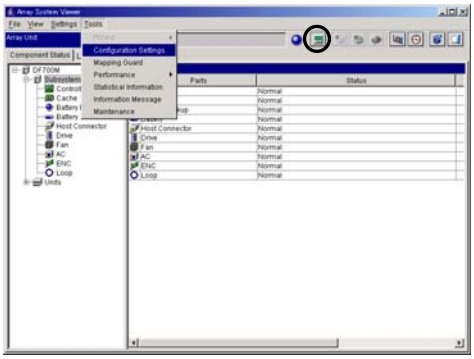
The icons of the disk array subsystem are displayed in the order of the registration of the disk array subsystems.

Copyright © 2006, Hitachi, Ltd.



3.4.7 Making sure of various settings for the disk array subsystem

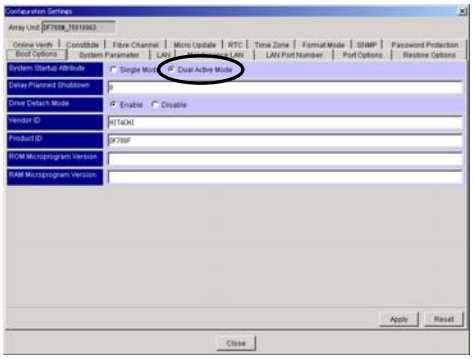
Because the Hitachi TagmaStore® AMS 1000™ does not support the Single mode, make sure that the disk array subsystem is not in the Single mode using Storage Navigator Modular.



NOTE : The array subsystem to be upgraded to the Hitachi TagmaStore® AMS 1000™ is required to be set to the dual active mode.

(1) Turn on the power supply.
(2) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode".
(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again.



(3) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

Copyright © 2006, Hitachi, Ltd.

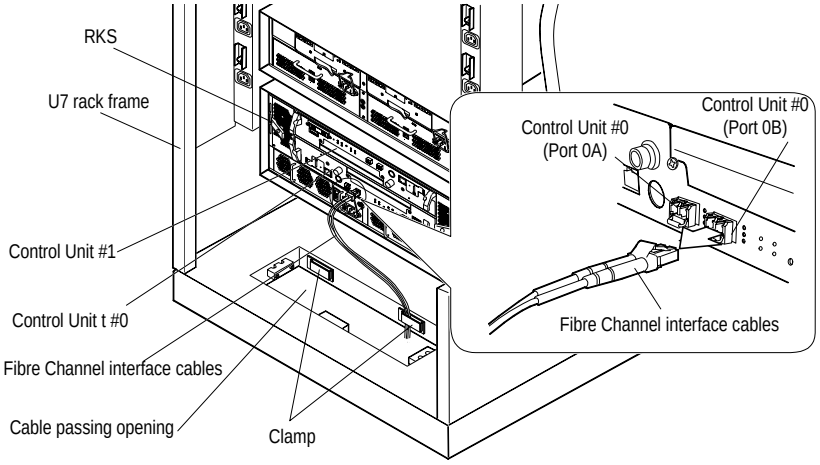
(4) Click the [Boot Options] tab.

(5) Click the [Close] button.

When [System Start Attribute] is set to "Single Mode", be sure to remember that it is necessary to change it to "Dual Active Mode" in the following procedure.

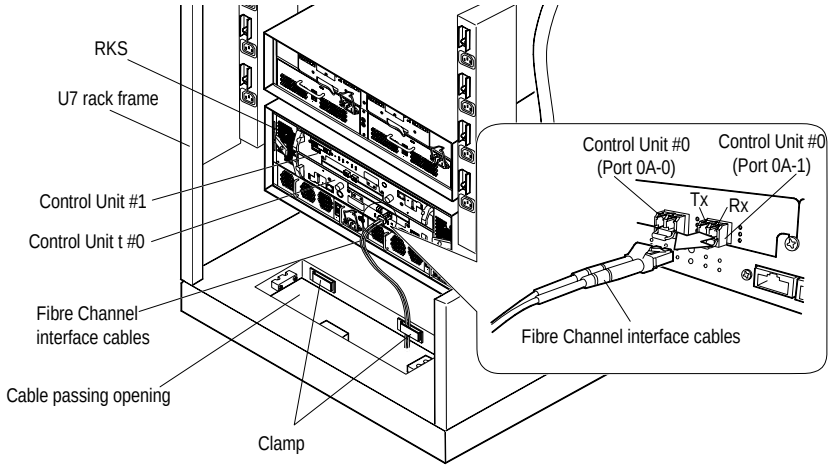
Copyright © 2006, Hitachi, Ltd.

3.4.8 Remove the interface cables (Hard)



To execute the subsequent operation, Fibre Channel Interface cables and iSCSI cables should be disconnected. If connected, the other connected devices may be affected whenever the Disk Array subsystem reboots.
Disconnect all the Fibre Channel interface cables and iSCSI cables connected to the Disk Array subsystem (on the side of connecting to the Control Unit only).

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

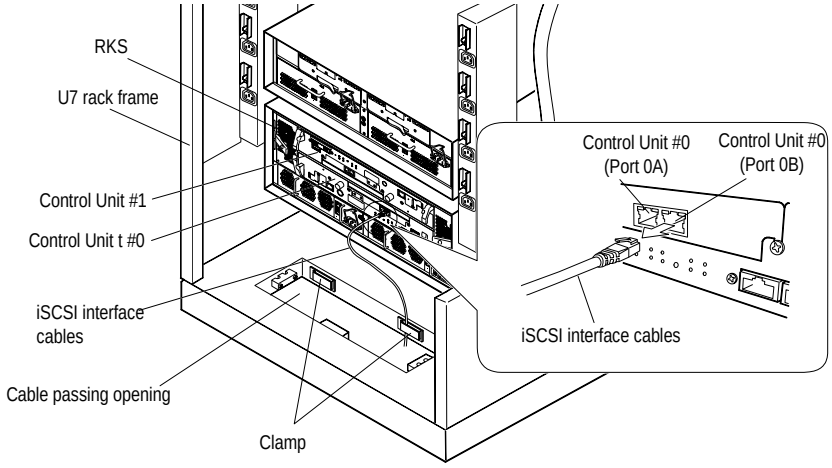


Copyright © 2006, Hitachi, Ltd.

- When the Hitachi TagmaStore® AMS 200™ is the system configuration of the Fibre Channel interface

(a) Disconnect the Fibre Channel interface cable connected to the Control Unit (RKS).
When removing the Fibre Channel interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

*1 : The figure shows the case where the FC Interface Board is not added in the Control Unit of the RKS.



*1 : The figure shows the case where the FC Interface Board is added in the Control Unit of the RKS.

Figure 3.4.5 Disconnecting Interface Cable (1)

• When the Hitachi TagmaStore® AMS 200™ is the system configuration of the iSCSI interface

(a) Disconnect the iSCSI interface cable connected to the Control Unit (RKS).

*1 : The figure shows the case where the iSCSI Interface Board is added in the Control Unit of the RKS.

Figure 3.4.5 Disconnecting Interface Cable (2)

Copyright © 2006, Hitachi, Ltd.

- When the Hitachi TagmaStore® AMS 500™ is the system configuration of the Fibre Channel interface

(a) Disconnect the Fibre Channel interface cable connected to the Control Unit (RKM).
When removing the Fibre Channel interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

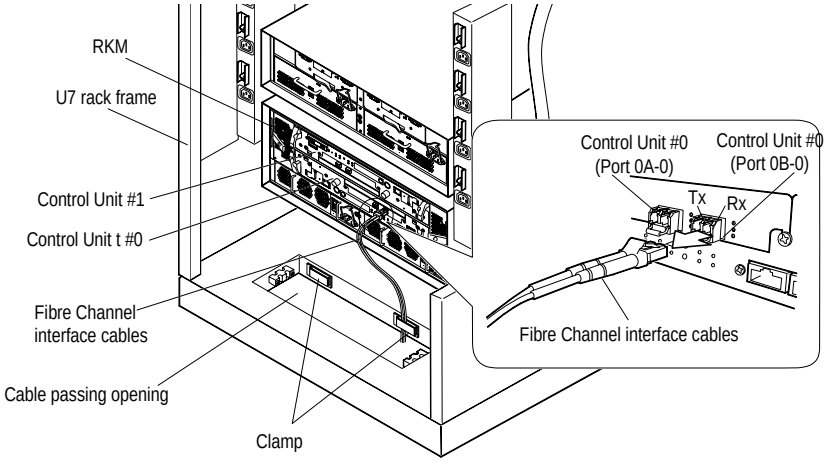

Figure 3.4.5 Disconnecting Interface Cable (3)

- When the Hitachi TagmaStore® AMS 500™ is the system configuration of the iSCSI interface

(a) Disconnect the iSCSI interface cable connected to the Control Unit (RKM).

3.4.9 Updating installation of microprogram for Hitachi TagmaStore® AMS 200™/AMS 500™

Install the microprogram for the Hitachi TagmaStore® AMS 200™/AMS 500™ (Microprogram of the same revision with the Hitachi TagmaStore® AMS 1000™of 0731/A-S, or 0731/A-M or later) using the Storage Navigator Modular.

The updating installation must be executed twice in order to completely change information of the microprograms of two generations.

The procedure is shown below.

(1) Preparation for update installation of microprogram

(a) Set up the maintenance PC before starting the update installation.

The setting up is completed when the installer stored in the CD-ROM of the microprogram is executed.

Outline of the setting up is shown below.

- Installation of the JRE 1.3.1_03
- Setting of the security policy file
- Copying of the microprogram from the CD-ROM for the microprogram installation to the maintenance PC

(b) Prerequisites for setting up of a maintenance PC

Prerequisites concerning the user ID of Windows® are as follows.

- The user ID of Windows® at the time when the microprogram is installed in the maintenance PC must be identical with that at the time when a maintenance work is done.

A prerequisite of a drive for booting the OS of the maintenance PC

- The drive for booting the OS must be the C drive.

Copyright © 2006, Hitachi, Ltd.

(2) Hierarchy of Microprogram Storage Directories

The hierarchical structure of Microprogram storage directories is shown below.
The structure of directories of the CD-ROM for installing the Microprogram is the same as that shown below.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:\diskarray-microprogram\microprogram."
When installing the Microprogram, specify the unified version directory.

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	microprogram file	-	-

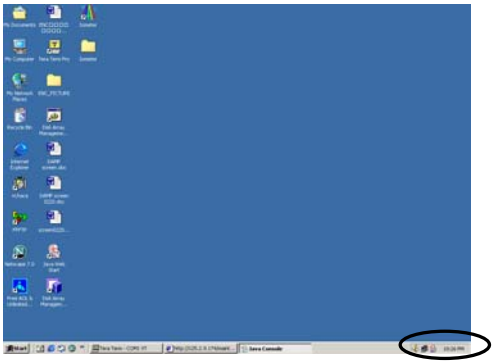
NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The Microprogram becomes unable to be installed if the directory name is changed.

Copyright © 2006, Hitachi, Ltd.

(a) Java error codes displayed at the time of update installation and actions for coping with them.

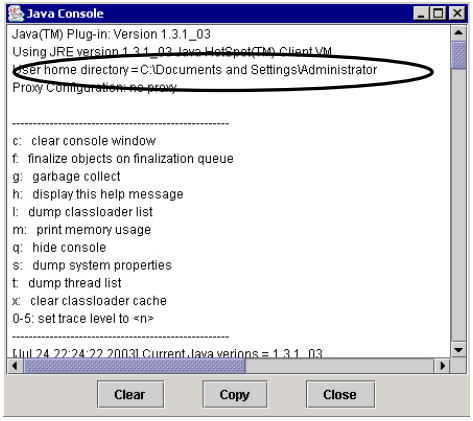
When the PC does not satisfy the prerequisite shown in Item (1)(b), a Java error occurs. Details of the Java errors and actions for coping with them are shown below.

Table 3.4.1 Java error codes



Message code	Message text	Time when the error occurs/ Cause estimated	Action for coping with the error
1216	Access to the property information was rejected. Confirm the setup of the security policy.	Time when the error occurs • The error occurs immediately after the [Select] key is pressed when the microprogram is selected. Cause estimated • A drive for booting the OS is not the c drive. • The user name of Windows® at the time when the microprogram was installed in the maintenance PC is not identical with that at the time when the microprogram is updated, or two-byte characters (full size characters or Japanese characters) are used to define the user name	① Check if the drive for booting the OS is the c drive. (Refer to the (i) of (2)(a) in Subsection 3.4.9) In the case of the dual boot, boot Windows® using the c drive and perform the installation again. ② Check if the user name of Windows® at the time when the microprogram is installed in the maintenance PC is identical with that at the time when the microprogram is updated and if two-byte characters (such as full size characters and Japanese characters) are not used. If an illegal specification has been made, perform the logon over again using an appropriate user name and perform the installation again after connecting the browser.
1219	An error occurred during the communication with the subsystem. Confirm the subsystem status and the LAN environment.	Time when the error occurs • The error occurs when the resource for the LAN cannot be ensured. Cause estimated • The error occurs because the resource (memory) of the maintenance PC is insufficient.	① Reboot the subsystem and the maintenance PC and quit unnecessary application programs. Make sure that the subsystem is in the READY status, place the subsystem in the Maintenance mode, and perform the installation again. ② If the error recurs in spite of the operations above, replace the maintenance PC and perform the installation over again from the beginning. Use a PC whose memory capacity is as large as possible.

Copyright © 2006, Hitachi, Ltd.



(i) Method for checking the drive for booting the OS

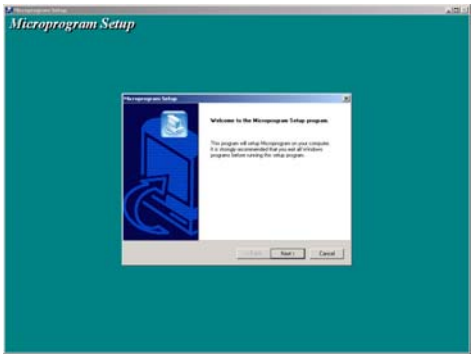
A method for checking the boot drive when the Java message (message code: 1216) is issued is shown below.

① Double click the [: Java icon]on the task tray at the bottom right in the Service PC window.

② Since the JavaConsole window opens, make sure that the [User Home Directory] is the c drive (=C: *****…).

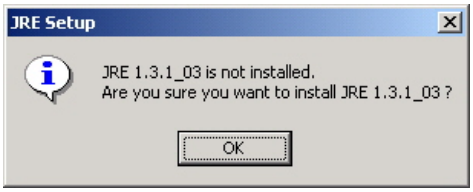
Copyright © 2006, Hitachi, Ltd.

(b) Procedure for setting up the maintenance PC



(i) Double click the "Program\micro upload\micro setup\Setup.exe" of the CD-ROM for microprogram installation.

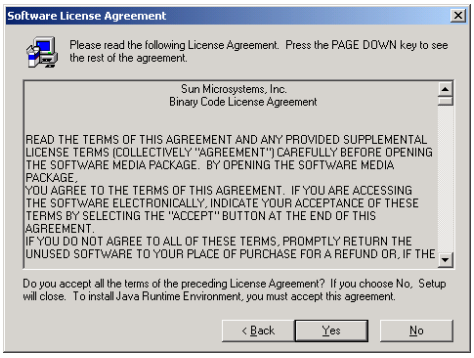
Deleted: ??



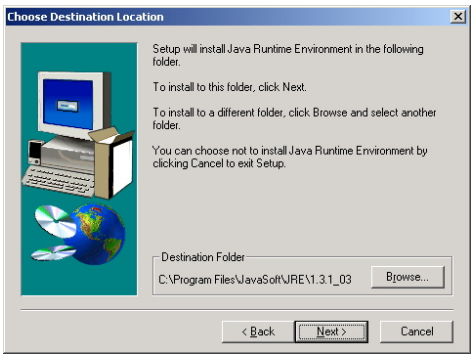
Deleted: ??

Deleted: ??

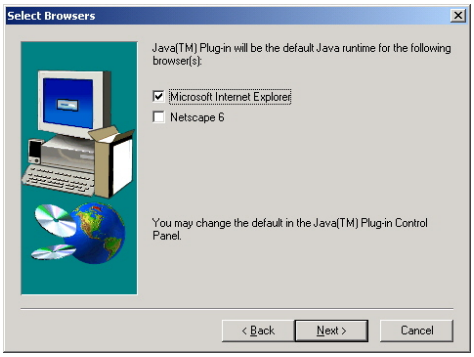
(ii) The initial window of the setting up appears.
When the [Next] button is pressed, the JRE 1.3.1_03 installer is activated in the case where the JRE 1.3.1_03 is not installed yet.
In the case where the JRE 1.3.1_03 has been installed, windows® shown in Steps (iii) to (vii) are not displayed.



(iii) A dialog box for asking confirmation of starting the JRE 1.3.1_03 installer. Click the [OK] button.

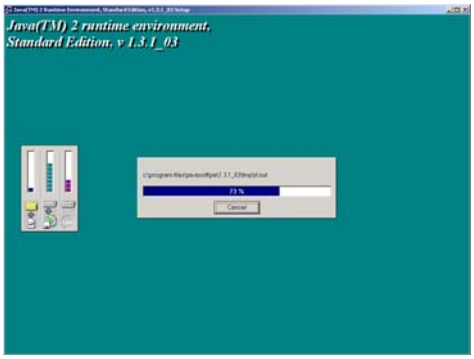


Copyright © 2006, Hitachi, Ltd.



(iv) A window of product licensing contract is displayed. Click the [Yes] button.

(v) A window for selecting a directory in which the JRE 1.3.1_03 is to be installed. Select the directory for the installation and click the [Next] button.

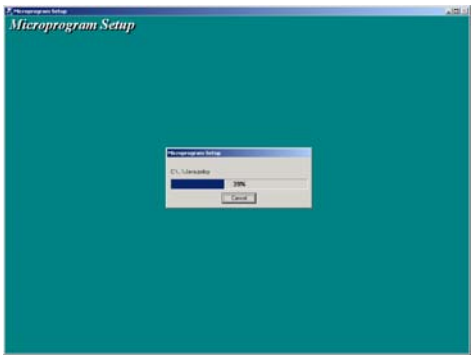


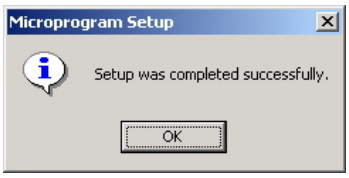
(vi) A window for specifying the Java default browser is displayed. Select the browser being used and click the [Next] button.

Copyright © 2006, Hitachi, Ltd.

(vii) Installation of the JRE 1.3.1_03 is started.

(viii)After the installation of the JRE 1.3.1_03 is completed, set the security policy file.
When the security policy file (.java.policy) exists in the home directory of the current user, a window for asking confirmation of starting the setting is displayed.
Click the [Yes] button.





Copyright © 2006, Hitachi, Ltd.

(ix) The microprogram is copied on the maintenance PC.

Create a directory to which the microprogram is to be copied directly under the "C:\diskarray-microprogram\microprogram" for each microprogram revision and copy the microprogram file with the subdirectories (DF700M, DF700S, ENC, ---) into the directory.

(x) The setting up is completed. Press the [OK] button.

NOTE : • Note that the settings of the security policy file is changed when the maintenance PC is set up.
• If the microprogram is transferred to a directory other than "C:\diskarray-microprogram\microprogram" which is a directory copied by the installer, the installation cannot be done. Therefore, care should be taken.
• Do not change a name of the unified version directory(‡1) or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

‡1 : For the unified version directory, refer to "3.4.9 (2) Hierarchy of Microprogram Storage Directories" (SMUP 03-0260).

Copyright © 2006, Hitachi, Ltd.

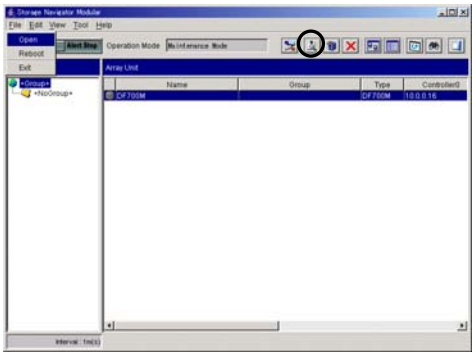
(3) Install the microprogram for the Hitachi TagmaStore® AMS 200™/AMS 500™.

(3-1) Procedure for download

(a) Matters to be made sure of before starting update installation.

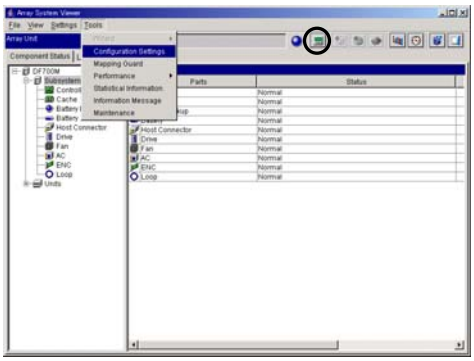
Make sure of the following before starting the update installation.

- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem. (refer to Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).)
- Check that the READY LED (green) on the Front Bezel of the Basic Chassis lights up. When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 50 minutes until it lights up because the automatic download of the ENC/SENC firmware is being executed. When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 85 minutes until the READY LED (green) on the front of the Basic Chassis lights up because the automatic download of the ENC/SENC firmware or the update of the flash program is being executed.
  Also, check that the WARNING LED (orange) on the Front Bezel does not light up.
- Also, check that the WARNING LED (yellow) on the Front Bezel does not light up or blink at low-speed. When it lights up or blinks at low-speed, connect it to WEB, and perform the maintenance according to the information message on WEB. After the recovery is made, install the microprogram in order to update it.
- Make sure that the system copy is not being executed through the information message (I140xy System copy started (x: Unit number, y: HDU number)) of the WEB.
  If it is in the middle of system copy, please wait until that is completed and update installation of microprogram.



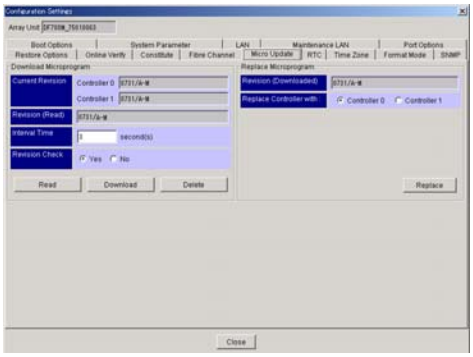
(b) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).

(c) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150).)



Copyright © 2006, Hitachi, Ltd.

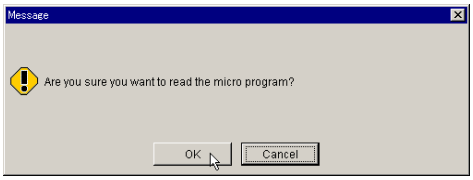
(d) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.



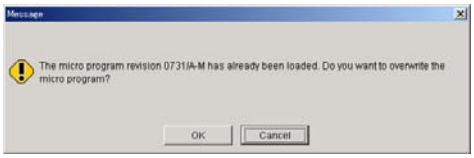
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(e) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

(f) Click the [Micro Update] tab.

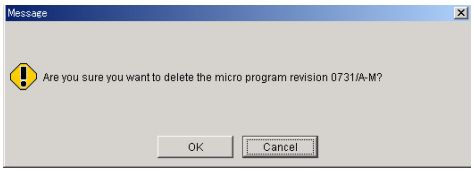


Copyright © 2006, Hitachi, Ltd.



(g) Read in the microprogram to the service PC in which Storage Navigator Modular is installed. Click the [Read] button.
When a microprogram revision is displayed in the [Revision(Read)] box, the microprogram has already been read in. When only the Unified version directory storing the microprogram is specified, the whole microprogram is read in automatically.

(h) Since a message asking for confirmation whether or not to read in the microprogram, click the [OK] button.

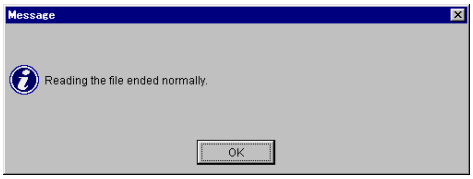


NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the download of the microprogram again from the beginning.

In the case where the microprogram has already been read in, the message asking for the confirmation is displayed. When you click the [OK] button, the microprogram is overwritten. When you abort the reading in, click the [Cancel] button.

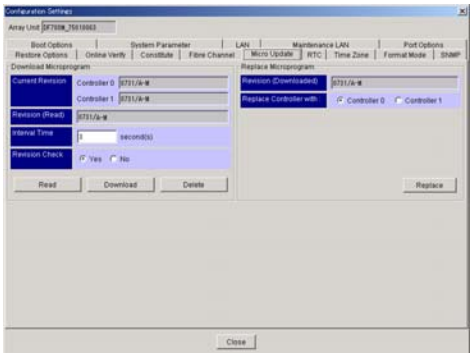
When you eliminate the microprogram that has already been read in to the computer, click the [Delete] button. Since the message asking for confirmation is displayed, click the [OK] button.

Copyright © 2006, Hitachi, Ltd.



(i) Since a window for specifying the directory in which the microprogram to be read in is stored is displayed, specify the Unified version directory. When you click the [OK] button, reading in of the microprogram is started.
Examples of the path entry are shown below.

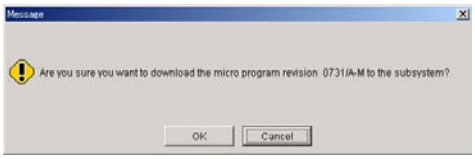
When using Windows®:



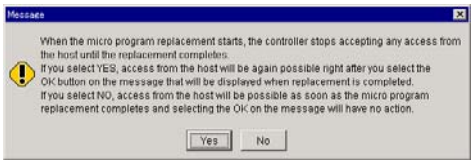
c:/diskarray-microprogram/microprogram/micro/0731A

Unified version directory in the hard disk in which the micro program is copied.

(j) Since a message is displayed when the reading in of the microprogram is completed, click the [OK] button.

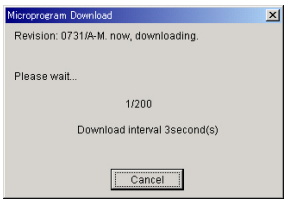


The revision of the microprogram that has been read in is displayed in the [Revision(Read)] box.

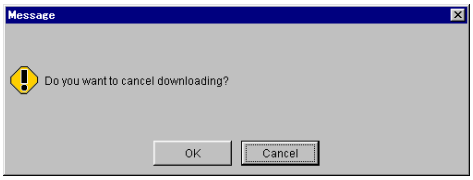


(k) Click the [Download] tab.

Copyright © 2006, Hitachi, Ltd.



(l) The confirmation window is display. Click the [OK] button.



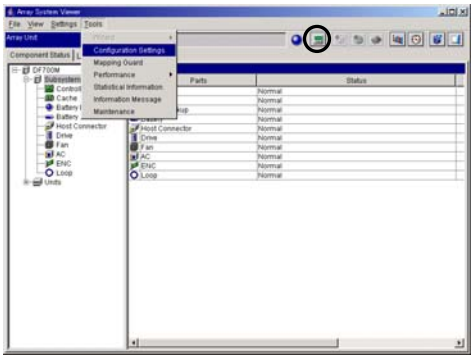
The confirmation window is display. Click the [Yes] button.

The download of the microprogram starts by clicking the [Yes] button, and the dialog is displayed.

When you abort the downloading, click the [Cancel] button.
A message asking for confirmation is displayed. When you click the [OK] button, the downloading is aborted.
When you click the [Cancel] button, the downloading is continued.

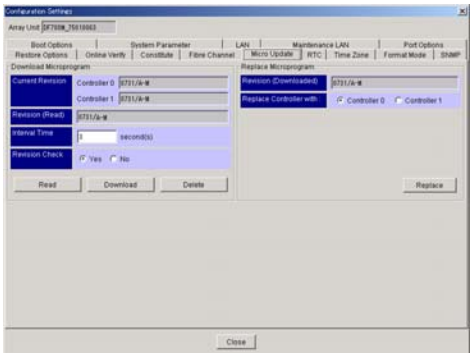
Copyright © 2006, Hitachi, Ltd.

(m) Since a message is displayed when the downloading is completed normally, click the [OK] button.



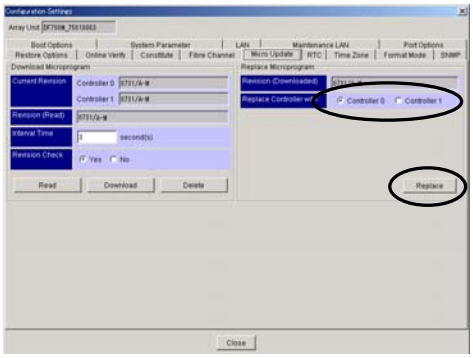
NOTE : After the microprogram is downloaded, be sure to restart the disk array subsystem or replace the microprogram. If the Control Unit board is replaced in the online mode before restarting the disk array subsystem or replacing the microprogram, the replaced Control Unit may be detached. When the subsystem is burdened with a heavy I/O load by a host at the time of the downloading, the downloading may be terminated abnormally. Perform the downloading again.

(3-2) Replacing the microprogram



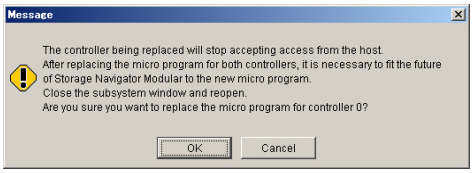
Replace the microprogram that was downloaded to the disk array subsystem with the microprogram installed in the Control Unit. When making replacement, be sure to replace the microprograms of the both Control Units 0 and 1. When the microprogram of one of the Control Units is replaced and the unit window of Storage Navigator Modular is closed, the unit window may be opened no more. When the unit window is not opened, replace the microprogram after changing the subsystem configuration by eliminating the IP address of the Control Unit whose microprogram has been replaced using an IP address of the Control Unit whose microprogram is not replaced yet.

(a) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

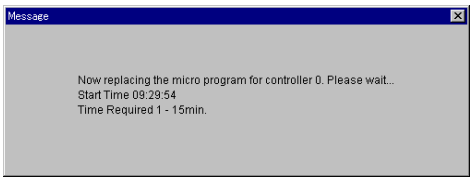


Copyright © 2006, Hitachi, Ltd.

(b) Click the [Micro Update] tab.



(c) Select the Control Unit whose microprogram is to be replaced and click the [Replace] button.



(d) The confirmation window is display. Check if the selected Control Unit is correctly displayed and click the [OK] button.

NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the replace of the microprogram again from the beginning.

Copyright © 2006, Hitachi, Ltd.

↓

Click the [OK] button according to the dialog message.

(e) When the replacement of the microprogram terminates normally, a completion message is displayed. When the [OK] button is clicked, the revision of the replaced microprogram is updated and the window is displayed.

NOTE : When making the access from the host accepted by the instruction from Storage Navigator Modular, the following message may be displayed if it is not operated for 20 minutes or more in the case where Account Authentication is valid, and it may not be completed normally. Perform the dummy replacement (‡1) of the Control Unit whose microprogram was replaced to make the access from the host accepted.
If the access from the host is made accepted when the replacement of the microprogram is completed, the dummy replacement (‡1) is unnecessary.

(f) Replace the microprogram in the other Control Unit according to the procedure (c) to (e). When replacement of the both Control Units is terminated normally, the microprogram replacement of the disk array subsystem is completed.

NOTE : When the replacement of the microproram is made for only one of the dual Control Unit, the disk array subsystem is put in the status in which a warning is issued. The warning is called off when the other one of the dual Control Unit is replaced. When you replace the microprogram, be sure to make the replacement for the both Control Units continuously.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2006, Hitachi, Ltd.

(g) Because the microprogram is managed by two generations, return to the procedure (3) reference place, and perform the update installation of the microprogram again.

NOTE : Because TrueCopy remote replication/TrueCopy Extended Distance manages information stored in paired disk array subsystems, the path of the mate disk subsystem (not the subsystem being upgraded but the other one of the paired subsystems) is detached when TrueCopy remote replication/TrueCopy Extended Distance is used.
When the subsystem "B" shown in Figure 3.4.6 is upgraded, the path of the subsystem "A" is detached.
The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
This is because the "A" becomes unable to access the "B" as a result that the "B" is placed in the Maintenance mode. Therefore, this is not a problem.
However, when the pair status is changed to PSUE, there may have been a mistake in operations that have been made. Recover the pair from the PSUE status referring to Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).

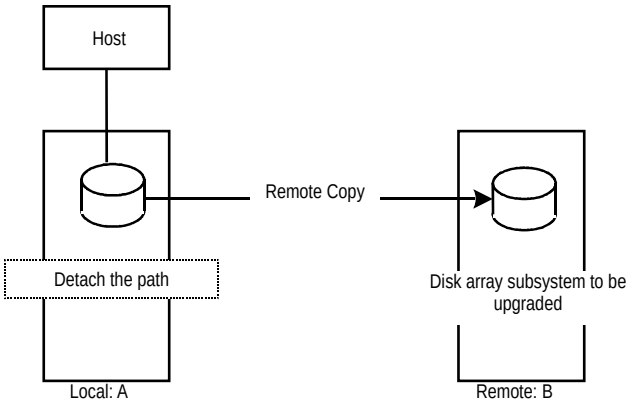


Figure 3.4.6 Paired Disk Array Subsystems (TrueCopy remote replication/TrueCopy Extended Distance)

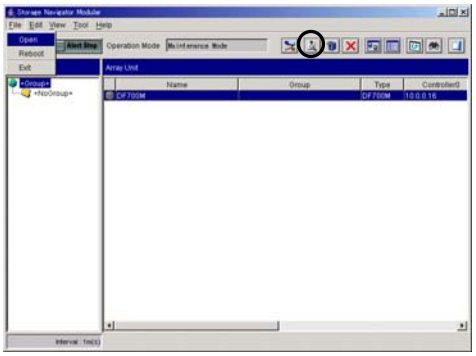
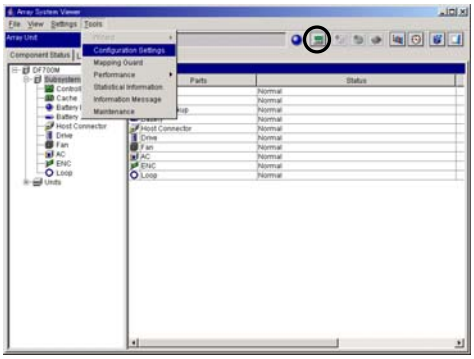
Copyright © 2006, Hitachi, Ltd.



3.4.10 Canceling Single Controller Mode

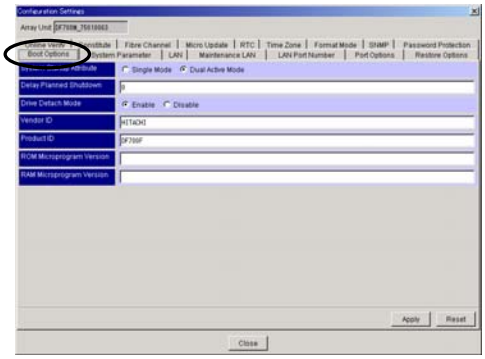
When it is made clear that the Single Mode is set through the check that has been made according to Subsection "3.4.7 Making sure of various settings for the disk array subsystem" (SMUP 03-0190), change it to the "Dual Active Mode" using Storage Navigator Modular.
The procedure is shown below.

NOTE : The array subsystem to be upgraded to the Hitachi TagmaStore® AMS 1000™ is required to be set to the dual active mode.

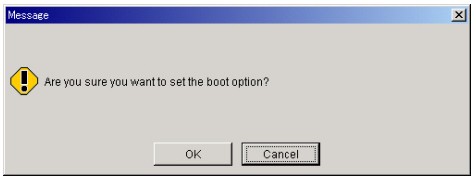


(1) Turn on the power supply.
(2) Start the Storage Navigator Modular and set the Operation Mode to the "Maintenance Mode".
(3) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

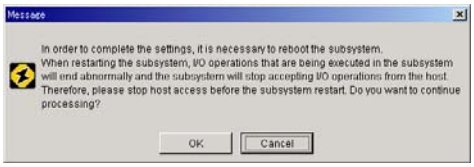
NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again.



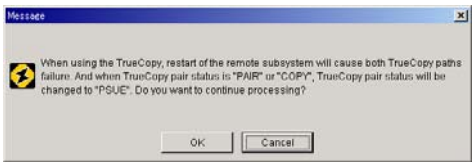
Copyright © 2006, Hitachi, Ltd.

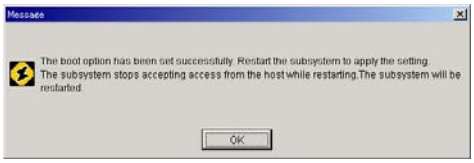


(4) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.



(5) Click the [Boot Options] tab.





(6) Select the [System Startup Attribute] as [Dual Active Mode], and click the [Apply] button.
(7) The confirmation window is display. Click the [OK] button.

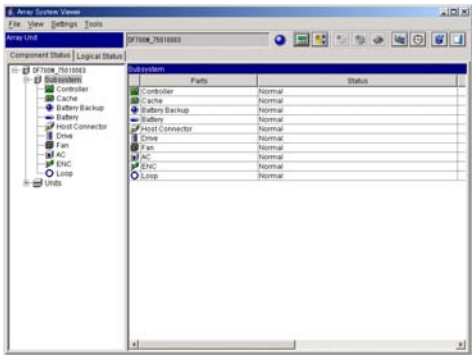
Copyright © 2006, Hitachi, Ltd.

The following message is displayed further to the message of "Wait a moment", so that click the [OK] button.

The Unit screen is closed. To perform other operations on the Main screen, select an array unit from the Main screen and open the selected Unit screen.

NOTE : There is no problem though WARNING LED lights.
Go to the next work after checking that only the message of "Controller Alarm" is displayed in [Information Message].

(8) Power off the disk array subsystem. ("3.4.13 System power off" (SMUP 03-0530))
(9) Power on the disk array subsystem. ("3.4.15 Subsystem power on" (SMUP 03-1270))

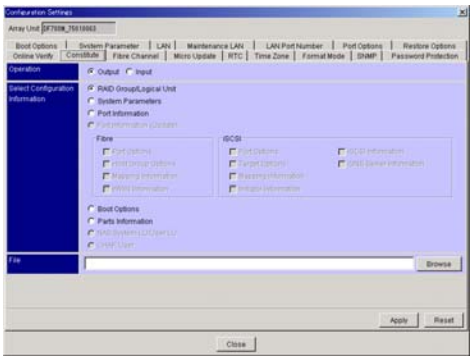


NOTE : There is no problem though WARNING LED lights.
Go to the next work after checking that only the message of "Controller Alarm" is displayed in [Information Message].

Copyright © 2006, Hitachi, Ltd.

3.4.11 Collecting serial numbers of Disk Drives

There are operations such as removing the Disk Drive from the chassis, moving the chassis in the rack, and inserting the disk Drive in the unchanged installation position of that before removing it in the procedure for the Hitachi TagmaStore® AMS 1000™ upgrade "3.4.14 Hardware upgrade work(Hard)" (SMUP 03-0550).
In that case, it is required to collect the information of the Disk Drive installation position at the Hitachi TagmaStore® AMS 200™/AMS 500™ and save it to cope with such cases that the installation position of the Disk Drive becomes uncertain or the error is found in the installation position.
Collect the serial numbers of the Disk Drives using Storage Navigator Modular.



(1) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular. ("3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140))
(2) Set the operation mode of Storage Navigator Modular as Maintenance mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))
(3) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.

(4) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

Copyright © 2006, Hitachi, Ltd.

(5) Click the [Constitute] tab.

(6) Click the [Operation] radio button and [Output] radio button in the [Select Configuration Information] box.
(7) Check the [RAID Group/Logical Unit] radio button in the [Select Configuration Information] box.
(8) Click the [Browse] button, and specify the directory and file name to output the file of the configuration.
(9) Click the [Apply] button.

Copyright © 2006, Hitachi, Ltd.

(10) Open the configuration information file that has been got in Step (9) and make sure that the following information is output.

```
Array unit configuration information list.

3.4.12 Collecting simple trace (Hard)

Collect the simple trace and keep it so that in case of failure. It can be investigated. Collect the simple trace using the WEB.
The procedure is shown below.

(1) Before collecting the simple trace

(a) Items to be prepared

Collection is performed using the normal mode of WEB or Maintenance mode.
For connecting to the WEB, a PC terminal with Browser installed is necessary.
For collecting the simple trace, disk space of 30 M bytes is required. (15 M bytes for temporary data and 15 M bytes for Full Dump data)

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN-cross-cable.

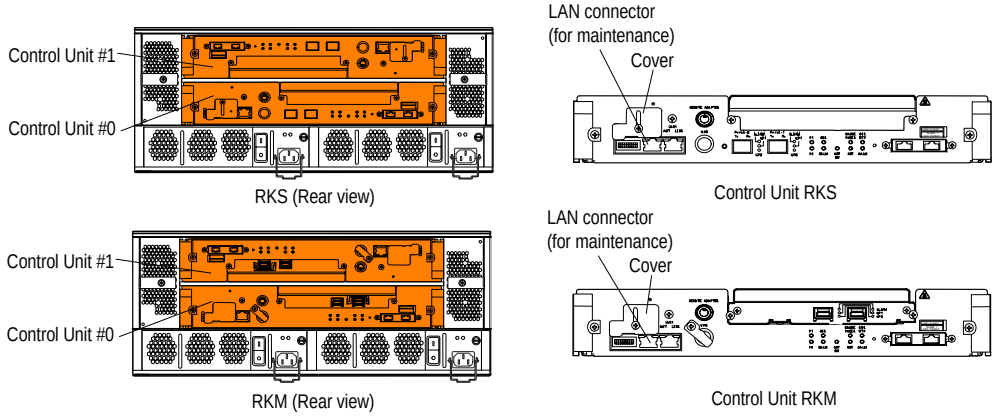

Figure 3.4.7 LAN Connector Position

(c) With Simple Trace Collection, the information of both controllers can be collected from one controller. Therefore, this function does not need to be performed from both Controllers. (As a file name during the collection, “smpl_trc0.dat” is provided for the collection from Control Unit #0, and “simpl_trc1.dat” for the collection from Control Unit #1”.)

(d) Make sure that the WARNING LED (orange) on the Front Bezel is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

Copyright © 2006, Hitachi, Ltd.

(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] - [Cache] - [Clear Cache] in this order.

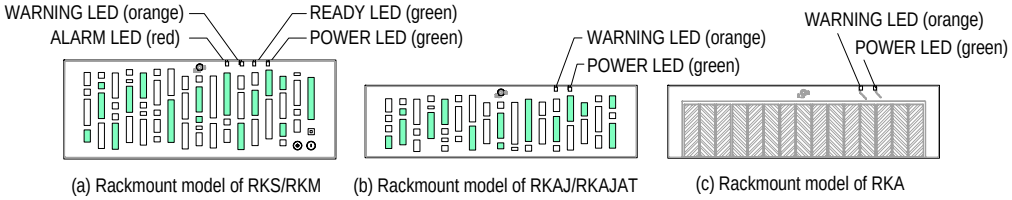

Figure 3.4.8 Indication Locations and Names of LED (Front Bezel)

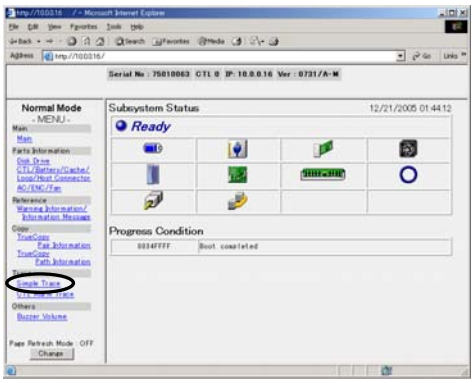
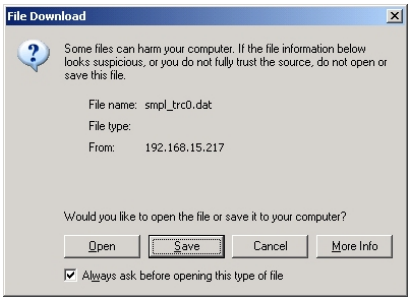
(2) Procedure for a simple trace collection

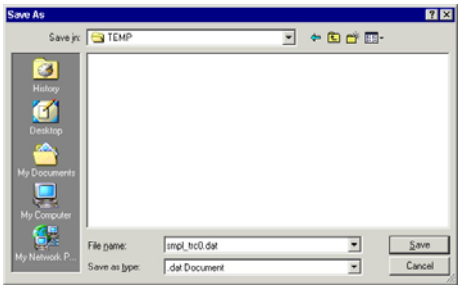


(a) Enter the IP address of the LAN connector for maintenance, to which the maintenance PC is connected, from the browser. When the WEB has already been connected, update the page by pressing the Update button. (For the procedure for connecting the WEB, refer to Maintenance Manual WEB "Chapter 1 Before Using Web" (WEB 01-0000).)



(b) When Windows® XP Service Pack2 or Windows® 2003 Service Pack1 is used in the OS of the maintenance PC, collect the simple trace after changing the setting of the following Internet Explorer.
- Select [Tools] - [Internet Options] from the Internet Explorer menu.
- Select the [Privacy] tab, check [Blocked pop-up] of [Pop-up block], and click the [Set] button.
- Set [Filter level] to [Medium] in the [Setting pop-up block] window and click the [Close] button.
- Select [OK] button in the [Internet Options] window.

Copyright © 2006, Hitachi, Ltd.



(c) Collect the simple trace according to the WEB and the following procedure.
Click "Trace" in the menu frame of "Simple Trace".

(d) The following dialog is displayed.
Click the [Save] button.

(e) Select the place to save the file and file name (Default file name: CTL#0:smpl_trc0.dat, CTL#1: smpl_trcl.dat) and click [Save][‡1].

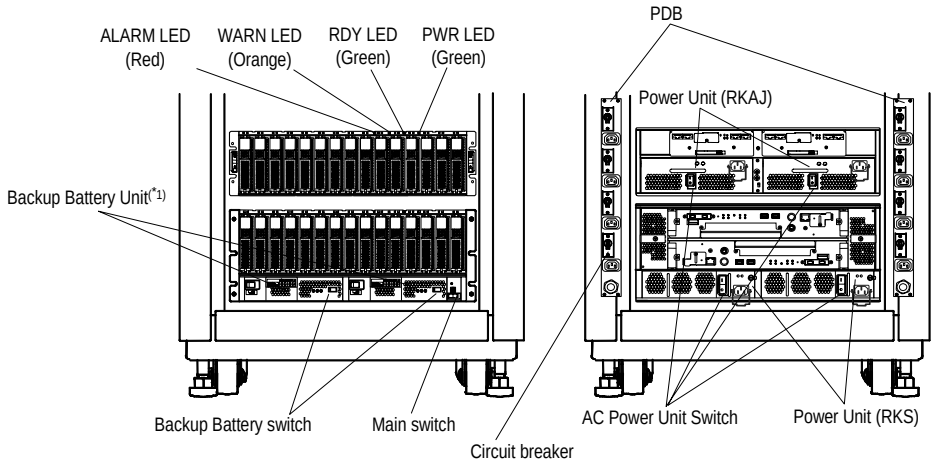
The down-loading is started and the progress indicating message window is displayed.

‡1 : There may be a case where the default file name is given as "ctla_trc0.dat..dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

Copyright © 2006, Hitachi, Ltd.

In this procedure Simple trace is collected by WEB Normal mode. Similarly, Simple trace can be collected by WEB Maintenance mode through Menu Frame.
For entering Maintenance mode, refer to the Maintenance Manual WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

When the USB memory needs to store the simple trace information, refer to Maintenance Manual Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300).



Copyright © 2006, Hitachi, Ltd.

3.4.13 System power off

Execute the deliberate shutdown of the disk array subsystem.
The procedure is shown below.

NOTE : Do not perform the planned shutdown (power-off) while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 30 to 50 minutes).

(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the front of the subsystem is off.
(3) All turn off the AC Power Unit Switch of the Power Unit.
(4) Turn off the battery switch of the Backup Battery Unit.
(5) All turn off the circuit breaker of the PDB.

*1 : There is only one Backup Battery Unit to be installed in the RKS and install it in the left side of the subsystem.
*2 : The RKS+RKAJ is shown as an example.

Figure 3.4.9 Locations of Switches for Power Off

Copyright © 2006, Hitachi, Ltd.

NOTE : Because TrueCopy remote replication/TrueCopy Extended Distance manages information stored in paired disk array subsystems, the path of the mate disk subsystem (not the subsystem being upgraded but the other one of the paired subsystems) is detached when TrueCopy remote replication/TrueCopy Extended Distance is used.
When the subsystem "B" shown in Figure 3.4.10 is upgraded, the path of the subsystem "A" is detached.
The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
This is because the "A" becomes unable to access the "B" as a result that the "B" is placed in the Maintenance mode. Therefore, this is not a problem.
However, when the pair status is changed to PSUE, there may have been a mistake in operations that have been made. Recover the pair from the PSUE status referring to Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1170).

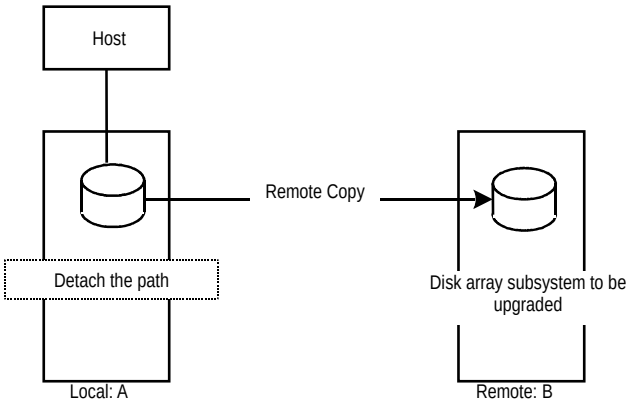


Figure 3.4.10 Paired Disk Array Subsystems (TrueCopy remote replication/TrueCopy Extended Distance)

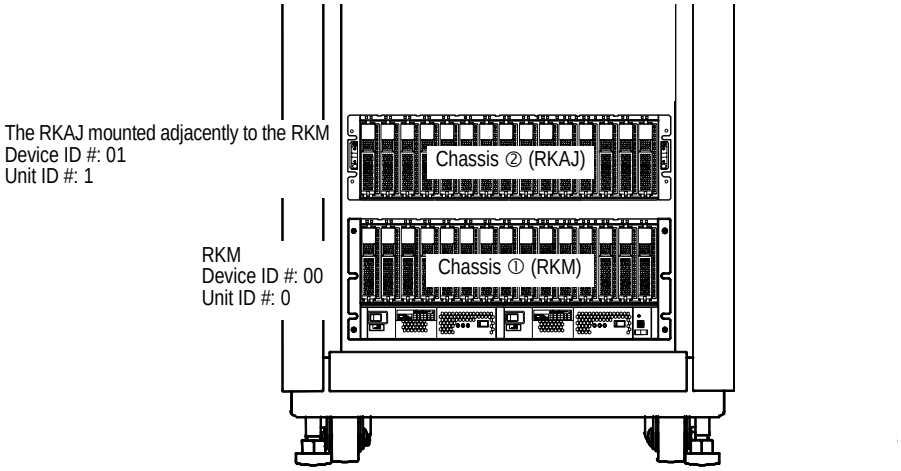
Copyright © 2006, Hitachi, Ltd.

3.4.14 Hardware upgrade work(Hard)

Replace some components with those for upgrading the disk array subsystem to the Hitachi TagmaStore® AMS 1000™. Make the replacement above and have the customer keep the components that become unused because they are used in the configuration of the Hitachi TagmaStore® AMS 200™/AMS 500™.
The procedure is shown below.

The hardware upgrade procedure is shown in this section based on the Hitachi TagmaStore® AMS 500™ of the configuration of Figure 3.4.11.
The basic chassis RKM and the additional chassis RKAJ connected to the first unit are shown as "Chassis ① (RKM)" and "Chassis ② (RKAJ)", respectively.
However, if the procedure for upgrading the Hitachi TagmaStore® AMS 200™ differs from the procedure for the Hitachi TagmaStore® AMS 500™, the supplement is added.
When upgrading the Hitachi TagmaStore® AMS 200™, perform the operation by reading the RKM as the RKS and the Hitachi TagmaStore® AMS 500™ as the Hitachi TagmaStore® AMS 200™ for this section.
Also, the procedure for the FibreChannel configuration is shown in this section, but if the procedure differs in the iSCSI configuration, the supplement is added.
Perform the work in the same way when the RKAJAT or the RKA of the additional chassis is installed.
In this section, the procedure only when the additional chassis is the RKAJ is shown, but when the procedure differs for the RKAJAT or the RKA, supplements are added.



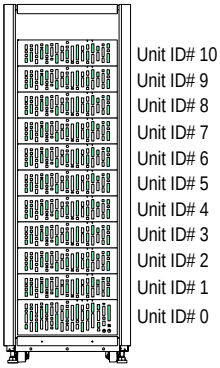


Figure 3.4.11 Procedure for Removing Front Bezel

Copyright © 2006, Hitachi, Ltd.

NOTE : In this section, the case where a unit ID# is ascending order from the bottom of the U7 rack frame in the configuration before the upgrade is explained to an example.
Start the work after checking this in order of the ENC cable connection. If it is not so, the work occurs in moving the installed chassis to the installation destination, etc. when the chassis is moved in the rack frame.

NOTE : When the number of the U7 rack frame maximum chassis is installed in the configuration before the upgrade, add the U7 rack frame newly. (Refer to Maintenance Manual Installation "3.2.1 U7 Rack Frame (Unpacking/Installing and Installation areas/maintenance areas)" (INST 03-0020))

(1) Note on hardware upgrade works

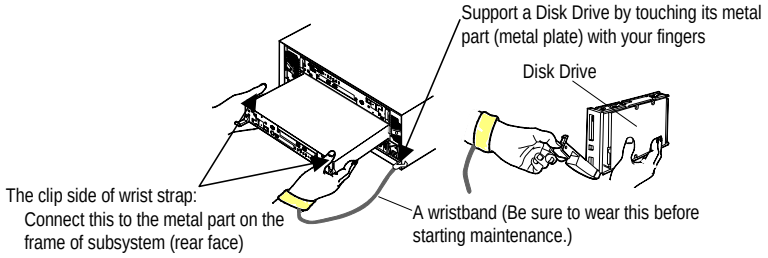
(a) Perform the powering on/off operation correctly.

It is feared that user data is lost if the powering on/off operation is not done following the procedure correctly.
Since the power supplying system is duplicated, operate AC Power Unit Switch of the both systems when turning on/off the Power Unit.

⚠ CAUTION

Hazard exists that can cause an electric shock.
Start the work after making sure that the breaker in the power distribution box has been turned off.

Copyright © 2006, Hitachi, Ltd.



(b) Notes when Unpacking, Installing or Removing the Parts

For installing or removing the parts, do not apply any shock as the precise parts are installed. Be sure to wear a wrist strap connected to the chassis frame before starting the work and do not take it off until it is finished.

For installing the Disk Drive, Cache Memory, support it as touching the metal part at the side with the fingers of the hand that wears a wrist strap.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting (before removing bezel) and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install are Disk Drive, Control Unit and ENC Unit/SENC Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.
- When you install the Control Unit or a cache memory in the Control Unit, do the installation holding it by its sheet steel part with your hand(s) wearing the ESD grounding wrist band. The electrostatic charge can be discharged through your touch to the sheet steel part.

Copyright © 2006, Hitachi, Ltd.

(c) Notes on cable routing

(i) Handling of cables placed on the installation floor

- Protect the cables, which cannot be accommodated by the subsystem and thus laid on the floor or cross a passage, with the cable protection duct.
- For cables that relay between the subsystems, lay them on the floor and do not leave them from the floor.

(ii) Handling of under floor cables when the subsystem is installed on the free access floor.

- Give extra lengths to cables routed under the floor and do not make them float in the air.

(iii) Routing method

- Give a room for routing as earthquake and the like are considered.
- Give a room for routing not to disturb the part replacement for maintenance.
- Make the AC cables apart from each other and when they should be adjacent, do not make them in parallel but make them cross at right angle.
- When using a cable protection duct, be careful not to damage or cut cables by catching them.

(iv) Hold the connector to insert or pull out a cable. If the cable part is pulled, it may cause a failure.

(v) For connecting the Fibre Channel interface cable, the FC (ENC) cable, or iSCSI interface cable, bend it with a long radius (not less than 30mm) and do not give the load to the cable and the connector.

(d) Note on completing the work

Close all the external covers when the work is completed.

(The cover is to maintain the performance of the subsystem (radio wave noise suppression and others), so that be sure to keep all the external covers closed to operate the subsystem normally.)

Copyright © 2006, Hitachi, Ltd.

(2) Open the Rear Door of U7 rack frame.

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

(a) Fit an Allen wrench in the key socket on the rear door, turn the Allen wrench in the direction shown by the arrow (⟶), and open the rear door slowly leaving the wrench as it is.

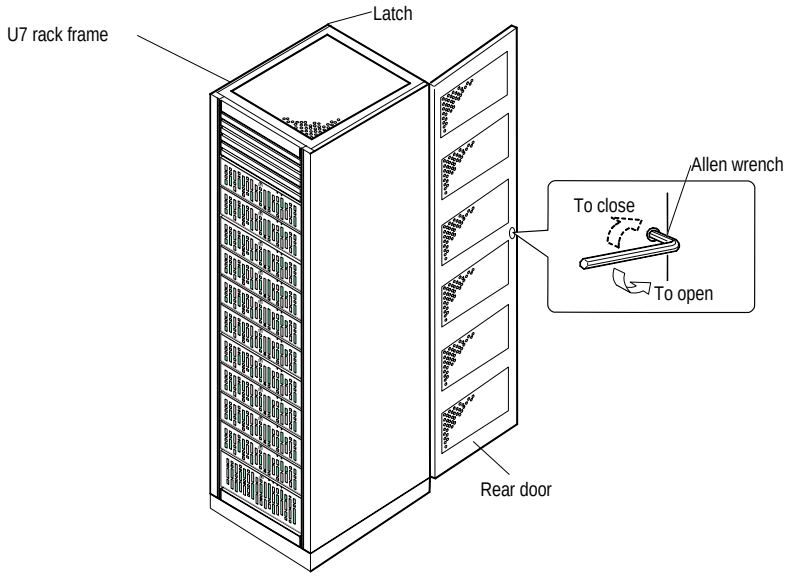


Figure 3.4.12 Procedure for Opening Rear Door

Copyright © 2006, Hitachi, Ltd.

(3) Installing the rails

Install the rack rail because it is required to add the RKAJ to change the Disk Drive which was installed to the RKM.

EIA units and intervals of mounting holes of 19-inch rack frame conforming to EIA standard

- A unit (U) space conforming to EIA standard is 19 inches wide and 44.5mm high as shown in the figure below.
- The boundary of the unit falls on the middle of the interval of 12.7mm.
- When the unit space is shifted by 0.5 units, the unit boundary is shifted from the normal position by 22.2mm.

For the U7 rack frame

Wide intervals: Repeat of 44.45mm (31.75mm + 12.7mm)

Maximum number of mountable unit spaces: 38

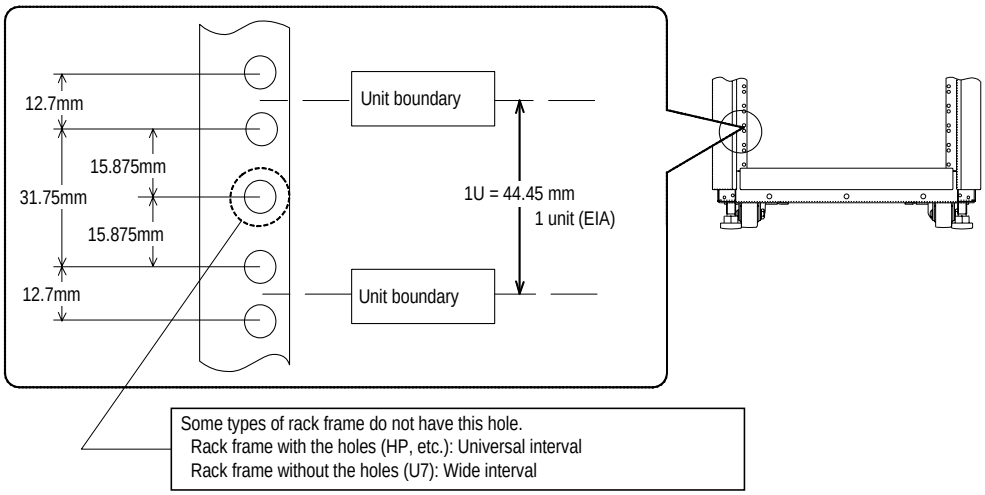

Figure 3.4.13 Attachment Hole Size of Rack

Copyright © 2006, Hitachi, Ltd.

The addresses are given as 1, 2, 3, and so on counted from the bottom of the rack frame. In the case of the U7 rack frame, you must count the holes to know the address because no number is marked on the rack frame.

The following figure illustrates the whole layout of addresses of installation positions in the U7 rack frame.

There are 38 addresses, that is, the 1U to 38U counted in the vertical direction starting from the lower boundary of the 1U (the lowest unit).

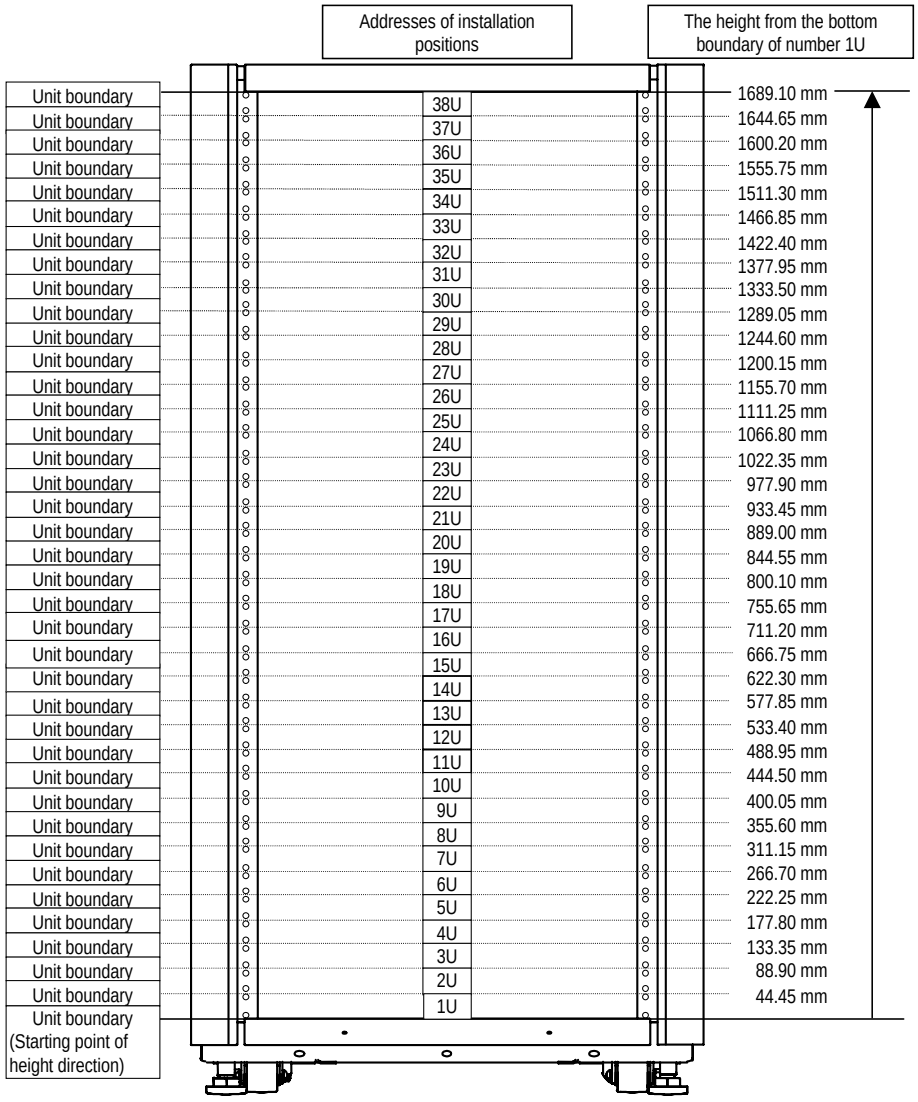

Figure 3.4.14 Whole Layout of Installation Position Addresses

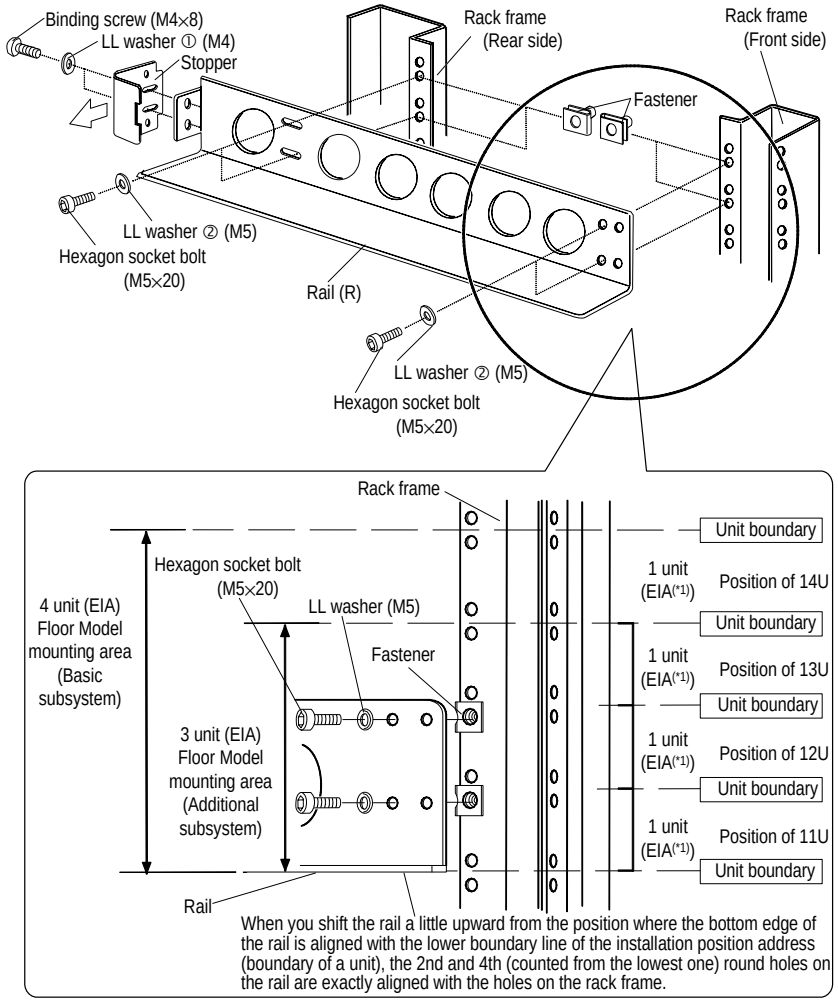
Copyright © 2006, Hitachi, Ltd.



Install the rack rail in the position adjacent to the existing basic chassis or the additional chassis. When the system of the maximum installation is upgraded, install it in the added U7 rack frame.

(a) Slide the stopper in the direction shown by the arrow and temporarily fix it to the Rail (R) using the binding screws and LL washers ① (M4 (at two places.)).
For the installation position address, see "Figure 3.4.14 Whole Layout of Installation Position Addresses" (SMUP 03-0610).

(b) On the right side of the installation location in the rack frame, align the round holes of the Rail (R) with those of the rack frame and insert the fasteners (at four places in total in front and rear.).

(c) Fasten the Rail (R) to the rack frame using the hexagon socket bolts and LL washers ② (M5 (at two places each on the front and rear sides.)).

(d) Install the Rail (L) to the rack frame in the same way.

*1 : One EIA unit is approximately 44. 45 mm.

Figure 3.4.15 Installation of Rails to the Rack frame and Installation Positions

Copyright © 2006, Hitachi, Ltd.

(4) Installing fasteners on the front side of the rack frame

Install the fasteners on the front side of the rack frame in order to fasten the subsystems to be mounted on the rack frame.

(a) Fit the two fasteners to each of the right and left beams on the front side of the rack frame referring to Figures 3.4.16 and 3.4.17.

Install the mounting fasteners at the 2nd and 5th (counted upward from the unit boundary on the rack frame at the same height as the bottom of the rail) round holes.

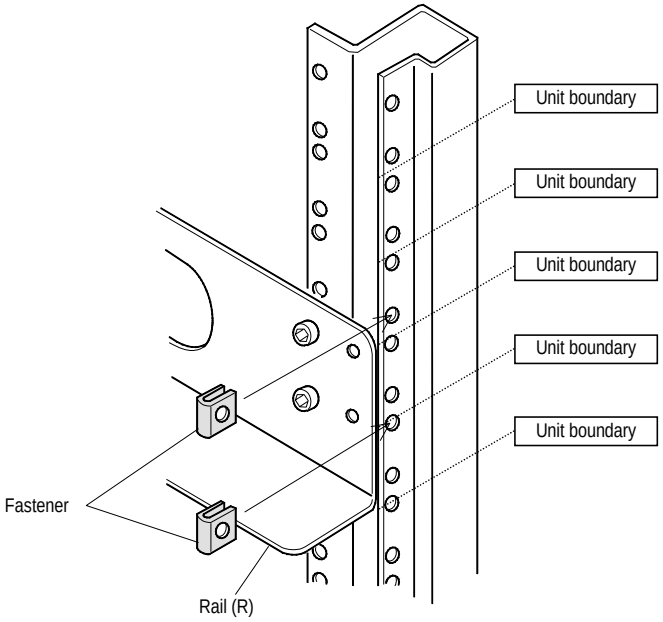


Figure 3.4.16 Installing Fasteners on the Front Side of the Rack Frame

Copyright © 2006, Hitachi, Ltd.

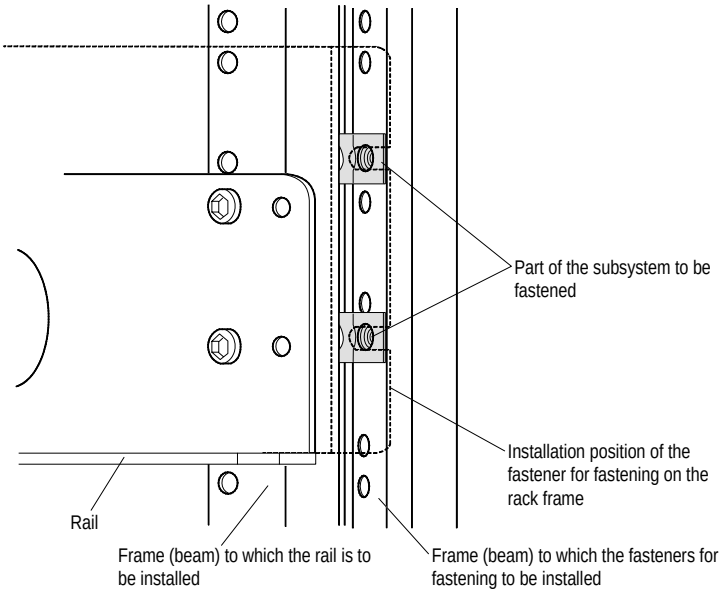

Figure 3.4.17 Installation Positions of Fasteners and Relation with Rails

Copyright © 2006, Hitachi, Ltd.

(5) Remove the Front Bezel

Remove the Front Bezel attached to "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

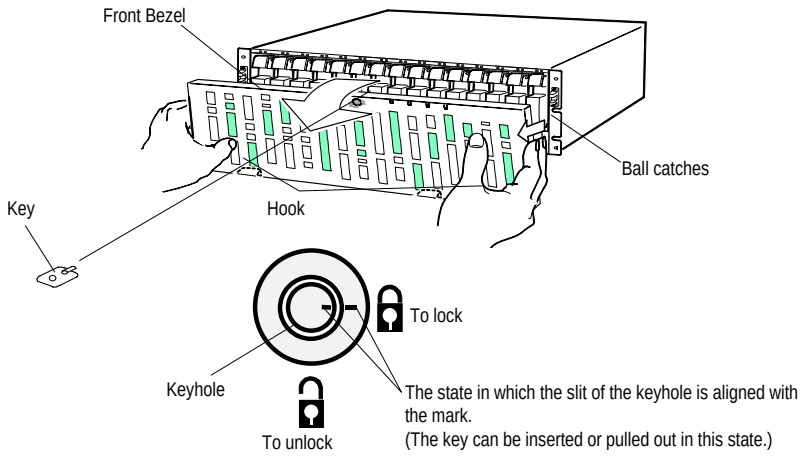
NOTE : Please skip to "3.4.14 (13) Remove the Front Bezel" (SMUP 03-0810) when the additional chassis is not connected.

A key is necessary to attach or remove the Front Bezel.

CAUTION

Remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.
(b) Pull the front bezel toward you holding its sides to disengage it from the ball catches.
(c) Disengage the two hooks of the front bezel from the slots on the subsystem main body by shifting the bezel to the right and remove the bezel.



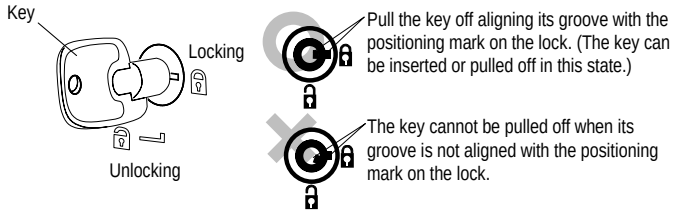


Figure 3.4.18 Procedure for Removing Front Bezel

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

Copyright © 2006, Hitachi, Ltd.

(6) Remove the power cable connected to "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

(a) Disconnect the power cable connected to the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

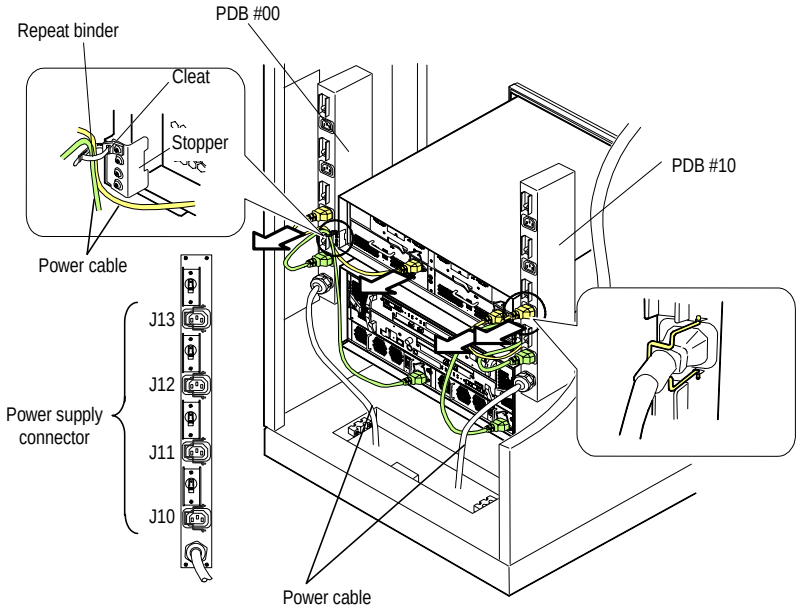

Figure 3.4.19 Disconnecting Power Cables

Copyright © 2006, Hitachi, Ltd.

(7) Remove the ENC cables connected to the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).
  (a) Remove Repeat Binders securing the ENC cable to the stopper.
  (b) Remove all the ENC cables connecting the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

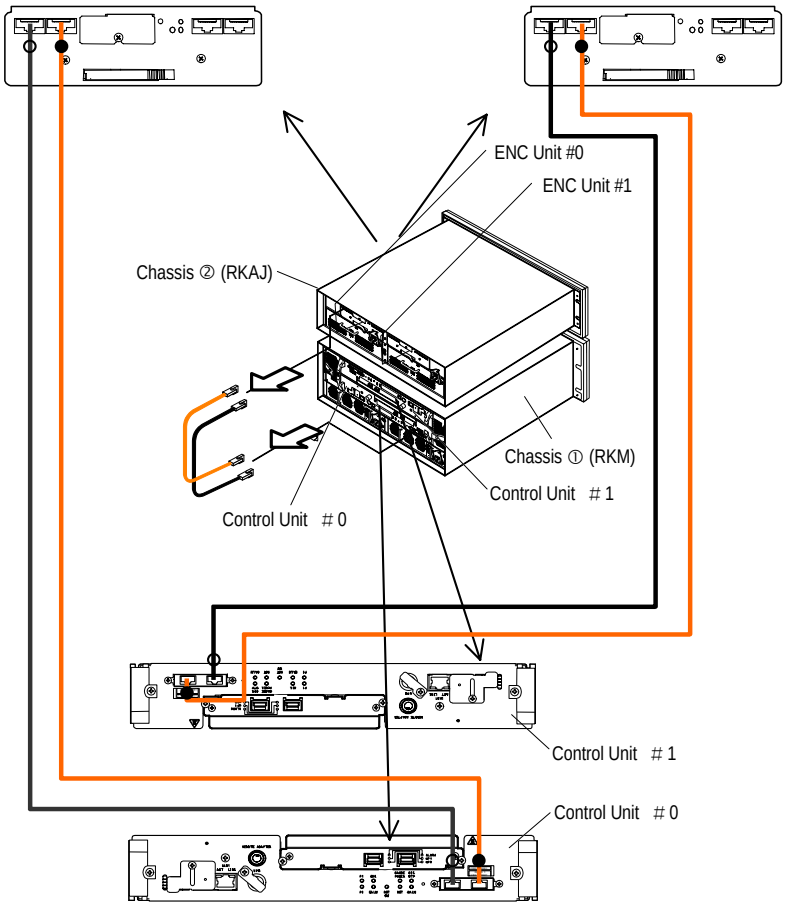

Figure 3.4.20 Disconnecting Power Cables

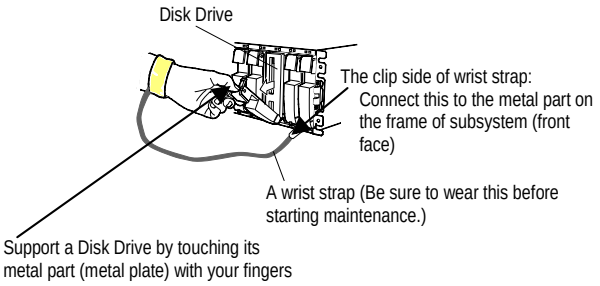


Copyright © 2006, Hitachi, Ltd.

(8) Remove the disk drives installed in the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.

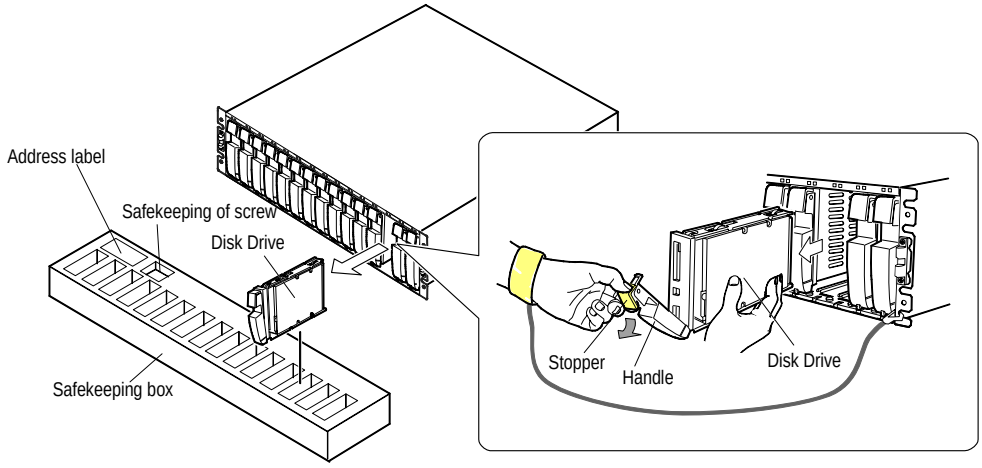
NOTE : Before replacing, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

(a) Affix labels with the HDD numbers to all the Disk Drives that were installed in the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

Deleted:

Copyright © 2006, Hitachi, Ltd.

(b) Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive by pulling it out taking care not to apply a shock to it.
When using the removed Disk Drive for the purpose of addition to another disk array unit, keep it in custody with its handle returned to its original state (locked by the stopper) taking care not to apply a shock to it.



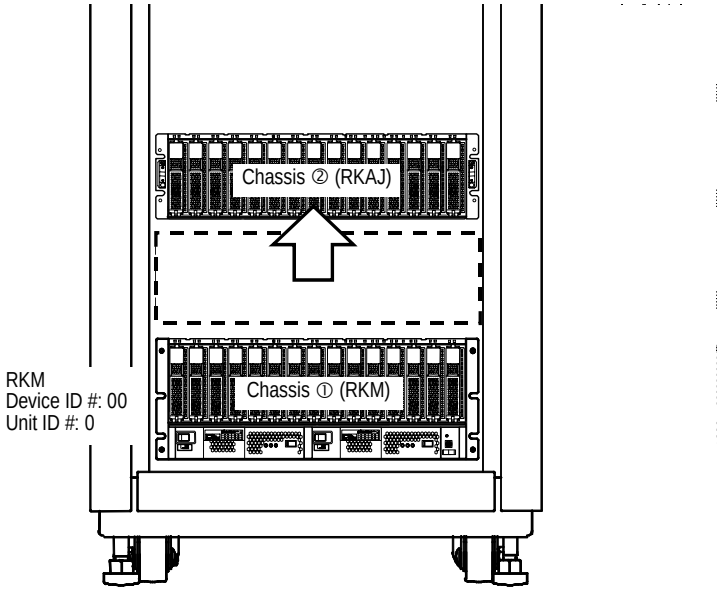


Figure 3.4.21 Remove the Disk Drive

Copyright © 2006, Hitachi, Ltd.

(9) Move the position of "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) to the position in which the rack rail was installed in the procedure (3) (for three units).

Copyright © 2006, Hitachi, Ltd.

External appearance of the external lifter.

Figure 3.4.22 shows external appearance of the external lifter.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Be sure to perform the operation with two or more workers.

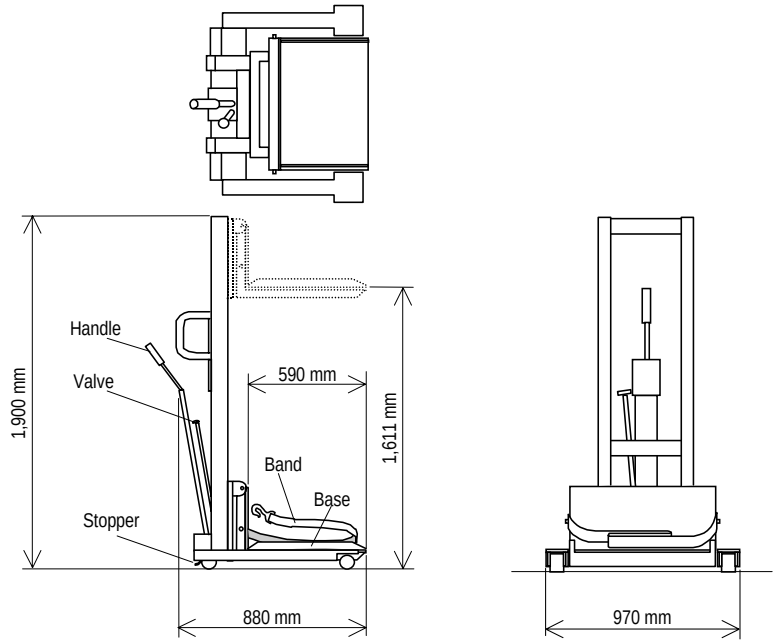

Figure 3.4.22 External Lifter

Copyright © 2006, Hitachi, Ltd.

(a) Remove the front side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

(i) Remove the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) to the rack frame with the four M5×10 binding screws.

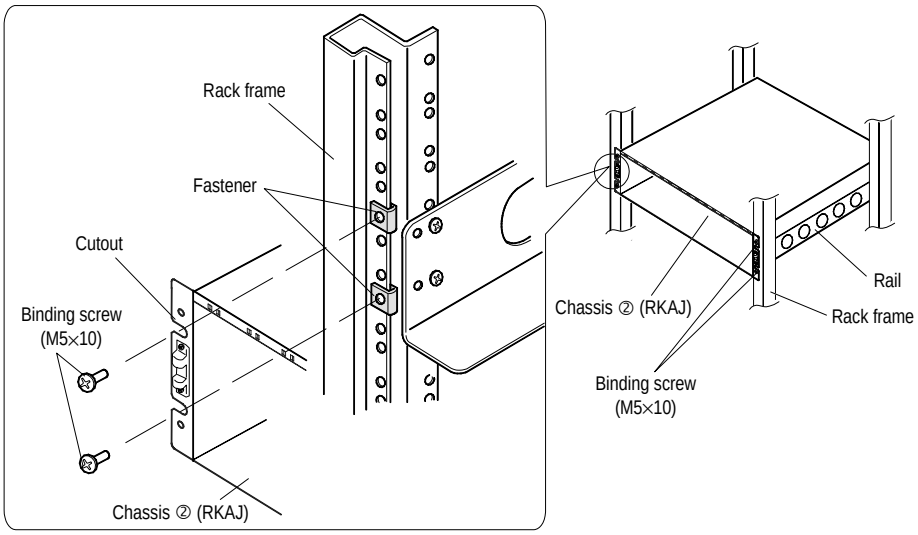

Figure 3.4.23 Fastening Front Side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

(b) Remove rear side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

(i) Remove the binding screws.

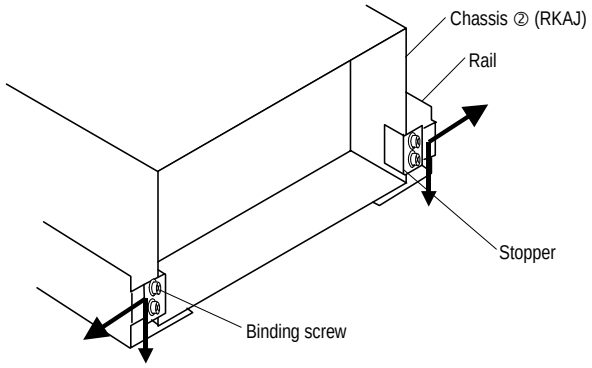

Figure 3.4.24 Securing Rear Side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

Copyright © 2006, Hitachi, Ltd.

(c) Demount the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) from the U7 rack frame.

(i) Adjust the position of the rack frame, and apply the brake to the lifter.

(ii) Move the pumping handle of the external lifter to the right and left repeatedly to lift the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) up to the height suitable for the unloading.

WARNING

If the RKAJ/RKAJAT falls when the elevator of the lifter is at a high position, a personal injury will be caused.
Perform the positioning, fastening, or other handlings very carefully.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Operate the valve slowly when opening it. If it is opened quickly, the elevator of the lifter descends rapidly and may cause personal injury.
- Work carefully because the mass of the single RKAJ/RKAJAT is about 40 kg, RKA is about 42 kg.

Copyright © 2006, Hitachi, Ltd.

(iii) Shift the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) onto the elevating base of the external lifter. Shift the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) gently until it hits the backboard of the elevating base.

CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKAJ/RKAJAT enters the base across the end of it. Otherwise, falling of the RKAJ/RKAJAT may be caused.

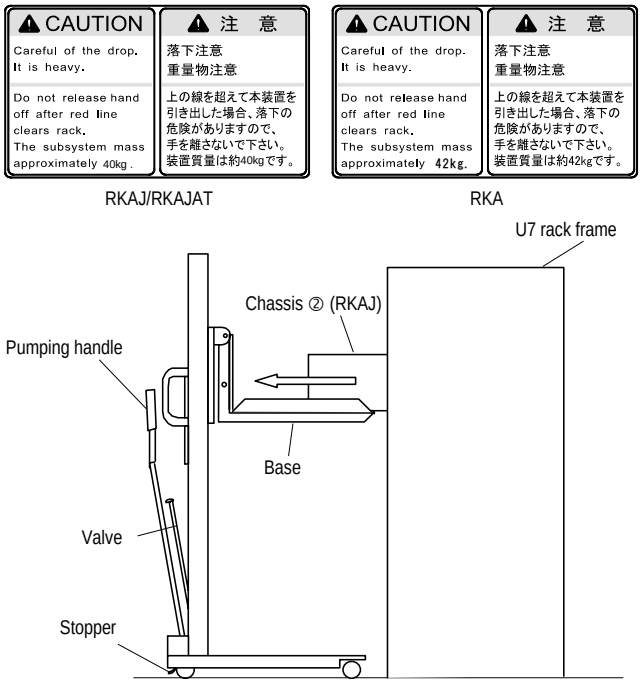

Figure 3.4.25 Mounting "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) on Eternal Lifter

Copyright © 2006, Hitachi, Ltd.

(iv) Secure the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) to the lifter with a band of the lifter.
Bind the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) with the band tightly by fitting the length of the belt to the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

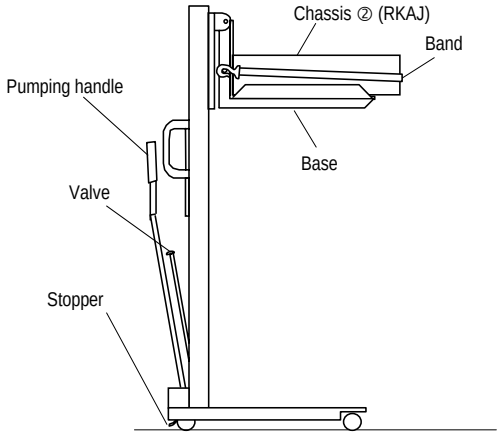

Figure 3.4.26 Secure the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

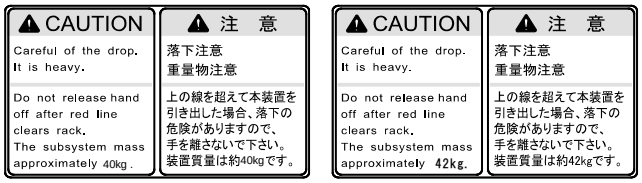

(v) Move the pump handle of the special lifter right and left, and lift it to the height (for three units) of the position where the rack rail was installed in the procedure (3).
(vi) Remove the band and adjust the position of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) so that the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) comes in the center in front of the rack frame. If the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) is positioned off-centered, a screw contacts the front bezel preventing the bezel from being opened or closed.

Copyright © 2006, Hitachi, Ltd.

(vii) Shift the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) onto the rails in the rack frame. When shifting the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last), push it in to the end gently.

CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKAJ/RKAJAT/RKA enters the rack frame across the end of it. Otherwise, falling of the RKAJ/RKAJAT/RKA may be caused.

RKAJ/RKAJAT RKA

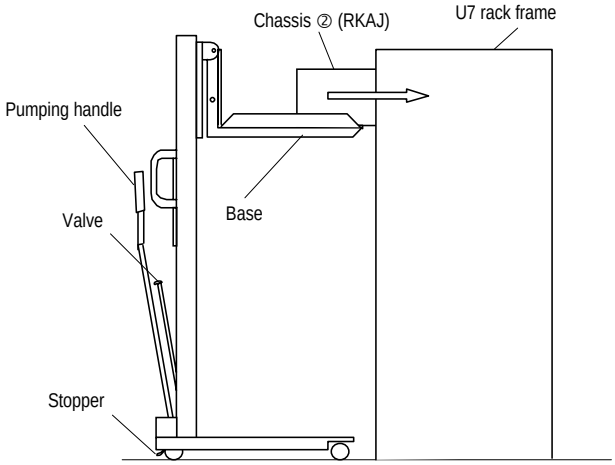

Figure 3.4.27 Mounting "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) on Rack Frame

Copyright © 2006, Hitachi, Ltd.

(viii) Fasten the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) to the rack frame with the four M5×10 binding screws.

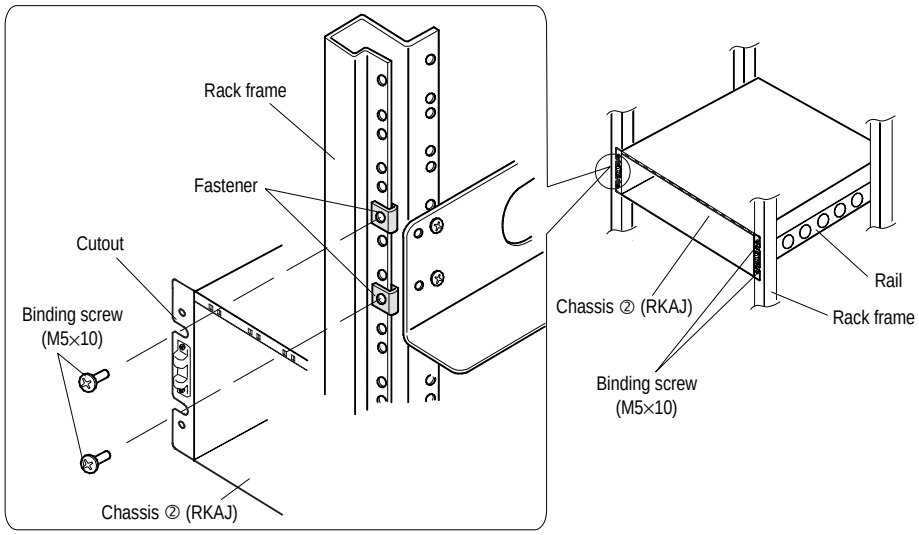

Figure 3.4.28 Fastening Front Side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

(ix) Shift each of the two stoppers in the direction shown by the arrow and make it contact the frame.

(x) Tighten the binding screws.

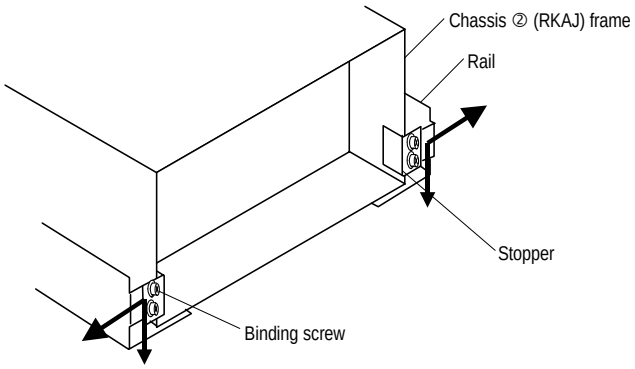

Figure 3.4.29 Securing Rear Side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last)

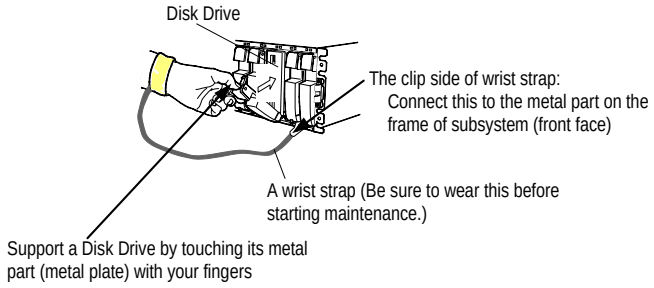

Copyright © 2006, Hitachi, Ltd.

(10) Install the Disk Drive which was removed in the procedure (8) in "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2006, Hitachi, Ltd.

(a) Pull the parts out of the Disk Drives safekeeping of component.
Be sure to install the removed Disk Drive to the original bay.
(b) Insert the Disk Drive into the position (address) where it was by holding it with the handle.
(i) Fit the Disk Drive in the guide rail of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last) and slide it in the direction shown by the arrow.
(ii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).
(iii) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(c) Pull the handle lightly to make sure that the Disk Drive cannot be pulled out.
(d) Attach the dummy (Disk Drive) to the each Disk Drive slot in which no Disk Drive is installed.

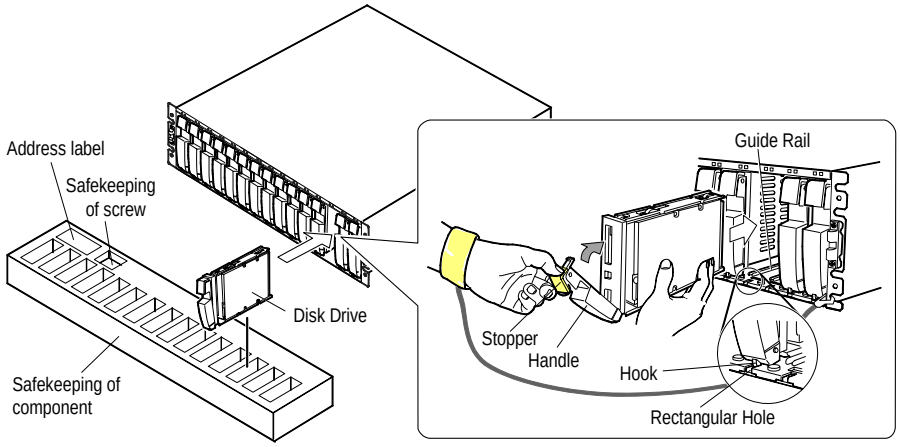

Figure 3.4.30 Installing of Disk Drive

Copyright © 2006, Hitachi, Ltd.

(11) Attach the Front Bezel attached to "Chassis ② (RKAJ)" (the additional chassis whose Unit ID# is the last).

(a) Hold the side of Front Bezel with your both hands.

(b) Engage two hooks of the front bezel with the slots on the right side of the subsystem main body.

(c) After making the hooks of the front bezel engaged, press the bezel against the main body until it is stopped.

(d) Fix the front bezel by turning the key.

(12) When two or more additional chassis (RKAJ/RKAJAT/RKA) are installed, repeat the procedure (5) to (11) in order whose Unit ID# is large, and move all the rack installation positions by three units.

NOTE : Be sure to execute the movement of the additional chassis one by one.

If the movement of all the additional chassis (RKAJ/RKAJAT/RKA) is completed, go to the procedure (13).

Copyright © 2006, Hitachi, Ltd.

(13) Remove the Front Bezel

Remove the Front Bezel attached to "Chassis ① (RKM)" (the basic chassis).

A key is necessary to attach or remove the Front Bezel.

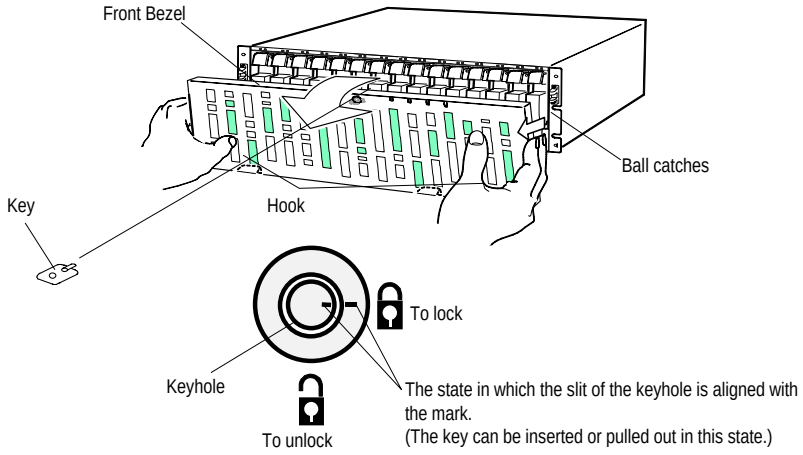
CAUTION

Remove the Front Bezel carefully following the procedure. Otherwise, you may hurt your fingers by pinching them.

(a) Insert the key into the keyhole on the Front Bezel and release the Lock of the Front Bezel.

(b) Pull the front bezel toward you holding its sides to disengage it from the ball catches.

(c) Disengage the two hooks of the front bezel from the slots on the subsystem main body by shifting the bezel to the right and remove the bezel.



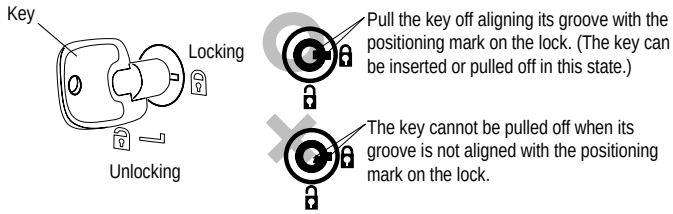


Figure 3.4.31 Procedure for Removing Front Bezel

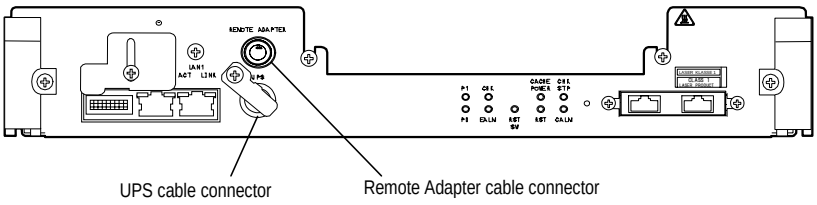

NOTE : • When inserting and turning the key, have it inserted completely. If it is turned when it is inserted half way, a damage of it may be caused.

• When removing the key after locking up the Front Bezel, pull it off aligning its groove with the positioning mark on the lock.
When the key is pulled off in the state where its groove is not aligned with the positioning mark on the lock, a damage of the lock may be caused.

Copyright © 2006, Hitachi, Ltd.

(14) When the Remote Adapter is connected, remove all of them.
When the UPS is connected, remote all of them.

(15) Disconnect only the connector, which is connected to the AC/DC Power Unit (RKM), of the power cable connected to the "Chassis ① (RKM)" (the basic chassis).

⚠ CAUTION

Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Pull out the parts a little, and then perform the cable removal again.

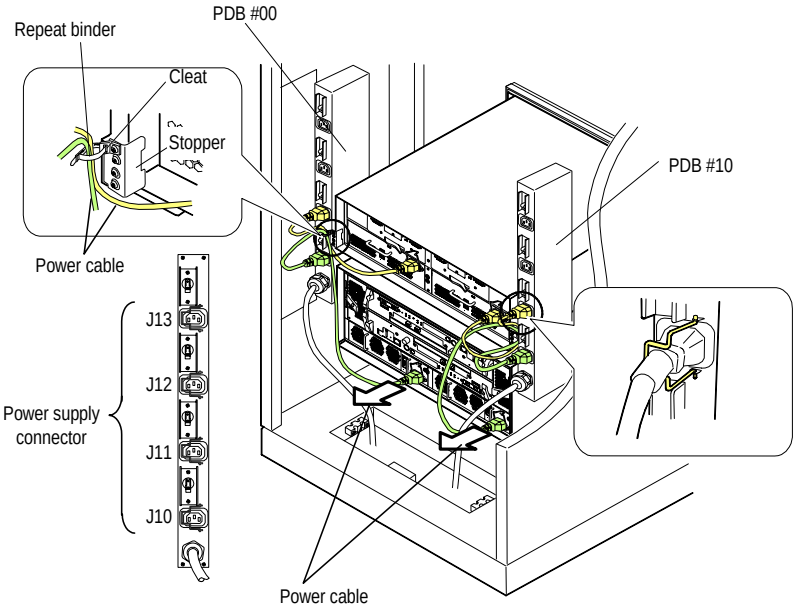

Figure 3.4.32 Disconnecting Power Cables

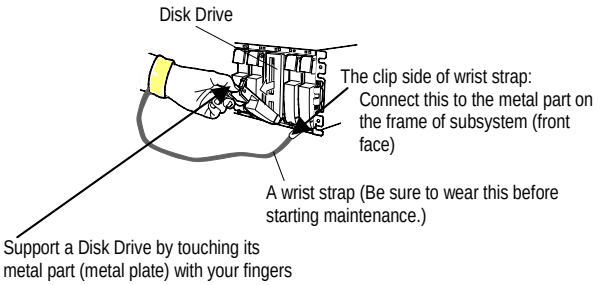

Copyright © 2006, Hitachi, Ltd.

(16) Remove the disk drives installed in the "Chassis ① (RKM)" (the basic chassis) .

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.

NOTE : Before replacing, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

(a) Affix labels with the HDD numbers to all the Disk Drives that were installed in the "Chassis ① (RKM)" (the basic chassis) .

Deleted:

Copyright © 2006, Hitachi, Ltd.

(b) Pull the stopper at the upper part of the disk drive handle toward you to have the lock off, tilt the handle toward you, and then remove the Disk Drive by pulling it out taking care not to apply a shock to it.
When using the removed Disk Drive for the purpose of addition to another disk array unit, keep it in custody with its handle returned to its original state (locked by the stopper) taking care not to apply a shock to it.

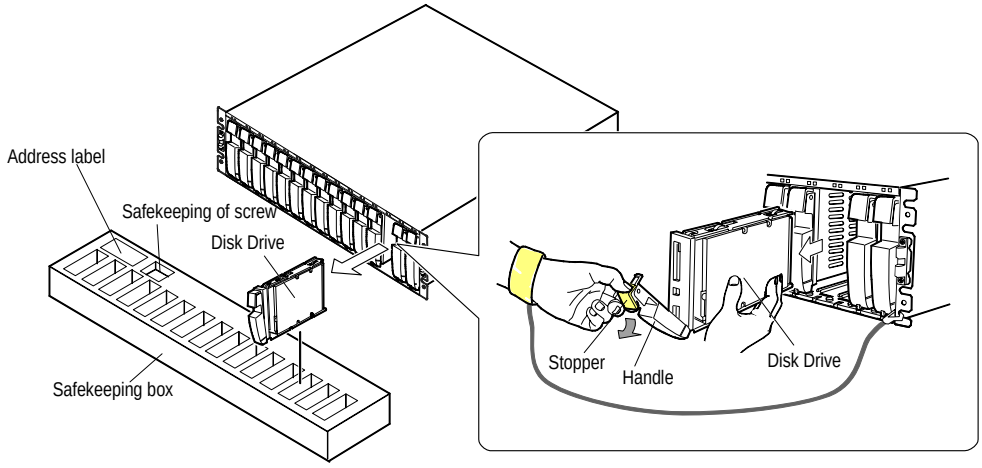

Figure 3.4.33 Remove the Disk Drive

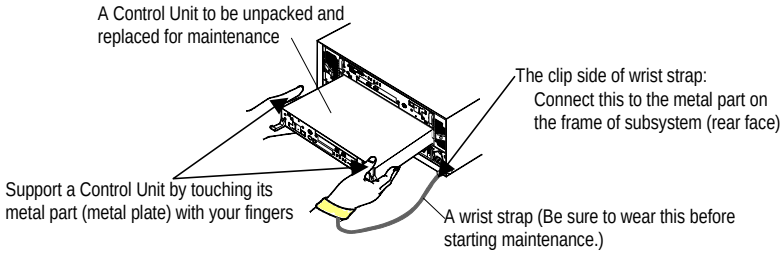
(17) Remove the Cache Unit from the Control Unit installed in the "Chassis ① (RKM)" (the basic chassis) .
In case of the dual controller configuration, remove all the Cache Units from both Control Units.
Request the customer to keep the removed Cache Unit which is not used for the Hitachi TagmaStore® AMS 1000™ with caution.

⚠ CAUTION



Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install is Control Unit, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

When replacing the additional chassis, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2006, Hitachi, Ltd.

- When the Hitachi TagmaStore® AMS 500™ is the system configuration of the Fibre Channel interface

(a) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(b) Remove the Control Unit by pulling it out toward you.
(c) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.
(d) Replace the Cache Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(e) In the case of the dual controller configuration, remove the cache memories from the other Control Unit by repeating Steps (a) to (d).

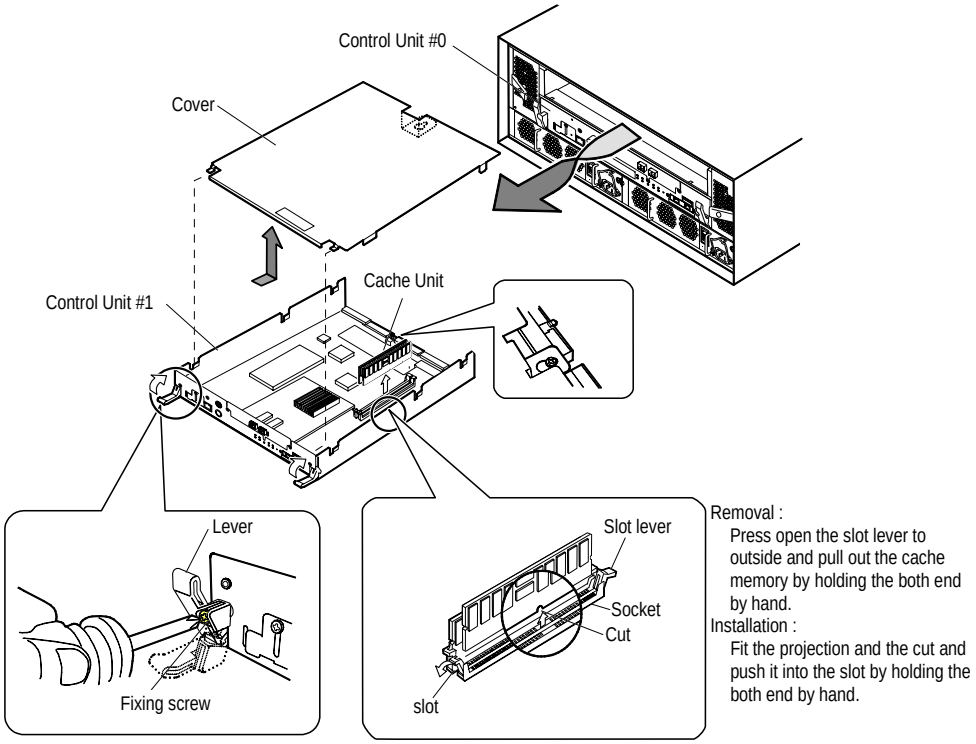


Figure 3.4.34 Remote the Cache Unit (1)

Copyright © 2006, Hitachi, Ltd.

• When the SANRISE AMS500 is the system configuration of the iSCSI interface

(a) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(b) Remove the Control Unit by pulling it out toward you.

(c) Loosen the fixing screw for the cover at the back of the cover, slide the cover in the direction shown by the arrow (⟶), and remove it.

(d) Replace the Cache Unit.

NOTE : Place the removed Cache Unit in the place where anti-static measures are taken.

(e) In the case of the dual controller configuration, remove the cache memories from the other Control Unit by repeating Steps (a) to (d).

(18) Replace the "Chassis ① (RKM)" (the basic chassis) with the RKH.

External appearance of the external lifter.

Figure 3.4.35 shows external appearance of the external lifter.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Be sure to perform the operation with two or more workers.

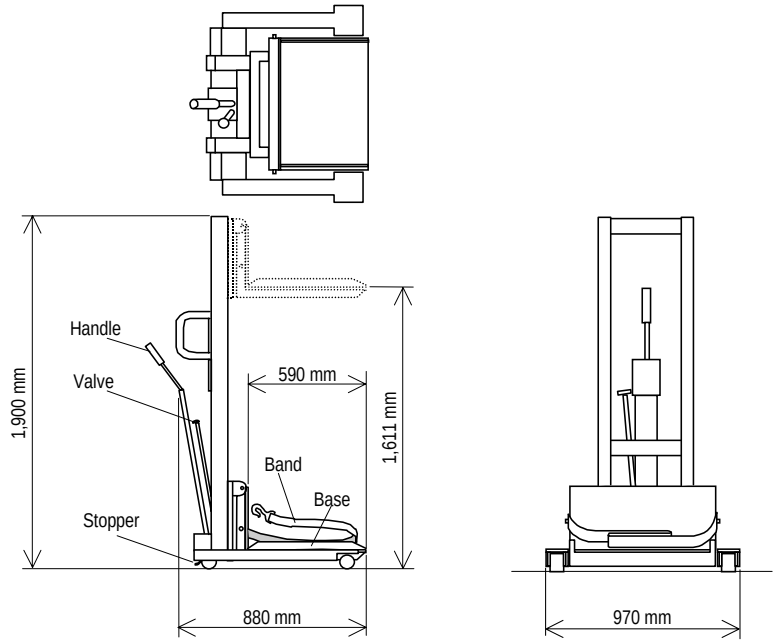

Figure 3.4.35 External Lifter

Copyright © 2006, Hitachi, Ltd.

(a) Remove the front side of the "Chassis ① (RKM)" (the basic chassis)

(i) Remove the "Chassis ① (RKM)" (the basic chassis) to the rack frame with the four M5×10 binding screws.

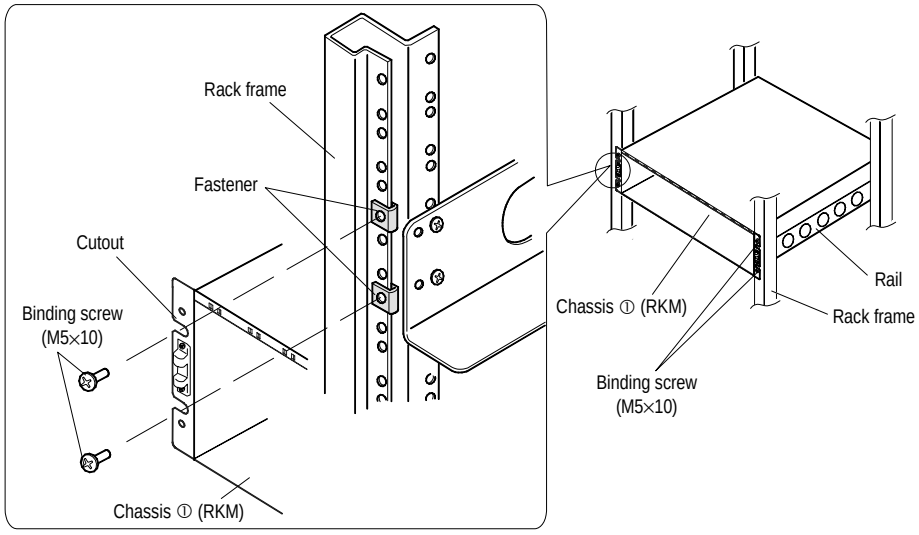

Figure 3.4.36 Fastening Front Side of the "Chassis ① (RKM)" (the basic chassis)

(b) Remove rear side of the "Chassis ① (RKM)" (the basic chassis)

(i) Remove the binding screws.

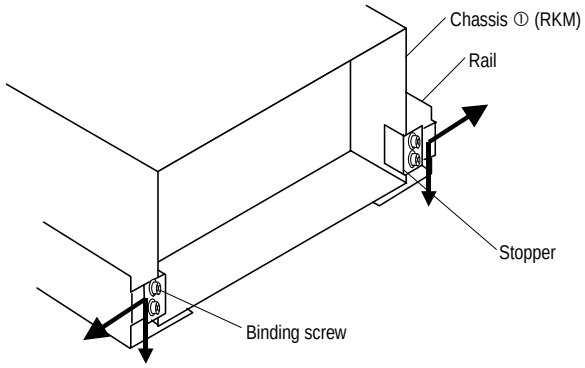

Figure 3.4.37 Securing Rear Side of the "Chassis ① (RKM)" (the basic chassis)

Copyright © 2006, Hitachi, Ltd.

(c) Demount the "Chassis ① (RKM)" (the basic chassis) from the U7 rack frame.

(i) Adjust the position of the rack frame, and apply the brake to the lifter.

(ii) Move the pumping handle of the external lifter to the right and left repeatedly to lift the "Chassis ① (RKM)" (the basic chassis) up to the height suitable for the unloading.

WARNING

If the RKS/RKM/RKH falls when the elevator of the lifter is at a high position, a personal injury will be caused.
Perform the positioning, fastening, or other handlings very carefully.

CAUTION

- Rack mounting and lifter operation should only be conducted by a person who has been trained and qualified since the subsystem could turn over or a worker could be caught under the subsystem.
- Operate the valve slowly when opening it. If it is opened quickly, the elevator of the lifter descends rapidly and may cause personal injury.
- Work carefully because the mass of the single RKS is about 56 kg, RKM is about 58 kg, RKH is about 47 kg.

Copyright © 2006, Hitachi, Ltd.

(iii) Shift the "Chassis ① (RKM)" (the basic chassis) onto the elevating base of the external lifter. Shift the "Chassis ① (RKM)" (the basic chassis) gently until it hits the backboard of the elevating base.

⚠ CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKS/RKM/RKH enters the base across the end of it. Otherwise, falling of the RKS/RKM/RKH may be caused.

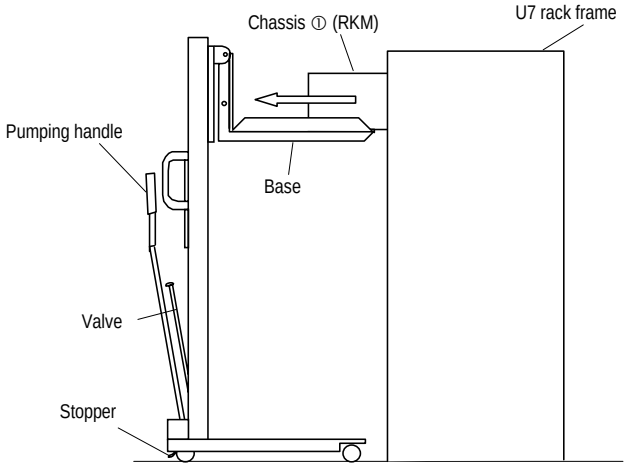

Figure 3.4.38 Mounting "Chassis ① (RKM)" (the basic chassis) on Eternal Lifter

Copyright © 2006, Hitachi, Ltd.

(iv) Secure the "Chassis ① (RKM)" (the basic chassis) to the lifter with a band of the lifter. Bind the "Chassis ① (RKM)" (the basic chassis) with the band tightly by fitting the length of the belt to the "Chassis ① (RKM)" (the basic chassis) .

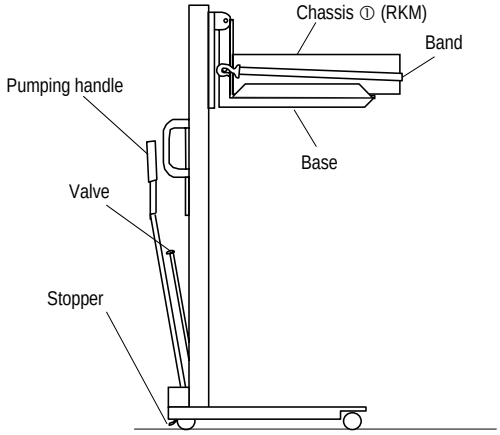

Figure 3.4.39 Secure the "Chassis ① (RKM)" (the basic chassis)

(v) After securing the "Chassis ① (RKM)" (the basic chassis) to the elevating base, open the up/down valve of the external lifter gently and lower the elevating base to the lowermost position.

(vi) Take off the brake of the external lifter, move the lifter away from the U7 rack frame, and take down the "Chassis ① (RKM)" (the basic chassis) after loosening the belt.

(vii) Move the external lifter to the place where the lifter does not disturb the following works.

(viii) Packing the "Chassis ① (RKM)" (the basic chassis). (See "Export Packing Specifications")

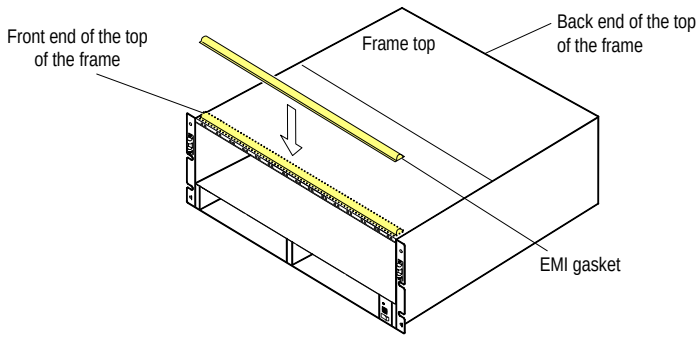
(d) Sticking EMI gasket

Stick the EMI gasket supplied with the rack rail on the top of the RKH/RKAJ frame.

(i) Peel off the anti-adhesion sheet from the bottom surface of the EMI gasket.

(ii) Stick the EMI gasket by aligning it with the front end of the top of the frame.

(iii) Stick the EMI gasket by aligning it with the back end of the top of the frame.



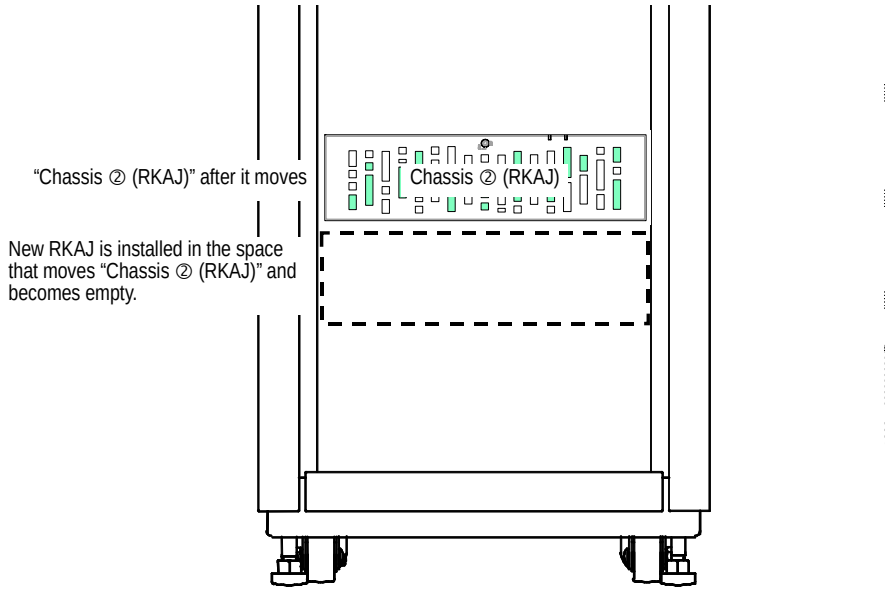


Figure 3.4.40 Position for Sticking EMI Gasket

Copyright © 2006, Hitachi, Ltd.

(e) Mounting the RKAJ on the U7 rack frame.

Copyright © 2006, Hitachi, Ltd.

(i) Bring the lifter close to the RKAJ to be mounted and apply the brake to the lifter.

NOTE : When putting the RKAJ on the lifter, be sure to remove the front bezel beforehand.

(ii) Put the RKAJ on the lifter.

(iii) Secure the RKAJ to the lifter with a band of the lifter.
Bind the RKAJ with the band tightly by fitting the length of the belt to the RKAJ.

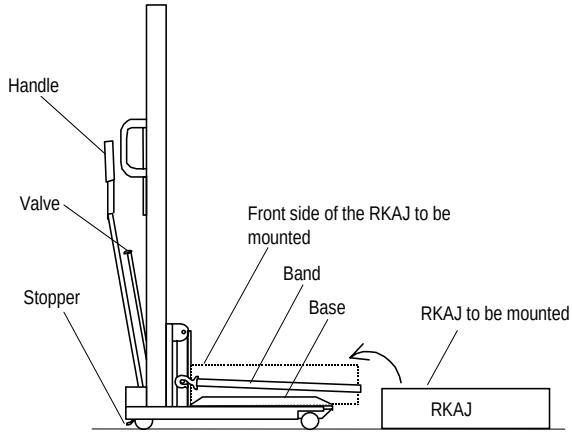

Figure 3.4.41 Putting the RKAJ on Lifter

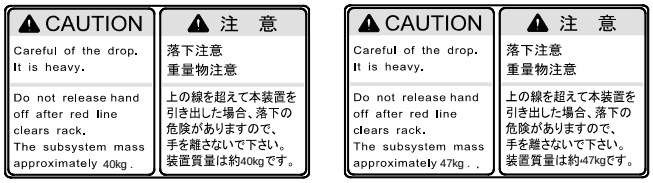
WARNING

If the RKH/RKAJ falls when the elevator of the lifter is at a high position, a personal injury will be caused.
Perform the positioning, fastening, or other handlings very carefully.

(iv) Take off the brake of the lifter on which the RKAJ has been put, and move the lifter close to the U7 rack frame.

(v) Adjust the position of the RKAJ so that it is seated in the center of the U7 rack frame.

(vi) Move the pumping handle of the lifter to the right and left repeatedly to lift the RKAJ up to the height suitable for the mounting.
Be careful not to lift the elevating base too high. If you lift it too high, lower it by opening the up/down valve gently.



(vii) Remove the band and adjust the position of the RKAJ so that the RKAJ comes in the center in front of the rack frame. If the RKAJ is positioned off-centered, a screw contacts the front bezel preventing the bezel from being opened or closed.

Copyright © 2006, Hitachi, Ltd.

(viii) Shift the RKAJ onto the rails in the rack frame. When shifting the RKAJ, push it in to the end gently.

CAUTION

Do not move the lifter away from the rack frame nor lower the elevator until the red line on the label affixed on the RKH/RKAJ enters the rack frame across the end of it. Otherwise, falling of the RKH/RKAJ may be caused.

RKAJ RKH

(ix) Fasten the RKAJ to the rack frame with the four M5×10 binding screws.

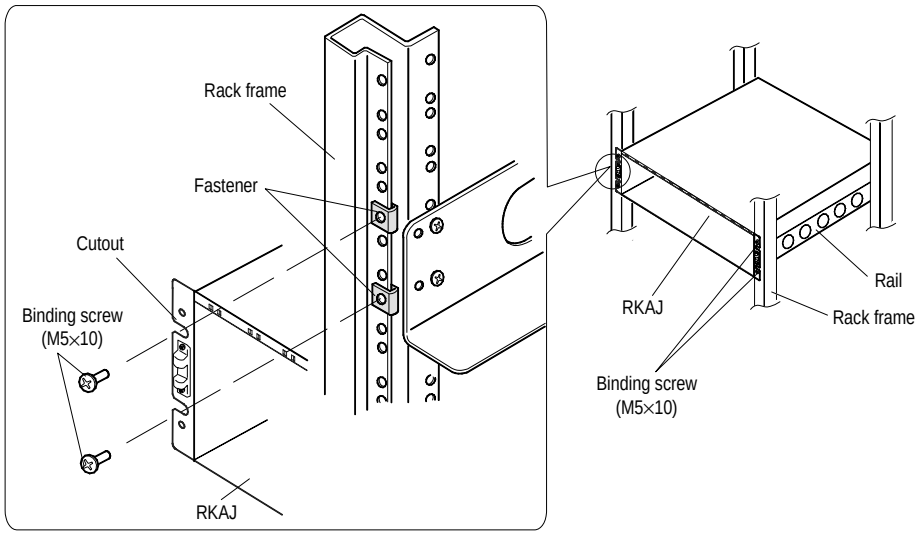


Figure 3.4.42 Fastening Front Side of the RKAJ

Copyright © 2006, Hitachi, Ltd.

(x) Shift each of the two stoppers in the direction shown by the arrow and make it contact the frame.

(xi) Tighten the binding screws.

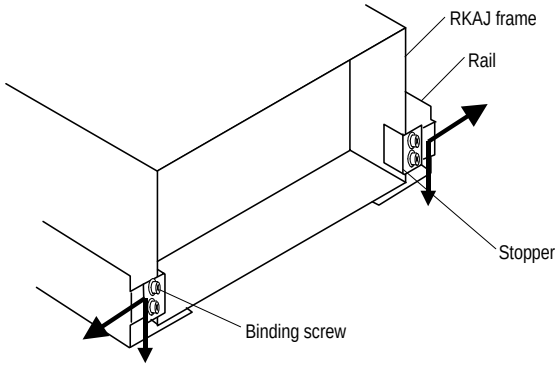

Figure 3.4.43 Securing Rear Side of the RKAJ

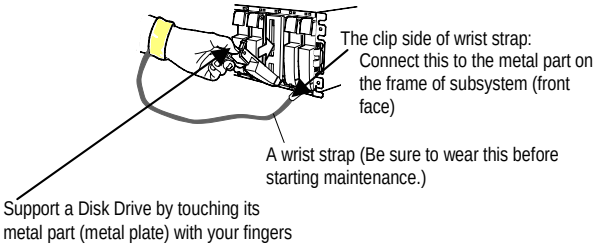
Copyright © 2006, Hitachi, Ltd.

(f) Install the disk drives, which were removed from the "Chassis ① (RKM)" (the basic chassis), in the RKAJ.



NOTE : There is no setting of the Device ID for the RKH (because the Disk Drive is not installed).

Notes on the move of the Disk Drives:
Because the Disk Drive cannot be installed in the RKH, it is required to replace the Disk Drive installed in "Chassis ① (RKM)" (the basic chassis) at the Hitachi TagmaStore® AMS 200™/AMS 500™ to the RKAJ which is newly installed.
Make the Disk Drive number unchanged with the position where it was installed in the chassis before replacing it.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting (before removing bezel) and do not take it off until you finish.
  Please be sure to keep a wrist strap near the subsystem.
- Disk Drives are precision components.
  Be careful not to expose drives to hard shock.
- When you install a Disk Drive, support its metal part with your hand that has the wrist strap. You can discharge static electricity by touching the metal plate.

NOTE : Before unpacking and replacing maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Disk Drive into the subsystem, support the Disk Drive as touching its metal part with fingers of your hand that wears a wrist strap.

Copyright © 2006, Hitachi, Ltd.

(i) Pull the parts out of the Disk Drives safekeeping of component.
Be sure to install the removed Disk Drive to the original bay.

NOTE : Install the Disk Drives making sure that the locations are the same as those where the Disk Drives were installed when the disk array subsystem was the Hitachi TagmaStore® AMS 500™ by referring to the record made according to Subsection "3.4.11 Getting serial numbers of Disk Drives" (SMUP 03-0450).

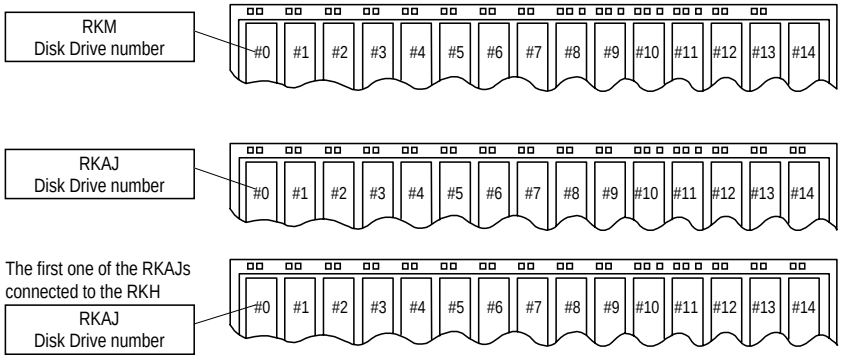


Figure 3.4.44 Disk Drive Mounting Location

Copyright © 2006, Hitachi, Ltd.

(ii) Fit the Disk Drive in the guide rail of the RKAJ and slide it in the direction shown by the arrow.

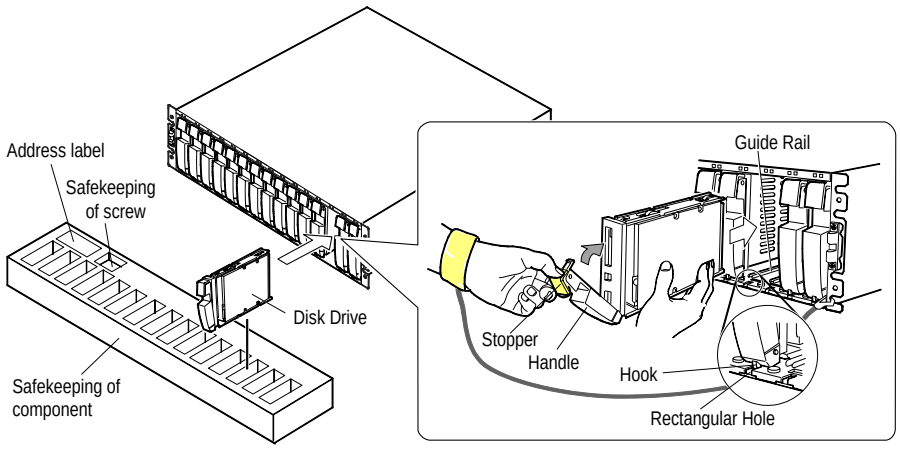
(iii) Push it in until it reaches the position where a hook of the handle can be entered into the rectangular hole at the lower part of a frame on the front side of the RKAJ.

(iv) Raise the stopper, which has been titled toward you, and then have the lock on by pressing the stopper.

NOTE : If the handle is raised in the state in which its hook cannot be entered into the rectangular hole, the Disk Drive cannot be installed correctly because it runs into the frame of the disk array unit.

(v) Pull the handle lightly to make sure that the Disk Drive cannot be pulled out.

(vi) Attach the dummy (Disk Drive) to the each Disk Drive slot in which no Disk Drive is installed.



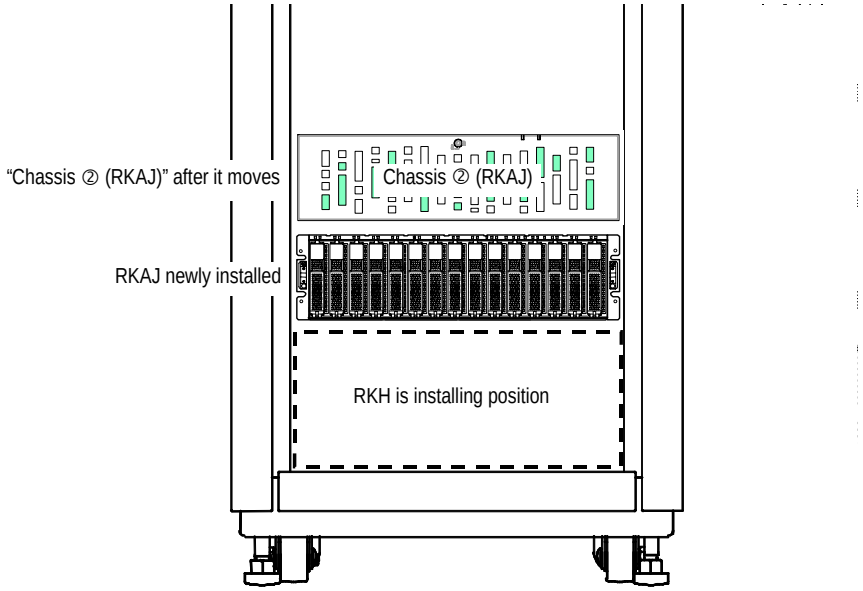


Figure 3.4.45 Installing of Disk Drive

Copyright © 2006, Hitachi, Ltd.

(g) Mounting the RKH on the U7 rack frame.

(i) Install the RKH and fix it in the position where "Chassis ① (RKM)" (the basic chassis) of the U7 rack frame was installed referring to the procedure (18) (e) (i) to (xi).

Copyright © 2006, Hitachi, Ltd.

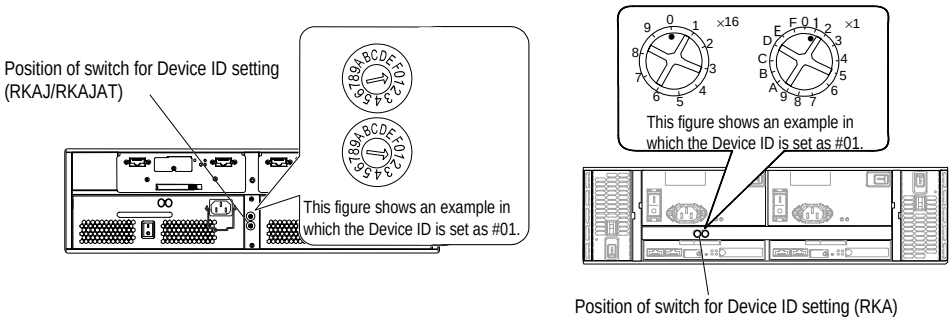
(19) Change the device ID# of all the RKAJs/RKAJAT/RKAs to that for the Hitachi TagmaStore® AMS 1000™ configuration.

NOTE : There is no setting of the Device ID for the RKH (because the Disk Drive is not installed).

It is required to make the unit ID# of each RKAJ/RKAJAT/RKA at the Hitachi TagmaStore® AMS 1000™ same as that of the Hitachi TagmaStore® AMS 200™/AMS 500™ even if each RKAJ/RKAJAT/RKA is moved by three units in the rack.
The installation position, the device ID#, and the unit ID# of each RKAJ/RKAJAT/RKA in the rack is already checked in the "3.4.14 Hardware upgrade work(Hard)" (SMUP 03-0550). Set the device ID# of each RKAJ/RKAJAT/RKA at the Hitachi TagmaStore® AMS 1000™ configuration so that the unit ID# of each RKAJ/RKAJAT/RKA becomes the same as that at the Hitachi TagmaStore® AMS 200™/AMS 500™ configuration(if x16 switch of the device ID setting switch is set to 0 and x1 switch is set to 0 to F, the unit ID is allocated to 0 to 15).

NOTE : If the Device ID# is set wrongly, the upgrade will fail because the disk array subsystem is not recognized correctly.

NOTE : Set the Device ID# 00 to the RKAJ which was newly added in the procedure (18) (e).



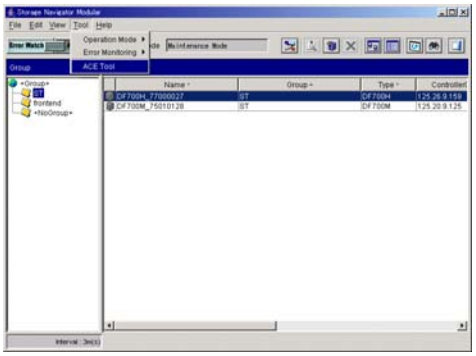


Figure 3.4.46 Setting of Device ID

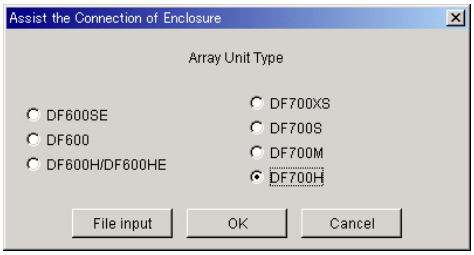
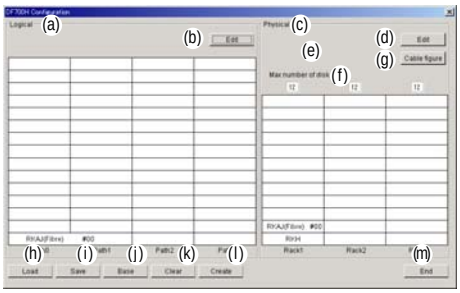
Copyright © 2006, Hitachi, Ltd.



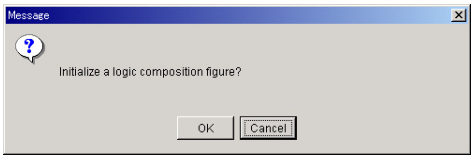
(a) Start Storage Navigator Modular and select [Tool] and [ACE Tool] in this order in the main window. The ACE Tool is started and a window for selecting a subsystem is displayed.

NOTE : There is a case that the LAN Port Number is changed. When the main screen is not displayed even though the icon of the array subsystem is clicked, use the changed LAN Port Number, and execute it again.



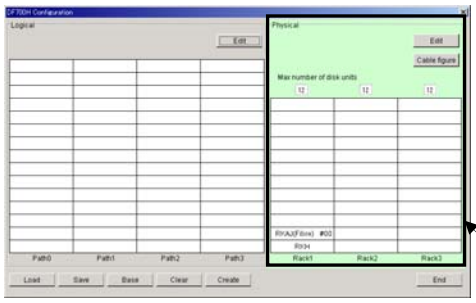
(b) Select the [DF700H], and click the [OK] button.

NOTE : When selecting a subsystem in (a), this dialog is not displayed.



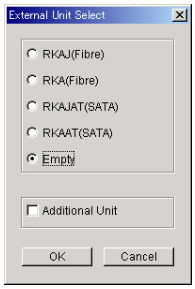
Copyright © 2006, Hitachi, Ltd.

(c) Set the subsystem to be configured in the frame part of the Physical.
Click the [Edit] button in the Physical part.

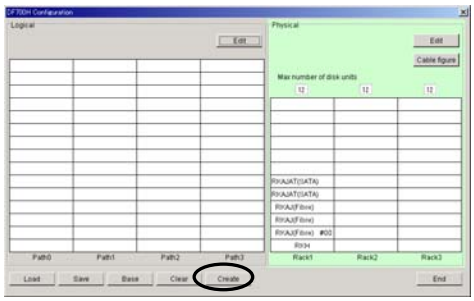


(a) [Logical] : The device ID can be checked per Path.
(b) [Edit in Logical] button : The chassis frame in Logical can be edited manually. If [Create] button is selected after the setting, the subsystem and the device ID are displayed in the Logical part and the Physical part.
(c) [Physical] : The device ID can be checked per Rack.
(d) [Edit in Physical] button : The chassis frame in Physical can be edited manually. If [Create] button is selected after the setting, the subsystem and the device ID are displayed in the Logical part and the Physical part.
(e) [Single, Dual in Physical] button : It selects the installation configuration of the Control Unit.
(f) [Max number of disk units] button : The maximum number of chassis frames per Rack can be specified.
(g) [Cable figure] button : The ENC cable connection figure is displayed.
(h) [Load] button : The configuration figure can be read.
(i) [Save] button : The configuration figure can be stored in files.
(j) [Base] button : The chassis frame type and the device ID are displayed automatically in the Logical part and the Physical part.
(k) [Clear] button : The subsystem and the device ID, which have been set, are cleared.
(l) [Create] button : The name and ID number of the subsystem are displayed in the Logical part and Physical part.
(m) [End] button : It returns to the device model selection window.

(d) Click the [OK] button.

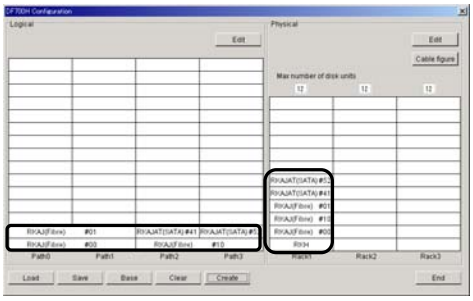


Copyright © 2006, Hitachi, Ltd.

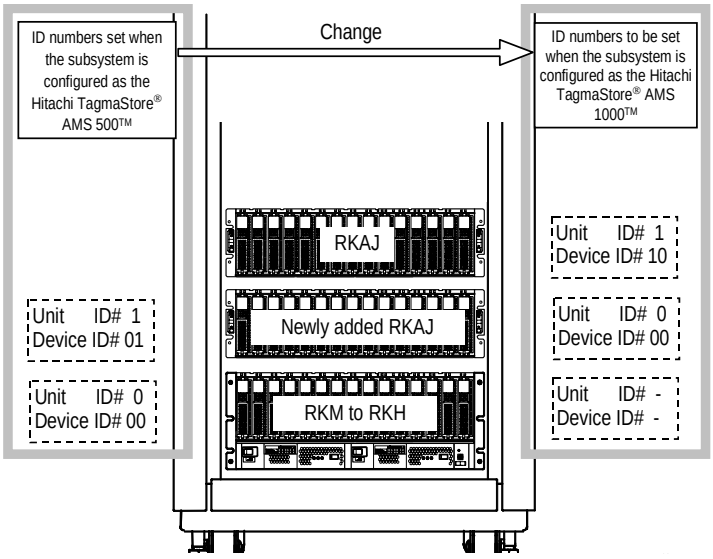


(e) If the chassis frame section the Physical part is clicked, the “Unit Select” window is displayed. Select RKAJ (Fibre), RKA(Fibre), RKAJAT (SATA) or Empty and input the configuration.
Check that the actual rack mounting position and the Physical part are the same.

Frame type selection window



(f) Click the [Create] button.



Copyright © 2006, Hitachi, Ltd.

(g) The Device ID# is output in the Logical part and the Physical part window.

(h) Set the Device ID# shown in the Physical part window to all the RKAJs/RKAJAT/RKAs which are installed in the same position.

Setting changes in the case where the two RKAJs were connected when the disk array subsystem was configured as the Hitachi TagmaStore® AMS 500™
(Set the Device ID# 10(Unit ID# 1) for the RKAJ for which the Device ID# 01(Unit ID# 1) were set.
Set the Device ID# 00(Unit ID# 0) for the RKAJ newly added.)

Copyright © 2006, Hitachi, Ltd.

Example 1: The Unit ID# and the Device ID# for the Hitachi TagmaStore® AMS 1000™ are set based on those at the configuration before the upgrade.
The relation between the Unit ID# and the Device ID# when it is upgraded at the Hitachi TagmaStore® AMS 500™ configuration is shown as an example.

ID numbers set when the subsystem is configured as the Hitachi TagmaStore® AMS 500™				ID numbers to be set when the subsystem is configured as the Hitachi TagmaStore® AMS 1000™		
Unit ID	Device ID	Device		Unit ID	Device ID	Device
-	-	-	→	-	-	RKH
#0	#00	RKM	→	#0	#00	RKAJ
#1	#01	RKAJ	→	#1	#10	RKAJ
#2	#02	RKAJ	→	#2	#01	RKAJ
#3	#03	RKAJ	→	#3	#11	RKAJ
#4	#04	RKAJ	→	#4	#02	RKAJ
#5	#05	RKAJ	→	#5	#12	RKAJ
#6	#06	RKAJ	→	#6	#03	RKAJ
#7	#07	RKAJ	→	#7	#13	RKAJ
#8	#08	RKAJ	→	#8	#04	RKAJ
#9	#09	RKAJAT	→	#9	#44	RKAJAT
#10	#0A	RKAJAT	→	#10	#55	RKAJAT
#11	#0B	RKAJAT	→	#11	#25	RKAJAT
#12	#0C	RKAJAT	→	#12	#36	RKAJAT
#13	#0D	RKAJAT	→	#13	#46	RKAJAT
#14	#0E	RKAJAT	→	#14	#57	RKAJAT

(i) When the RKAJ is connected to the RKS, make the setting of the device identification switches of all the RKAJs. When the basic subsystem to be connected is the RKH, set it in the M side.

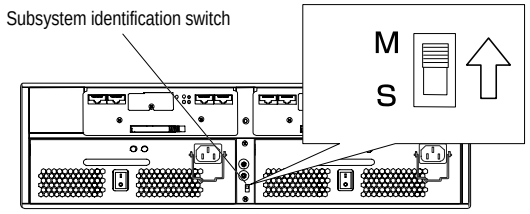


Figure 3.4.47 Position of Switch for Device ID Setting

Copyright © 2006, Hitachi, Ltd.

(20) Install the Cache Unit, which were removed from the RKM, in the RKH.
In the case of the dual controller configuration, install the Cache Units in the both Control Units.
When using Copy-on-write SnapShot, Cache Partition Manager and Cache Residency Manager with the Hitachi TagmaStore® AMS 500™ and using them continuously even after upgrading it to the Hitachi TagmaStore® AMS 1000™, install the Cache Unit for the necessary capacity referring to "3.3 Notes" (SMUP 03-0020).
When the iSCSI interface system configuration, install the iSCSI interface board for iSCSI.

(a) Loosen two fixing screws for the cover at the back of the cover, remove the cover in the direction shown by the arrow (⟶).

(b) When the FC Interface Board was installed, Push the host connector once to check that it is not to be removed.

(c) Install the Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
Insert the connectors surely.
Install the Interface Board making its sheet metal part face inside of the Control Unit.

NOTE : • Be careful that the position to install the Interface Board is determined. (Refer to Table 3.4.2).
• Install the Interface Boards of the same type in the same position of the Control Unit #0 and #1.
• Please install Interface Board on #0 sides when installing it only by one Interface Board.

(d) Make sure that the Interface Board is firmly installed.
When the NAS Interface Board was installed, loosen the screws of the connector cover for the maintenance of the Control Unit, open it.

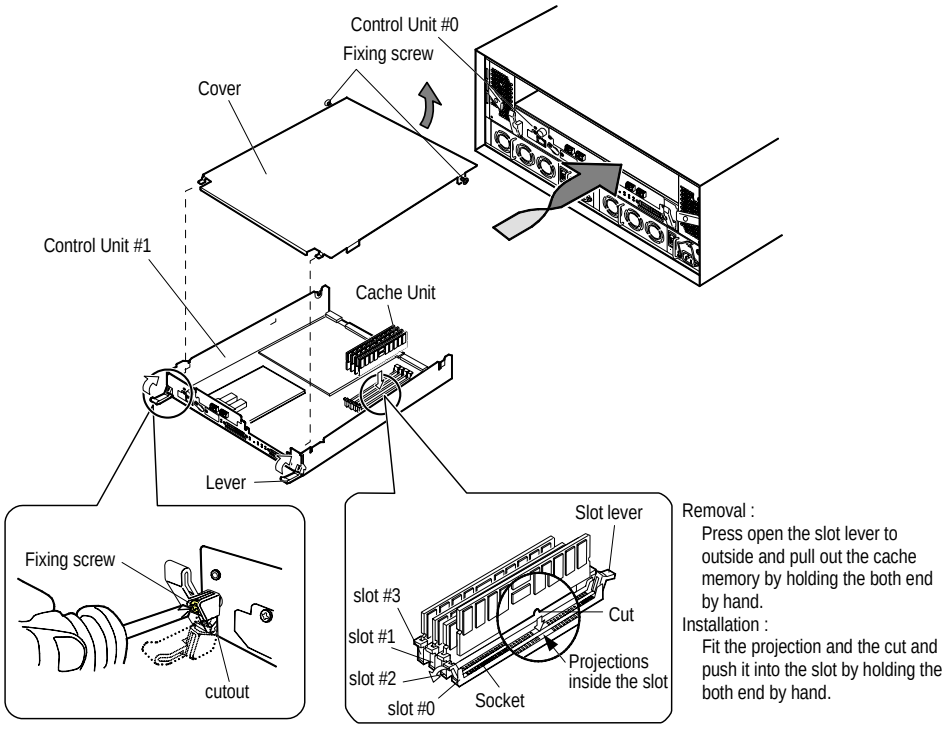
(e) Install the Cache memory after removing the dust cover from the Cache slot of the Control Unit.

NOTE : • Install the Cache Units in order of the slot #0, #1, #2 and #3.
• Install the Cache Unit of the same capacity in the Control Unit #0 and #1.
• Install the Cache Units by the set of two in the slot #0 and #1 and the slot #2 and #3.
• Install the Cache Unit of the same capacity in the slot #0, slot #1 and slot #2, slot #3, respectively.
• Insert the dust cover in the Cache slot in which the Cache memory is not installed.

(f) Make sure that the Cache Unit is firmly installed.

(g) Attach the cover in the opposite direction of which it was removed, and tighten the fixing screw for the cover at the back of the cover.

(h) Insert it into the position in the Control Unit #0 with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
Insert it into the position in the Control Unit #1 too.



NOTE : The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

Copyright © 2006, Hitachi, Ltd.

Table 3.4.2 Installation position of the Interface Board

Installation case	Installation position	
	Interface Board #0	Interface Board #1
1	FC Interface Board	–
2	iSCSI Interface Board	–

NOTE : When adding the Interface Board, add it referring to the Maintenance Manual after completing the upgrade.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.48 Installing Control Unit, Cache Unit and Interface Board

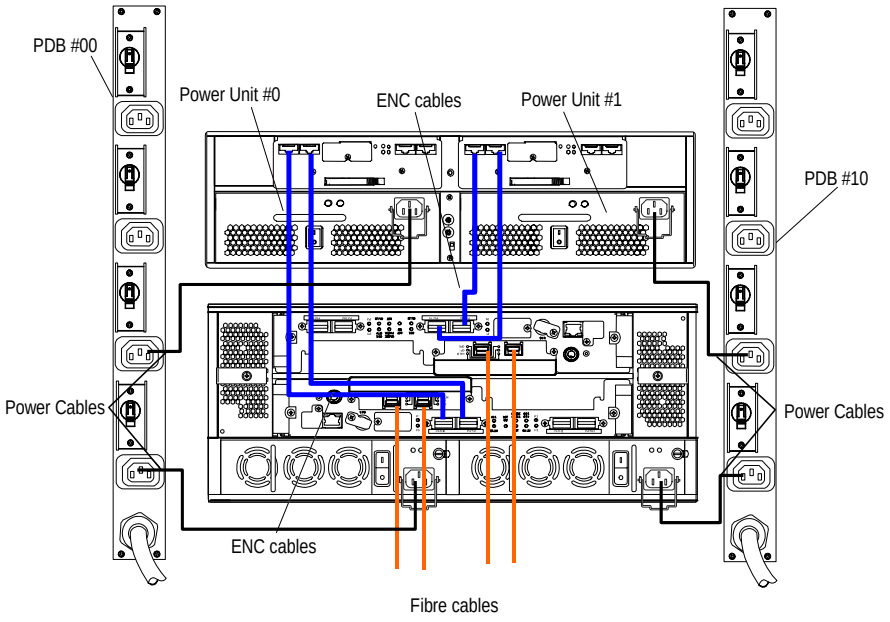
(21) Connecting Cables

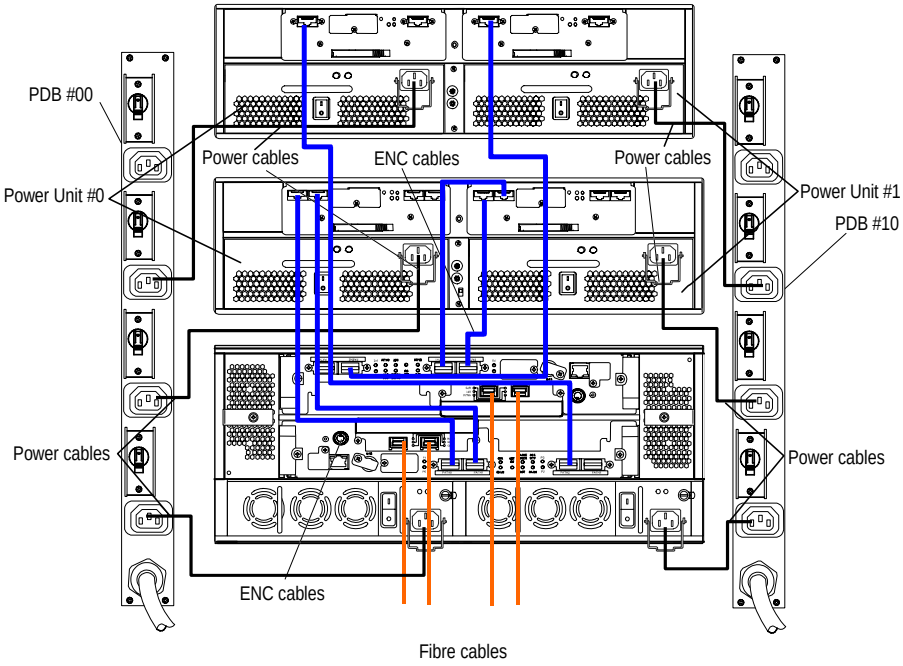


CAUTION

Take full care to connect cables correctly.

Because operation of the subsystem is affected by the cable routing, follow the "3.4.14 (1) (c) Notes on cable routing" (SMUP 03-0580).

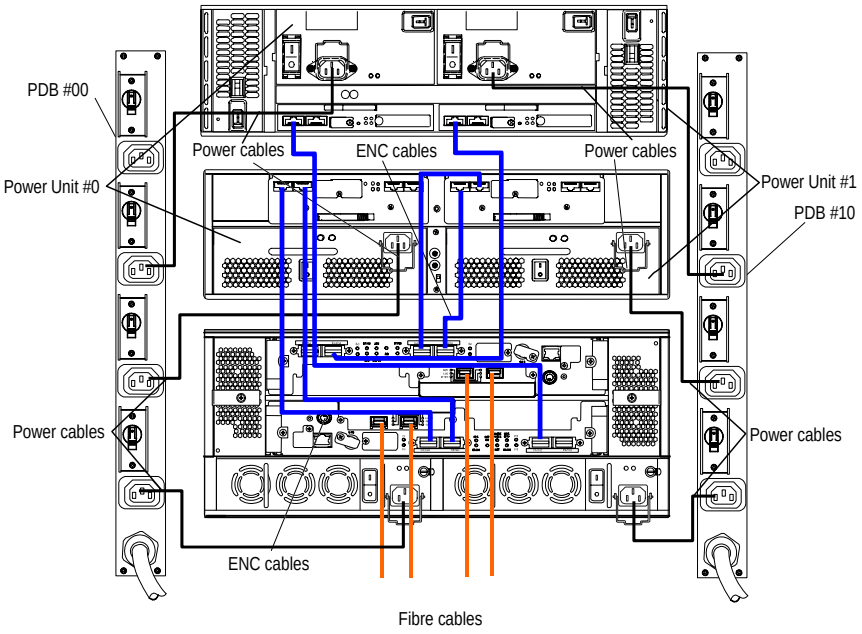
NOTE : Power supply system of the RKH/RKAJ/RKAJAT/RKA is duplicated.
It is recommended to connect each system to outlet of one of the two power sources independent of each other.



The cable routing for the subsystem which is mounted on the rack frame is shown in Figure 3.4.49, Figure 3.4.50, Figure 3.4.50.1, and Figure 3.4.51.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.49 FC Interface cable Routing for the Subsystem (RKH+RKAJ)



Copyright © 2006, Hitachi, Ltd.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

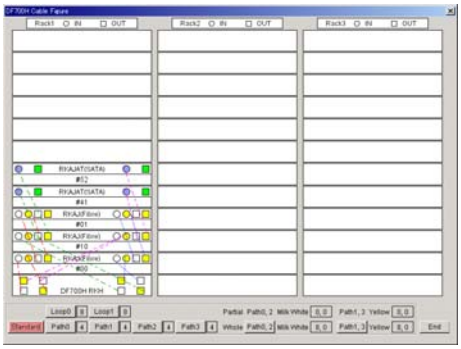
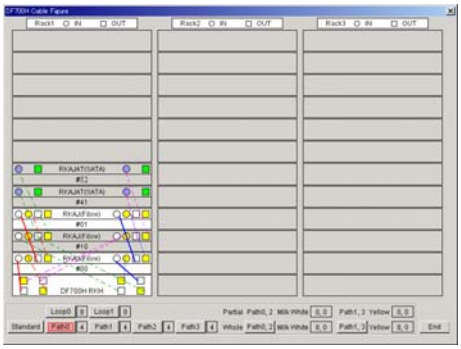
(a) Connecting ENC cables

Connect the ENC cables according to the connection figure of the ACE tool.



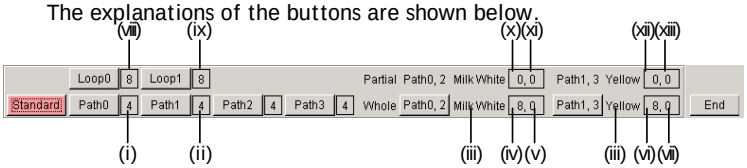
(i) Perform (a) to (g) in the procedure (19).

(ii) Click the [Cable figure] button.



(iii) The ENC cable connection diagram is displayed.

Refer to the ENC cable connection figure, and perform the ENC cable connection.



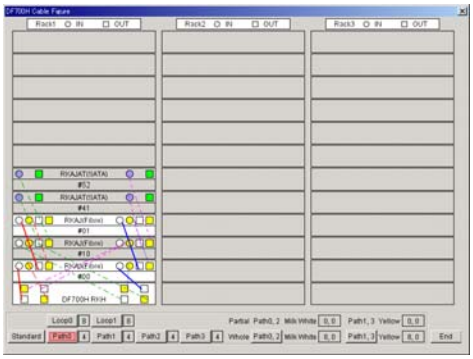
Copyright © 2006, Hitachi, Ltd.

① When Path 0 is selected, the Path 0 is highlighted and the disk units connected to its lines are displayed in white.

When the each [Path] button is clicked, the displayed lines connected to the path are highlighted, disk units connected to the lines are displayed in white, and disk units not connected to the lines are displayed in gray.
To cancel the highlighting, click the [Standard] button.

The explanations of the buttons are shown below.

[Explanation of each button]

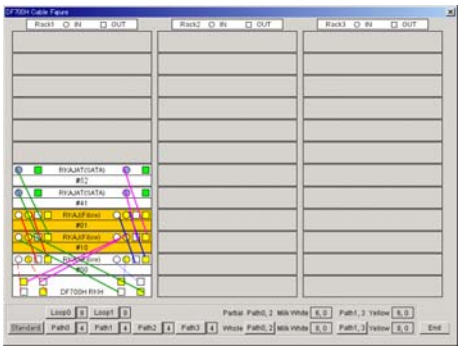


[Standard] button	:	It returns the window line to the initial status (the highlighting is cancelled).
[Path0] button	:	The line connected to Path0 is highlighted.
[Path1] button	:	The line connected to Path1 is highlighted.
[Path2] button	:	The line connected to Path2 is highlighted (it is not displayed in the 700M (RKM)).
[Path3] button	:	The line connected to Path3 is highlighted (it is not displayed in the 700M (RKM)).
[Path0/2] button	:	The lines connected to Path0 and Path2 are highlighted (Path2 does not exist in the 700M (RKM)).
[Path1/3] button	:	The lines connected to Path1 and Path3 are highlighted (Path3 does not exist in the 700M (RKM)).
[Loop0] button	:	The line connected to Loop0 is highlighted.
[Loop1] button	:	The line connected to Loop1 is highlighted.

Copyright © 2006, Hitachi, Ltd.

[Explanation of the window display]

(i) The number of ENC cables of Path0 is displayed.
(ii) The number of ENC cables of Path1 is displayed.
(iii) The color of the binders attached to both ends of the ENC cable is displayed.
(iv) The number of ENC cables of Path0 is displayed.
(v) The number of ENC cables (long ENC cables) between the racks of Path0 is displayed.
(vi) The number of ENC cables of Path1 is displayed.
(vii) The number of ENC cables (long ENC cables) between the racks of Path1 is displayed.
(viii) The number of ENC cables of Loop0 is displayed.
(ix) The number of ENC cables of Loop1 is displayed.
(x) The number of the cables of the Path 0 connected to the selected disk unit or that of the Path 0 connected to the additional disk unit is displayed.
(xi) The number of the inter-rack cables (long ENC cables) of the Path 0 connected to the selected disk unit or that of the Path 0 connected to the additional disk unit is displayed.
(xii) The number of the cables of the Path 1 connected to the selected disk unit or that of the Path 1 connected to the additional disk unit is displayed.
(xiii) The number of the inter-rack cables (long ENC cables) of the Path 1 connected to the selected disk unit or that of the Path 1 connected to the additional disk unit is displayed.

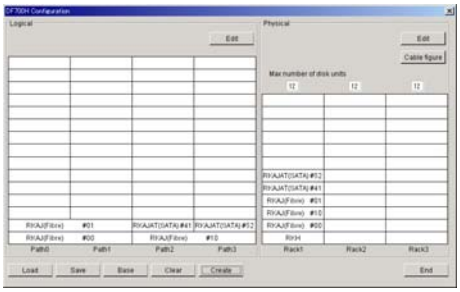


② When [RKAJ(Fibre) #01] is selected, the [RKAJ(Fibre) #01] disk unit is displayed in orange and disk units connected to the [RKAJ(Fibre) #01] disk unit are displayed in white. Besides, the displayed ENC cables connected to the [RKAJ(Fibre) #01] disk unit are highlighted.

To cancel the selection of the disk unit, click the [Standard] button.

Copyright © 2006, Hitachi, Ltd.

③ When [RKAJ(Fibre) #01] is selected and [RKAJAT(SATA) #10] is clicked while the control [Ctrl] key is pressed, the chassis frame connected to the [RKAJ(Fibre) #01 and RKAJAT(SATA) #10] chassis frame is displayed in white. Also, the connecting ENC cable from the [RKAJ(Fibre) #01 and RKAJAT(SATA) #10] chassis frame is highlighted.



Any of the following methods is able to cancel the selection of two or more chassis frames.

① Click the selected chassis frame again while the control [Ctrl] key is pressed.
② Click the [Standard] button.
③ Click another chassis frame while the control [Ctrl] key is not pressed.

(iv) Click the [End] button in the ENC cable connection figure.
It returns to the Configuration window.

(v) Click the [End] button.

(vi) Click the [OK] button.

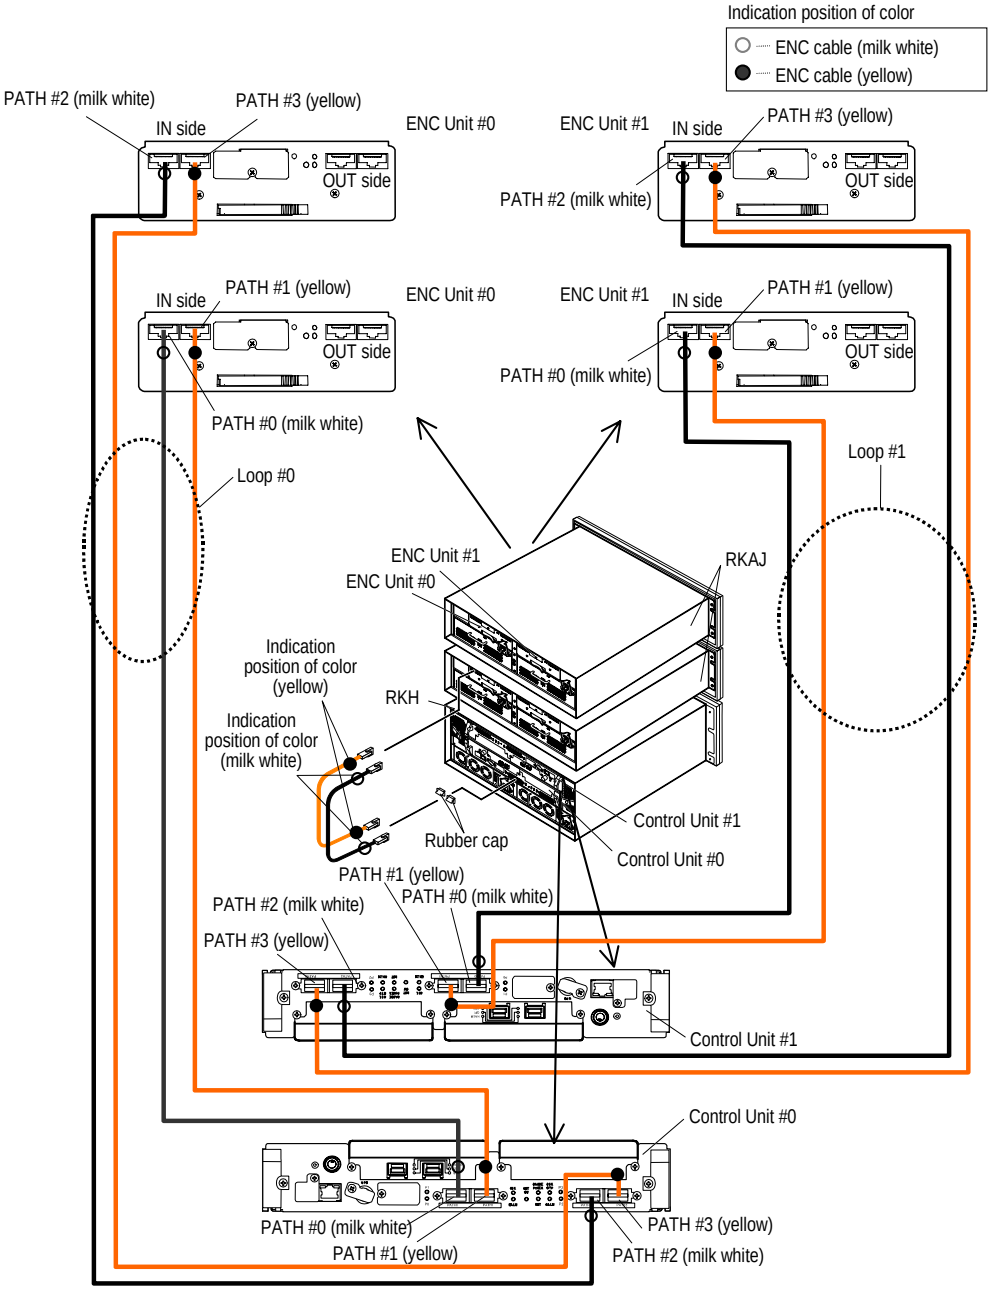
(vii) Connect the ENC cables according to the connection figure of the ACE tool.

Copyright © 2006, Hitachi, Ltd.

• When connecting the RKH and RKAJ/RKA
In the case of the RKAJ/RKA with both of the Control Unit of RKAJ/RKA, it is required to connect the Control Unit (RKH) and the ENC Unit with the ENC cables.

NOTE : When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(i) Remove the rubber cap on the Control Unit.
(ii) Connect the ENC cable to the RKH.
(iii) Connect the ENC cable to the ENC Unit of the RKAJ/RKA.



NOTE : Connect the Control Unit#0 of the RKH with the ENC Unit#0 of the RKAJ and the Control Unit#1 of the RKH with the ENC Unit#1 of the RKAJ. Connect two Path#0, #2 connectors (with milk white indication) using the ENC cable and also connect two Path#1, #3 connectors (with yellow indication) using another ENC cable (see Figure 3.4.52, Figure 3.4.52.1).

① To the PATH#0, #2 (marked in milky white on the RKH side), connect the ENC cable marked in milky white.
② To the PATH#1, #3 (marked in yellow on the RKH side), connect the ENC cable marked in yellow.

(iv) When the two or more RKAJ/RKAs are mounted, connect each of the sets of the adjacent connectors of the same kind, that is, the PATH#0, PATH#1, PATH#2 and PATH#3 of the RKAJ/RKAs using the ENC cables. (see Figure 3.4.52, Figure 3.4.52.1).
① Remove the rubber cap of the ENC Units in the locations where the ENC cables are to be connected by loosening the thumb screws.
② Connect each of the connectors PATH#0, #2 (marked in milk white) and PATH#1, #3 (marked in yellow) of the ENC Unit, from which the rubber cap was removed, with the ENC cables marked in the same color respectively.
③ Connect each of the connectors PATH#0, #2 (marked in milk white) and PATH#1, #3 (marked in yellow) of the adjacent RKAJ/RKA with the ENC cables marked in the same color.

(iv) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

- When connecting the RKH and RKAJ/RKAJAT
  In the case of the RKAJAT with both of the Control Unit of RKH, it is required to connect the Control Unit (RKH) and the ENC Unit/ SENC Unit with the ENC cables.

  NOTE : • When bending the ENC cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses ..
  • The IN and OUT connectors of the SENC Unit of the RKAJAT have indications by means of blue and green labels respectively.

Execute the following.
When connecting the RKH+ RKA and RKAJAT, refer to Figure 3.4.53.

(i) Attach milk white or yellow Mini-Binders to the ENC cable.
(ii) Remove the rubber cap on the Control Unit.
(iii) Connect the ENC cable to the RKH.
(iv) Connect the ENC cable to the ENC Unit of the RKAJ.

NOTE : Connect the Control Unit#0 of the RKH with the ENC Unit#0 of the RKAJ and the Control Unit#1 of the RKH with the ENC Unit#1 of the RKAJ.
Connect two PATH#0 connectors (with milk white indication) using the ENC cable and also connect two PATH#1 connectors (with yellow indication) using another ENC cable.

① To the PATH#0 (marked in milky white on the RKAJ side), connect the ENC cable marked in milky white.
② To the PATH#1 (marked in yellow on the RKAJ side), connect the ENC cable marked in yellow.

(v) When the two or more RKAJATs are mounted, connect the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit of the RKAATs/RKAJATs using the ENC cables.
① Remove the rubber cap of the ENC Units/SENC Units in the locations where the ENC cables are to be connected by loosening the thumb screws.
② Connect each of the connectors the OUT side (Green Label) and the IN side (Blue Label) of the SENC Unit, from which the rubber cap was removed, with the ENC cables.
(vi) After connecting the ENC cable, roll up the excess part of the cable in a circle, tighten it lightly with the repeat binder.

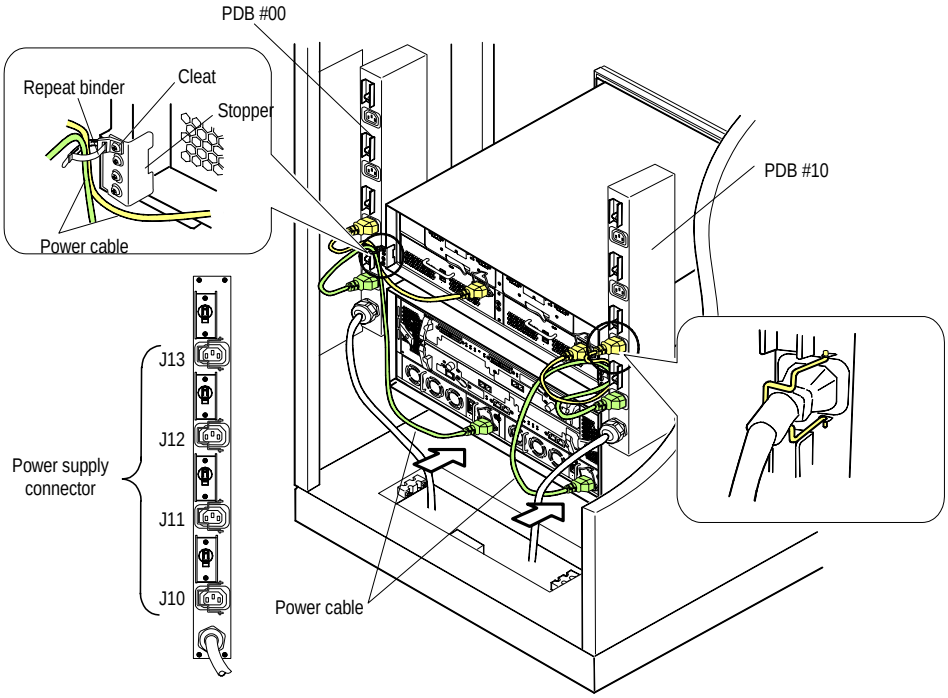
(b) Connecting the power cables of Power Unit

⚠ CAUTION



Make sure that there is no scratch or flaw on a power cable. It can cause an electric shock or even a fire.

(i) Make sure that the breaker of the each PDB has been turned off.
(ii) Make sure that the AC Power Unit Switch of the each Power Unit has been turned off.
(iii) Insert the power cable plug into the receptacle on the each Power Unit.
(iv) Pass Repeat Binders through the cleats attached to the right and left stoppers and fasten the power cable with the Binders.
(v) Insert the each power cable plug into the corresponding receptacle of the PDB. (Use the PDB receptacles in the order from the J10 to J13.)

NOTE : • Be sure to plug the power cable for the Power Unit#0 in the receptacle of the PDB#00 or PDB#01.
Be sure to plug the power cable for the Power Unit#1 in the receptacle of the PDB#10 or PDB#11.
If they are plugged in the receptacles of the PDBs on the same side, the function of the duplicated power supply does not work.
• Do not plug any cable other than the power cable of the mounted subsystem in the outlet of the PDB.
• Limit the total current output from the outlets J10 to J13 so that it does not exceed 20 amperes.

(vi) Hang the cable clamp of PDB on the plug of the power cable.
(vii) Route the power cables.
(viii) Push in the plug of the power cable which has been inserted into the PDB again.
It may be loosened owing to a routing.

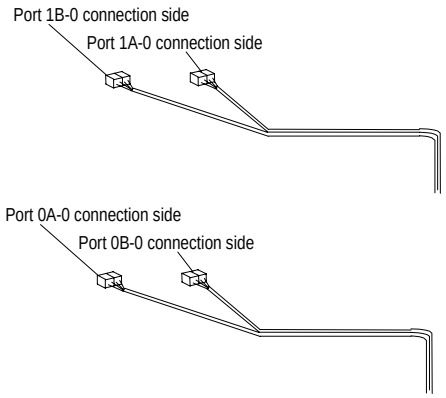
(c) Connecting interface cables

- When upgrading the Hitachi TagmaStore® AMS 500™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 1000™

(i) Connect the Fibre Channel Interface cables after making sure of the ports to be connected the LOCATION (REAR) label.
When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

NOTE : When bending the Fibre Channel Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(ii) Pull all the Fibre Channel Interface cables into the rack frame passing them through an opening for cables on the bottom plate of the U7 rack frame.



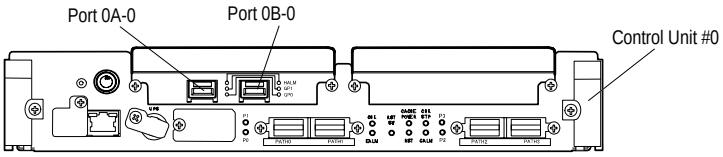


Figure 3.4.55 Binding Interface Cables

Copyright © 2006, Hitachi, Ltd.

(iii) Connect the Fibre Channel interface cable to the connector of each port in the same position before upgrading it.
When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors. If the Fibre Channel interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

(iv) In the case of the U7 rack frame, affix the clamps attached to the DF-F700-URHT7 (rail kit for the U7) on it, and perform the routing of the Fibre Channel interface cables.

(v) Fasten the Fibre Channel Interface cables to the rack frame at the cable passing opening on the he bottom plate giving them excessive lengths so that they will not be pulled.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.56 Routing Interface Cables

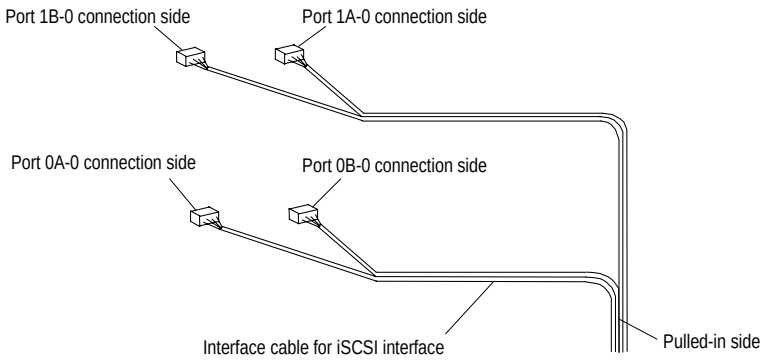
- When upgrading the Hitachi TagmaStore® AMS 500™, which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 1000™

(i) Connect the iSCSI Interface cables after making sure of the ports to be connected the LOCATION (REAR) label.

NOTE : When bending the iSCSI Interface cable to connect it, give it a bend with a long radius (not less than 30 mm) so as not to apply the cable and the connector excessive stresses.

(ii) Pull all the Interface cables into the rack frame passing them through an opening for cables on the bottom plate of the U7 rack frame.



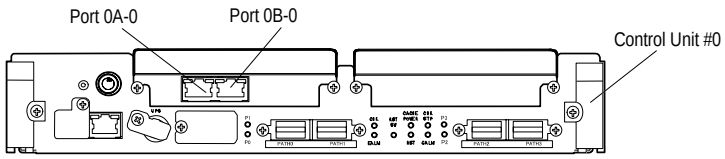


Figure 3.4.57 Binding Interface Cables

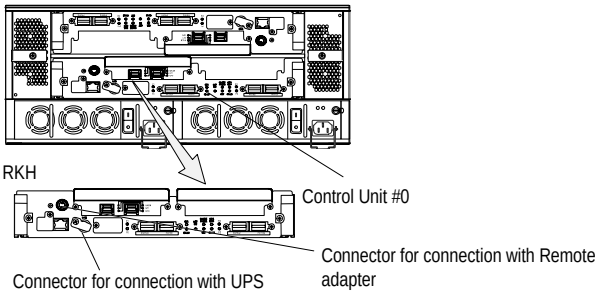
Copyright © 2006, Hitachi, Ltd.

(iii) Connect the iSCSI interface cable to the connector of each port in the same position before upgrading it.

(iv) In case of the U7 rack frame, perform the routing of the iSCSI interface cables, attach the cleat to the stopper, and fix the iSCSI interface cables through the repeat binder.

(v) Fasten the iSCSI interface cables giving them excessive lengths so that they will not be pulled.



*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.58 Routing Interface Cables

(22) Connecting the Remote adapter/UPS

(a) When connecting the Remote adapter/UPS to the RKH, connect the Connector in the Control Unit.

*1 : The Interface Board is installed on interface #0 sides for RKH. Please install the dummy on interface #1 side.

Figure 3.4.59 Physical Location of Connector on Subsystems for Remote Adapter/UPS Connection

(b) Setting the Rotary switch.

Set the mode of power control. Either Local mode or Remote mode is set by the Rotary switch. Local/Remote mode settings and corresponding operation modes are shown below.

Rotary switch	Operation mode name	Operation mode
0	LOCAL	Local mode (Before shipment. When the remote adaptor is not used.)
1	—	—
2	REMOTE	Remote mode by means of the HOST AC (using a remote adapter)
3	—	—
4	UPS Interlock mode 1	Interlock mode 1 with an UPS exclusive for the subsystem To set the mode, connect AC#0 and AC#1 to the UPS and an external and an external AC power supply or the PDB of the U7 rack frame respectively.
5	UPS Interlock mode 2	Interlocking mode 2 with an UPS exclusive for the subsystem To set the mode connect AC#0 and AC#1 to the one UPS.(*1)
6	UPS Interlock mode 3	Interlocking mode 3 with an UPS exclusive for the subsystem To set the mode, connect each of AC#0 and AC#1 to the different UPSs. (*2)
7	—	—
8	—	—
9	—	—

: Do not make this setting when the UPS is not connected.

*1 : The duplication of the power supply system becomes unable to be done.

*2 : This cannot be used in the case of the single controller configuration.

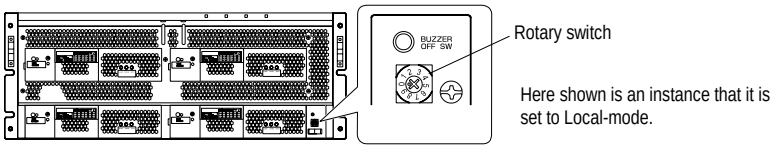

Figure 3.4.60 Location of Rotary Switch for Setting Power Control Mode

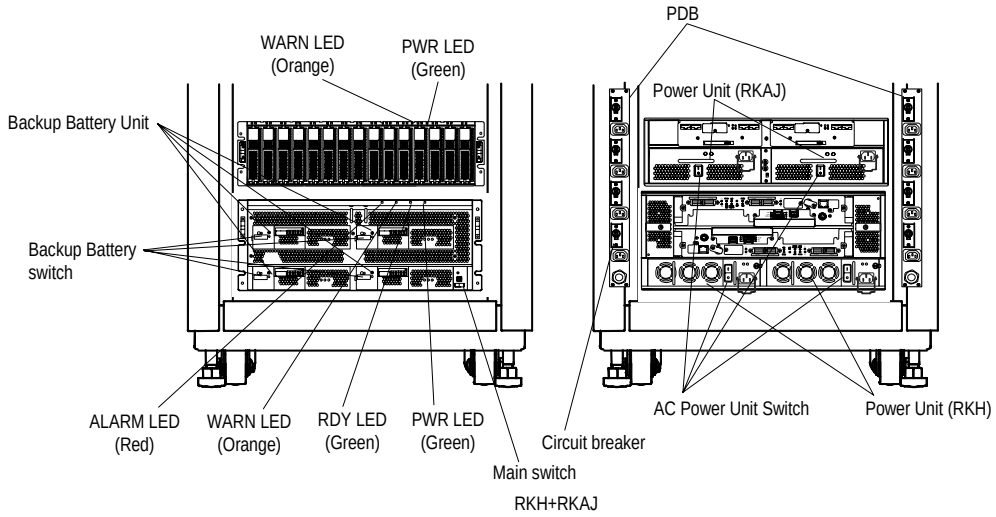

(23) Connect the maintenance PC to the disk array subsystem.

Connect the maintenance PC to the RKH referring to Step "3.4.5 Connection of the maintenance PC" (SMUP 03-0130).

3.4.15 Subsystem power on

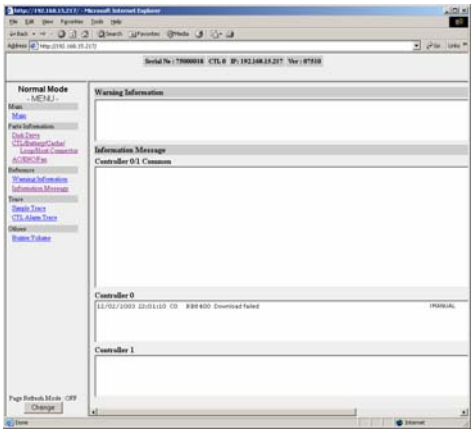
(1) Make sure that the circuit breaker is turned off.
(2) Make sure that the main switch is turned off.
(3) All turn on the battery switch of the Backup Battery Unit on the front of the subsystem.
(4) Turn on the circuit breaker of the PDB.
(5) Turn on the AC Power Unit Switch of the Power Unit on the Basic and Additional subsystem. (‡1)
(6) Turn on the main switch.
(7) Make sure that the ALARM LED (red) on the Front Bezel of the RKH comes on.
At this time, the Disk Drive, which was spun down due to the power saving of the priced option, also spins up in SANRISE AMS200/500. When the array subsystem finally becomes a ready status as SANRISE AMS1000, the Disk Drive set tot the power saving spins down.
(8) Check if the CALM LEDs (red) on the both Control Units light on.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Figure 3.4.61 Locations of Switches for Power On

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

Table 3.4.62 LED Indication on Control Unit



‡1 : When Disk Drives are not installed on the additional Disk Drive, shut off the power to the Power Unit (RKAJ).

(9) Connect the WEB by connecting the LAN cross cable to the LAN connector for maintenance on the disk array subsystem. ("3.4.5 Connection of the maintenance PC" (SMUP 03-0130))

(10) Select the [Information Message].

(11) Check that [RB8400 Download failed] message is displayed in [Information Message], and move on to the next operation.

NOTE : When the checked contents in the operation (7), (8) , (11) are not shown as above, the operation so far may have errors. Refer to "Chapter 4. Trouble Shooting" (SMUP 04-0000) to solve the problem.

Copyright © 2006, Hitachi, Ltd.

3.4.16 Updating installation of microprogram for Hitachi TagmaStore® AMS 1000™

Install the microprogram for the Hitachi TagmaStore® AMS 1000™ (latest revision) using the WEB.

Check if the microprogram revision is 0731/A-H or later.

(1) The point to be checked before installation

Make sure of the following before starting installation

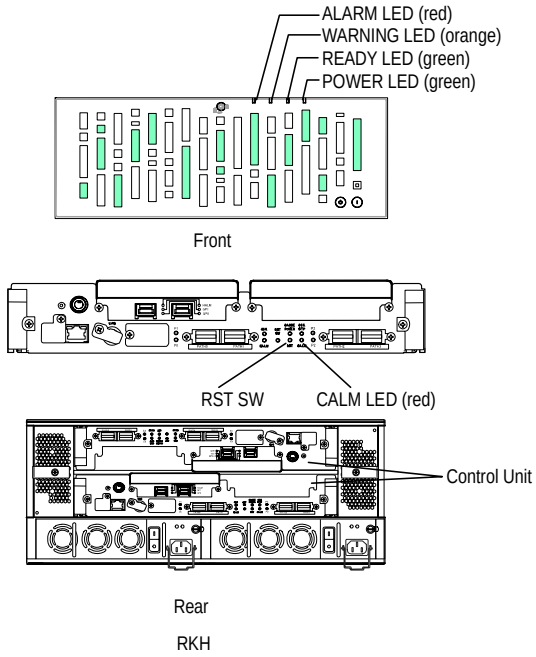
- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem. (refer to Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).)

(2) Procedure for installation

(a) Press the RST SW of the Control Unit #0. (While pressing RST SW, the RST LED is on.)

Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

(b) Press the RST SW of the Control Unit #1 immediately (within ten seconds) checking the CALM LED (red) of the Control Unit#0 comes on.



(Sometimes the buzzer may beeps when the RST SW is pressed, however, you do not have to stop it until these operations are completed.)

When the CALM LED on the Control Unit #0 does not go out after that, turn off the subsystem power and then turn it on without pulling out and inserting the Control Unit. Then, return to Step (1) and do all the works over again.

NOTE : Because the Control Unit is shutdown status for the Maintenance Mode, the command from the host is impossible execution.

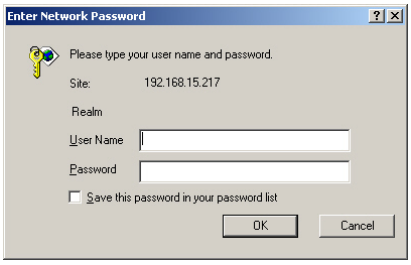
When CALM LED on Control Unit #0 turns off and READY LED on Front Bezel turns off, it transfers to Maintenance mode.

Copyright © 2006, Hitachi, Ltd.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

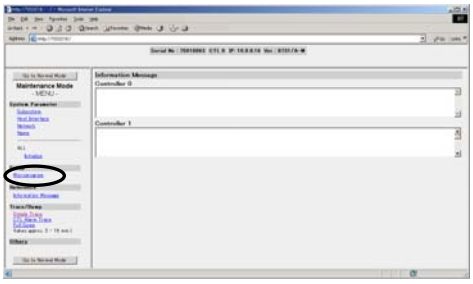
Figure 3.4.63 Indication Position

NOTE : • Set the TCP/IP to "Disable DNS" because the connection takes a long time when the TCP/IP of the network is set to the condition in which the DNS is used. For the setting procedure, refer to the instruction manual of the PC to be used.
• Make sure that the browser is set to the condition in which the proxy server is not used because the connection cannot be done if the proxy server is set to be used. To make sure the setting, refer to the instruction manual of the browser to be used.



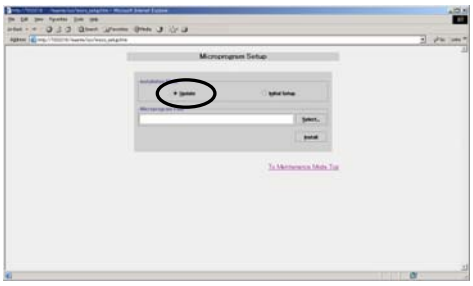
Copyright © 2006, Hitachi, Ltd.

(c) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the Web.



(d) Please input the IP Address of the Control Unit where it was connected with the network to the browser. Please input the page by the update button of the browser if it has already been connected with WEB.

NOTE : The contents that were set up with "System Parameter" and the Microprogram that was installed with "Setup" come into effect after the rebooting of the Control Unit.

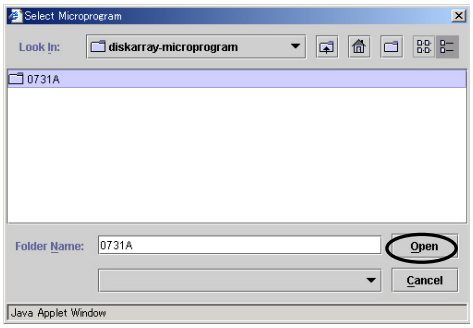


A [User Name] and a [Password] may be requested at the time of Web connection or Web operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(e) Click "Maintenance", "Setup", and "Microprogram" in this order in the Web window.

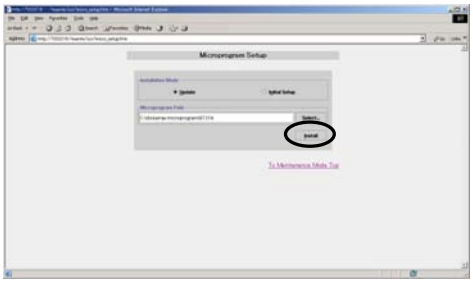
(f) When the Microprogram Setup window is displayed, check the "Update" radio button of the "Installation Mode."

Copyright © 2006, Hitachi, Ltd.



(g) Set the microprogram path.

Specify the Unified version directory(‡1) in which the microprogram that has been copied to the service PC is stored.

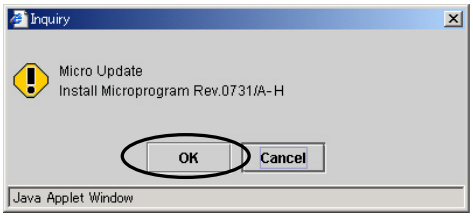


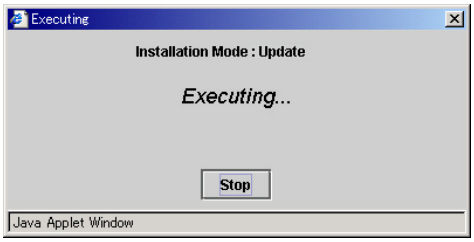
When the "Select" button is clicked, the "Select Microprogram" window is displayed.

Select the Unified version directory in which the microprogram is stored and click the "Open" button.

NOTE : If the window is not displayed, the JRE 1.3.1 03 may have not been installed or the installation of it may have failed.
Perform the installation of the JRE 1.3.1 03 (See Refer to "3.4.9 (2)(a)(i) Method for checking the drive for booting the OS" (SMUP 03-0280)) again.

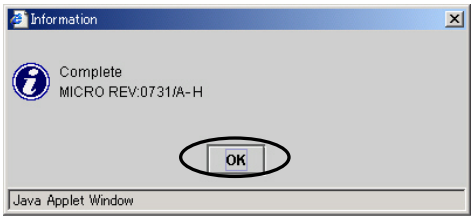
(h) Click the [Install] button to install the microprogram.





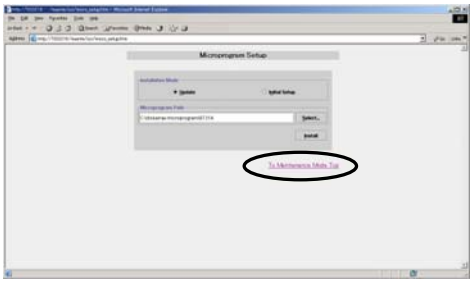
‡1 : For the unified version directory, refer to "3.4.9 Updating installation of microprogram for Hitachi TagmaStore® AMS 200™/AMS 500™" (SMUP 03-0250).

Copyright © 2006, Hitachi, Ltd.

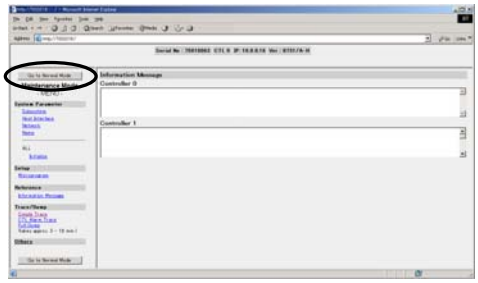


(i) The following window that asks for confirmation is displayed. When the [OK] button in the window is clicked, the installation is started.

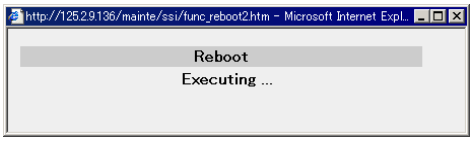
NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the window in the procedure (j) was displayed, execute the update installation procedure again from the beginning.



(j) When the installation is completed, the completion window is displayed. Click the [OK] button.

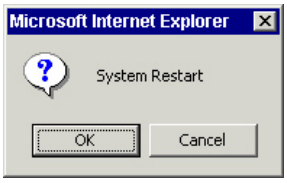


(k) Go to the “Maintenance Mode” window by clicking “To Maintenance Mode Top” in the Microprogram Setup” window.



Copyright © 2006, Hitachi, Ltd.

(l) Change the mode from Maintenance to Normal by clicking the [Go to Normal Mode] button.



(m) When the [Go to Normal Mode] button is clicked, the following window is displayed.

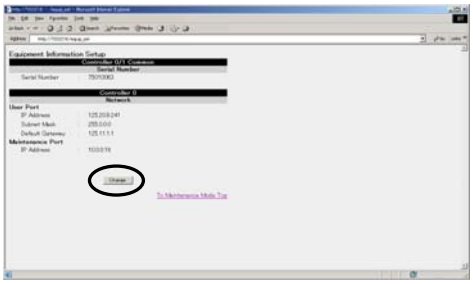
NOTE : When a LAN failure, etc. occurred and the processing of WEB terminated abnormally before the display of the following window disappears, click [View] – [Refresh] of the menu bar or the [Refresh] button of the tool bar, and then update the page of WEB.
After that, click the [Go to Normal Mode] button when the main window is displayed.

(n) Click the [OK] button.

(o) The subsystem becomes ready in about five minutes.
Make sure that the READY LED of the front bezel is on.
If the READY LED does not come on, the installation may have failed. Perform the installation over again.

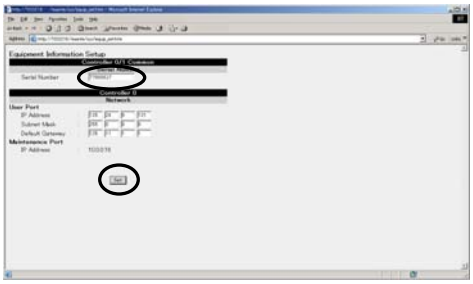
NOTE : • When [Abnormal End Empty System Retry Full Install] is displayed, refer to the recovery procedure, "4.2 When Abnormal End Empty System Retry Full Install occurs" (SMUP 04-0120).
• After the updating installation is executed, the configuration of the disk array subsystem becomes unable to be returned to that of the Hitachi TagmaStore® AMS 200™/AMS 500™ at the time when the subsystem enters the READY status.

Copyright © 2006, Hitachi, Ltd.

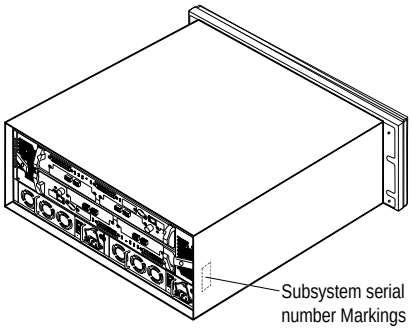


3.4.17 Setting serial number of disk array subsystem

Change the serial number of the disk array subsystem through the hidden WEB window using the serial number setting up function.
The procedure is shown below.

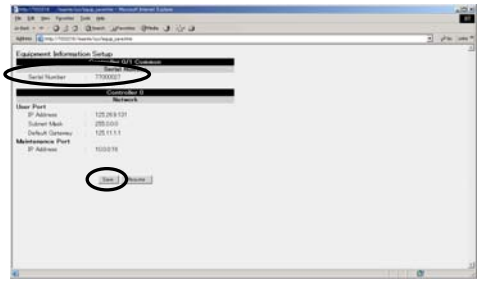


(1) Set the operation mode in the Maintenance Mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))



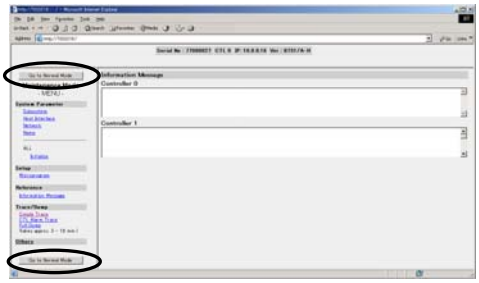
(2) Enter "http://(IP address of the disk array subsystem)/equip_set" in the [Address].
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(3) Displayed the [Equipment Information Setup].
Click the [Change] button.



(4) Enter a serial number in the [Serial Number] box and click the [Set] button.
The serial number is an eight figure number indicated in the section for the serial number in Figure.

Copyright © 2006, Hitachi, Ltd.



(5) After making sure that the change to be made is correct, click the [Save] button.

The subsystem serial number is changed.

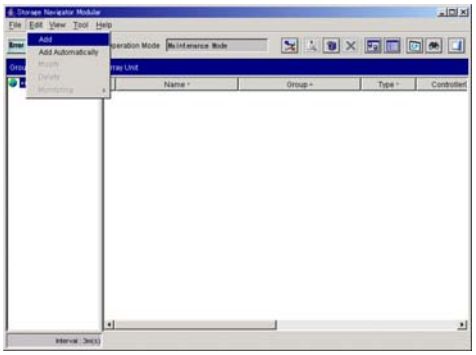
(6) Enter "http://(IP address of the disk array subsystem)/" in the [Address].

(7) Change the mode from Maintenance to Normal by clicking the [Go to Normal Mode] button.

When the [Go to Normal Mode] button is clicked, the following window is displayed.

(8) Click the [OK] button.

(9) The subsystem becomes ready in about 5 to 15 minutes.
Make sure that the RDY LED of the RKH is on.



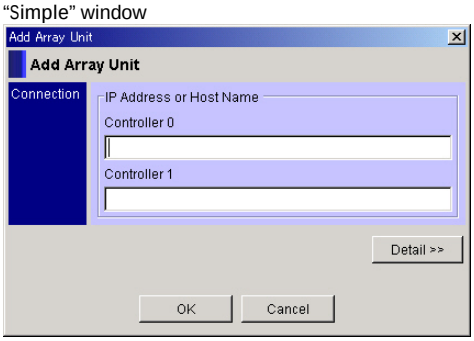
(10) Quit the WEB.

Copyright © 2006, Hitachi, Ltd.

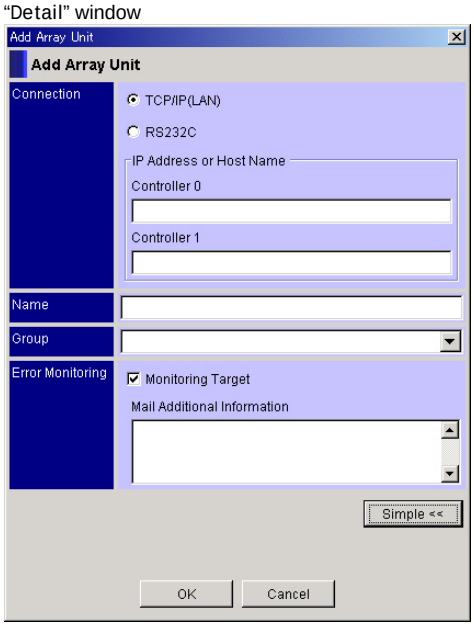
3.4.18 Registration of Hitachi TagmaStore® AMS 1000™

Register the Hitachi TagmaStore® AMS 1000™ that does the up-grade to Storage Navigator Modular.
The procedure is shown below.

(1) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular. ("3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140))
(2) Set the operation mode of Storage Navigator Modular as Maintenance mode. ("3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))
(3) Click the icon of an array unit on the Main screen. On the [Edit] menu, click [Add].



Copyright © 2006, Hitachi, Ltd.



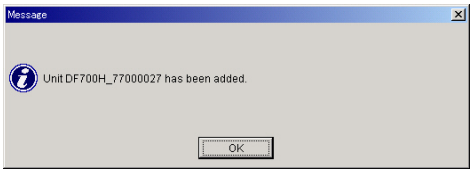
(4) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.

NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. [Array Unit Type] is used to select a type of the subsystem to be connected. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.
• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

"Simple" window

"Detail" window

[Connection] : Select TCP/IP (LAN) connection to be used for the disk array subsystem.
When connecting the LAN, select the [TCP/IP (LAN)], and then specify the [IP Address], [Host Name], and [IP Address] or [Host Name] of controller 0 and 1.



[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).
The maximum number of the groups allowed to be registered is 200. The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.

Copyright © 2006, Hitachi, Ltd.

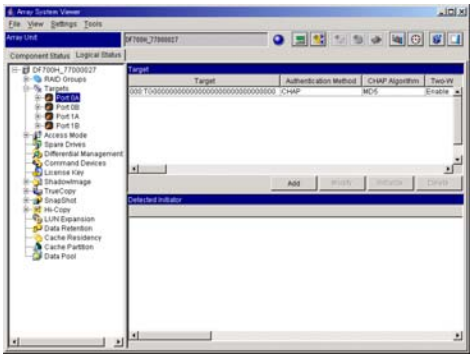
[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

(5) When a message informing of a completion of the registration is displayed, click the [OK] button.

The Main screen is updated and then displayed.

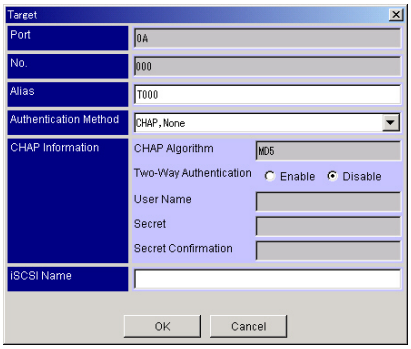
(6) When the property window is open, click the [Close] button.
(7) Close the unit window. Quit Storage Navigator Modular by selecting [File] and [Exit] in this order in the main window or clicking the [: Exit] button.

Copyright © 2006, Hitachi, Ltd.



3.4.19 iSCSI Name change of Target

The procedure to upgrade the Hitachi TagmaStore® AMS 200™/AMS 500™ , which is the system configuration of the iSCSI interface, to the Hitachi TagmaStore® AMS 1000™ is shown.
For Targets, only the "000:T000" is supported.

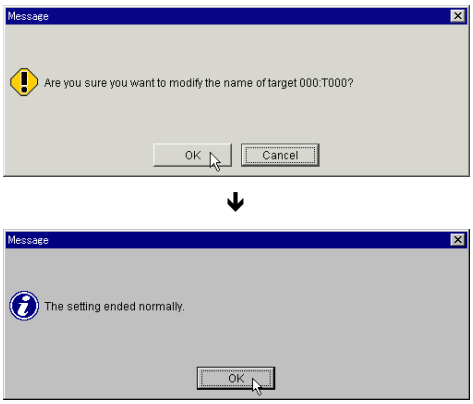


NOTE : Up to 128 targets can be set when the LUN Manager, which is an extra cost optional feature, is used.
In that case, change all the Target iSCSI Names.

(1) Click the [Logical Status] tab in the unit screen.

(2) Double-click the port which changes the information on the two-way authentication, select [000:T000], and click the [Modify] button.

(3) The "Target" dialog is displayed.
Change the "iSCSI Name".



① [iSCSI Name] : Enter the name of the iSCSI Name with 233 or less alphanumeric character. A period (.), hyphen (-), and colon (:) can be used.

(4) Click the [OK] button.

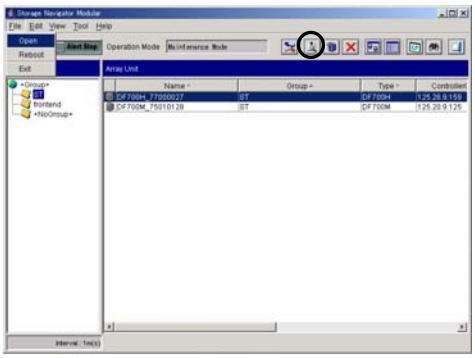
Copyright © 2006, Hitachi, Ltd.

(5) The confirmation message is displayed. Select the [OK] button.

Copyright © 2006, Hitachi, Ltd.

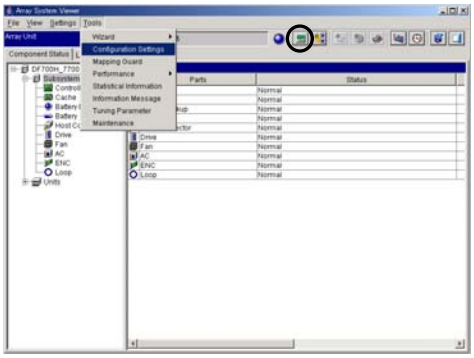
3.4.20 Other settings

The procedure to upgrade the Hitachi TagmaStore® AMS 200™, which is the system configuration of the Fibre Channel interface, to the Hitachi TagmaStore® AMS 1000™ is shown. When the RKS, which was using the Mini-HUB, was upgraded to the RKH, perform the following settings of (1) to (5) as needed.



(1) Setting the Port Options

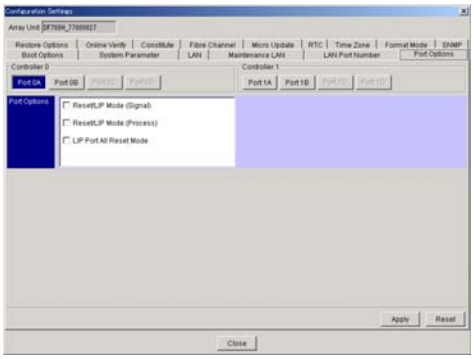
(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).



(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150).)

(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [ : Open]

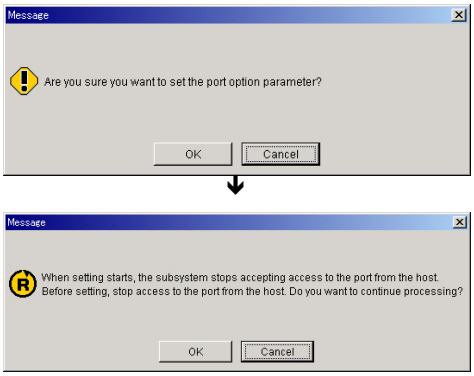


(d) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

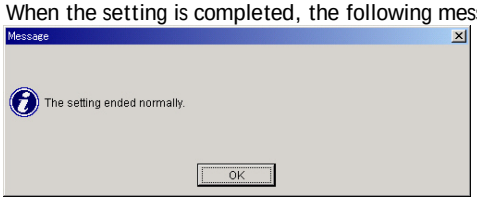
Copyright © 2006, Hitachi, Ltd.

(e) Click the [Port Options] tab. The window for setting the "Port Options" is displayed.

(f) Click the [Port 0A] button.



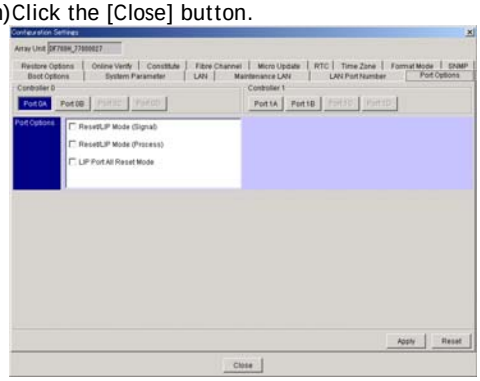
(g) Check the set contents.



(h) Specify a port options. Select an option you want to set by clicking its check box.

(i) When the setting is completed, click the [Apply] button at lower right corner of the window.

(j) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



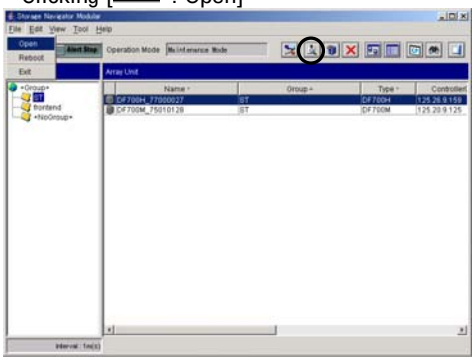
(k) When the setting is completed, the following message is displayed. Click the [OK] button.

Copyright © 2006, Hitachi, Ltd.

(l) The setting/verification of the port 0A is completed. Do the same for the other ports.

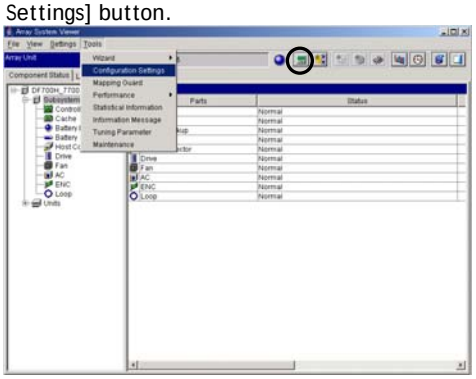
(m) Click the [Close] button.

Copyright © 2006, Hitachi, Ltd.



(2) Setting the Fibre Channel

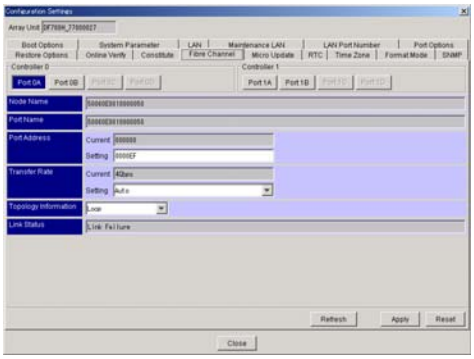
(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).



(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))

(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

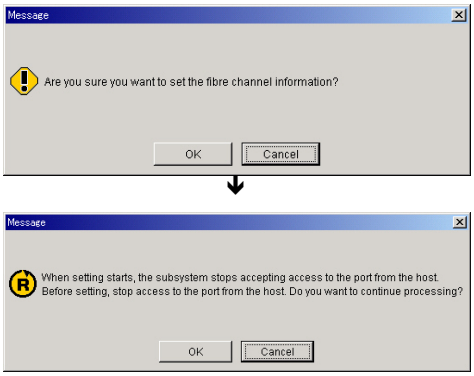


(d) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

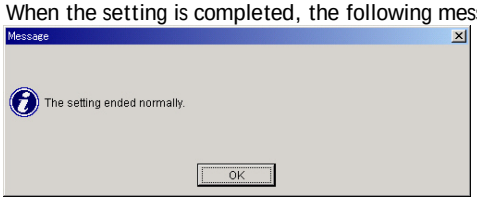
Copyright © 2006, Hitachi, Ltd.

(e) Click the [Fibre Channel] tab. The window for setting the "Fibre Channel" is displayed.

(f) Click the [Port 0A] button.



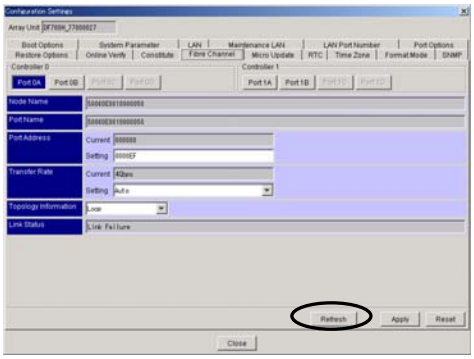
(g) Check the set contents.



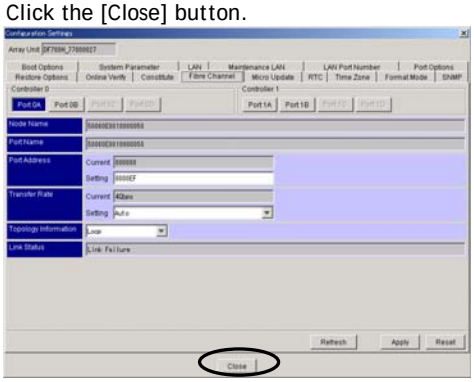
(h) Setting value of [Port Address], [Transfer Rate] and [Topology Information].

(i) When the setting is completed, click the [Apply] button at lower right corner of the window.

(j) A message asking you to verify the setting is displayed.
After making sure that the I/O request from a host is suppressed, click the [OK] button.



(k) When the setting is completed, the following message is displayed. Click the [OK] button.



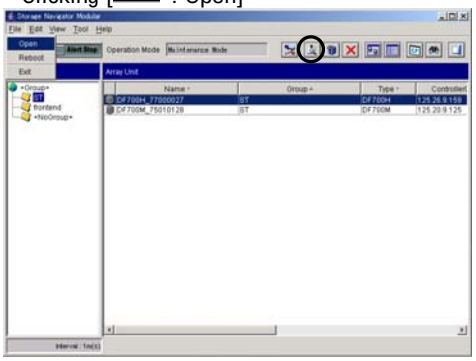
Copyright © 2006, Hitachi, Ltd.

(l) Click the [Refresh] button at the lower right part of the window to check if the setting is reflected on the display.

(m) The setting /verification for the Port 0A is completed. Do the same for the other ports.

(n) Click the [Close] button.

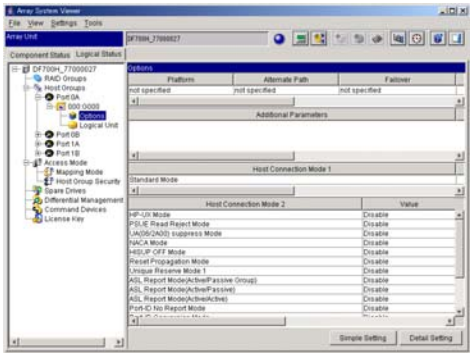
Copyright © 2006, Hitachi, Ltd.



(3) Setting the Host Group Options

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).

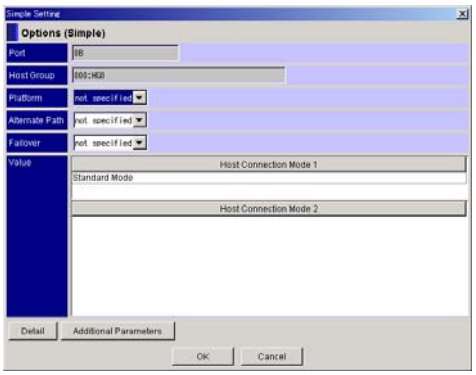
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))



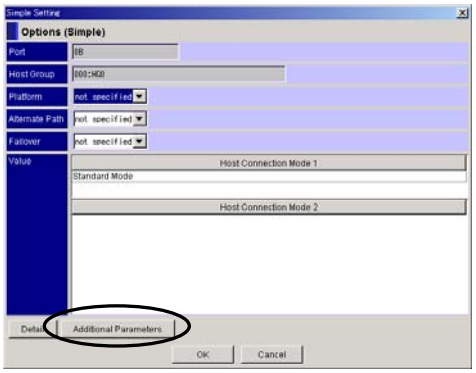
(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.

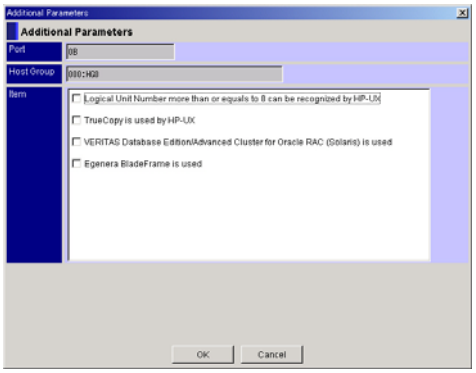


(e) Display the [000: G000] by double clicking the [Port XX] for which you want to set the mode for connecting a host after double clicking the [Host Groups].
Display the option and logical unit by double clicking the [000: G000], and then click the [Options].



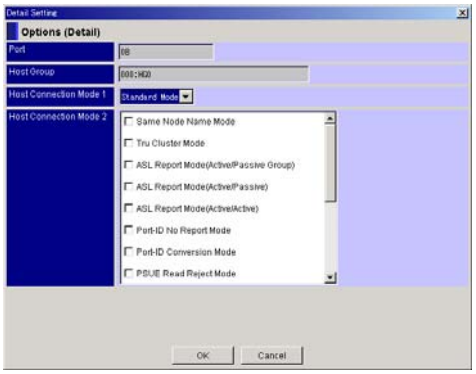
Copyright © 2006, Hitachi, Ltd.

(f) Click the [Simple Setting] button that is displayed at the lower right part of the window.



(g) "Option (Simple)"Property window is opened.
Select [Platform], [Alternative Path], and [Failover] that conform to the environment of a host to be connected.

(h) Click the [Additional Parameters] button.



(i) The "Additional Parameters" window is opened. Select the [Item] as occasion demands and click the [OK] button.

Copyright © 2006, Hitachi, Ltd.

(j) Click the [Detail] button as occasion demands.

(k) Select [Host Connection Mode 1] and [Host Connection Mode 2] and click the [OK] button.

(l) Click the [OK] button in the "Option (Simple)" window.

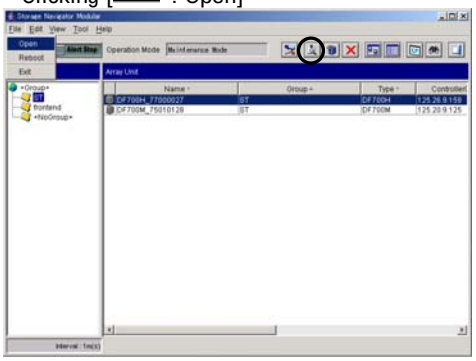
(m) The setting that has been made is displayed.

Make sure that the selected host environment (platform, alternate path, and failover) and the Additional Parameter are reflected in the display. Besides, when you have set the host connection mode 1 and 2 directly, make sure that the mode that has been set is reflected in the display.

(n) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

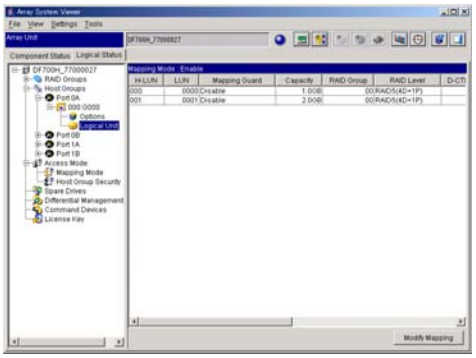
Copyright © 2006, Hitachi, Ltd.



(4) Setting the LU mapping

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).

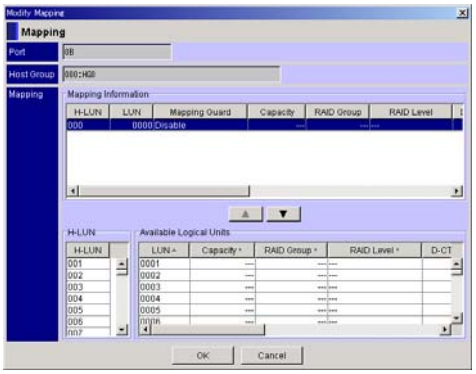
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))



(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

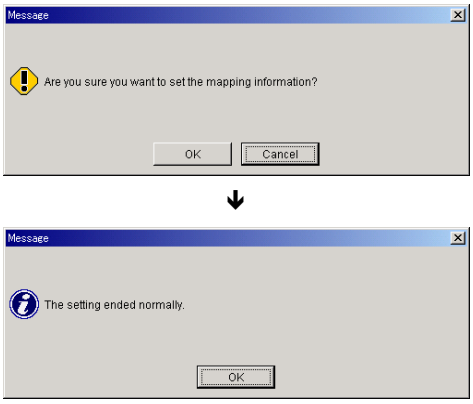
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.



(e) In the unit window, display [000: G000] by double clicking the [Port XX] to be specified after double clicking the [Host Groups].
Display the [Option] and [Logical Unit] by clicking the [000:G000], and then click the [Logical Unit].

(f) Click the [Modify Mapping] button that is displayed at the lower right part of the window.



Copyright © 2006, Hitachi, Ltd.

(g) Select one H-LUN from the [H-LUN] list of the mapping. Then select one LUN you want to map on the H-LUN from the list of the [Available Logical Units] and click the [▲] button.

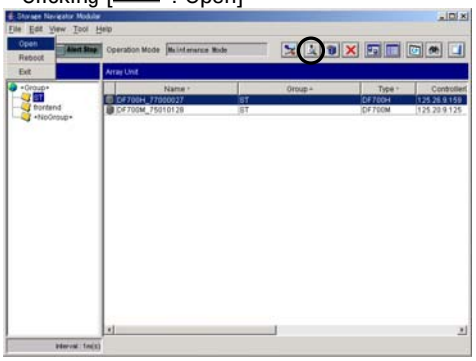
The H-LUN and LUN that were selected are moved to the [Mapping Information] list.
Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

(i) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

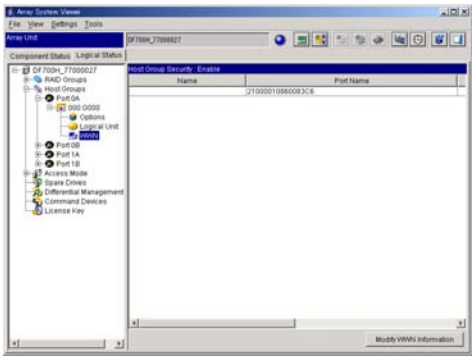
Copyright © 2006, Hitachi, Ltd.



(5) Setting the Host Group Security

(a) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.5 (2) Connecting the LAN cross cable0" (SMUP 03-0140).

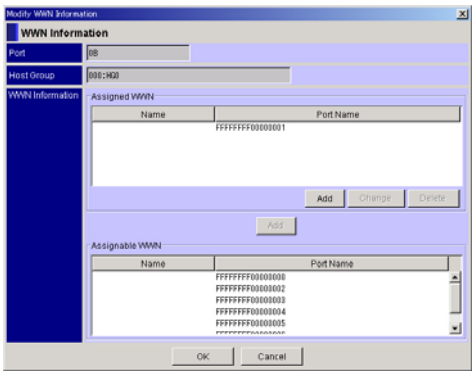
(b) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem" (SMUP 03-0150))



(c) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.

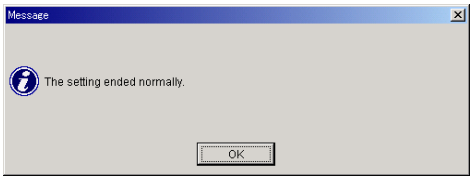
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(d) Click the [Logical Status] tab in the unit window.



(e) Double click the [Host Groups] in the tree, and then double click the port for which you have validated the host group security. Select [WWN] by clicking the [000:G000].

(f) Click the [Modify WWN Information] button that is displayed at the lower right part of the window.



Copyright © 2006, Hitachi, Ltd.

(g) Select WWN Information in the [Assignable WWN] list and select the [Add] button.
The WWN moves from the [Assignable WWN] list to the [Assigned WWN] list.
When the WWN to be assigned to a Host Group is not listed in the [Assignable WWN] list, input and add the WWN.

Click the [OK] button.

(h) The confirmation window is display. Click the [OK] button.

(i) Set the remaining ports in the same way.

NOTE : When two or more host groups are set using the LUN Manager of the priced option, set all the host groups in the same way.

Copyright © 2006, Hitachi, Ltd.

3.4.21 Changing the registration information for the monitoring failures

Change the device model name of the SNMP Agent Support Function from the RKH to the RKHE.

3.4.22 Works to be done after the upgrade is completed

When all the upgrade works are completed, do the works such as removal of the maintenance PC.
The procedure is shown below.

(1) Disconnect the maintenance PC from the disk array subsystem referring to the instruction given in Step "3.4.5 Connection of the maintenance PC" (SMUP 03-0130).
(2) Attach the Front Bezels to the RKH by executing the procedure "3.4.14 (5) Removing the Front Bezels" (SMUP 03-0650) in reverse order.

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

(3) Close the rear door referring to the instruction given in Step "3.4.14 (2) Open the Rear Door of U7 rack frame" (SMUP 03-0590).
Make sure that the rear door is latched and cannot be opened.

3.4.23 Resetting of the Host

Reboot the connecting Host and execute the setting.
For notes, refer to "5.1 For Setting Changes in Host Computer and Others" (SMUP 05-0000).

Copyright © 2006, Hitachi, Ltd.

3.4.24 Revalidation the TrueCopy remote replication/TrueCopy Extended Distance

This operation is not required when TrueCopy remote replication/TrueCopy Extended Distance is not used.

Perform the revalidation

For example, even when the remote disk array subsystem is upgraded as shown in Figure 3.4.64, the microprogram of the local disk array subsystem must be updated.

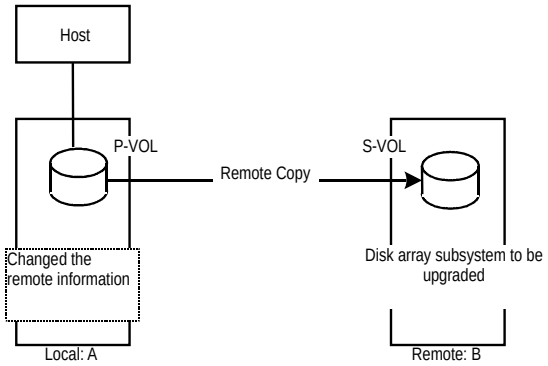


Figure 3.4.64 Change the Remote Information

The procedure is shown below.

(1) Connect the service PC to the other one of the two subsystems paired by TrueCopy remote replication/TrueCopy Extended Distance.

(2) Start Storage Navigator Modular and register the other one of the two subsystems paired by TrueCopy remote replication/TrueCopy Extended Distance.

(3) Changing settings of the disk array subsystem

It is required to change remote information of the disk array subsystem that has not been upgraded. Make the change as shown below.

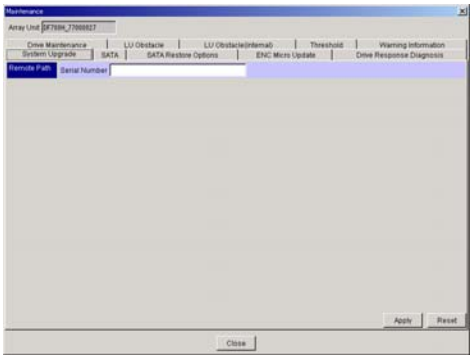
(a) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular.

(b) Set the operation mode of Storage Navigator Modular as Maintenance mode.

(c) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.

(d) Select [Tools] and [Maintenance] in this order in the unit window.

(e) Click the [System Upgrade] tab.

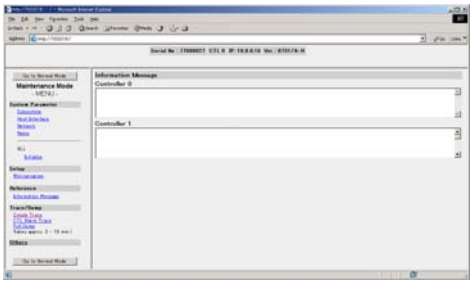


Take down notes of the displayed serial number in the following blank lines.

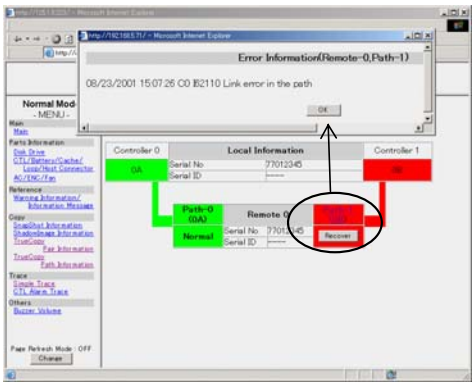
Serial Number: _____

Copyright © 2006, Hitachi, Ltd.

(e) Change the serial number.



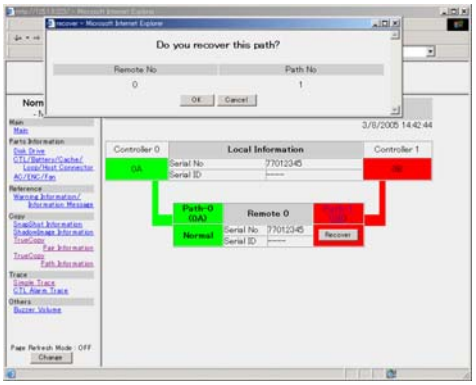
Enter the serial number of the disk array subsystem that has been upgraded.



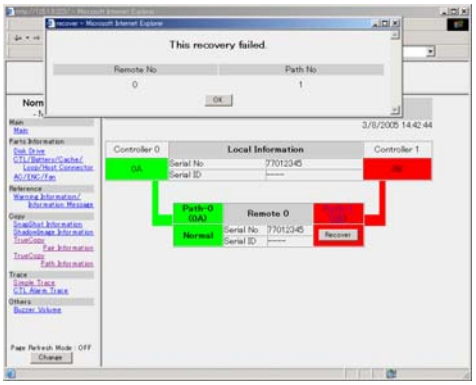
(4) Revalidate the path using the Web.

Perform the revalidation through the "TrueCopy Path Information" window.

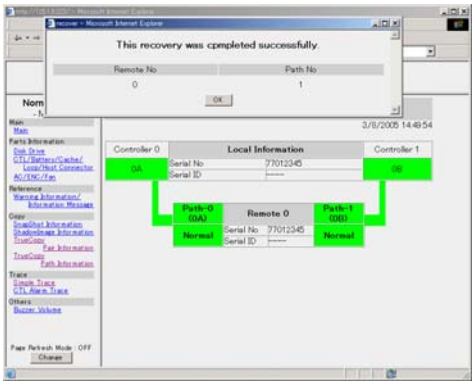
Screen 1: Image of the "Information Message" window



Screen 2: Image of the "Path Detachment Factors" window



Copyright © 2006, Hitachi, Ltd.



Screen 3: Image of the "Revalidation Instruction" window

Screen 4: Image of the "Revalidation Result" window (for the case where the operation terminated abnormally)

Screen 5: Image of the "Revalidation Result" window (for the case where the operation terminated normally)

Copyright © 2006, Hitachi, Ltd.

(5) Restart RAID Manager. Start the HORCM using the "horcmstart" command.
It is necessary to set an environmental variable (for TrueCopy) of the environment in which the command is executed. This example of the setting is premised on a configuration in which two instances in the same server (Windows NT®/Windows® 2000) use the same command device.

(a) Set an environmental variable that shows the each instance number. Enter the following via the command prompt window.

```
c:¥horcm¥etc>set HORCMINST=0
```

(b) Execute the horcm starting script, and then make sure of the configuration by executing the pairdisplay command.

```
c:¥horcm¥etc>horcmstart 0 1
starting HORCM inst 0
HORCM inst 0 starts successfully.
starting HORCM inst 1
HORCM inst 1 starts successfully.

Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)    (CL1-A , 1,  1)   174    1..P-VOL PSUS NEVER ,   175    2  -
vg01     oradb1(R)    (CL1-B , 1,  2)   175    2..S-VOL SSUS NEVER ,-----     1  -
```

A preparation for starting TrueCopy has been completed.

(6) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
The method for resynchronizing a TrueCopy remote replication/TrueCopy Extended Distance pair is explained below.

(a) Set the group name in the configuration definition file as "vg01".
Resynchronize a TrueCopy remote replication/TrueCopy Extended Distance pair, which has been split, using the pairresync command. When doing this, be sure to set the value of the -c option, which specifies the copy speed, as 15. Furthermore, make sure that the status of each volume becomes PAIR by executing the pairevtwait command.

```
c:¥horcm¥etc>pairresync –g vg01 –c 15
c:¥horcm¥etc>pairevtwait –g vg01 –s pair –t 300 10
pairevtwait : Wait status done.
```

Figure 3.4.65 Examples of Input and Output Results of Pairresync Command

(b) Make sure of the status and configuration of the resynchronized pair by executing the pairdisplay command.

```
c:¥horcm¥etc>pairdisplay -g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)    (CL1-A , 1,  1)   174    1..P-VOL PAIR NEVER , 174      2  -
vg01     oradb1(R)    (CL1-B , 2,  2)   175    2..S-VOL PAIR NEVER ,-----     1  -
```

The TrueCopy remote replication/TrueCopy Extended Distance pair has been resynchronize.
For details of the pairsplit command and its options, refer to Chapter 4 in the "RAID Manager System Administrator's Guide (Hitachi TagmaStore® AMS Series)".

Chapter 4. Trouble Shooting

4.1 Error Messages

4.1.1 Flash detected messages

Message code	Message text	Description	Collect the error			Recovery measures
			Simple Trace	CTL Trace	Full Dump	
RB0G00	Initial setup of microprogram failed	It tried to install the microprogram newly although the installation guard of the microprogram was set to “Disable”.	Gather			① Perform the update installation of the microprogram of the lower grade model.
RBE900	Upgrade failed [the installed microprogram is incorrect]	The upgrade failed because the microprogram, installation of which was attempted, was incorrect.	Gather			① Select the unified version directory, whose version is a unified version same as that of the microprogram of the lower grade model, and install the microprogram in the subsystem of the higher grade model for the purpose of update.
RBEA00	Downgrade failed [the installed microprogram is incorrect]	The downgrade failed because the microprogram, installation of which was attempted, was incorrect.	Gather			① Select the unified version directory, whose version is a unified version same as that of the microprogram of the higher grade model already installed, and install the microprogram in the subsystem of the higher grade model for the purpose of update.

4.1.2 Failure messages

Message code	Message text	Description	Collect the error			Recovery measures
			Simple Trace	CTL Trace	Full Dump	
HH13B0	System change failed [PIN]	The upgrade cannot be made because the system change has not been made normally and a pinned segment exists.		Gather		① Return the Disk Drives to the lower grade model, restart the subsystem, clear the pinned segment, and then make the upgrade again.
HH13B1	System change failed [PSOFF]	The upgrade cannot be made because the system change has not been made normally.		Gather		① Return the Disk Drives to the lower grade model, restart the subsystem, execute the deliberate shutdown, and then make the upgrade again.
HH2B00	Upgrade failed [PSOFF]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the deliberate shutdown had not been executed.	Gather			① Set the downgrade check as Disable, and then install the lower grade model microprogram to update it. ② After the updating installation is completed, turn off the AC Power Unit Switches of all the disk array units and return the hardware configuration of the disk array unit concerned to that of the lower grade model. ③ Turn on the AC Power Unit Switches of all the disk array units and execute the deliberate shutdown after the disk array units become ready. ④ Make the upgrade from the lower grade model to the higher grade model again.
HH2C00	Upgrade failed [Single]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the System Startup Attribute was set as the Single mode.	Gather			① Do the upgrading installation of the microprogram for the lower grade model after disabling the installation guard. ② Power off the subsystem after the updating installation is completed. ③ Return the hardware configuration to that of the lower grade model. ④ Change the mode to the Maintenance mode after booting the subsystem while it is the lower grade model. ⑤ Execute the “Go to Normal Mode” after setting the “System Setup Attribute” as the “Dual Active Mode”. ⑥ Boot the subsystem. ⑦ Execute the procedure for the upgrade from the lower grade model to the higher grade model.
HH2D00	Upgrade failed [microprogram revision]	When upgrade from the lower grade model to the higher grade model was attempted, it failed because the microprogram revisions of the lower grade model and higher grade model were not the same.	Gather			① Install the higher grade model microproram revision, which is the same as the lower grade model microprogram revision in the drive.

Copyright © 2006, Hitachi, Ltd.

Message code	Message text	Description	Collect the error			Recovery measures
			Simple Trace	CTL Trace	Full Dump	
HH2F00	Downgrade failed [Subsystem can not take over the user data]	The subsystem start-up of the lower model failed because it tried to downgrade from the upper model to the lower model.	Gather			① Execute the initial setup to the subsystem that is the hardware configuration of the lower model, and start up the subsystem when operating the subsystem as a lower model. ② Turn on all the AC input power supply switches of the subsystem after returning the hardware configuration of the subsystem to the status that is upgraded to the upper model, and start up the subsystem of the upper model when operating the subsystem as an upper model.
HZ0300	Not enough Cache memory to use QuickShadow function	The capacity of the cache memory is not sufficient to use the Copy-on write SnapShot function.		Gather		① Increase the cache memory capacity to 2 Gbytes per controller.
HZ0S00	Not enough Cache memory to use Cache Partition Manager	The Cache capacity to use Cache Partition Manager was insufficient due to the upgrade of the model.	Gather			① Add the Cache memory in the capacity to be able to upgrade the model.

Copyright © 2006, Hitachi, Ltd.

4.1.3 WEB error messages

Message code	Message text	Description	Recovery measures
—	Abnormal End Empty System Retry Full Install	The updating installation of the microprogram cannot be done because the old microprogram does not exist in the system disk drive.	① In the case where this message is displayed when the microprogram is installed in the subsystem of the higher grade model for the purpose of update during the upgrade from the lower grade model to the higher grade model, take recovery actions according to Section "4.2 When Abnormal End Empty System Retry Full Install occurs" (SUP 04-0050). ② When it is evident that the old microprogram does not exist in the system disk drive, install the microprogram newly. ③ When this message is displayed in a case other than the case ① or ②, execute the updating installation again after making sure that the system copy has been completed through the Information Message of the Web. In either of the following cases, the system copy has been completed. • "I140xy (or I140HH) System copy started" is not displayed. • "I140xy (or I140HH) System copy started" and "I141xy (or I141HH) System copy completed" are displayed consecutively. When the system copy is being made, turn off the main switch and then turn it on again later than 20 seconds. In the following case, the system copy is being made. (refer to Maintenance Manual Installation "1.7.2 Subsystem power off (Sequential shutdown)" (INST 01-0310), Maintenance Manual Installation "1.7.1 Subsystem power on" (INST 01-0290).) • While "I140xy (or I140HH) System copy started" is displayed, "I141xy (or I141HH) System copy completed" is not displayed successively. Execute the updating installation again after making sure that the RDY LED (green) comes on and then the system copy is completed.
1204	A specified file doesn't exist. Confirm elements of designation.	The specified file does not exist.	① Make sure that the path to the directory of the microprogram to be installed is specified correctly.
—	Abnormal End Down Grade Check NG	Though a version down of the microprogram was attempted, the updating installation terminated abnormally because the Down Grade Check was not disabled.	① Change the mode of the Down Grade Check to Disable. (Refer to "4.4.2 Procedure for removing downgrade check" (SMUP 04-0180)) Then execute the updating installation again.

4.1.5 Other messages

When a message other than the above is displayed, be sure to check the configuration first. Check whether the Disk Drive locations are correct, whether the settings of the Device ID is correct, whether the cable connections are correct, and so on following the procedure.
To check the Disk Drive locations, refer to Section "4.3 When a Disk Drive was inserted in a wrong location" (SMUP 04-0130).

Example)

- RA7900 System HDU spin up failed:
  Spin-up of the system drive failed.
- HE05HH Backend down [Unit# ERR] (Unit-01):
  The back end was blocked : Abnormality was detected in the connection order of the array subsystem, the setting of the device ID, or the setting of the subsystem identification switch.
- HH1Q00 SES error inf. [SES-HDU error]:
  The Control Unit was detached because both of the two SES drives could not access the ENC.
- W080xy Loop alarm (Path-x, Loop-y):
  Since the Fibre Channel loop failed, the operation is continued with the alternative loop.

When one of the following messages is displayed, there may be a mistake in the Disk Drive location, the Device ID, or some other matter. Check if the configuration is correct.

When a problem is found in the configuration related to the upgrade, correct the configuration. When no problem is found in the configuration and the operation, take some recovery action referring to the Maintenance Manual.

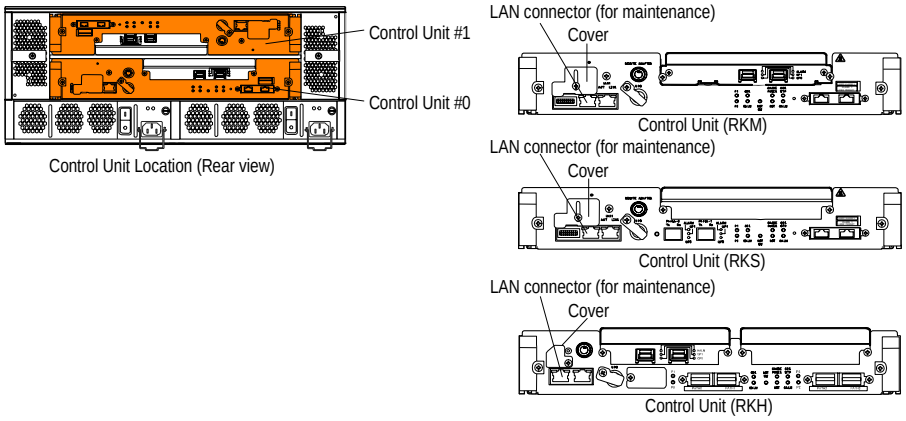
Copyright © 2006, Hitachi, Ltd.

4.1.6 Collecting CTL Alarm Trace

Through the CTL Alarm Trace collection, detailed information (the CTL Alarm Trace) on the immediately previous Controller blockage stored in the Controller is collected.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

Since the above-mentioned CTL Alarm Trace information is taken over from the blocked Control Unit to the replaced Control Unit, it can be collected after the Control Unit is recovered from the failure. If the Control Unit is blocked while collecting the CTL Alarm Trace may not be collected normally. Therefore, in this case, collect the CTL Alarm Trace again.



The method of collecting the CTL Alarm Trace is shown below.

(1) Before collecting the CTL Alarm Trace

(a) Items to be prepared

The CTL Alarm Trace is collected in the normal mode or the maintenance mode of the WEB. For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary. For collecting the CTL ALARM TRACE, disk space of 40 M bytes per one Control Unit is required. (20 M bytes for temporary data and 20 M bytes for Full Dump data)

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN cross cable.

*1 : The Interface Board is installed on interface #0 sides for RKH.
Please install the dummy on interface #1 side.

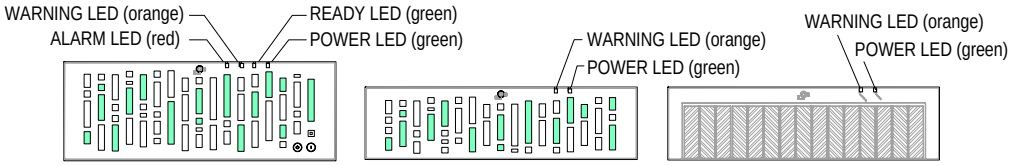


Figure 4.1.1 LAN Connector Position

(c) Collect the CTL Alarm Trace information from each Control Unit.

Save the files collected from different controllers into different directories or put different names to them so that you will see from which controller they were collected.

Copyright © 2006, Hitachi, Ltd.

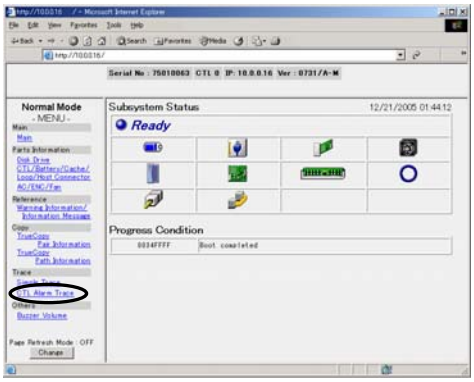
(d) Make sure that the WARNING LED (orange) on the Front Bezel of RKM/RKS is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

(a) Rackmount model of RKS/RKM/RKH (b) Rackmount model of RKAJ/RKAJAT (c) Rackmount model of RKA

Figure 4.1.2 Indication Locations and Names of LED (Front Bezel)

(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.

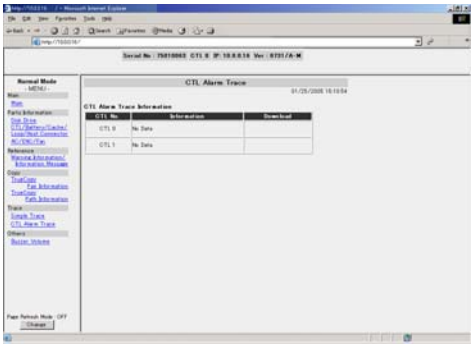
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.



Copyright © 2006, Hitachi, Ltd.

(2) Procedure for collecting a CTL Alarm Trace

(a) Enter the IP address of the LAN connector for maintenance, to which the maintenance PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button.



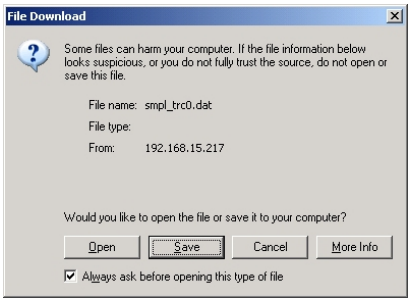
(b) Collect the memory dump according to the WEB and the following procedure.
Click “CTL Alarm Trace” in the menu frame of “Trace”.

Copyright © 2006, Hitachi, Ltd.

If CTL Alarm Trace exists, the CTL Alarm Trace information window is displayed.

Description of information

"Not Ready" ····· Indicates the situation where the trace area is not established in the device.

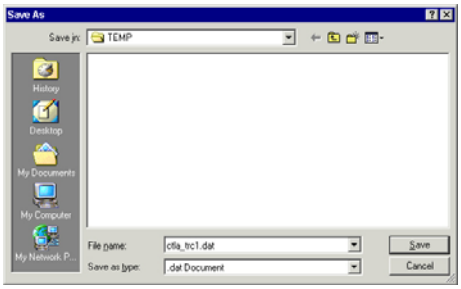


"No Data" ····· CTL Alarm Trace information does not exist or while information is being created.

"MM/DD/20YY hh:mm:ss" ····· CTL Alarm Trace information exists.

NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL Alarm Trace may not be collected normally. Therefore, collect the Simple Trace.
If Simple Trace cannot be obtained through detached Control Unit, connect the Maintenance PC to the Control Unit at the opposite side, and collect the Simple Trace.

(c) Press the "Download" button on the Control Unit side to be collected in "CTL Alarm Trace information".(‡1)



(d) The following dialog is displayed. Click the [Save] button.

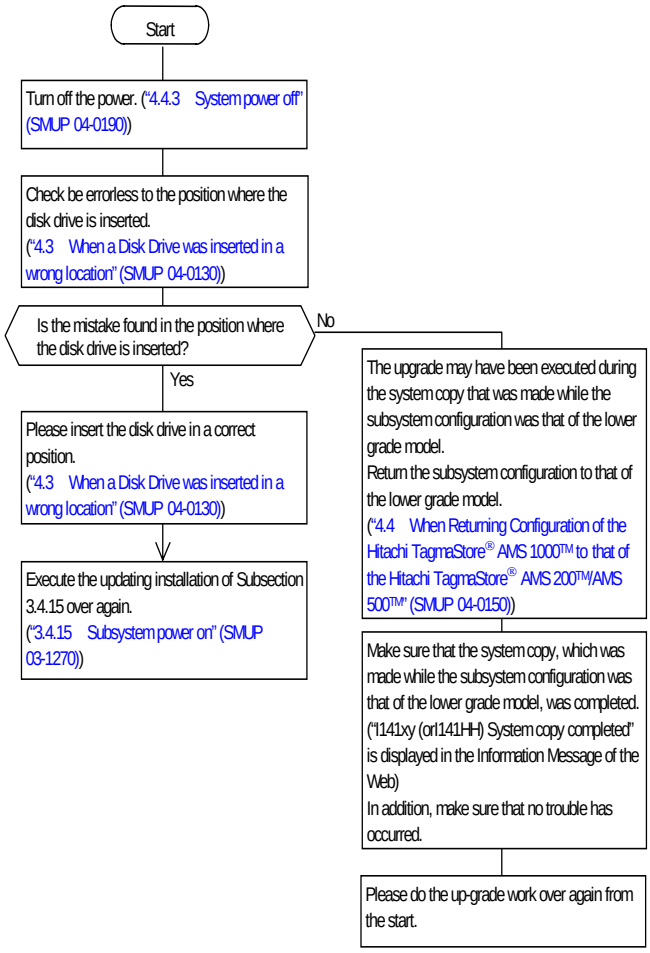
‡1 : An error message may be displayed. If it is displayed, click [OK], and collect the CTL Alarm Trace again after waiting for a while.

Copyright © 2006, Hitachi, Ltd.

(e) Select the place to save the file and file name (Default file name: ctla_trc0.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed. When the down-loading completes, the progress indicating message window is closed.

In this procedure is collected by WEB Normal mode. Similarly, CTL Alarm Trace can be collected by WEB Maintenance mode through Menu Frame.



‡1 : There may be a case where the default file name is given as “ctla_trc0.dat.dat” depending on the setting of the PC. In this case, reset the file name to “ctla_trc0.dat” or any other name.

Copyright © 2006, Hitachi, Ltd.

4.2 When Abnormal End Empty System Retry Full Install occurs

The procedure for troubleshooting and actions to be taken when the Abnormal End Empty System Retry Full Install occurs are shown below.

Make a recovery from the failure following the procedure for troubleshooting.

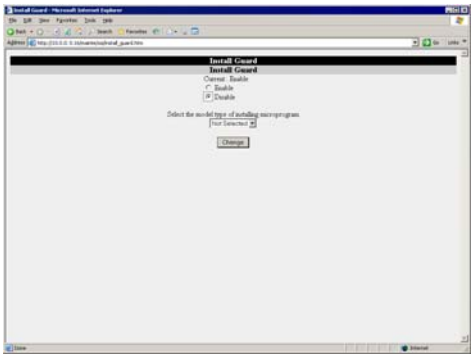
4.4 When Returning Configuration of the Hitachi TagmaStore® AMS 1000™ to that of the Hitachi TagmaStore® AMS 200™/AMS 500™

The procedure to be used in case the upgrade fails is explained below. In the procedure, the upgrade is made again after the configuration of the disk array subsystem is returned to that of the Hitachi TagmaStore® AMS 200™/AMS 500™ once.

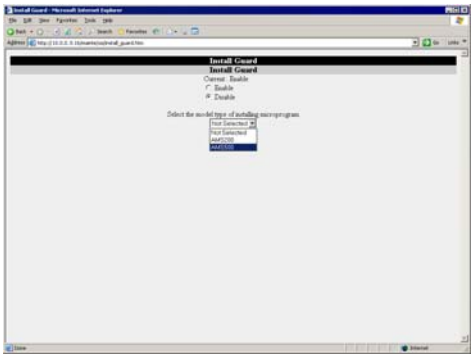
NOTE : The configuration of the disk array subsystem cannot be returned to that of the Hitachi TagmaStore® AMS 200™/AMS 500™ after the updating installation of the microprogram for the Hitachi TagmaStore® AMS 1000™ is executed according to the procedure described in Subsection "3.4.16 Updating installation of microprogram for Hitachi TagmaStore® AMS 1000™" (SMUP 03-1290) and the subsystem enters the READY status.

NOTE : Be sure to review all the settings and operations that have been made before making the upgrade again.



Copyright © 2006, Hitachi, Ltd.

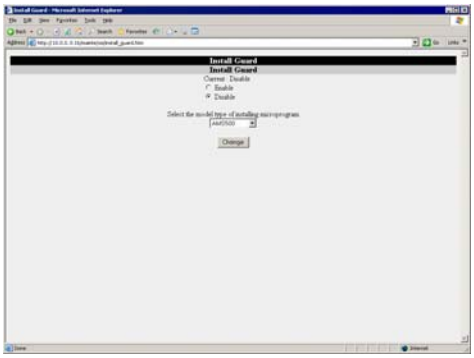
4.4.1 Procedure for removing guard check against installation of the microprogram for the Hitachi TagmaStore® AMS 200™/AMS 500™



The procedure for removing the microprogram installation guard check is shown below.

(1) Enter "http://(IP address of the disk array subsystem)/instlgrd" in the [Address].
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input "maintenance" for the [User Name] and "hosyu9500" for the [Password].

(2) Select the "Disable".



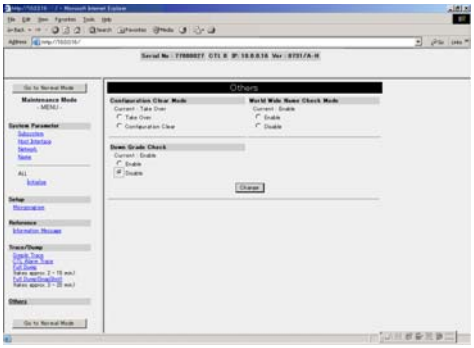
(3) Select the subsystem that tries to be returned from the Hitachi TagmaStore® AMS 1000™ , and click the [Change] button.

Copyright © 2006, Hitachi, Ltd.

The microprogram installation guard check was removed.

Copyright © 2006, Hitachi, Ltd.

4.4.2 Procedure for removing downgrade check



The procedure for removing the downgrade check is shown below.

(1) Set the operation mode in the Maintenance Mode. (“3.4.6 Changing mode of Storage Navigator Modular and registering disk array subsystem” (SMUP 03-0150))

(2) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (“3.4.5 Connection of the maintenance PC” (SMUP 03-0130))
A [User Name] and a [Password] may be requested at the time of WEB connection or WEB operation. In that case, input “maintenance” for the [User Name] and “hosyu9500” for the [Password].

(3) Click [Others] in the menu tree.

(4) Select the [Disable] radio button of the [Down Grade Check].
Click the [Change] button.

Copyright © 2006, Hitachi, Ltd.

4.4.3 System power off

Because a message, "Download Failed" is displayed and the disk array subsystem is in the Alarm status, the RKAJ/RKAJAT/RKA cannot be powered off although the main switch on the front side of the RKH is turned off. The power of the RKAJ/RKAJAT/RKA must be turned off by the other means.

(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the Front Bezel is off.
(3) Turn off the AC Power Unit Switches of the AC/DC power supplies installed in the RKH and all the RKAJ/RKAJAT/RKAs.
(4) Turn off the battery switch of the Battery Unit on the front side of the disk array subsystem.
(5) All turn off the circuit breaker of the PDB.

Copyright © 2006, Hitachi, Ltd.

4.5 Procedure for Recovery from Path Detachment and PSUE Status Occur during Upgrade Made when TrueCopy remote replication/TrueCopy Extended Distance is Enabled

The procedure for recovery, which is to be used when the pair status is changed to PSUE during the upgrade made when TrueCopy remote replication/TrueCopy Extended Distance is enabled, is explained below.
The recovery procedure varies depending on which configuration, the Hitachi TagmaStore® AMS 1000™ or the Hitachi TagmaStore® AMS 200™/AMS 500™ , the disk array subsystem has when the PSUE status occurs.

4.5.1 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 200™/AMS 500™

When a path detachment and the PSUE status occur in the case where the disk array subsystem is configured as the Hitachi TagmaStore® AMS 200™/AMS 500™ , make a recovery from the PSUE status first, split the pair again, and then make the ordinary upgrade.
The procedure for resynchronizing a TrueCopy remote replication/TrueCopy Extended Distance pair is shown below. The resynchronization must be done using the pairresync command issued by RAID Manager.

(1) Restart RAID Manager. Start the HORCM using the "horcmstart" command.
(2) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
(3) Splitting a pair
Split a pair by executing the pairsplit command and make sure that pair status has been changed to PSUS/SSUS.
(4) Return to the ordinary upgrade operation.
Revalidate the path when necessary, return to the ordinary upgrade, and make the operations over again from the step in which the PSUE status occurred.

Copyright © 2006, Hitachi, Ltd.

4.5.2 When path detachment and PSUE status occur in the case where disk array subsystem is configured as the Hitachi TagmaStore® AMS 1000™

When a path detachment and the PSUE status occur in the case where the disk array subsystem is configured as the Hitachi TagmaStore® AMS 1000™ , a wrong setting may have been made in the operation that has been made according to Item "3.4.24 (3) Changing settings of the disk array subsystem" (SMUP 03-1560).
The recovery procedure is explained below.

(1) Checking/changing settings of the disk array subsystem
Check the remote information of the disk array subsystem that has not been upgraded.
(a) Connect the maintenance PC to the disk array subsystem and start Storage Navigator Modular.
(b) Set the operation mode of Storage Navigator Modular as Maintenance mode.
(c) Double click the icon of the disk array subsystem to be operated in the main window and display the unit window.
(d) Select [Tools] and [Maintenance] in this order in the unit window.
(e) Click the [System Upgrade] tab.
Verification of the displayed serial number.
If an error is found, enter the value of the disk array subsystem that has been upgraded.

If the information setting has been made for a disk array subsystem belonging to another pair by mistake, return the status of the subsystem taken for a target subsystem as it was before by setting the serial number that were noted down in Step "3.4.24 (3) Changing settings of the disk array subsystem" (SMUP 03-1560) and by revalidating the path. Then make the settings for the target disk array subsystem.

(2) Revalidate the path using the WEB.
(3) Restart RAID Manager. Start the HORCM using the “horcmstart” command.
(4) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
(5) Make sure that recovery from the path detachment and the PSUE status has been made referring to the "Information MSG" window of the WEB.

Chapter 5. Appendix

5.1 For Setting Changes in Host Computer and Others

When upgraded from Hitachi TagmaStore® AMS 200™/AMS 500™ to Hitachi TagmaStore® AMS 1000™, the Disk Array subsystem shows the following changes.

No.	Name of Items	Hitachi TagmaStore® AMS 200™	Hitachi TagmaStore® AMS 500™	Hitachi TagmaStore® AMS 1000™	Existence of Limits
1	Subsystem Product Serial Number	730xxxxx	750xxxxx	770xxxxx	The following contents may be changed depending on the subsystem product serial number changes. As occasion demands, the changing operation for upper host device information or various application setting may be needed. ・World Wide Name ・Product Serial Number of Inquiry
2	World Wide Name	-	-	-	By registering the subsystem product serial number to Hitachi TagmaStore® AMS 1000™ in the Subsystem Maintenance Mode and rebooting the subsystem, WWN on Front End Fibre Channel is changed to the different value from Hitachi TagmaStore® AMS 200™/AMS 500™ after Hitachi TagmaStore® AMS 1000™ Ready, Front End Fibre Channel can be used, and the LU recognition from the upper Host enables.
3	Target iSCSI Name	-	-	Same value with the lower model	When the Hitachi TagmaStore® AMS 200™/AMS 500™ to be upgraded is the system configuration of the iSCSI interface, the Target iSCSI Name of the Hitachi TagmaStore® AMS 1000™ succeeds the value before the upgrade. However, when the default iSCSI Name of the Target was used in the array subsystem before the upgrade, it is required to change the Target iSCSI Name of the Hitachi TagmaStore® AMS 1000™ to a unique value in the network. If the Hitachi TagmaStore® AMS 1000™ is used without changing the Target iSCSI Name and when the array subsystem before the upgrade is configured with the system of the iSCSI interface again after using the Hitachi TagmaStore® AMS 1000™ , the iSCSI Name of both array subsystems is duplicated in the network, and trouble is caused to the iSCSI protocol.
4	Inquiry	730xxxxx	750xxxxx	770xxxxx	Product Serial Number After upgrading from Hitachi TagmaStore® AMS 200™/AMS 500™ to Hitachi TagmaStore® AMS 1000™, Hitachi TagmaStore® AMS 1000™ responds to 770xxxxx.

(1) When the Disk Array subsystem is the system configuration of the iSCSI interface
You will set new iSCSI name for all targets of the Hitachi TagmaStore® AMS 1000™.
And you will follow proper setting procedures to set the information of CHAP authentication, Two-way autentication and digest with new target iSCSI name on the host computer if needed.
Then you will login to the target of Hitachi TagmaStore® AMS 1000™ with new target iSCSI name which you set in the upgrade.
The host computer may continue to execute login process to the target of old iSCSI name if the target iSCSI name or the IP address for the iSCSI interface of Hitachi TagmaStore® AMS 1000™ are changed.
If it happens, you will logout from the target of old iSCSI name.

Copyright © 2006, Hitachi, Ltd.

(2) When the Disk Array subsystem is the system configuration of the Fibre Channel interface

The device file name changes due to World Wide Name or iSCSI Name change. Following the change, OS reconstruction is needed.
The setting review is also needed in the application software using the device file name.

If you use the WWN/iSCSI Name binding in the Driver setting file, it is necessary to change the setting. And the Host needs rebooting after the setting change.

When Fabric Switch is used and WWN executes zoning, it is necessary to execute the zoning setting review since WWN is changed.

The upgrading operation from Hitachi TagmaStore® AMS 200™/AMS 500™ to Hitachi TagmaStore® AMS 1000™ is new device addition image for OS. However, as different from the ordinary new device addition, the user's data is maintained when installed. Therefore, great care is needed for setting the Host computer and peripherals.

For each platform, the points of which special care is needed are shown below.

- When HP-UX is used.
  It is necessary to export the Volume Group before upgrading and import the Volume Group after upgrading.
  When MC/service guard is used, it is necessary to suspend the MC/service guard before upgrading and reboot the MC/service guard after upgrading.
- When AIX + HDLM is used.
  It is necessary to export the Volume Group before upgrading and note the disk property such as queue depth for the physical disk and the HDLM device. It is also necessary to import the Volume Group after remaking the HDLM device when the upgrade is completed.

Deleted: que

Examples of the HDLM device file remake

① deletion of the HDLM device file	# rmdev
② reset of the device configuration information	# chdev
③ remake of the HDLM device file	# dlmcfgmgr

Copyright © 2006, Hitachi, Ltd.

- When Solaris + VxVM is used.
  It is necessary to boot the Host with option "r" after upgrading and boot VxVM.

  NOTE : • When HBA: Sun genuine, rebooting is necessary since the driver setting is changed at the time of the device recognition.
  • When SunCluster is used, it is necessary to exclude the wide area device from the definition (excluding "quorum device" in the wide area device from the definition). The correspondence between the disk ID instance number in the wide area device and the disk device (cXtYdZ) is also changed due to the LU serial number change after upgrading. Therefore, check the correspondence between the disk ID instance number and the local and remote path. If the correspondence is illegal, it is necessary to redefine. Then, redefine the wide area device as SunCluster (redefine quorum device from the optional wide area device).

- When IRIX is used.
  It is necessary to execute the device recognition and mapping file making again after upgrading and reboot the Host.

- When Windows®-related system is used.
  Rebooting is necessary after upgrading.

- When Linux + VxVM is used.
  It is necessary to deport the Disk Group before upgrading and import the Disk Group after upgrading.

- When Tru64 is used.
  For UFS: It is necessary to mount with the new device.
  For AdvFS: It is necessary to link again with the new device as the registered device.

① device recognition check	# scu show edt
② device file check	# hwmgr –view devices
③ transfer to domain directory	# cd /etc/fdmns/[domain name]
④ domain directory contents check	# ls
⑤ allocation to domain directory	# ln –fs /dev/disk/dskzzzc dskxxxc

  Registered device
  New device file name

  For LSM, the data must be restored at the time of the LSM configuration since the disk group cannot be imported.

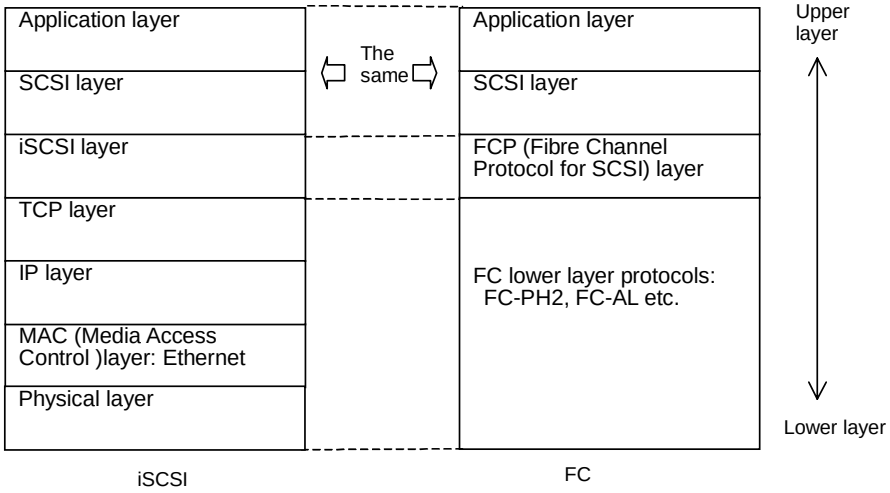
1 Overview of iSCSI

This chapter includes the following information:

1.1	What is iSCSI?
1.2	DF700 iSCSI
1.3	System Configuration Example



1.1 What is iSCSI?

1.1.1 What is iSCSI?

iSCSI1 (Internet SCSI) is a protocol for sending and receiving a SCSI2 command via an IP network, and it can transfer data in units of block.

The inexpensive IP-SAN (IP-Storage Area Network) that uses the existing or ready-made network equipments can be constructed and operated by using the iSCSI. For application software of a host, a disk array communicated with iSCSI is the same as an internal disk drive and is the same as a disk array communicated with FC (Fibre Channel) in terms of using SCSI command for accessing storage (Figure 1.1). Therefore iSCSI is applicable with existing software property used. Further, illegal access from a host to the storage can be prevented by using the CHAP3 authentication.

Figure 1.1 Protocol Stack of iSCSI and FC

1 iSCSI was standardized by IETF (Internet Engineering Task force) as RFC3720, in 2003 (http://www.ietf.org/rfc/rfc3720.txt).
2 Small Computer Systems Interface
3 Challenge Handshake Authentication Protocol

1.1.2 Characteristics of iSCSI

iSCSI can be introduced to a host at a low cost by using software initiator (Microsoft® iSCSI Software Initiator4, etc.) and NIC5. Furthermore the disk array can be connected lots of hosts at a low cost, by using existing IP network equipments.

Table 1.1 lists Comparison of iSCSI with FC

Table 1.1 Comparison of iSCSI with FC

No.	Item	iSCSI	Fibre Channel
1	Utilizing IP network	With iSCSI, it is able to utilize IP network constructed by Gigabit Ethernet.	To utilize IP network, protocol converters that converts FC and IP are needed. (iFCP or FCIP6)
2	Packet/frame loss on a communication link	The loss may occur by TCP control, but the TCP retransmission recovers the lost packet.	The frame loss does not occur except for the failure.
3	Data protection	CRC7 (Ethernet), check sum (TCP and IP), iSCSI Header/Data digest (optional)	CRC (FC-PH2)
4	Name Service (associating address and identifier)	As “Discovery” process in iSCSI layer. By using iSNS8, it is able to process discovery without knowing IP addresses of targets.	Switch (Fabric) processes automatically.

As a comparison of physical link of iSCSI and FC, Table 1.2 lists comparison of Gigabit Ethernet (1000BASE-T) with FC lower Protocol. In FC, fiber cable is major for host connection, whereas copper cable is used for connecting disk drives in a disk array.

Table 1.2 Comparison of Gigabit Ethernet (1000BASE-T) with FC lower Protocol

No.	Item	1000BASE-T (full duplex)	FC lower layer protocol
1	Cable	Category 5e9 or 6 (Copper)	Single/Multi Mode Fiber Optic cable
2	Connector type	RJ45	LC/SC
3	Transfer speed	Can communicate at a maximum of 1 Gbps per port.	Can communicate at a maximum of 4 Gbps per port by using the 4 Gbps Fibre Channel Interface Card.
4	Distance between direct attached nodes	Max 100 m	Max 10 km

4 Refer to Appendix B for installing Microsoft® iSCSI Software Initiator.

5 Network Interface Card. In this document, NIC includes not only the interface cards connected with PCI, PCI-X, or PCI-Express, but also network ports implemented on the mother board of the host.

6 Internet Fibre Channel Protocol, Fibre Channel over IP. They are technologies that communicates FC by way of IP.

7 Cyclic Redundancy Check.

8 Internet Storage Name Service. iSNS was standardized by IETF as RFC4171, in 2005 (http://www.ietf.org/rfc/rfc3720.txt).

9 Also called as Category 5 Enhanced or as Enhanced Category 5.

1.1.3 Points to Consider for designing IP-SAN

iSCSI makes it possible to construct IP-SAN by connecting many hosts and disk arrays at a low cost. On the other hand, loads of network and disk array will increase. When using iSCSI, it is required to design a system configuration that distributes the loads concentrated on the network, port, controller, and disk drive.

Followings are points to consider for designing IP-SAN. Though switches and NICs are the same to LAN (Local Area Network), points to consider are different, especially from the office LAN.

- iSCSI consumes almost all the bandwidth of Ethernet, whereas LAN is usually designed and constructed to consume a fraction of the band of Ethernet for communication. If IP-SAN is made to exist together to the office LAN, the cost to construct is low, but IP-SAN and office LAN mutually affects negatively.
  - iSCSI traffic disturbs LAN traffic.
  - Collisions among iSCSI traffic and LAN traffic occurs and packets will be lost. So iSCSI transfer performance will be decrease considerably.

  Thus, IP-SAN and office LAN strongly recommended to be separated.
- Packet loss will cause TCP congestion control and that will let iSCSI transfer performance slow down. Packet loss and congestion control is unavoidable at network, but to minimize the probability of them is effective to keep iSCSI performance. It is very important to minimize the probability of packet loss.
- Conditions of host accesses influence the performance of iSCSI traffic (actual amount of data transfer per second, response time, etc.). Moreover, the larger the number of initiator to an iSCSI resource (port, controller etc.) of a diskarray becomes, the lower the iSCSI performance viewed from each initiator will become.
- The market of network equipments is huge and various venders have entered there. As a result of the market competition, prices of network equipments are lower than those of FC equipments. The customer can apply such equipments to construct IP-SAN at a low cost. However the whole system's reliability depends on each equipment. So please decide the equipment to adopt carefully. IP-SAN should not use to the communication of mission-critical data.
- When high performance and high reliability are required for the system, to apply FC is recommended than to apply iSCSI.
- The failover path between host and DF700 iSCSI makes it possible to update the micro-program of DF700 iSCSI without stopping the system. Without such failover path, updating micro-program needs to stop the service of object controller.
- Using NIC for iSCSI communication, the NIC will handle not only iSCSI traffic but also non-iSCSI traffic as required OS or other services.

1.2 DF700 iSCSI

1.2.1 Characteristics of DF700 iSCSI

Installing iSCSI interface board (option), DF700 can communicate to host with iSCSI. That configuration is expressed as “DF700 iSCSI” in this document. Characteristics of DF700 iSCSI are as follows:

- DF700 iSCSI communicates through IP network constructed on Gigabit Ethernet.
- Applying LUN Manager (optional program), max 128 (255: the micro program version 0750/A or later) iSCSI targets (thereafter, simply written as “target”) can be defined under an iSCSI port. As LU mapping and host connection mode are configured per target, each host can access separate logical iSCSI storage (i.e. target). Thus it comes to be able to set LU configuration and access authentication flexibly.
- DF700 iSCSI authenticates a host (or a user of hosts) by setting the authorized user of the access and the Secret, and determines which user can access which target. Moreover, DF700 iSCSI can authenticate hosts for individual target of plural targets by using the LUN Manager together.
- Using both ports on a controller, the total performance does not reach twice the maximum performance of one port.
- Operation and management of the features not related iSCSI communication (e.g. RAID group, LU configuration etc.) are the same as FC communication to hosts.
- User management ports and maintenance ports, which communicate to Storage Navigator Modular, are the same as usual and do not support iSCSI. Those ports communicate with 10/100BASE-T.

1.2.2 Specifications of iSCSI

The specifications of DF700 iSCSI are shown in Table 1.3.

Table 1.3 DF700 iSCSI specifications

No.	Protocol layer	Item	DF700 iSCSI	Remark
1	General	iSCSI target function	Support	
2		iSCSI initiator function	Not Available	
3		iSCSI ports	2 iSCSI ports/controller (Max 4 iSCSI ports/disk array)	
4		Connecting hosts at a time	Max 128 (255: the micro program version 0750/A or later) hosts/iSCSI port	With Linux software initiator, the max number will be decrease. (See the notification of section 2.7)
5		Path failover	-	Not supporting Microsoft® MPIO (Multi Path IO)
6	Physical layer,	Link	1000BASE-T (full duplex)	Only 1000BASE-T (full duplex) is available to the directly connected port.
7	MAC layer	Transfer speed	1000 Mbps (full duplex)	
8		Connector type	RJ45	General type of LAN connector
9		Cable	Category 5e or 6 (Copper)	Please refer to the manual of the connected equipment to check which cable type should be used straight or cross10.
10		Network switch	L2 switch, L3 switch	Should be compliant to IEEE802.3ab (1000BASE-T (full duplex))
11		Switch cascading	Max 5	Minimum number of cascading is recommended.
12		MAC address	Per port (fixed value)	Factory setting: World Wide Unique value. Unchangeable.
13		Max Transfer Unit (MTU)	1500 bytes (Ethernet frame)	Unchangeable
14		Jumbo frame	Not Available	
15		Link aggregation	Not Available	
16		Tagged-VLAN	Not Available	Meanwhile port VLAN on a switch is available as long as it is transparent to DF700 iSCSI.
17	IP	IPv4	Support	
18		IPv6	Not Available	
19		Subnet mask	Support	
20		Gateway address	Support	
21		DHCP	Not Available	
22		DNS	Not Available	

10 To generic NIC, HBA and switch port, it is possible to connect with both straight cable and cross cable.

No.	Protocol layer	Item	DF700 iSCSI	Remark
23		Ping (ICMP ECHO) transmit/ receive	Support	See the notification of section 2.7.
24		IPsec11	Not Available	
25	iSCSI	TCP port number	3260	Changeable among 1-65,535, but be careful for changing: (1) the setting of the corresponding host should be also changed to login the new port number, (2) the new port number might conflict other network communication or be filtered on some network equipment. As results, there is a possibility that unable to communicate through the new port number.
26		iSCSI Name	Both iqn12 and eui13 type are supported	iqn value, which is World Wide Unique, is automatically set when a target is made. iSCSI Name is Configurable.
27		Error Recovery Level	0 (zero)	Error recovery by retrying from the host. Not supporting Level 1, 2
28		Header digest	Support	Detects header error or data error of iSCSI communication. DF700 iSCSI follows the setting of the host about the digest. When digest is enabled, the performance will degrade. (How much the performance will degrade depends of the performance of host, the transaction pattern, etc.)
29		Data digest	Support	
30		Max numbers of connections at a time	Max 128 (255: the micro program version 0750/A or later) connections/iSCSI port	
31		CHAP	Support	Authentication: the login request is sent from proper host, for the storage. CHAP does not supported in discovery session.
32		Mutual CHAP	Support (If connected to Linux software initiator, Not Available)	Authentication: the login request is sent to proper storage, for the host. Also referred to as two-way authentication.
33		CHAP User registration	Max 256 (512: the micro program version 0750/A or later) users/iSCSI port	
34		iSNS	Support	With iSNS (Name service), a host can discover a target even not knowing IP address of the target.

11 IP Security. Authentication and encryption of IP packets. DF700 iSCSI does not support IPsec.

12 iqn: iSCSI Qualified Name

The iqn consists of a type identifier, “iqn”, a date of domain acquisition, a domain name, and a character string given by a person who acquired the domain.
Example: iqn.1994-04.jp.co.hitachi:rsd.d7m.t.10020.1b000.Tar

13 eui: 64bit Extended Unique Identifier
The eui consists of a type identifier, “eui” and an ASCII coded hexadecimal EUI-64 identifier.
Example: eui.0123456789abcdef

1.2.3 Settings of DF700 iSCSI

The settings of DF700 iSCSI are shown in Table 1.4. The setting can be added, modified, or deleted by Storage Navigator Modular. When adding, modifying, or deleting the setting, it is not necessary to reboot the Disk Array subsystem. However configuring the setting when communicating to hosts will close related connections with hosts on the same controller.

Table 1.4 Settings of DF700 iSCSI

No.	Item	Details
1	Target	• iSCSI initiator in a host logs-in iSCSI target of DF700 iSCSI. • Target 0 (zero) is set as default. • Up to 128 (255: the micro program version 0750/A or later) targets can be set for each Port by purchasing the LUN Manager.
2	Setting/Deleting a target	• Purchasing the LUN Manager, targets 1 through 127 (1 through 254: the micro program version 0750/A or later) can be set or deleted. • Target 0 (zero) cannot be deleted. In order to delete iSCSI Name, options, and LU Mapping of target 0 (zero), initialize target 0 (zero).
3	Target alias	• It is required to set a target alias when the target is created. • The target alias can also be changed.
4	iSCSI Name	• Used for identifying initiators and targets. iSCSI Name need to have World Wide Unique value. • iqn and eui are supported. • iSCSI Name of a target is automatically set as a World Wide Unique when initializing the target. The value can be changed by purchasing the LUN Manager, however the customer need to assure the World Wide Uniqueness of the new iSCSI Name14.
5	iSCSI User Name	• Used for identifying an initiator itself or a user who use the initiator at the process of CHAP authentication. • Up to 256 (512: the micro program version 0750/A or later) iSCSI User Name accessing iSCSI targets, can be set for an iSCSI port. • The same iSCSI User Name cannot be set to the other target of the same port with another Secret.
6	iSNS	• If IP address of iSNS server is set, iSNS can be used for discovery.
7	Login Authentication	• None, CHAP is supported. None: always no authentication, CHAP: always CHAP authentication is executed, None, CHAP: Follows to the host setting. When the host also presents “None, CHAP” in login, CHAP authentication is executed. • Mutual authentication is supported
8	LU Mapping	• LU Mapping can be set per a target. • Up to 256 LU Mappings can be set for a target. Up to 256X128 (256X255: the micro program version 0750/A or later) LU Mappings can be set for a Port. (However the max number should not exceed the max number of LU per port.)

14 If new iSCSI Name is not World Wide Unique and overlapped to other one as a result, the communication will not be guaranteed.

No.	Item	Details
9	Concurrent use of LUN Manager	• Up to 128 (255: the micro program version 0750/A or later) targets can be set by using the LAN Manager together.

1.2.4 Requirements for using iSCSI

The requirements for using iSCSI are shown in Table1.5. See section 2.7 for construction and operation of IP-SAN.

Table 1.5 The requirements for using DF700 iSCSI

No.	Item	Conditions
1	Hardware	iSCSI interface board needs to be installed. When updating a host interface of DF700S, please confirm the manufacturing number of a basic chassis and contact your local Hitachi sales office. It is necessary to update the controller of DF700S according to its shipment time.
2	Means of making setting	Storage Navigator Modular of the version 3.00 or later, which corresponds to the micro program, is required. (For example, use Storage Navigator Modular of the version 5.00 when the micro program of the version 0750/A is installed.)
3	Micro program revision	For DF700XS, DF700S, and DF700M: micro code version 0730/B or higher is required. For DF700H: micro code version 0732/A or higher is required.
4	Concurrent use of other optional functions	TrueCopy remote replication cannot be used.
5	Network equipments	Switch, NIC and HBA that is directly connected with iSCSI port of DF700 should support IEEE 802.3ab (1000Base-T (full duplex)).
6	Network cable	Category 5e or Category 6 is required.
7	Host OS	Refer to the most recent product announcement or contact your local Hitachi sales office for supporting OS. Meanwhile operation under virtual OS environment is not supported.
8	Host NIC	iSCSI interface of Host should be either a network port on the motherboard or a NIC that is recommended by the vendor of the host.
9	ISNS	When using iSNS client function of DF700, Microsoft® iSNS Server 3.0 needs to be available on the same IP-SAN so as to be registered target information.

1.3 System Configuration Example

The Direct Attached and the Network Switch connection (Network Attached) are supported as the connection methods, and the IP-SAN using the Layer 2 network switch/Layer 3 network switch can be constructed.

Configured only 1 path in 1 port, it might take long time to recover for the cable tie changing the reconnecting at the failure. On the other hand, the configuration having redundant paths will make maintenance easy as the exchanging micro-program is possible while even the disk array is operating.

Section 1.3.1 shows examples of direct attached configuration and section 1.3.2 shows examples of network attached configuration. In each figure,

0A, 0B, 1A, 1B: iSCSI port of DF700 to communicate with hosts,

GbE: Gigabit Ethernet link,

L2 switch: Layer 2 network switch,

L3 switch: Layer 3 network switch,

Broken line: standby path.

Note: At a Configuration without redundant paths (like Figure 1.6), the recovery means at the failure is limited, and there is a risk that requires a lot of time to recover in no composition of tedium in communication path.

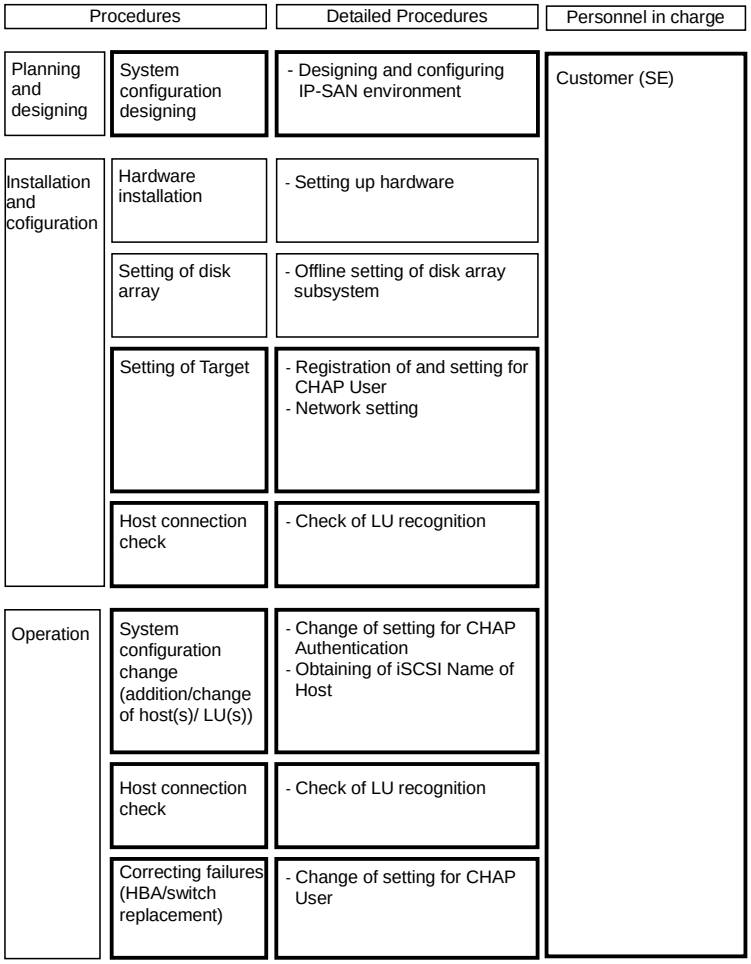
2 Configuring of iSCSI



This chapter explains procedures for configuring and using iSCSI. Actions to be taken when failures occur are also explained.

2.1	Overview
2.2	System Design
2.3	System Configuration
2.4	Test of Host Connection
2.5	Adding and Replacing Equipment
2.6	Multi-Interface Configuration
2.7	Notes in Construction and Operation of IP-SAN

2.1 Overview

The procedures required to install and use iSCSI are shown in Figure 2.1.

Figure 2.1 Flow of Operations Required for Using iSCSI

2.2 System Design

System design should consider each of the following.

2.2.1 Deciding the Number of Hosts, Storage Capacity and Bandwidth

- Deciding the number of hosts which communicate with the diskarray(s)

  The scale of IP-SAN will be influenced.

- Deciding the storage capacities that each host will access.

  If the total capacity is too much than DF700 can be accessed, more disk array will be needed. Thus the scale of IP-SAN will be influenced.

Note: DF700 iSCSI does not support the operation as network boot disk. Don't use DF700 iSCSI as a netboot device. Storage of User data will be appropriate.

- Estimating the bandwidth to be used by the hosts.

  Required bandwidth depends of the application software. In general, only for office application, such as document making and spreadsheet handling, a host need as more as average 5 MB/s bandwidth or so. However, if many access from hosts concentrate to a port, heavy load to the network and disk array will be caused. Thus, periodical accessing program (e.g. scanning of anti-virus software etc.) should be executed one by one at a time, in order to avoid the concentration of loads.

2.2.2 Confirm the Settings of Each Hosts

- Confirm the kind of OS

  Each host should have OS supported by DF700 iSCSI.

- Deciding the interface of the host

  Deciding which method is used in a host, ISCS HBA or NIC+ iSCSI software initiator. The performance of NIC+ iSCSI software initiator will be affected by the specifications of the host (CPU, memory size).

Table 2.1 The characteristics of the ways to iSCSI support

Interface	Cost	Load of host CPU
ISCSI HBA	iSCSI HBA is required. That costs much than NIC + software initiator collection.	Relatively low, as HBA offloads most protocol processing.
Controlling a NIC by iSCSI Software initiator driver	Network port already the server has on its mother board or NIC is required. Such cost is less than that of HBA.	Relatively high

2.2.3 Preventing Illegal Access

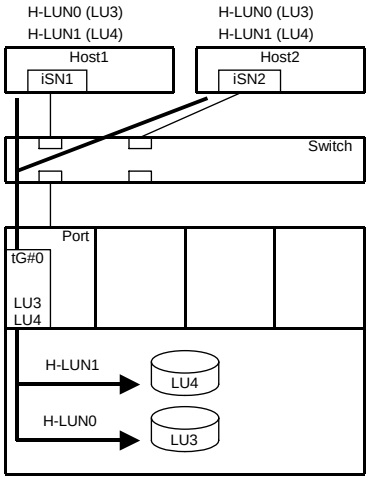
Decide to apply CHAP authentication, LUN Manager (option), or both in order to prevent illegal access. Moreover, to constitute IP-SAN completely isolated from external networks is effective.

- Closed IP-SAN

  In the point of view of security, it is effective to design IP-SAN completely isolated from the other external networks.

- CHAP authentication

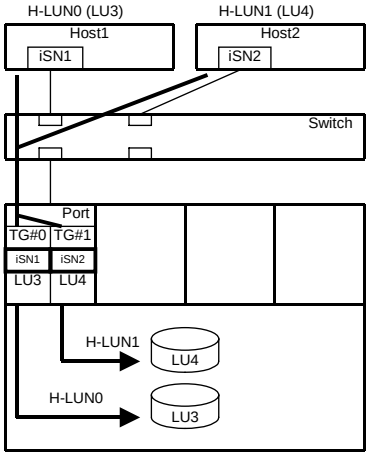
  The user is authenticated using the CHAP. It is required to register the CHAP user who is authorized of the connection and the Secret in the disk array subsystem.



- LUN Manager

  Determine input/output paths between hosts and LUs according to the assignment mode using LUN Manager. The input/output path is a route through which access from the host is permitted.

The user can be authenticated for each target by using the LUN Manager together. When connecting hosts and one port of the disk array subsystem using the network switch, a control to distinguish accessible host is required for each LU.



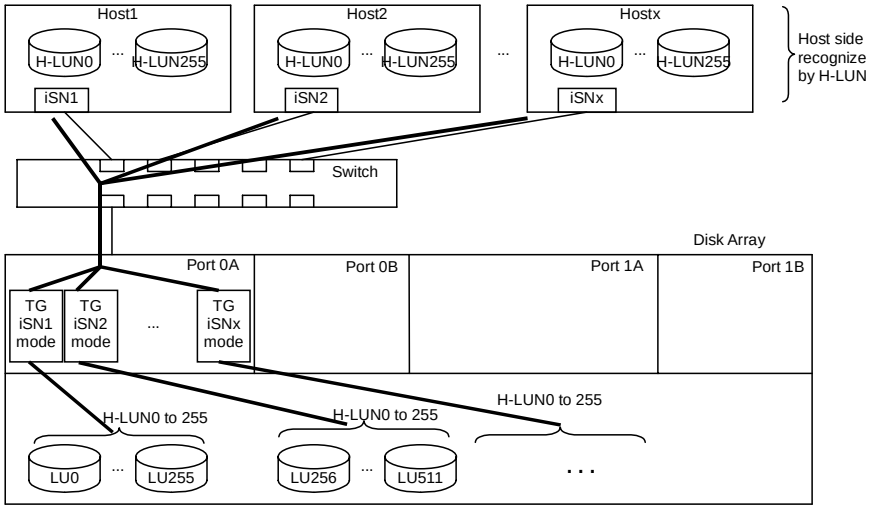
When assigning LU3 to Host 1 and LU4 to Host 2, both hosts can access the same LU if the LU mapping is set alone as shown in Figure 2.2. When LUN Manager and CHAP are used in this case, the host (iSCSI Name) access to each LU can be distinguished even in the same port as shown in Figure 2.3.

Figure 2.2 A Case Where Only LU Mapping is Set

(TG: Target, iSN: iSCSI Name)

Figure 2.3 A Case Where LUN Manager and CHAP Authentication is Used

(TG: Target, iSN: iSCSI Name)



2.2.4 Assigning Targets and LUs to Hosts

Groups of LU, for which certain hosts are allowed to access, are associated to a target by LU mapping. To apply CHAP authentication, the required configurations (username, Secret) can be set per target. Max 128 (255: the micro program version 0750/A or later) targets can be defined for an iSCSI port.

Up to 256 LU Mappings can be set for a target. The host recognizes LUN(s) in the range between H-LUN0 and H-LUN255. A Host computer will specify a target by iSCSI Name and will access LU that is mapped to the target. Figure 2.4 shows address setting, target setting and LUN mapping for an iSCSI port.

Up to 256 LU mapping ×128 (255: the micro program version 0750/A or later) target can be set for a Port.

Figure 2.4 Number of LU mappings that can be set for targets

(iSN: iSCSI Name, TG: Target)

2.2.5 Make a Decision about Redundancy

Each component, path of IP-SAN might be doubled if necessary.

- At a Configuration with redundant paths, the tolerance for failure is higher. But the cost to construct and operate the IP-SAN soars.
- At a Configuration without redundant paths, many hosts could be attached at a low cost. Total performance does not exceed certain level, even lots of host is logged-in a disk array. But in that configuration, the recovery means at the failure is limited, and there is a risk that requires a lot of time to recover in no composition of tedium in communication path.

When it is necessary to exchange a controller, it is necessary to ensure the time of the maintenance for the exchange of the controller. During exchanging a controller, all hosts who use that controller without redundant way to access will be unable to use the disk array.

When building the system that can be shutdown every day, failures will not seriously impact the operation of the system even the system does not have redundant communication paths.

There are various ways and degrees to construct redundant SAN, for example, redundant switch is used but the connections to the controllers are not redundant. There are also switches that can reroute the communication path to working path automatically at the time of the failure.

When increasing the degrees of the duplication of the IP-SAN component, the low cost advantage of IP-SAN will be lost. For constructing high reliability system, FC is recommended instead of iSCSI.

2.2.6 Deciding connection number to iSCSI ports

By consolidating plural host connection to an iSCSI port, it is possible to connect an iSCSI port up to max 128 (255: the micro program version 0750/A or later) hosts. On the other hand, there are limits for processing commands and transfer capacity of a port. If too much load exceeds such limits, the performance of the port will degrade.

Maximum bandwidth of one iSCSI port is at most 100 MB or so, according to a physical limit of Gigabit Ethernet. When the communication frequency of an iSCSI port becomes more than is this limit, the delay and the timeout of commands will occur frequently. In that case, it is recommended to decrease the number of hosts and I/Os, or to increase the number of disk arrays.

When the heavy load I/O is processed in the state in which many hosts are connected to a port in the DF700 iSCSI, there may be a case where the operation performance is deteriorated. Generally speaking, the heavier the load becomes, the longer the response time becomes. Degrees of the performance deterioration and the response delay depend on the number of the connected hosts, performance of the hosts, applications, network configuration, etc.

Example 1: The operation with 255 hosts/port is possible in the network in which the time required for communication from and to the host is 1 ms or less if the use of the network is limited to the office applications in which disks are accessed not frequently. However even in this case, it is recommended to limit the number of the hosts, which execute the heavy load virus scanning at the same time, to up to 50 or so (stagger the time for the scheduled virus scanning).

Example 2: In the case where the database or the like is accessed very frequently, reduce the number of the connected hosts per port. As to the database servers that require the line speed to be 20 MB/s, for instance, log in only five of them per port.

2.2.7 Deciding on whether to use iSNS

DF700 iSCSI supports iSNS. When operating many iSCSI storage systems, iSNS is effective. To introduce iSNS, it is necessary that iSNS is connected to IP-SAN and it is accessible from DF700 iSCSI and the host. Refer to Appendix C for installation of iSNS.

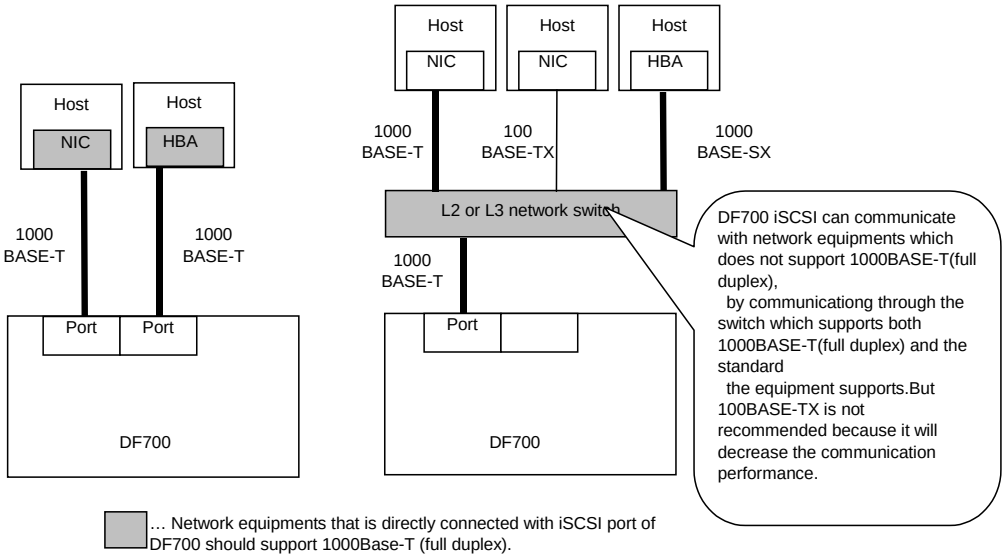
Introducing iSNS into the IP-SAN has advantage and disadvantage:

- Advantage: When there is a change in iSCSI Name or the IP address of the target, there is no need to retype in from all of the connecting initiators. Because information on the target that can be taken from iSNS is updated, please login again according to the information after update.
- Disadvantage: A server attached to the IP-SAN is required to install and provide iSNS service. Make sure to prevent the load concentrate.

2.2.8 Designing Network

Network connections among hosts and disk arrays should be designed.

- Select whether to use or not to use network switches.
  - If the number of hosts to connect is greater than the number of iSCSI ports, network switches are needed to connect them.
  - DF700 iSCSI cannot connect directly to the switch as long as that does not support 1000BASE-T (full duplex), however a switch which supports both 1000BASE-T (full duplex) and 1000BASE-SX or 100BASE-TX will make DF700 iSCSI possible to communicate with 1000BASE-SX or 100BASE-TX.



Note 1: All connections direct to iSCSI in the IP-SAN should be 1000BASE-T (full duplex)15.

Note 2: 100BASE-T will decrease the performance of IP-SAN. It is recommended to apply 1000BASE-T(full duplex) for all connections.

Note 3: DF700 iSCSI doesn't support directly or indirectly to attach to the network peripheral which only supports 10BASE.

15 On the other hand, management ports and maintenance ports of DF700 only supports 10/100BASE.

Figure 2.5 Notice about network connection

– Feature of the network switch will be available, as long as that is transparent to disk arrays. (port base VLAN etc.)

Note 4: DF700 iSCSI doesn't support either tagged VLAN or link aggregation. The packets to transfer such protocols should filtered out in switches.

– When IP-SAN is designed, cautions same to build IP network with gigabit Ethernet, is also necessary. Especially, overlapping of addresses or connecting loop-shape made in a subnet will cause serious degrade of communication performance and even cause disconnections.

– If a network switch with the network management function such as SNMP, it can know the trouble of the communication route and the ratio of the packet loss. Please refer to the manual of the switch for use. A low-cost network switch has something without such a function. In that case, it might be delayed to aware the failure or the analysis of the trouble become difficult.

– It is required to separate an IP-SAN (i.e. the network on that iSCSI communication is done) from the other network (management LAN, office LAN, other IP-SAN etc.) when you need the performance of iSCSI communication or security of iSCSI communication. Port VLAN function of a switch will be able to separate the networks logically.

– When multiple NICs are installed in a host, they should have addresses as belonging to different network segments16.

16 For example, IP address of NIC1 is 172.16.0.221 and that of NIC2 is 17.16.1.222. The address of different NICs should be segmented.

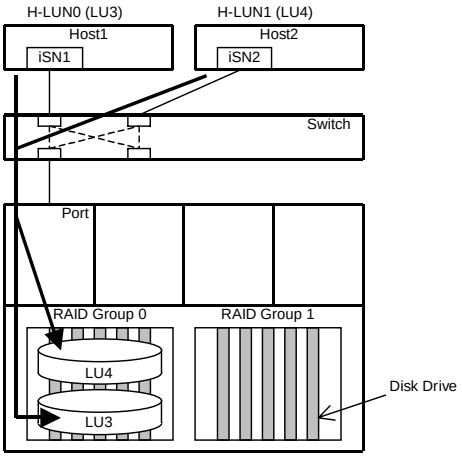
- Network settings of iSCSI ports should be decided.
  - Make sure to set the IP address (IPv4) to each iSCSI port, so as not to overlap the other ports (including other network equipments'). Then make sure to set appropriate subnetmask and default gateway address to the port.
  - Targets are set to the subordinate of iSCSI ports. Target 0 is made in default for each iSCSI ports.
  - Each iSCSI target is assigned its iSCSI name automatically.

2.2.9 Avoiding RAID Group Conflicts

When two or more hosts are connected to a disk array subsystem and LUs assigned to each host belong to the same RAID group, concurrent access to the same disk drive will occur. Because of this conflict for access to the disk drive, performance may decrease. Basically, LUNs in one RAID group should only be accessed by one host. To avoid a conflict, you should never have more than one host access multiple LUNs in one RAID group.

The number of RAID groups that can be created is determined by the number of mounted disk drives and the RAID level of the RAID groups to be created. If unable to create as many RAID groups as hosts to be connected, organize the RAID groups according to operational states of the hosts (see Figure 2.6 and Figure 2.7).

Figure 2.6 In the Case of the Same RAID Group



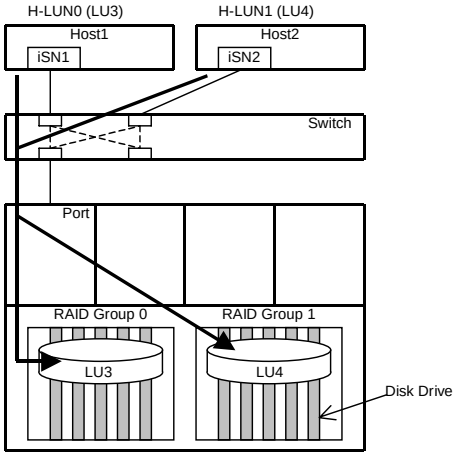


Figure 2.7 In the Case of Respective RAID Groups

2.2.10 Other point

DF700 iSCSI supports both iSCSI Header digest and iSCSI Data digest. Make a decision whether to use iSCSI digest or not to use iSCSI digest:

- Advantage: data is assured on network as these check code are used to check data integrity.
- Disadvantage: processing power is consumed at hosts and disk arrays, in order to generate and check the data digest code.

In many cases if iSCSI digest enabling, the performance of transfer decreases to about 90% owing to the disadvantage. (This rate will be affected by network configuration, hosts' performance, hosts' application etc.) iSCSI Header digest and iSCSI Data digest should be used with L3 switch (including router) in the link of hosts and DF700 iSCSI port.

2.3 System Configuration

System configuration entails doing the following:

- Setting a network consisting of hosts and disk array subsystems
- Making setting for LUN Manager

  Set the following for the disk array subsystem in order to specify input/output paths between hosts and LUs using LUN Manager (option). It is recommended to connect DF700 iSCSI to IP-SAN after setting LU mapping and CHAP User and Secret, in order to prevent illegal access. (Please refer LUN Manager User's Guide for setting parameters)

  - Target
  - iSCSI Name of HBA
  - LU mapping
  - Host connection mode

  It is necessary to manage the settings that have been made for the disk array subsystem keeping a documented record. When an HBA is replaced, change the iSCSI Name accordingly. In this way, you can identify the iSCSI Name that was set before the replacement by referring to the record.

- Registering CHAP User

  The user is authenticated using the CHAP. Set the target, the CHAP user and the Secret, which authorize the connection to the disk array subsystem. (Please refer DF700 Disk Array Subsystem User's Guide for setting parameters)

  - Target
  - CHAP User and Secret

  It is necessary to manage the settings that have been made for the disk array subsystem keeping a documented record. When an HBA is replaced, change the iSCSI Name accordingly. In this way, you can identify the iSCSI Name that was set before the replacement by referring to the record.

  CHAP authentication information can be imported by a CSV format file. (Please refer to Storage Navigator Modular (for GUI) User's Guide.) On the other hand, the function to output CHAP authentication information is not provided, from the consideration on security.

  Note: Please manage the documented record and the CSV format file of CHAP authentication information strictly to prevent illegal access.

- Setting Option function

  It is required to examine the iSCSI name to be registered for the CHAP authentication. Refer to the user's guide for the method of acquiring the iSCSI Name for each platform and each HBA. Set the port-based VLAN of the Network Switch if necessary.

2.3.1 Setting of iSCSI Network

Refer to the DF700 Disk Array Subsystem User's Guide for setting of iSCSI network.

2.3.2 Setting of LUN Manager

Refer to the LUN Manager user's guide for setting of LUN Manager.

2.3.3 Setting of CHAP User

Refer to the DF700 Disk Array Subsystem User's Guide for setting of CHAP User.

2.4 Test of Host Connection

Whether the host can be recognized from the DF700 iSCSI as the system construction design is confirmed, please refer to the user's manual for the method of recognizing the host LU. If the host LU cannot be recognized from DF700 iSCSI, please solve the problem by referring to the network system trouble shooting in the user's guide.

2.5 Adding and Replacing Equipment

After installing iSCSI, you must perform the following tasks:

- Add a host and HBA

  When assigning LUs within the disk array subsystem to a host and an HBA, add a target to the disk array subsystem. When adding a setting of CHAP, it is not necessary to restart the disk array subsystem. Execute a host boot or the disk recognition command after making a setting of CHAP.

- Add an LU

  When adding an LU to the disk array subsystem and assigning it to a host that has been connected, add a mapping of the LU to the target to which the host belongs. When adding the setting for CHAP, it is not necessary to restart the disk array subsystem. Execute a host boot or the disk recognition command after making a setting of CHAP.

- Replace HBA

  When replacing an HBA of a host, the setting for CHAP must be modified. Change the iSCSI User Name of the HBA. If you do not make this change, the host will not be able to access the LU after the replacement of the HBA.

  Each setting for CHAP must be documented when the configuration is created so that the previous setting can be reviewed before making a change to the setting.

- Replace the switch

  When the Network Switch is replaced, it is required to set the same connection as before the replacement to the Switch after the replacement.

When the exchange and the composition change of equipments are done, it is required to test to connect host and to let host recognize the LU.

2.6 Multi-Interface Configuration

DF700H can be equipped with maximum 2 of the following interfaces on the array controller. One array can be connected to multiple types of interfaces.

- Fibre Channel : FC interface board
- NAS : NAS interface board
- iSCSI : iSCSI interface board

2.6.1 Interface Board Configuration Rule when Mixing Interfaces

Install the interfaces on DF700H by following configurations only.

Table 2.2 Location of Interface Board

Case#	Location	
	Interface Board #0	Interface Board #1
1	FC interface board	–
2	–	NAS interface board
3	iSCSI interface board	–
4	FC interface board	FC interface board
5	FC interface board	NAS interface board
6	iSCSI interface board	FC interface board
7	iSCSI interface board	NAS interface board

- Conditions/cautions for interface intermix
  - Be sure to use same type of interface on same locations on controllers #0 and #1.
  - Install iSCSI boards only on interface board #0.
  - Install NAS boards on interface board #1 only.
  - If the type of the installed interface board is changed, all of the configuration setting described below will be cleared for that changed port. Please redo the setting after exchanging the interface board.

  a) Host group information/target information

  b) Host group options/target options

  c) Mapping information

  d) Fibre Channel port setting information/NAS connection information/iSCSI port setting information

  e) CHAP security information (iSCSI)

2.6.2 Cautions for Interface Intermix

- Cautions when intermixing Fibre Channel and iSCSI interfaces

  When intermixing Fibre Channel and iSCSI interfaces, the following conditions/cautions must be met.

  - Install iSCSI board onto interface board #0 only.
  - It is possible to access the same LU from Fibre Channel interface and iSCSI interface, as was with multiple Fibre Channel ports. However, if exclusive access is necessary at the application level, then it is recommended to install exclusive access by LU mapping, as was with multiple Fibre Channel ports.
  - CCI can be used shared between Fibre Channel and iSCSI interfaces. Therefore, it is possible to manage the LU used from Fibre Channel interface via the iSCSI interface.
  - Path failover software (such as HDLM) and cluster configuration between Fibre Channel and iSCSI interfaces are not supported.

- Cautions when mixing iSCSI and NAS interfaces

  When intermixing iSCSI and NAS interfaces, the following conditions/cautions must be met.

  - Install iSCSI board onto interface board #0 only, and NAS board onto interface board #1 only.
  - When both iSCSI and NAS interfaced are used, be sure to perform LU mapping on all created LUs, and make sure that LUs used by iSCSI and LUs used by NAS are mapped exclusive of each other.
  - When intermixing iSCSI and NAS interfaces, it is recommended to use different partitions for NAS logical units and iSCSI logical units by using Cache Partition Manager function.
  - When both iSCSI and NAS interface are used, and when NAS OS is shutdown, booted, or rebooted while there is I/O load from the iSCSI Interface, there may be cases where the process abnormally ends (e.g. timeout).
  - When intermixing iSCSI and NAS interfaces, it is recommended to set user LUs and system LUs for NAS on RAID groups that are NOT used for LUs used for iSCSI access.
  - When both iSCSI and NAS interfaces are used, the load on NAS can have impact on the iSCSI, or vice versa. It is recommended to design the system with good performance margin.
  - When both iSCSI and NAS interfaces are used, iSCSI performance may be affected during such periods as failover processing due to NAS failure, or NAS maintenance operation (boot/reboot/shutdown of NAS OS, installation of NAS OS related Program Product). It is recommended to design the system with good performance margin.

2.6.3 Addition/Subtraction on iSCSI Interface Boards

Followings are cautions/procedures for adding or subtracting on iSCSI interface boards.

- Cautions
  - iSCSI boards can be installed only as interface board #0.
  - If the type of the installed interface board is changed, all of the configuration setting described below will be cleared for that changed port. Therefore, be sure to output the configuration information to keep a copy of the configuration setting before exchanging the interface board. CHAP information (except for the information of two-way authentication) can be input by a file but cannot be output to a file, for security reasons.

    a) Host group information/target information

    b) Host group options/target options

    c) Mapping information

    d) Fibre Channel port setting information/NAS connection information/iSCSI port setting information

    e) CHAP security information (iSCSI)
  - For the same location on controllers #0 and #1, the same type of interface boards must be installed.
- Procedures

1. Acquiring the configuration information

   Acquire the configuration information by the “Constitute” function of Storage Navigator Modular.

2. Stopping the disk array subsystem

   Turn off the main switch of the disk array subsystem. After stopping the disk array subsystem, turn off the AC input power switch.

3. De-installation of the controllers

   Remove off the attached cables, and then de-install the controllers.

4. Add/subtract on iSCSI interface boards

   Install or uninstall iSCSI interface boards on interface board #0, for each controller. If other interface board is already installed on interface board #0 in case of adding on iSCSI interface board, move that board from #0 to #1 before installing the iSCSI board.

5. Installation the controllers

   Install the controllers to the chassis of the disk array subsystem. Then connecting the cables.

6. Starting up the disk array subsystem

   Turn on the AC input power switch/main switch of the disk array subsystem to start up.

7. Setting the interface information

   Set the following configuration information about the iSCSI ports of the iSCSI boards. If interface boards (that was installed #0 and has moved from #0 to #1), set the following configuration information about the ports of these (moved) boards, too.

   a) Host group information/target information
   b) Host group options/target options
   c) Mapping information
   d) Fibre Channel port setting information/iSCSI port setting information
   e) CHAP security information (iSCSI)

2.7 Notes in Construction and Operation of IP-SAN

Keep the following in mind while using iSCSI:

- Target information must be accurate. If CHAP authentication information is set wrong, the system will not operate normally for the following reasons:
  - Initiator (user), which is intended to be allowed to login the target, cannot login actually.
  - Initiator (user), which is not intended to be allowed to login the target, can login actually.
- This function is not available when a host (OS or driver) cannot identify an LU without LUN0. It is necessary to set H-LUN = 0 to the target in this case.

Table 2.3 Combinations of OS and HBA for iSCSI

OS	Software initiator/HBA
Windows® XP	Microsoft® iSCSI Software initiator
Windows Server™ 2003	Microsoft® iSCSI Software initiator Qlogic® HBA
Linux®	SourceForge iSCSI Software initiator Qlogic® HBA

- When you replace an HBA in a host attached to a Disk Array subsystem using target, be sure to change the iSCSI Name setting in CHAP.
- Transmit/receive Ping
  - DF700 iSCSI port responds ping up to 404 bytes payload.
  - DF700 iSCSI port does not respond ping more than 404 bytes payload.
- Sending PING to unreachable address might cause the delay of the host I/O processing on the controller. Especially pinging from both ports on a controller at a time cause I/O timeout. It is strongly recommended that ping test should be executed when no I/O exists on the controller.
- Please disable the Spanning Tree function for a physical port of the network switch connected directly with the host or DF700 iSCSI (see the manual of the switch to be used for the checking and setting methods). There is a possibility that the communication is obstructed by the Spanning Tree.

Windows® Host:

- When some trouble has been caused on the communication between DF700 iSCSI and a host, the cause will be either the host, the network or the DF700. Therefore, to solve the issue, the customer would be needed to research or analyze from the point of view of the host or the network in some case.
- Make sure to use powerful computer enough to operate Windows Server™ 2003/ Windows® XP without stress. Recommendation: CPU Pentium 4, Clock 2 GHz+, Memory 512MB+

- For a host, the Configuration of NIC with iSCSI software initiator needs more computing power than the configuration of HBA. Thus other applications, concurrently executing on the host, might be degraded their performances.
- The NIC or HBA that have the designed for Windows® logo is recommended to use.
- Please apply the service pack and the patch of the latest version to the OS, NIC and HBA drivers.
- On using Microsoft® iSCSI software initiator, be sure to use version 2.0. The lower version is not supported by DF700 iSCSI. For the higher version, please refer to the most recent product announcement or contact your local Hitachi sales office for information on feature and product availability.
- The service of application and OS not used is recommended to stop. As a result, an unnecessary communication and the load are reduced.
- Connection host and disk array through one or more switches, the NIC of the host is not necessarily support 1000BASE-T. However the performance might decrease. (It depends on the configuration of the IP-SAN.)
- When using iSCSI Data Digest and Header Digest (CRC/Checksum), though the reliability of data on the communication link is improve, the performance will decrease. The ratio of the decrease depends on the environment on the host and the network, etc. In most environments, the performance will decrease by about 10%. However with some old-fashioned HBA, the performance will decrease by 50% or more.

Linux® Host:

- When some trouble has been caused on the communication between DF700 iSCSI and a host, the cause will be either the host, the network or the DF700. Therefore, to solve the issue, the customer would be needed to research or analyze from the point of view of the host or the network in some case.
- For a host, the Configuration of NIC with iSCSI software initiator needs more computing power than the configuration of HBA. Thus other applications, concurrently executing on the host, might be degraded their performances.
- Mutual CHAP is not supported to communicate with Linux® software initiator.
- When using iSCSI Data Digest and Header Digest, though the reliability of data on the communication link is improve, the performance will decrease. The ratio of the decrease depends on the environment on the host and the network, etc. In most environments, the performance will decrease by about 10%. However with some old-fashioned HBA, the performance will decrease by 50% or more.
- Linux software initiator establishes two connections in order to communicate with a target. DF700 iSCSI can establish max 128 (255: the micro program version 0750/A or later) connections at the same time in an iSCSI port and it can communicate with max 128 (255: the micro program version 0750/A or later) hosts, however, the max number of the of hosts that can be communicated with will decrease when Linux software initiator are included in the hosts, according to the characteristic of above mentioned. For instance, when all hosts use Linux software initiator, DF700 iSCSI can communicate with 64 (127: the micro program version 0750/A or later) hosts or less in an iSCSI port.

Notes on iSCSI connection

- Do not change the host computer's registry (TCP/IP Stack). Use the default value.

Appendix A Acronyms and Abbreviations

CRC	Cyclic Redundancy Check
FC	Fibre Channel
HBA	Host Bus Adapter
H-LUN	Host Logical Unit Number
I/O	input/output
IETF	Internet Engineering Task Force
iSCSI	internet SCSI
iSNS	internet Storage Name Service
LU	Logical Unit
LUN	Logical Unit Number
NIC	Network Interface Card
RFC	Request for Comments
SAN	Storage Area Network
SCSI	Small Computer Systems Interface

Appendix B Installing of Microsoft® iSCSI Software Initiator

B.1 What is Microsoft® iSCSI Software Initiator?

It is iSCSI software initiator for Windows® 2000/Windows Server™ 2003/Windows® XP which Microsoft® offers. You use general NIC and can be connected to a host in iSCSI without installing iSCSI HBA by introducing this software.

B.2 Download

1. On the Web, connect to http://www.microsoft.com/.
2. Select **Downloads**.
3. Search **iSCSI initiator**.
4. Select Microsoft® iSCSI software initiator, download it to your PC.

B.3 Installation of Microsoft® iSCSI Software Initiator

1. Double click the downloaded file and execute the installing.
2. Select **Next**.
3. Select **Next**.
4. Read the License Agreement and select **I Agree**. And select **Next**.
5. Select **Complete**.

B.4 Setting Microsoft® iSCSI Software Initiator

1. On the **Control Panel** of Windows, select **iSCSI Initiator**.
2. When applying two-way authentication (i.e. Mutual CHAP), push **Secret** button of the **General** tab beforehand here, and input Secret of the host and click **OK**. The length of Secret must be from 12-character (96 bits) to 16-character. In Microsoft iSCSI software initiator, Username of the host is not set for mutual authentication. Secret of the host doesn't depend on the logging target and only one secret can be set.
3. Select the **Discovery** tab. (Step 4 to 8 is about discovery. When applying iSNS, click **Add** button of **iSNS Server** area (on the iSCSI initiator) to input IP address of iSNS server and go to step 9.)
4. Select **Add** on the **Target Portals**. Then add the connecting Target.
5. Set the IP address of Target. If TCP port number of DF700 iSCSI is changed from 3260, input the TCP port number, too. After that, click **Advanced** button.

6. When applying **CRC/Checksum** (**iSCSI Data Digest, Header Digest**), check the corresponding check box. They are recommended to apply when L3 switch is used in the IP-SAN. When using iSCSI Data Digest and Header Digest, though the reliability of data on the communication link is improve, the performance will decrease. The ratio of the decrease depends on the environment on the host and the network, etc. In most environments, the performance will decrease by about 10%. However with some old-fashioned HBA, the performance will decrease by 50% or more.
7. Click on **OK** button. DF700 iSCSI doesn't support CHAP authentication in the Discovery session.
8. Click on **OK** button.
9. Select **Targets** tab. (Step 10-16 is about log on (log in) to the target.)
10. Select a logging target from the displayed targets and check **Logon** button.
11. When reconnecting automatically every time it does a host in the reboot in the future, check **Automatically restore this connection when the system boots** check box.
12. Click on **Advanced** button.
13. When applying **CRC/Checksum** (**iSCSI Data Digest, Header Digest**), check the corresponding check box. They are recommended to apply when L3 switch is used in the IP-SAN. When using iSCSI Data Digest and Header Digest, though the reliability of data on the communication link is improve, the performance will decrease. The ratio of the decrease depends on the environment on the host and the network, etc. In most environments, the performance will decrease by about 10%. However with some old-fashioned HBA, the performance will decrease by 50% or more.
14. When applying CHAP authentication at the time of the log on from this initiator, check **CHAP Logon Information** check box and input Username and Target Secret. The length of Secret must be from 12-character (96 bits) to 16-character. Moreover, when applying mutual authentication, check **Perform mutual authentication** check box (In this case, be sure to input the secret of the host in step 2 beforehand).
15. Click on **OK** button.
16. Click on **OK** button.
17. Confirms that status of the target which was chosen in the **Targets** tab became "Connected", then click on **OK** button. Thus the initiator has Logged on the target. The recognition and the format of the disk are same as the disk that connected with the FC. Do appropriate processing about the disk which was added from Windows' **Control Panel** → management tool → management of the computer → management of the disk.

Note: Data will be destroyed when partitioning or formatting the area where data is already stored. Implement after confirming that the data not to want to destroy isn't exist to the area.

B.5 Logging Off

Replacement of network cables or the power off of the target equipment, and so on, needs iSCSI log off (log out) to the initiators which have logged on the target. On the other hand, when a host is shutdown, there are no needs to reboot nor log off the target. Moreover, logging off a target doesn't have an influence on I/O with other targets nor with other hosts.

Note: Before logging off, make sure to stop the application that is accessing the target. Logging off while accessing from the host has a possibility to lose data.

1. Property of iSCSI software Initiator → **Targets** tab → Choose and click the target to want to log out → Click Details.
2. After step 1, property of the target window → **Sessions** tab → choose and click the session to want to log off → click on **Log off** button
3. Confirm that the display of the chosen session disappeared and click **OK** button.
4. Confirm that status of the chosen target is Inactive (not activated) and click **OK** button.

Appendix C Installation of Microsoft® iSNS Server

C.1 What is Microsoft® iSNS Server ?

This is iSNS Server provided by Microsoft Inc. for Windows® 2000 SP4/Windows Server™ 2003.

By using the server with iSNS on the IP-SAN network, the host can connect to the target by inquiring to iSNS, without having to specify the IP address of the iSCSI target directly and make a Discovery.

If Discovery domain is set, then the host will only know the existence of the target it needs to know when the host makes inquiry to iSNS. In other words, that host will not know of a target it does not need to know, or is not supposed to access.

For Windows® 2000 SP4 or Windows Server™ 2003, Microsoft® iSNS Server can be installed onto the same server where iSCSI initiator works, but it is recommended to install iSNS to server separate from the initiator to avoid overloading.

C.2 Download

1. Open and connect Web browser to www.microsoft.com.
2. Click **Downloads** to go to Microsoft Download Center.
3. Search for iSNS Server.
4. Select the latest edition of Microsoft® iSNS Server for the Operating System used and download to the local computer (version 3.0).

C.3 Installation of Microsoft® iSNS Server

1. Double click on the file that was downloaded as above procedure to start installation.
2. Click on **Next** button.
3. Read the License Agreement, choose **I agree** only when agreeing and click the **Next** button.
4. Choose the directory to install and click on **Next** button.
5. Click on **Next** button.
6. Confirm that **Install iSNS option** is chosen and click **OK**.
7. Read the License Agreement and click **Agree** only when agreeing.
8. Click on **Next** button.
9. The installation is completed. Click **complete** and end setup.

C.4 Setting to iSCSI Targets

1. Subscribe the IP address of iSNS from Storage Navigator Modular.

   Click Array System Viewer's **tool** button → Select the port → Click use iSNS → Enter IP address and the port number of iSNS server (That is the TCP port number for iSNS of DF700. 1 to 65535 is possible and 3205 should be set when not changing setting on the side of the iSNS server) → Click **Apply** button.

   Be sure not to set the correct IP address and correct TCP port number. iSNS can not be used when the IP address or the port number of the iSNS server is different to the value which is set to the target.

2. After the step 1, if changing in the IP address or iSCSI Name about the iSCSI target DF700 iSCSI will subscribe the new IP address or new iSCSI Name to iSNS automatically.

3. Just one iSNS Server is available for one port of DF700 iSCSI.

C.5 Setting to Microsoft® iSCSI Software Initiator

1. On the server which installed iSCSI software initiator, open the property of iSCSI software initiator → Select **Discovery** tab → Click on **Add** button in the area of **iSNS Servers** → Input IP address of iSNS.

2. After that, without inputting the IP address of the target to the **Target Portal** tab of the iSCSI initiator, iSCSI target which has been subscribed to iSNS is displayed.

   The registered information will be used for log on to the target.

   Click **Refresh** button then the latest registered information is displayed.

3. To subscribe IP address of more than one iSNS Server, the information on iSCSI target can be acquired using all of them.

C.6 Setting of Microsoft® iSNS Server

After installation (C.3), iSNS is working automatically.

If iSNS, hosts (initiators) and a disk array (target) are appropriately connected, then the iSNS will be able to register the initiators and the targets. iSNS can be used by C.4 and C.5.

The procedure to subscribe initiators and targets to iSNS and to set Discovery domain is as follows.

1. Open the property of iSNS from the Server to which iSNS was installed.

2. In the **General** tab, the list of the initiators and the targets registered to the iSNS is displayed.

3. To set and to confirm a Discovery domain, select **Discovery Domains** or **Discovery Domain sets** tabs of the property of iSNS. For more information, refer to Microsoft iSNS Server Users Guide that was installed simultaneously with installation of iSNS. That is stored in the directory to which iSNS was installed. To open the iSNS Server Users Guide, click **Start menu** button of Windows → **program** → **Microsoft iSNS Sever** → Users Guide.

Appendix D The IP-SAN Configuration Example

In this part, an example of the IP-SAN configuration is described.

The subject of this example is to construct a large scale IP-SAN at a low-cost.

D.1 Assumptions

Assumptions of this example are as follows:

- Hosts
  - Number of host is 224 (Host 0 to Host 223)
  - Each capacity and communications-zone ... host is the used only of the office application program and the storage capacity to use is 40 GB respectively. There are very few average communications-traffics and the some delay of access is allowable. Each host will access the storage area (LU) which was allocated to itself specifically.
  - The OS uses a NIC and Microsoft® iSCSI Software initiator in Microsoft® Windows® XP or Microsoft® Windows Server™ 2003.
- Redundancy
  - Host itself doesn't have a redundant access means.
  - A part of the network-path and the stand-by-system that doesn't use the half of the iSCSI ports in the ordinary access. The part will be used for detecting which component is fault and for the alternation at the time of the failure.
- The illegal access prevention policy
  - Constructed as closed IP-SAN, which is isolated to external environment.
  - LUN Manager is used. Each host is required CHAP authentication when log on to a target. It is possible for each host to refer only to allocated LU and to log on only to the allowed target.
- The iSNS use
  - Because there are many numbers of the hosts, the management of iSCSI Name and the IP address will be complex. To reduce the complexity, iSNS will be introduced.

D.2 The Network-Design

- Because there are more numbers of the hosts than the DF700 iSCSI numbers of the ports, the switch is needed to connect them. Using 16 port L2 network switch which supported 1000BASE-T(full duplex).
- Port 0A, host 112 to 223 logs on to the target of Port 0A which was allocated from the port 1B and host 0 to 111 accesses allocated LU (It expects that the division load resembles about the half about the half and that it becomes in the host among the controllers).
- It decides to compose a network (subnet 1) for the access by host 0 to 111, a network (subnet 2) for the access by host 112 to 223, doing Networks itch respectively in the second cascade. Introducing iSNS for each sub-net respectively.
- Assigning IP address to each port appropriately.

D.3 The Composition Inside DF700

Configure host 0 to 111 (Figure D.1).

- On CTL0, configuring target #1 to #111 of port 0A and setting host 0 to 111 to be able to log on to target #0 to #111 of port 0A respectively.
  - Assigning the LU that host 0 accesses through target 0 by the LU mapping.
  - (By setting iSCSI Name of host 0 and LUN of accessing LU. More than one LU is able to be assigned to a target).
  - Set CHAP authentication information so that host 0 may log on to target 0.
  - Hereinafter, host 1 to 111 is able to log on to target #1 to #111, too, in the same way.
- On CTL1, configuring target #1 to #111 of port 1A and setting host 0 to 111 to be able to log on to target #0 to #111 of port 1A respectively, in the same way as port 0A and target #0 to #111. Set the LU mapping of the target #0 of port 0A same to the LU mapping of the target #0 of port 0B (both target are associated to the same LU).

  Port 1A is used as the alternation path.

Also configure host 112 to 223 in the same way (Figure D.2).

- On CTL1, configuring target #1 to #111 of port 1B and setting host 112 to 223 to be able to log on to target #0 to #111 of port 1B respectively.
- On CTL0, configuring target #1 to #111 of port 0B and setting host 112 to 223 to be able to log on to target #0 to #111 of port 0B respectively.

D.4 The Initiator Setting and Connection

- Set the same target information to each host.
- The alternation between the normal path and the stand-by-path is handled by the switch or by the hand. Connects normal path and logs on to the target from the hosts.

  When switching a path through the reconnection, it is required to make the target recognized again by the hosts. When the path switching software is used, the path can be switched automatically when a failure occurs. However, there may be a case where the path switching software is not supported depending on the OS used by a host.

Chapter 1. Outline

This procedure manual describes the work procedures for upgrading the basic chassis of the Hitachi TagmaStore® AMS 1000™ from the RKH to the RKHE and for upgrading the array subsystem while maintaining the customer data in the Disk Drive used.
The procedures about the whole system, such as configuration change of the system, and the procedures of addition/subtraction of option parts and the setting of the priced option are not included.
In this procedure manual, the basic chassis (model name: DF700-RKH) is described as "RKH", the basic chassis (model name: DF700-RKHE) as "RKHE", the additional chassis (model name: DF700-RKAJ/RKAJAT) as "RKAJ/RKAJAT" and the additional chassis (model name: DF700-RKA) as "RKA" for the Hitachi TagmaStore® AMS 1000™.

Chapter 2. Components and Tools Required for Upgrade

Model names of components required for the upgrade are shown below.

Table 2.1 Components to Be Ordered for Upgrade

Upgrade	Upgrade Kit Model name	Components of Upgrade Kit		
		Parts	Model	Quantity
RKH → RKHE	DF-F700-F2JH	Control Unit	DF-F700-F2JH (Excluding DF-F700-DJ4G2H (FC Interface Board), DF-F700-DJNASH (NAS Interface Board), DF-F700-DJSC2H (iSCSI Interface Board), DF-F700-C1GJ (1 GB CacheUnit), (DF-F700-C2GJ (2 GB Cache Unit))	2

The following tools are required for the upgrade procedures.

Table 2.2 Tools Required

Division	Tool name	Specification	Usage
Tool	Phillips screwdriver	No.2	For replacing Control Unit.
	Allen wrench	No.6	Opening/closing of doors.
Tool of other	LAN cross cable	Category 5	For connecting a service PC and the subsystem
	PC for maintenance	Pentium	For maintenance (Pentium (Pentium Ⅱ (233 M Hz or more) is recommended), Memory 40 M bytes or more (64 M bytes or more is recommended) • Storage Navigator Modular (GUI) (Ver.6.00 or later) • TDCONV analysis tool (Ver.0615 or later) • IE 5.5 or later
	Wrist strap	-

Chapter 3. Upgrade Work

3.1 Prerequisites

- The Hitachi TagmaStore® AMS 1000™(RKH) to be upgraded must be in the state in an error free state or condition prior to performing the upgrade.
- The processing for re-recognizing the host is required because the setting of the host needs to be changed.
- Use the latest version (Ver.6.00 or later) of Storage Navigator Modular.
- Hitachi TagmaStore® AMS 1000™(RKHE) to the Hitachi TagmaStore® WMS 100™/AMS 200™/AMS 500™/AMS 1000™(RKH) downgrade is not supported.
- The Control Units that are used to upgrade to the Hitachi TagmaStore® AMS 1000™(RKH) need to 0760/A or later flash program installed prior to performing any upgrade work.
- When TrueCopy remote replication/TrueCopy Extended Distance is enabled and the array subsystem to be upgraded to the Hitachi TagmaStore® 1000™(RKHE) is the remote Disk Drive subsystem, perform it after changing the pair status (S-VOL) of TrueCopy remote replication/TrueCopy Extended Distance to PSUS.
  However, if the upgrade operation is performed, the path blockade occurs. If the upgrade work replacement is performed, a path blockade occurs. This path blockade automatically recovers after performing the upgrade work.
  Return the pair status (S-VOL) of TrueCopy remote replication/TrueCopy Extended Distance to the original status (PAIR, etc.) after completing the upgrade operation.
  Also, if the upgrade operation is performed, the following phenomenon occurs.
  - Both paths of the TrueCopy remote replication/TrueCopy Extended Distance are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
  - When the pair status of the TrueCopy remote replication/TrueCopy Extended Distance is PAIR or COPY, the pair status changes to PSUE.

3.2 Before Starting Upgrade Work

(1) Back up the user data by the day of the upgrade work in preparation for an emergency accident.
If a wrong operation is done in a upgrade work, it is feared that user data stored in the subsystem is lost.
Backup user data stored in the subsystem by operating a host computer.

(2) As for the upgrade work, settings of the subsystem must be changed through operation of a maintenance PC connected via a LAN. Besides, the microprogram must be installed from a CD-ROM. Make the following preparations before starting upgrade work.
- Prepare a PC in which Storage Navigator Modular of the latest revision is installed.
  The PC must fit the LAN environment and have a CD-ROM drive.
- LAN cross cable
- The CD-ROM for installation of the Hitachi TagmaStore® AMS 1000™ microprogram of the latest revision (0760/A-H or later).

Copyright © 2006, Hitachi, Ltd.

3.3 Notes

- When executing updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.
- When executing updating installation of the microprogram, use the microprogram whose revision is 0760/A-H or later.
- When upgrading the Disk Array subsystem, do not upgrade two or more Disk Array subsystem at the same time to avoid the disk drive replacement operation error.
- When the Hitachi TagmaStore® AMS 1000™(RKH) to be upgraded is the Fibre Channel/iSCSI interface system configuration, do not change the port which connects the Fibre Channel/iSCSI interface cable before and after the upgrade.
- The IP address of the LAN port for the user control or maintenance of the Control Unit succeeds the value before the upgrade. Reset it as occasion demands.
- When using the SNMP Agent Support Function, which is an optional feature, is used, the SNMP environment information file may have to be reviewed.
- When making the upgrade leaving Hitachi TrueCopy remote replication/TrueCopy Extended Distance enabled, do not upgrade both of the local and remote subsystems at the same time for security. However, if the splits of the pairs on both local side and remote side are confirmed, there is no problem to execute the upgrade at the same time. (refer to the Figure 3.3.1)
- The path is blocked if the upgrade work is performed with TrueCopy remote replication/TrueCopy Extended Distance made enabled. This path blockade automatically recovers after performing the upgrade work. (refer to the Figure 3.3.1)

Deleted: • When executing a updating installation of the microprogram, be sure to select [Update]. Never execute the [Initial Setup] because all data will be lost.¶

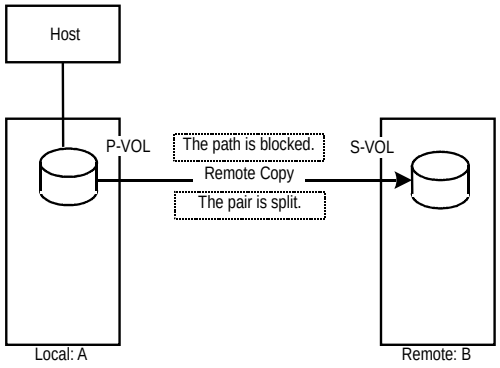

Figure 3.3.1 The array subsystem that a pair of TrueCopy remote replication/TrueCopy Extended Distance is set

- When Power Saving of the priced option is used, if you perform the upgrade after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host after replacing the microprogram and starting the array subsystem. Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then perform the upgrade. If the spin-down fails, execute the spin-down again.

Copyright © 2006, Hitachi, Ltd.

3.4 Upgrade Work

⚠ CAUTION

Touching heat sinks or ICs may cause injury. Be sure to handle with care.

CAUTION

- To prevent part failures caused by static electrical charge built up on your own body, be sure to wear a wrist strap connected to the chassis before starting and do not take it off until you finish.
- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts. Otherwise, the static electrical charge on your body may damage the parts.

The procedure for upgrading the Hitachi TagmaStore® AMS 1000™(RKH) to the Hitachi TagmaStore® 1000™(RKHE) is shown below.
The procedure is different depending on the cases where it is upgraded with the host online and it is upgraded offline.
Execute the procedure after making sure of the work to be done in each step.

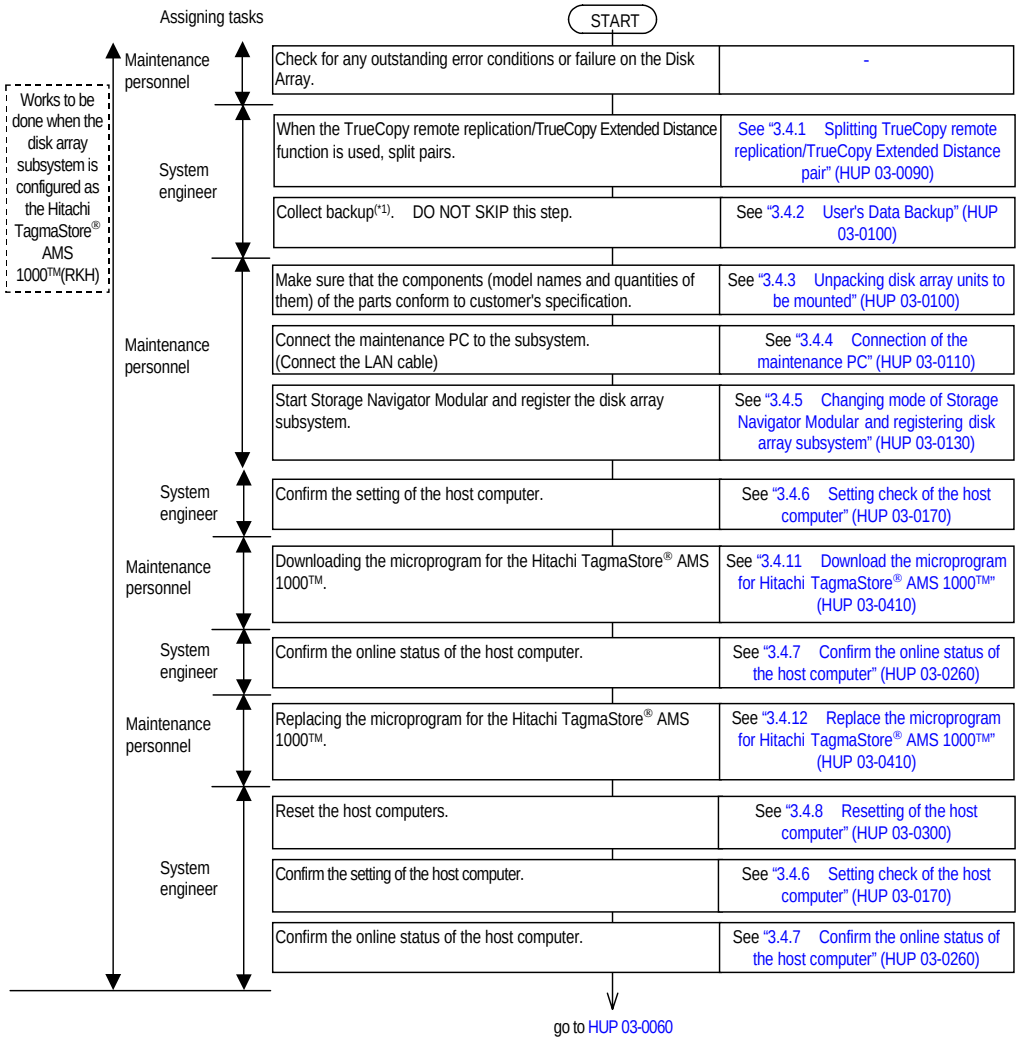
NOTE : • When you replace a microprogram, you cannot access the Control Unit that the microprogram is to be replaced. (The microprogram replacement takes place by rebooting the both Control Units one by one.) To perform the replacement, always follow the check list shown below and read the cautions.
• When you replace a Control Unit, you cannot access the Control Unit that the Control Unit is to be replaced. (The Control Unit replacement takes place by rebooting the both Control Units one by one.) To perform the replacement, always follow the check list shown below and read the cautions.

The replacement needs to check the host side, so perform the operations according to your customer's schedule. Since the host I/O (input and output) may be concentrated on one Control Unit during the microprogram replacement or the Control Unit replacement, it is recommended that the operations perform during a time period when the I/O load to the host is light.

Copyright © 2006, Hitachi, Ltd.

(1) Check List

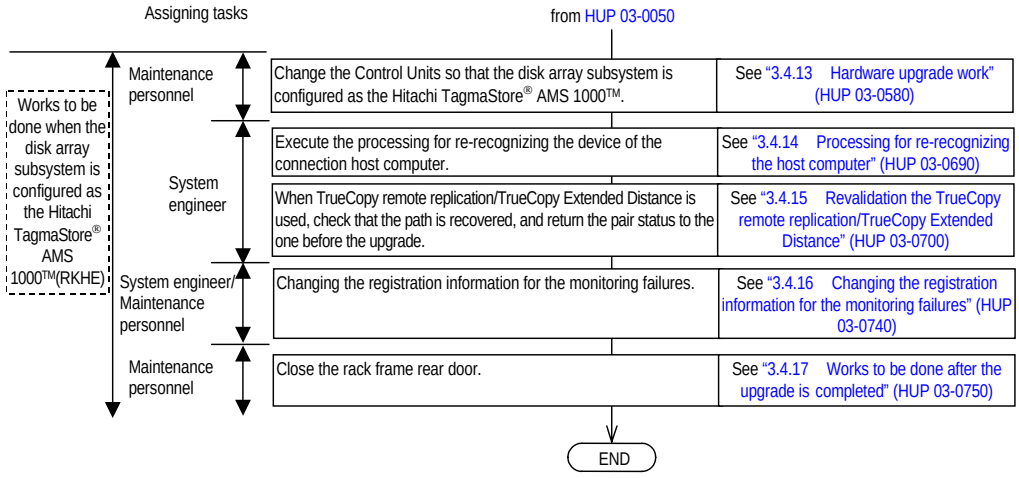
The upgrade work online (a status that the I/O with the host is not stopped) is possible when te following conditions are met. (refer to "3.4 (1)(a) Upgrade work online (a status that the I/O with the host is not stopped)" (HUP 03-0050))



Perform the upgrade work offline (a status that the I/O with the host is stopped) when there is any item that does not meet the following conditions. (refer to "3.4 (1)(b) Upgrade work offline (a status that the I/O with the host is stopped)" (HUP 03-0070))

- Are you using the path switching software (PVLink or HDLM or VxVM-DMP)?
- Is the Control Unit of a main path to LUs (Logical Units) separated from the Control Unit of an alternative path?
- Is the alternate path set in all the volumes accessed by the operating job during the microprogram replacement or the Control Unit replacement?
- Are the host side parameters set up correctly?
- Is it possible to stop the changing of pair status of ShadowImage in-system replication, TrueCopy remote replication, or Copy-on-write SnapShot during the microprogram replacement or the Control Unit replacement?
  (Customer cannot execute "paircreate" and "pairresync" commands.)
- Is it possible to change the pair status of TrueCopy Extended Distance from "PAIR" and "COPY" to "PSUS" during the microprogram replacement or the Control Unit replacement?
- If the customer uses the cluster software "MC/SG", is the lock disk stored in the disk other than the Hitachi TagmaStore® AMS 1000™?
- Is the boot disk stored in the disk other than the Hitachi TagmaStore® AMS 1000™?
  Is the redundancy condition of the boot path described on the System Construction Guide of BladeSymphony satisfied when it is connected to BladeSymphony?
- The I/O errors may be logged in a log file during the microprogram replacement or the Control Unit replacement, though the data accesses continue on an alternative path. Can the system ignore such the errors?
- The completion of I/O processing may take approximately 60 seconds during the microprogram replacement or the Control Unit replacement. Can the customer's system wait for this time?
- Is it possible to stop LU format?
  (The microprogram replacement during the LU format and the LU format during the microprogram replacement cannot be executed.)
- ShadowImage in-system replication is enabled, and pair status is not PSUE.
- Can other applications (JP1/HiCommnd Device Manager, other Storage Navigator Modular) which perform the LAN access to the Hitachi TagmaStore® AMS 1000™ be stopped during the microprogram replacement or the Control Unit replacement?

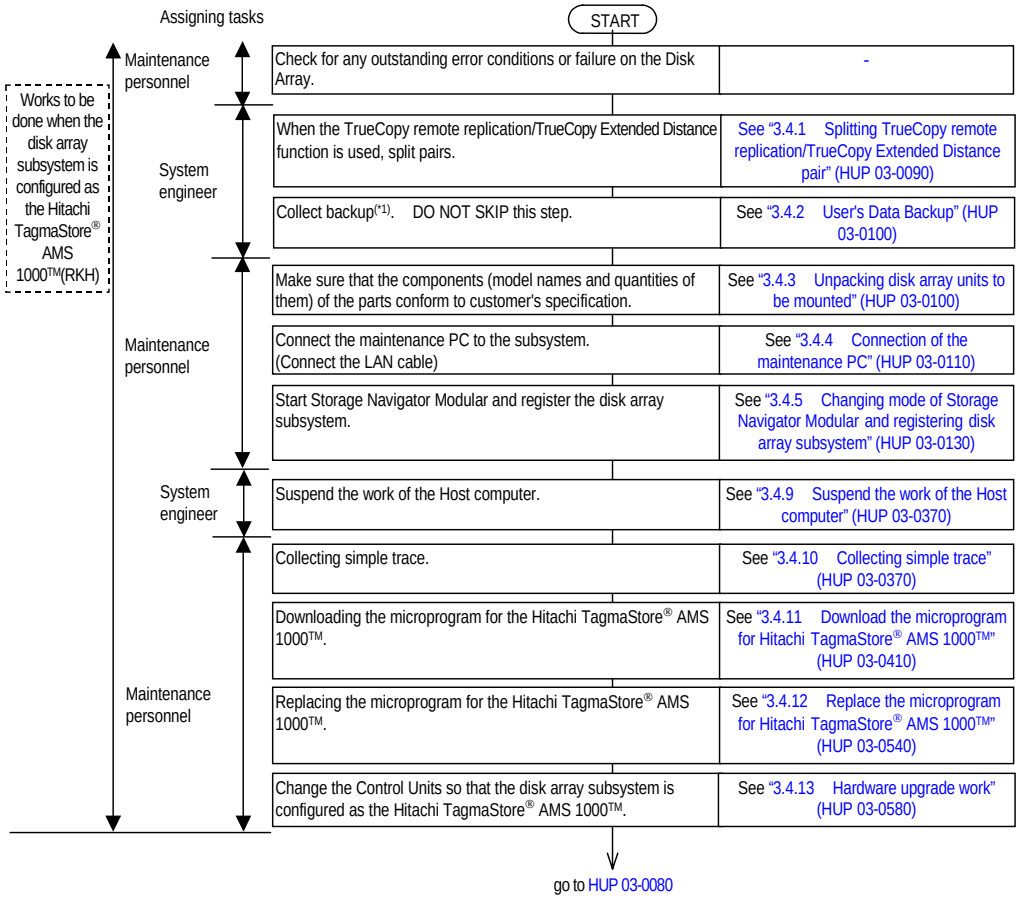
Copyright © 2006, Hitachi, Ltd.



(a) Upgrade work online (a status that the I/O with the host is not stopped)

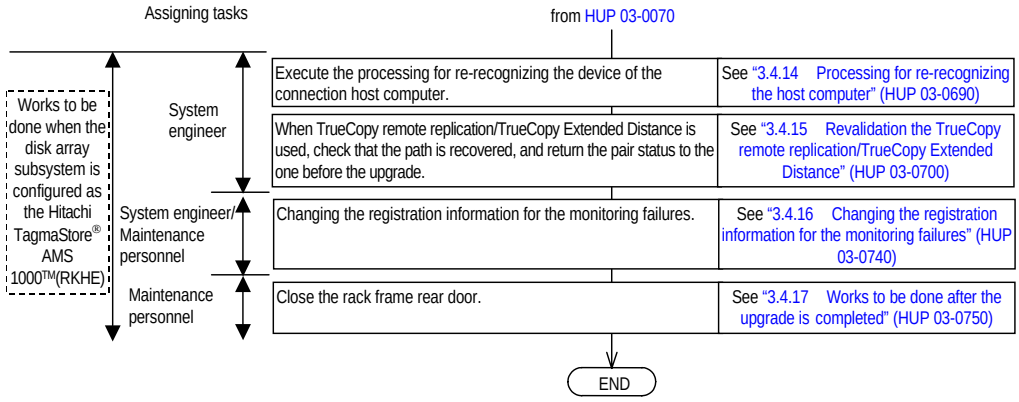
Perform the upgrade work according to the following procedure.

*1 : Maintenance personnel should check if customer has executed user data backups. Without the backups, the upgrade cannot be executed.



Copyright © 2006, Hitachi, Ltd.

Copyright © 2006, Hitachi, Ltd.

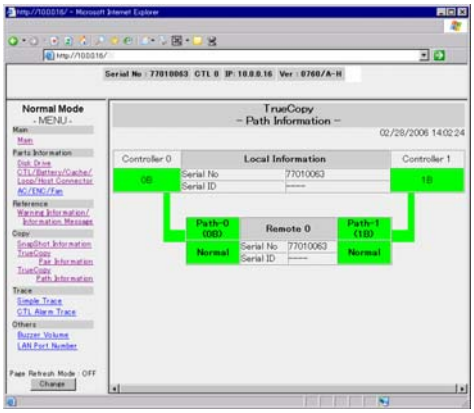


(b) Upgrade work offline (a status that the I/O with the host is stopped)

Perform the upgrade work according to the following procedure.

*1 : Maintenance personnel should check if customer has executed user data backups. Without the backups, the upgrade cannot be executed.

Copyright © 2006, Hitachi, Ltd.



Copyright © 2006, Hitachi, Ltd.

3.4.1 Splitting TrueCopy remote replication/TrueCopy Extended Distance pair

This operation is not required when Hitachi TrueCopy remote replication/TrueCopy Extended Distance is not used.
When making the upgrade leaving TrueCopy remote replication/TrueCopy Extended Distance enabled, a pair splitting must be done.
The procedure is shown below.

(1) Check if the path status is normal using the WEB.
Procedure for Confirming Log Messages:
It switched to the following window by clicking the remote path icon of [] on the main window, and the details of the path status are displayed.
It also switches to the following window by clicking [TrueCopy Path Information] of the menu frame on the main window, and the details of the path status are displayed.
For the maintenance operation for replacement and the recovery method, perform the recovery according to (Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1360)).

(2) Execute the pairsplit command, perform the pair split, and check that the change to PSUS/SSUS is completed.
It explains the method to split the pair of TrueCopy remote replication/TrueCopy Extended Distance.
(a) Set the group name in the configuration definition file as "vg01." Split the TrueCopy remote replication/TrueCopy Extended Distance pair in the PAIR status with the pairsplit command.

```
c:¥horcm¥etc>pairsplit –g vg01
```

Copyright © 2006, Hitachi, Ltd.

(b) Make sure of the status and configuration of the pair that has been split by executing the pairsplit command.

```
c:¥horcm¥etc>pairdisplay –g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)    (CL1-A , 1,  1)   174     1..P-VOL PSUS NEVER ,  175     2  -
vg01     oradb1(R)    (CL1-B , 1,  2)   175     2..S-VOL SSUS NEVER ,-----     1  -
```

The pair of TrueCopy remote replication/TrueCopy Extended Distance could be split. Refer to Chapter 4 of "RAID Manager System Administrator's Guide (TagmaStore® AMS/WMS series)" for the details of the pairsplit command and the option.

3.4.2 User's Data Backup

There is the possibility of loss of user data if the upgrade procedures fail. To prepare for an emergency, all the Disk Drive data mounted on Hitachi TagmaStore® AMS 1000™ should be backed up.

NOTE : Maintenance personnel must check if customers have executed users' data backups.

3.4.3 Unpacking disk array units to be mounted

Unpack the Control Unit to be mounted to compose the configuration of the Hitachi TagmaStore® AMS 1000™(RKHE). The procedure is shown below.

(1) Unpacking the Control Unit.

NOTE : • Unpack it indoor.
Especially, do not unpack it in such places with the outdoor dust, the direct sunlight, and the infiltration of rain water.
• Work on the unpacking in the place where a rapid difference of temperature does not occur.
It may have dew condensation when it is unpacked in the place where a difference of temperature is extreme.

(2) Check the contents of the package

(a) Check if the contents of the Upgrade kit (their model names, product serial numbers, and quantities) agree with those in the packing list.

Copyright © 2006, Hitachi, Ltd.

3.4.4 Connection of the maintenance PC

Connect the maintenance PC to the disk array subsystem.
The procedure is shown below.

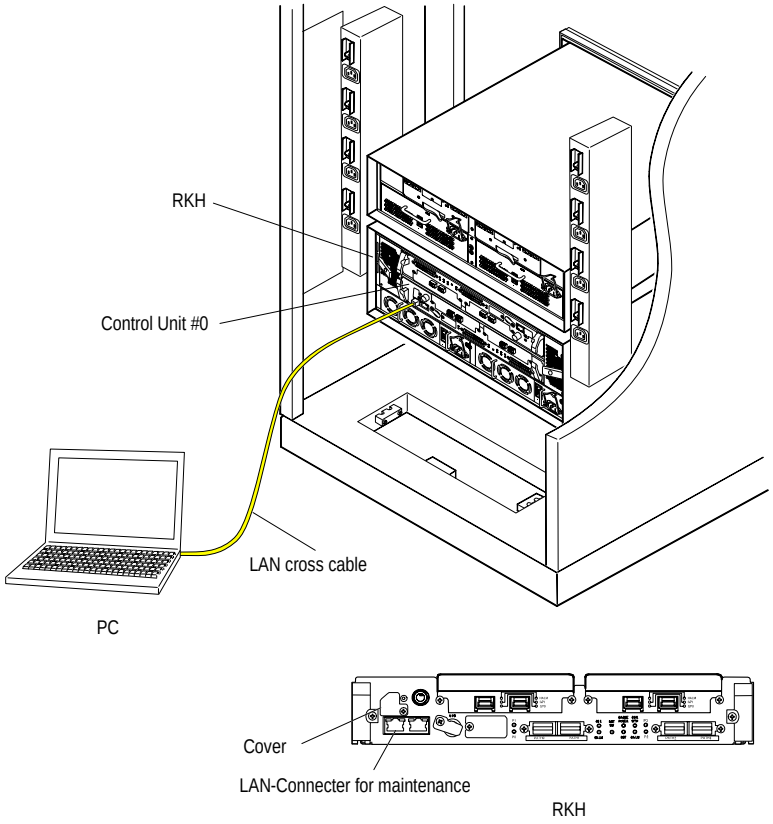
(1) Checking the LAN environment setting

(a) Make sure that the Storage Navigator Modular has been installed. (Make sure that the activation file startsnm.bat exists.)

(b) Check the LAN environment setting for the PC

- Make sure that the following settings have been made, or change the settings to the following.
  For the maintenance PC, set the IP address to 10.0.0.xxx as shown in No. 1.
  If the maintenance PC cannot establish a connection, set the value to shown in No.2 to 5.
  If not connected yet, refer to Maintenance Manual Troubleshooting "3.4 Procedure for specifying maintenance port IP address" (TRBL 03-0100).

No.	Subsystem (LAN maintenance port)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 10.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL0 : 192.168.233.16 CTL1 : 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL0 : 172.23.211.16 CTL1 : 172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL0 : 10.197.181.16 CTL1 : 10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0



- Manual change of the network parameter of the Maintenance port
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.

NOTE: However, when the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
The network address set to the maintenance port cannot be used for the LAN device to be connected to the User management port via the Gateway.
Therefore, use a network address other than that set for the maintenance port.

Copyright © 2006, Hitachi, Ltd.

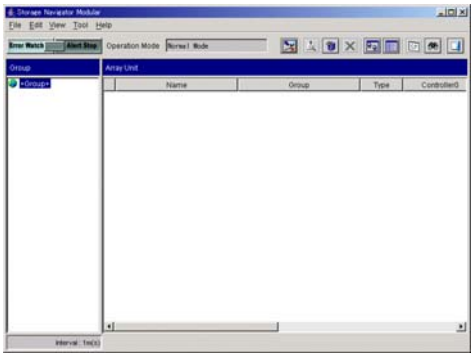
(2) Connecting the LAN cross cable0

Remove the cover on the Control Unit. Connect the LAN-Connecter for maintenance and the LAN-Connecter of Maintenance PC with a LAN-cross-cable.

*1 : The system configuration of the Fibre Channel interface is shown as an example.

Figure 3.4.1 Connecting the LAN Cross Cable

Copyright © 2006, Hitachi, Ltd.



3.4.5 Changing mode of Storage Navigator Modular and registering disk array subsystem

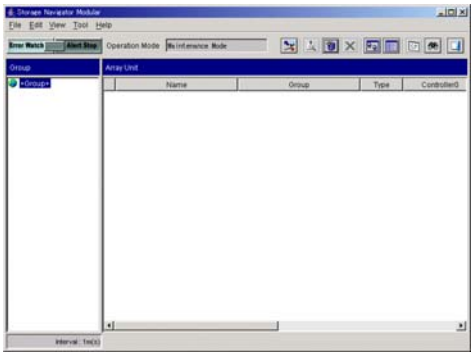
Register the disk array subsystem using Storage Navigator Modular.
The procedure is shown below.

(1) Activating the Storage Navigator Modular

(a) Execute the batch file or shell script for activating the Storage Navigator Modular.
In the case of Windows®, activate the batch file, startsnm.bat.

(b) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed(‡1).

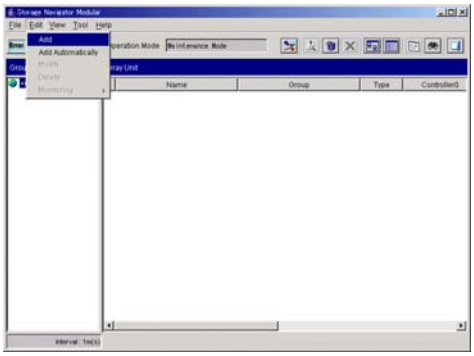
In the case of Windows®, the prompt window is also displayed.
The prompt window has nothing to do with operation of Storage Navigator Modular. But don't close the prompt screen. It is unusually finished.
The icon can be minimized automatically when "Program Quitting" is selected from the properties of the batch file.



‡1 : The mode change cannot be done at the time of the initial activation of the Storage Navigator Modular. A registration of a password validates the mode change.

Copyright © 2006, Hitachi, Ltd.

(2) Change the Operation Mode from the Normal Mode to the Maintenance Mode.

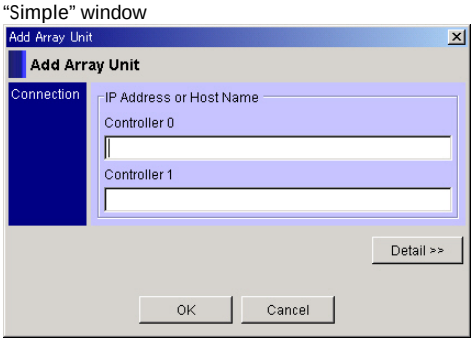


(a) In the main window, position the focus ([ ]) on the icon [ ] of the array subsystem register by pressing the [Tab] key, and then press the [Ctrl], [Shift], and [E] keys at the same time.

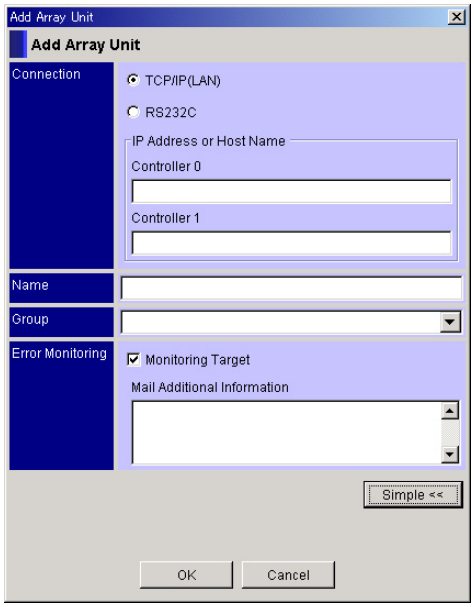
Maintenance Mode is displayed in the Operation Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.

(3) Registering the disk array subsystem

(a) Select [Add] in the main window or click [: Add].



Copyright © 2006, Hitachi, Ltd.



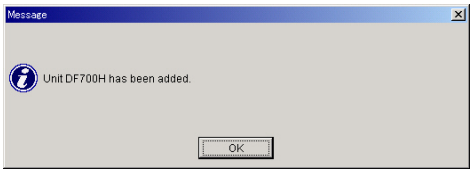
(b) Enter the information for the registration and click the [OK] button. Alternative, click the [Detail] button.

NOTE : • The disk array subsystem with the dual system can also be used with a single Controller only. For [IP Address, Host Name, or Device Name], enter information of the Controller connected to the maintenance PC.
• Enter the IP address only in the Control Unit to which the LAN cable is connected. If the IP address is entered in a Control Unit to which the LAN cable is not connected, an error is caused.

"Simple" window

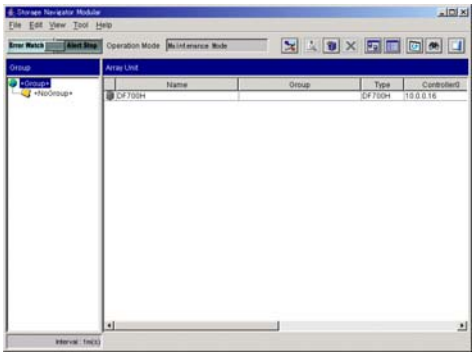
"Detail" window

[Connection] : Select "TCP/IP (LAN)" connection to be used for the disk array subsystem.



[Name] : Specify a disk array subsystem name to be registered. Specify it with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _).

[Group] : Specify group names when applying group control to the disk array subsystems. Specify each of them with16 or less half size alphabetic characters, numerals, and/or symbols (- and/or _). The maximum number of the groups allowed to be registered is 200. The entrance of the group names is not necessary when the group control is not applied to the disk array subsystems.



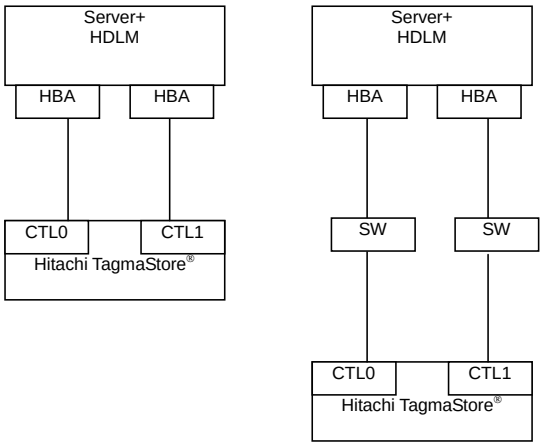
[Error Monitoring] : Set whether to apply the failure monitoring or not.
Checking off the box : The failure monitoring is applied.
Not checking off the box : The failure monitoring is not applied.

Copyright © 2006, Hitachi, Ltd.

(c) When a message informing of a completion of the registration is displayed, click the [OK] button.

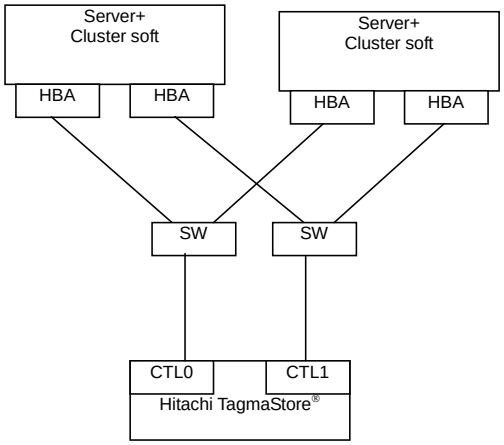
(d) The updated main window is displayed.

When an entry has been made in [Group Name], the group name is displayed in the tree diagram on the right side of the window. A clicking on the group name displays an icon(s) of the disk array subsystem(s) registered in the group.
The icons of the disk array subsystem are displayed in the order of the registration of the disk array subsystems.



Copyright © 2006, Hitachi, Ltd.

3.4.6 Setting check of the host computer



(1) When HP-UX+HDLM, Solaris+HDLM, AIX+HDLM, or Windows+HDLM is used

(a) System Configuration

If the system is configured as shown below, the replacement of an online microprogram/Control Unit are possible.

- Two or more HBAs (Host Bus Adapters) must be installed.
- Paths connect to an individual Control Unit.
- The HDLMs must be set correctly and all the paths must be monitored normally.
- If the TagmaStore® has a boot disk, the built-in disk needs to be mirrored by software because the subsystem cannot set an alternative path to rootdg.

- The cluster lock disk should not be stored in the Hitachi TagmaStore®.

Copyright © 2006, Hitachi, Ltd.

(b) Cautions

Always follow the cautions and restrictions shown below.

- The HDLM must run normally on all the servers connected to the Hitachi TagmaStore® and all the paths to the LUs (Logical Units) must be duplicated by the HDLM. If there are any LUs whose path is not duplicated, replace the microprogram/Control Unit after dismounting it beforehand.
- All the paths must be normal. If a failure is found on the path, replace the microprogram/Control Unit after recovering the failure.
- Replace the microprogram on the Control Unit #0, and then replace the microprogram on the Control Unit #1. The reverse order of the replacement is possible.

(c) Host side parameters

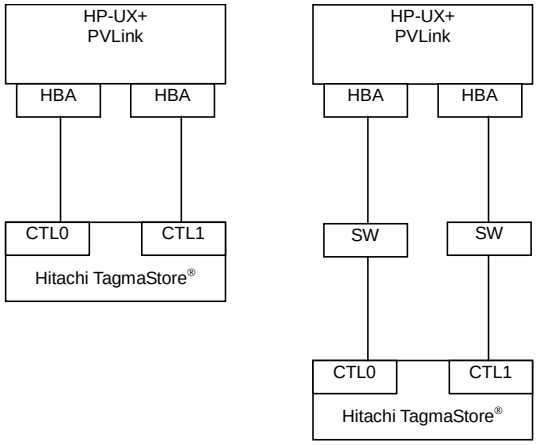
- For OS:
  Refer to the software data attached to HDLM, "Application OS (Operating System)/Application Models".
- For HBA and drivers:
  Refer to the software data attached to HDLM, "Application OS (Operating System)/Application Models".
- For HDLM:
  Refer to the user's guide, the software data attached or the hardware notes.

(d) Procedure for replacement

Perform the microprogram replacement or the Control Unit replacement following the procedure explained below.

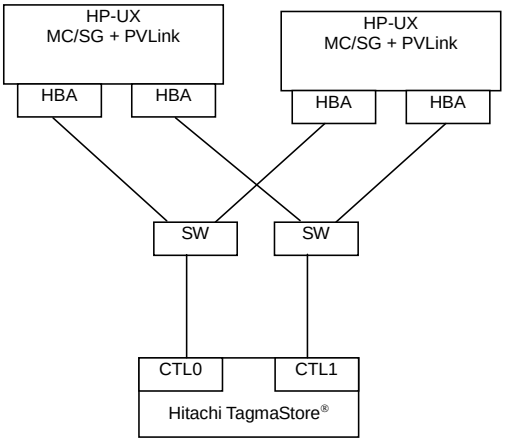
Take notice that the version of Storage Navigator Modular must be 6.00 or later.

(i) Do the following works before starting the microprogram replacement or the Control Unit replacement.



- The system parameters for the Hitachi TagmaStore® are set correctly.
- The parameters for the OS, HBA, or path switching software are set correctly.
- The alarm/warning light on the Hitachi TagmaStore®, the host or the switch does not light up.
- In case of a direct connection, a port on the Hitachi TagmaStore® is linked up with the system. In case of a switch connection, a port on the switch is linked up.
- An initial copy or resynchronization is not running in the ShadowImage in-system replication, Copy-on-write SnapShot, TrueCopy remote replication, or TrueCopy Extended Distance.
- Connect the Storage Navigator Modular and download the microprogram to be replaced.

Copyright © 2006, Hitachi, Ltd.



(2) When HP-UX+PVLink is used

(a) System Configuration

If the system is configured as shown below, the replacement of an online microprogram/Control Unit are possible.

- Two or more HBAs (Host Bus Adapters) must be installed.
- Paths connect to an individual Control Unit.
- The PVLinks must be set correctly and all the paths must be monitored normally.

- The cluster lock disk should not be stored in the Hitachi TagmaStore®.

Copyright © 2006, Hitachi, Ltd.

(b) Cautions

Always follow the cautions and restrictions shown below.

- The PVLink must run normally on all the HP-UX servers connected to the disk array subsystem and all paths to the LUs (Logical Units) are to be duplicated by the PVLink. If there are any LUs whose path is not duplicated, replace the microprogram/Control Unit after dismounting it beforehand.
- All the paths must be normal. If a failure is found on the path, replace the microprogram/Control Unit after recovering the failure.
- Replace the microprogram on the Control Unit #0, and then replace the microprogram on the Control Unit #1. The reverse order of the replacement is possible.

(c) Host side parameters

- HP-UX 11i, 11.0, and 10.20:

  No specific settings are provided.
- HBA and drivers:

  No specific settings are provided.

No.	HBA	Driver
1	A3404A (HT-F3360-FC2)	Bundle
2	A3591B (HT-F3360-FC3)	Bundle
3	A3636A (HT-F3360-FC1)	Bundle
4	A3740A (HT-F3360-PC5)	Bundle
5	A5158A (HT-F3360-PC5A)	Bundle
6	A6795A (HT-F3360-PCFC)	Bundle

- PVLink:

  Set the values of two parameters as shown in the following table during the online microprogram/Control Unit replacement, and return the values to the original values when the microprogram/Control Unit replacement is completed.

No.	Parameters	Default Value	Setting Information
1	IO Timeout value displayed by executing the "pvdisplay /dev/dsk/cxtxdx" command(*1).	default (30 seconds)	Check by syslog that the application retries in the Timeout value shown left.(*2)
2	Autoswitch value displayed by executing the "pvdisplay /dev/dsk/cxtxdx" command(*3)	On	Check that the path switching is valid.(*2)

*1: To change the IO Timeout value to 60 seconds, execute the [pvchange –t 60 /dev/dsk/cxtxdx] command.

*2: If the [tail –f /var/adm/syslog/syslog.log] command is executed, the retry information is displayed. Keep it displayed all the time during the operation.

*3: To change the Autoswitch value to On, execute the [pvchange –S y /dev/dsk/cxtxdx] command (the setting can be changed online).

Copyright © 2006, Hitachi, Ltd.

(d) Procedure for replacement

Perform the microprogram replacement or the Control Unit replacement following the procedure explained below.

Take notice that the version of Storage Navigator Modular must be 6.00 or later.

(i) Do the following works before starting the microprogram replacement or the Control Unit replacement.

- The system parameters for the Hitachi TagmaStore® series are set correctly.
- The parameters for the OS, HBA, or path switching software are set correctly.
- The alarm/warning light on the Hitachi TagmaStore®, the host or the switch does not light up.
- In case of a direct connection, a port on the Hitachi TagmaStore® is linked up with the system. In case of a switch connection, a port on the switch is linked up.
- An initial copy or resynchronization is not running in the ShadowImage in-system replication, Copy-on-write SnapShot, TrueCopy remote replication, or TrueCopy Extended Distance.

(ii) Log in as a user having the root authorization in HP-UX, and execute the [vgdisplay /dev/dsk/c?t?d] command.

Execution example of IO Timeout value change:

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        default
Autoswitch                  On
```

The default is 30 seconds and the host I/O may stop during the microprogram replacement/Control Unit replacement, so that be sure to change it to 60 seconds or more.

Copyright © 2006, Hitachi, Ltd.

Execution example of IO Timeout value change:

```
# pvchange -t 60 /dev/dsk/c11t0d1
Physical volume "/dev/dsk/c11t0d1" has been successfully changed.
Volume Group configuration for /dev/vg02 has been saved in /etc/lvmconf/vg02.conf

# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        60
Autoswitch                  On
```

Change the IO Timeout value to 60 seconds.

Check that the IO Timeout value was changed to 60 seconds.

Execute the [vgdisplay /dev/dsk/c?t?d?] command.

Execution example of Autoswitch value change:

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        60
Autoswitch                  Off
```

If the Autoswitch value is Off, it needs to be changed to On.

Copyright © 2006, Hitachi, Ltd.

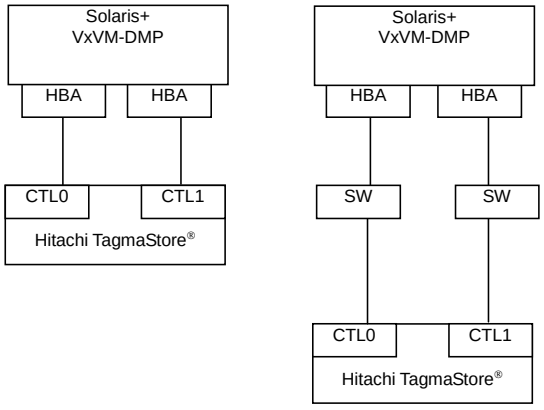
When "Off" is specified for Autoswitch, execute the [pvchange –S y /dev/dsk/c?t?d?] command.

Execution example of Autoswitch value change:

```
# pvchange -S y /dev/dsk/c11t0d1
Physical volume "/dev/dsk/c11t0d1" has been successfully changed.
Volume Group configuration for /dev/vg02 has been saved in /etc/lvmconf/vg02.conf

# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        60
Autoswitch                  On
```

Change the Autoswitch to On.



Check that the Autoswitch was changed to On.

(3) When Solaris+VxVM-DMP is used

(a) System Configuration

If the system is configured as shown below, the replacement of an online microprogram/Control Unit is possible.

- Two or more HBAs (Host Bus Adapters) must be installed.
- Paths connect to an individual Control Unit.
- The VxVM-DMPs must be set correctly and all the paths must be monitored normally.

Copyright © 2006, Hitachi, Ltd.

(b) Cautions

Always follow the cautions and restrictions shown below.

- The VxVM-DMP must run normally on all the Solaris servers connected to the disk array subsystem and all paths to the LUs (Logical Units) are to be duplicated by the VxVM-DMP. If there are any LUs whose path is not duplicated, replace the microprogram/Control Unit after dismounting it beforehand.
- All the paths must be normal. If a failure is found on the path, replace the microprogram/Control Unit after recovering the failure.
- Replace the microprogram on the Control Unit #0, and then replace the microprogram on the Control Unit #1. The reverse order of the replacement is possible.

(c) Host side parameters

- Solaris 2.6, 7, 8 and 9:

  No specific settings are provided.
- HBA and drivers:

  The following setup is necessary for JNI-made FCE-1063/FCE-6410 (driver 4.1.3).

No.	Parameters	Default Value	Setting Information
1	FcPortCfgEnable	0	1
2	FailoverDelay	0	30

  No specific settings are provided for other HBAs.
- VxVM-DMP:

  No specific settings are provided.

(d) Procedure for replacement

Perform the microprogram replacement or the Control Unit replacement following the procedure explained below.

Take notice that the version of Storage Navigator Modular must be 6.00 or later.

(i) Do the following works before starting the microprogram replacement or the Control Unit replacement.

- The system parameters for the Hitachi TagmaStore® series are set correctly.
- The parameters for the OS, HBA, or path switching software are set correctly.
- The alarm/warning light on the Hitachi TagmaStore®, the host or the switch does not light up.
- In case of a direct connection, a port on the Hitachi TagmaStore® is linked up with the system. In case of a switch connection, a port on the switch is linked up.
- An initial copy or resynchronization is not running in the ShadowImage in-system replication, Copy-on-write SnapShot, TrueCopy remote replication, or TrueCopy Extended Distance.
- Connect the Storage Navigator Modular and download the microprogram to be replaced.

3.4.7 Confirm the online status of the host computer

(1) When HP-UX+HDLM, Solaris+HDLM, AIX+HDLM, or Windows+HDLM is used

Log in the server as a user with the root authority and execute the [dlnkmgr view –path] command.

In the case of Windows, open the command prompt window and execute the [dlnkmgr view –path] command.

• In the case of HP-UX

Execution example:

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus    IO-Counts    IO-Errors
Online        310          0

PathID    PathNameDskName ···        ChaPort   Status    Type ···
000000    ···        HITACHI DF700F  0A        Online    Own
000001    ···        HITACHI DF700F  1A        Online    Non
:         :          :               :         :         :
```

• In the case of Solaris

Execution example:

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000016 OnlinePaths:000016
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID    PathNameDskName ···        ChaPort   Status    Type ···
000000    ···        HITACHI DF700F  0A        Online    Own
000001    ···        HITACHI DF700F  1A        Online    Non
:         :          :               :         :         :
```

• In the case of AIX

Execution example:

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID    PathNameDskName ···        ChaPort   Status    Type ···
000000    ···        HITACHI DF700F  0A        Online    Own
000001    ···        HITACHI DF700F  1A        Online    Non
:         :          :               :         :         :
```

Copyright © 2006, Hitachi, Ltd.

• In the case of Windows

Execution example:

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000006
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID   PathNameDskName ···          ChaPort  Status   Type ···
000000   ···         HITACHI DF700F   0A       Online   Own
000001   ···         HITACHI DF700F   1A       Online   Non
:        :           :                :        :        :
```

Make sure that values of the [Paths:] and [Online Paths:] are the same.
Next, make sure that descriptions in the [Status] column for all the paths are “Online”.
When at least one path has a failure, interrupt the microprogram/Control Unit replacement and take a recovery action.

NOTE : If multiple OS are connected, perform the operations on all the servers connected to the disk array subsystem that the microprogram/Control Unit is to be replaced.

Copyright © 2006, Hitachi, Ltd.

(2) When HP-UX+PVLink is used

Log in as a user having the root authorization in HP-UX, and execute the [vgdisplay –v vg??] command. "??" indicates VolumeGroup numbers.

Execution example:

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0

   --- Logical volumes ---
   LV Name                  /dev/vg02/lvol1
   LV Status                available/syncd
   LV Size (Mbytes)         1000
   Current LE               250
   Allocated PE             250
   Used PV                  1

   --- Physical volumes ---
   PV Name                  /dev/dsk/c83t0d0
   PV Name                  /dev/dsk/c24t0d0 Alternate Link
   PV Status                available
   Total PE                 511
   Free PE                  11
   Autoswitch               On
```

Record the initial status.

Check that two or more [PV Names] of [Physical volumes] are displayed and at least one path is displayed as [Alternate Link].

If any path has a failure, suspend the microprogram/Control Unit replacement and recover the failure. Also, record the PV Name of the active path. [/dev/dsk/c83t0d0] is the active path in the above figure.

NOTE : If multiple OS are connected, perform the operations on all the servers connected to the disk array subsystem that the microprogram/Control Unit is to be replaced.

Copyright © 2006, Hitachi, Ltd.

(3) When Solaris+VxVM-DMP is used

Log in as a user having the root authorization in Solaris, check the device through the "vxdisk list" command and execute the "vxdisk list cXtYdZs2" command (cXtYdZs2 is a device file).

Execution example:

```
V880-1# vxdisk list
DEVICE          TYPE      DISK          GROUP          STATUS
c1t0d0s2        sliced                                 error

3.4.8 Resetting of the host computer

(1) When HP-UX+HDLM, Solaris+HDLM, AIX+HDLM, or Windows+HDLM is used

(a) Execute the [dlnkmgr online] command and change the offline path to the online status.

• In the case of HP-UX

```
Execution example:
# /opt/DynamicLinkManager/bin/dlnkmgr online

Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name = online
```

• In the case of Solaris

```
Execution example:
# /opt/DynamicLinkManager/bin/dlnkmgr online

Execute command?
[y/n] : y
KAPL01022-I The eight paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name = online
```

• In the case of AIX

```
Execution example:
# /usr/DynamicLinkManager/bin/dlnkmgr online

Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name = online
```

• In the case of Windows

```
Execution example:
# dlnkmgr online

Execute command?
[y/n] : y
KAPL01022-I The three paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name = online
```

Copyright © 2006, Hitachi, Ltd.

(b) Execute the [dlnkmgr view -path] command.

• In the case of HP-UX

Execution example:

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus    IO-Counts    IO-Errors
Online        310          0

PathID   PathNameDskName ···        ChaPort  Status    Type ···
000000   ···      HITACHI DF700F    0A       Online    Own
000001   ···      HITACHI DF700F    1A       Online    Non
:        :        :                 :        :         :
```

• In the case of Solaris

Execution example:

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000016 OnlinePaths:000016
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID   PathNameDskName ···        ChaPort  Status    Type ···
000000   ···      HITACHI DF700F    0A       Online    Own
000001   ···      HITACHI DF700F    1A       Online    Non
:        :        :                 :        :         :
```

• In the case of AIX

Execution example:

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID   PathNameDskName ···        ChaPort  Status    Type ···
000000   ···      HITACHI DF700F    0A       Online    Own
000001   ···      HITACHI DF700F    1A       Online    Non
:        :        :                 :        :         :
```

Copyright © 2006, Hitachi, Ltd.

• In the case of Windows

Execution example:

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000006
PathStatus    IO-Counts    IO-Errors
Online        334          0

PathID   PathName DskName ···          ChaPort  Status    Type ···
000000   ···      HITACHI DF700F       0A       Online    Own
000001   ···      HITACHI DF700F       1A       Online    Non
:        :        :                    :        :         :
```

Make sure that values of the [Paths:] and [Online Paths:] are the same.
Next, make sure that descriptions in the [Status] column for all the paths are “Online”.

NOTE : If multiple OS are connected, perform the operations on all the servers connected to the disk array subsystem that the microprogram/Control Unit is to be replaced.

Copyright © 2006, Hitachi, Ltd.

(2) When HP-UX+PVLink is used

(a) Execute the [vgdisplay –v vg??] command, and check that all the active paths returned to the initial status. "??" indicates VolumeGroup numbers.

Execution example:

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0

   --- Logical volumes ---
   LV Name                  /dev/vg02/lvol1
   LV Status                available/syncd
   LV Size (Mbytes) 1000
   Current LE               250
   Allocated PE             250
   Used PV                  1

   --- Physical volumes ---
   PV Name                  /dev/dsk/c83t0d0
   PV Name                  /dev/dsk/c24t0d0 Alternate Link
   PV Status                available
   Total PE                 511
   Free PE                  11
   Autoswitch               On
```

Record the initial status.

If the path is not returned, execute the [vgdisplay –v vg??] command every 30 seconds and check.

NOTE : If multiple OS are connected, perform the operations on all the servers connected to the disk array subsystem that the microprogram/Control Unit is to be replaced.

Copyright © 2006, Hitachi, Ltd.

(b) When the setting has been changed, return it to the default one.

Execution example of IO Timeout value change:

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        60
Autoswitch                  On
```

Execution example of IO Timeout value change:

```
# pvchange -t 0 /dev/dsk/c11t0d1
Physical volume "/dev/dsk/c11t0d1" has been successfully changed.
Volume Group configuration for /dev/vg02 has been saved in /etc/lvmconf/vg02.conf

# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        default
Autoswitch                  On
```

Return this value to the original value. It returns to the default value if “0” is specified.

Copyright © 2006, Hitachi, Ltd.

Execution example of Autoswitch value changes:

```
# pvchange -S n /dev/dsk/c11t0d1
Physical volume "/dev/dsk/c11t0d1" has been successfully changed.
Volume Group configuration for /dev/vg02 has been saved in /etc/lvmconf/vg02.conf

# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1   Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        60
Autoswitch                  Off
```

Return this value to the original value. Default is “On”.

Copyright © 2006, Hitachi, Ltd.

(3) When Solaris+VxVM-DMP is used

(a) Execute the [xdisk list cXtYdZs2]command, and check that all the paths returned to the owner Control Unit.

```
Execution example:
# vxdisk list c4t0d0s2
Device:       c4t0d0s2
devicetag: c4t0d0
type:         sliced
hostid:
disk:         name= id=1067933033.3997.V880-1
group:        name= id=1067933103.4030.V880-1
flags:        online ready private autoconfig
pubpaths:    block=/dev/vx/dmp/c4t0d0s4 char=/dev/vx/rdmp/c4t0d0s4
privpaths: block=/dev/vx/dmp/c4t0d0s3 char=/dev/vx/rdmp/c4t0d0s3
version:     2.2
iosize:       min=512 (bytes) max=256 (blocks)
public:       slice=4 offset=0 len=8217600
private:     slice=3 offset=1 len=38143
update:       time=1067993564 seqno=0.147
headers:     0 248
configs:     count=1 len=28130
logs:         count=1 len=4262
Defined regions:
 config     priv 000017-000247[000231]: copy=01 offset=000000 enabled
 config     priv 000249-028147[027899]: copy=01 offset=000231 enabled
 log          priv 028148-032409[004262]: copy=01 offset=000000 enabled
Multipathing information:
numpaths:     2
c4t0d0s2            state=enabled     type=primary
c5t1d0s2            state=enabled     type=secondary
```

The following message is displayed in the console window when the path returns.

```
Display example:
vxdmp: [ID 916426 kern.notice] NOTICE:
vxvm:vxdmp: enabled controller
/sbus@a,0/fcr@2,400000 connected to disk array ???
```

NOTE : If multiple OS are connected, perform the operations on all the servers connected to the disk array subsystem that the microprogram/Control Unit is to be replaced.

Copyright © 2006, Hitachi, Ltd.

3.4.9 Suspend the work of the Host computer

Suspend the work of the Host computer.

3.4.10 Collecting simple trace

Collect the simple trace and keep it so that in case of failure. It can be investigated. Collect the simple trace using the WEB.
The procedure is shown below.

(1) Before collecting the simple trace

(a) Items to be prepared

Collection is performed using the normal mode of WEB or Maintenance mode.
For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary.
For collecting the simple trace, disk space of 520 M bytes is required. (260 M bytes for temporary data and 260 M bytes for Full Dump data)
Under ordinary maintenance works, disk space of no less than 5 M bytes is required.

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN-cross-cable.

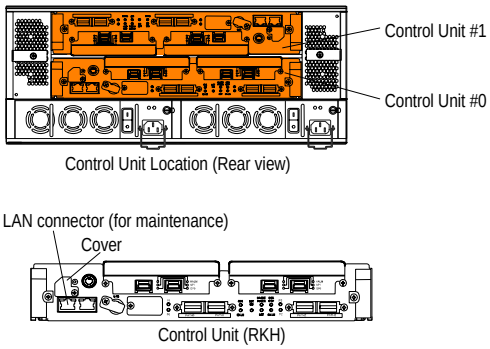

Figure 3.4.2 LAN Connector Position

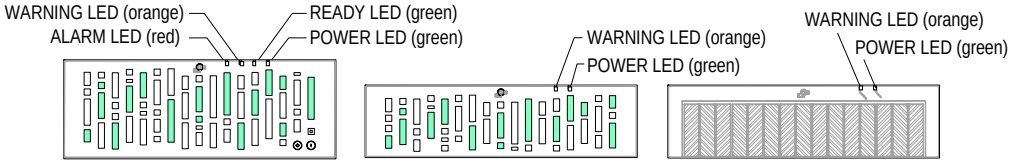


(c) With Simple Trace Collection, the information of both controllers can be collected from one controller. Therefore, this function does not need to be performed from both Controllers. (As a file name during the collection, “smpl_trc0.dat” is provided for the collection from Control Unit #0, and “simpl_trc1.dat” for the collection from Control Unit #1”.)

(d) Make sure that the WARNING LED (orange) on the Front Bezel is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

Copyright © 2006, Hitachi, Ltd.

(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.

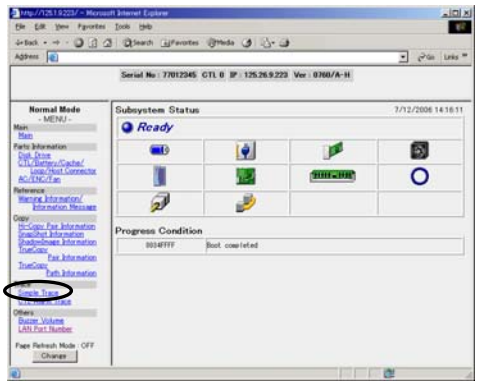
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] - [Cache] - [Clear Cache] in this order.

(a) Rackmount model of RKH (b) Rackmount model of RKAJ/RKAJAT (c) Rackmount model of RKA

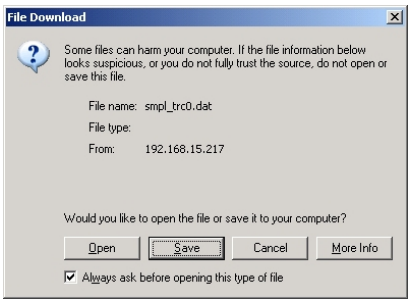
Figure 3.4.3 Indication Locations and Names of LED

(2) Procedure for a simple trace collection

(a) Enter the IP address of the LAN connector for maintenance, to which the service PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button. (For the procedure for connecting the Web, refer to Maintenance Manual Troubleshooting "Chapter 3. Before Starting WEB Connection" (TRBL 03-0000).)

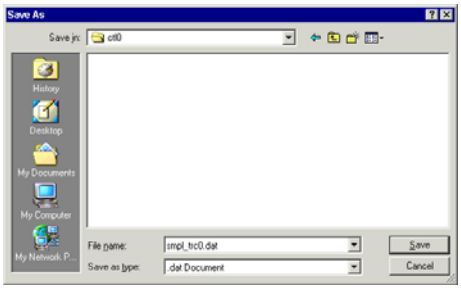


(b) When Windows XP Service Pack2 or Windows 2003 Service Pack1 is used in the OS of the maintenance PC, collect the simple trace after changing the setting of the following Internet Explorer.



- Select [Tools] - [Internet Options] from the Internet Explorer menu.
- Select the [Privacy] tab, check [Blocked pop-up] of [Pop-up block], and click the [Set] button.
- Set [Filter level] to [Medium] in the [Setting pop-up block] window and click the [Close] button.
- Select [OK] button in the [Internet Options] window.

Copyright © 2006, Hitachi, Ltd.



(c) Collect the simple trace according to the WEB and the following procedure.
Click “Trace” in the menu frame of “Simple Trace”.

(d) The following dialog is displayed.
Click the [Save] button.

(e) Select the place to save the file and file name (Default file name: CTL#0:smpl_trc0.dat, CTL#1: smpl_trcl.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed.

‡1 : There may be a case where the default file name is given as “ctla_trc0.dat..dat” depending on the setting of the PC. In this case, reset the file name to “ctla_trc0.dat” or any other name.

Copyright © 2006, Hitachi, Ltd.

In this procedure Simple trace is collected by WEB Normal mode. Similarly, Simple trace can be collected by WEB Maintenance mode through Menu Frame.
For entering Maintenance mode, refer to the Maintenance Manual WEB "3.1 Transferring to the Maintenance Mode" (WEB 03-0000).

When the USB memory needs to store the simple trace information, refer to Maintenance Manual Troubleshooting "7.8 Storing simple trace information in the USB memory" (TRBL 07-0300).

Copyright © 2006, Hitachi, Ltd.

3.4.11 Download the microprogram for Hitachi TagmaStore® AMS 1000™

Download the microprogram for the Hitachi TagmaStore® AMS 1000™ (0760/A-H or later) using the Storage Navigator Modular.

The procedure is shown below.

(1) Preparation for update installation of microprogram

(a) Set up the maintenance PC before starting the update installation.

The setting up is completed when the installer stored in the CD-ROM of the microprogram is executed.

Outline of the setting up is shown below.

- Installation of the JRE 1.3.1_03
- Setting of the security policy file
- Copying of the microprogram from the CD-ROM for the microprogram installation to the maintenance PC

(b) Prerequisites for setting up of a maintenance PC

Prerequisites concerning the user ID of Windows® are as follows.

- The user ID of Windows® at the time when the microprogram is installed in the maintenance PC must be identical with that at the time when a maintenance work is done.

A prerequisite of a drive for booting the OS of the maintenance PC

- The drive for booting the OS must be the C drive.

Copyright © 2006, Hitachi, Ltd.

(2) Hierarchy of Microprogram Storage Directories

The hierarchical structure of Microprogram storage directories is shown below.
The structure of directories of the CD-ROM for installing the Microprogram is the same as that shown below.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:\diskarray-microprogram\microprogram."
When installing the Microprogram, specify the unified version directory.

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	microprogram file	-	-

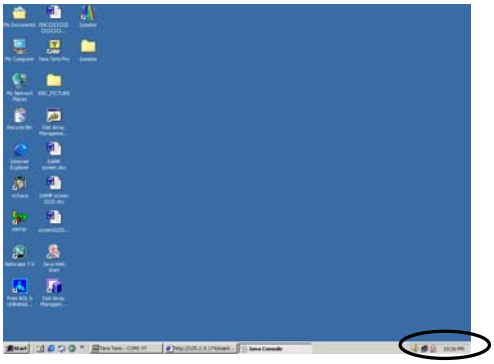
NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The Microprogram becomes unable to be installed if the directory name is changed.

Copyright © 2006, Hitachi, Ltd.

(a) Java error codes displayed at the time of update installation and actions for coping with them.

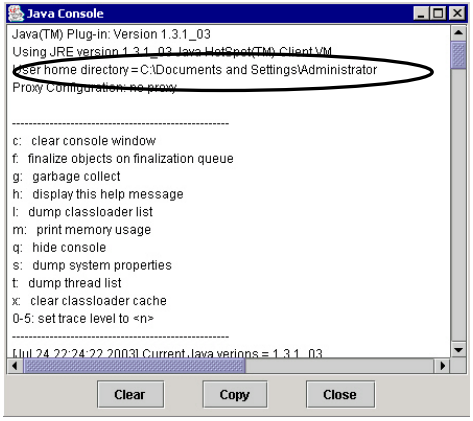
When the PC does not satisfy the prerequisite shown in Item (1)(b), a Java error occurs. Details of the Java errors and actions for coping with them are shown below.

Table 3.4.1 Java error codes



Message code	Message text	Time when the error occurs/ Cause estimated	Action for coping with the error
1216	Access to the property information was rejected. Confirm the setup of the security policy.	Time when the error occurs • The error occurs immediately after the [Select] key is pressed when the microprogram is selected. Cause estimated • A drive for booting the OS is not the c drive. • The user name of Windows® at the time when the microprogram was installed in the maintenance PC is not identical with that at the time when the microprogram is updated, or two-byte characters (full size characters or Japanese characters) are used to define the user name	① Check if the drive for booting the OS is the c drive. (Refer to the (i) of (2)(a) in Subsection 3.4.11) In the case of the dual boot, boot Windows® using the c drive and perform the installation again. ② Check if the user name of Windows® at the time when the microprogram is installed in the maintenance PC is identical with that at the time when the microprogram is updated and if two-byte characters (such as full size characters and Japanese characters) are not used. If an illegal specification has been made, perform the logon over again using an appropriate user name and perform the installation again after connecting the browser.
1219	An error occurred during the communication with the subsystem. Confirm the subsystem status and the LAN environment.	Time when the error occurs • The error occurs when the resource for the LAN cannot be ensured. Cause estimated • The error occurs because the resource (memory) of the maintenance PC is insufficient.	① Reboot the subsystem and the maintenance PC and quit unnecessary application programs. Make sure that the subsystem is in the READY status, place the subsystem in the Maintenance mode, and perform the installation again. ② If the error recurs in spite of the operations above, replace the maintenance PC and perform the installation over again from the beginning. Use a PC whose memory capacity is as large as possible.

Copyright © 2006, Hitachi, Ltd.



(i) Method for checking the drive for booting the OS

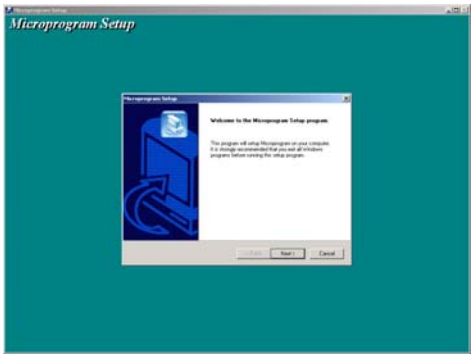
A method for checking the boot drive when the Java message (message code: 1216) is issued is shown below.

① Double click the [: Java icon]on the task tray at the bottom right in the Service PC window.

② Since the JavaConsole window opens, make sure that the [User Home Directory] is the c drive (=C: *****…).

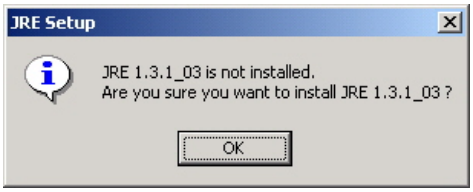
Copyright © 2006, Hitachi, Ltd.

(b) Procedure for setting up the maintenance PC



(i) Double click the "Program\micro upload\micro setup\Setup.exe" of the CD-ROM for microprogram installation.

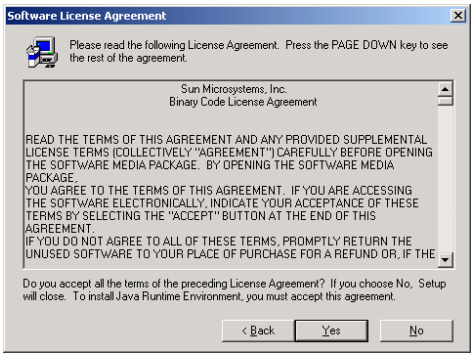
Deleted: ??



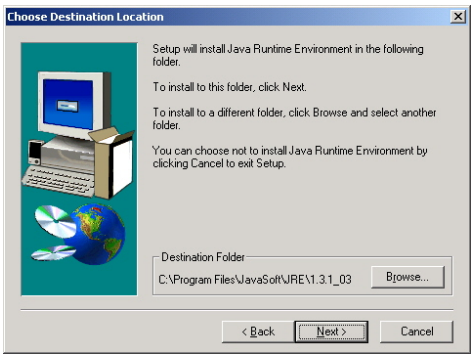
Deleted: ??

Deleted: ??

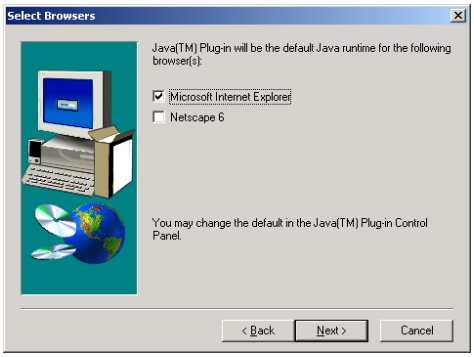
(ii) The initial window of the setting up appears.
When the [Next] button is pressed, the JRE 1.3.1_03 installer is activated in the case where the JRE 1.3.1_03 is not installed yet.
In the case where the JRE 1.3.1_03 has been installed, windows® shown in Steps (iii) to (vii) are not displayed.



(iii) A dialog box for asking confirmation of starting the JRE 1.3.1_03 installer. Click the [OK] button.

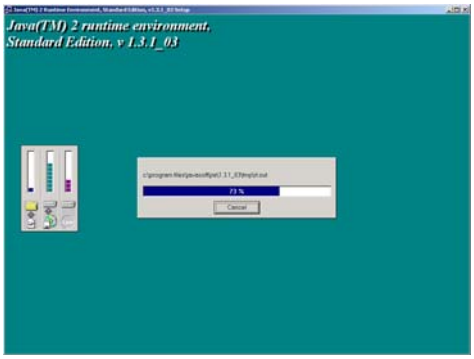


Copyright © 2006, Hitachi, Ltd.



(iv) A window of product licensing contract is displayed. Click the [Yes] button.

(v) A window for selecting a directory in which the JRE 1.3.1_03 is to be installed. Select the directory for the installation and click the [Next] button.

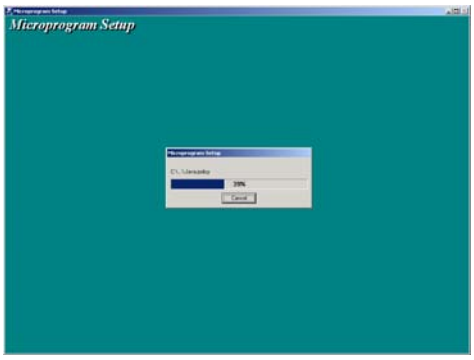


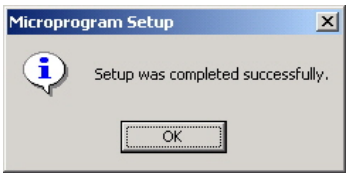
(vi) A window for specifying the Java default browser is displayed. Select the browser being used and click the [Next] button.

Copyright © 2006, Hitachi, Ltd.

(vii) Installation of the JRE 1.3.1_03 is started.

(viii)After the installation of the JRE 1.3.1_03 is completed, set the security policy file.
When the security policy file (.java.policy) exists in the home directory of the current user, a window for asking confirmation of starting the setting is displayed.
Click the [Yes] button.





Copyright © 2006, Hitachi, Ltd.

(ix) The microprogram is copied on the maintenance PC.

Create a directory to which the microprogram is to be copied directly under the "C:\diskarray-microprogram\microprogram" for each microprogram revision and copy the microprogram file with the subdirectories (DF700H, ENC, ---) into the directory.

(x) The setting up is completed. Press the [OK] button.

NOTE : • Note that the settings of the security policy file is changed when the maintenance PC is set up.
• If the microprogram is transferred to a directory other than "C:\diskarray-microprogram\microprogram" which is a directory copied by the installer, the installation cannot be done. Therefore, care should be taken.
• Do not change a name of the unified version directory(‡1) or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

‡1 : For the unified version directory, refer to "3.4.11 (2) Hierarchy of Microprogram Storage Directories" (HUP 03-0420).

Copyright © 2006, Hitachi, Ltd.

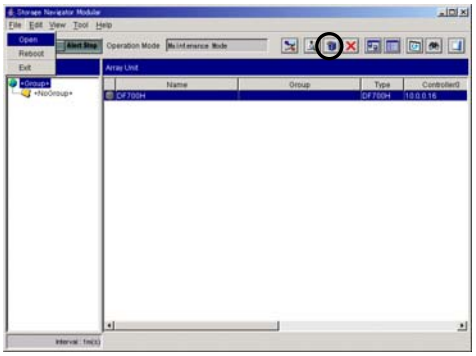
(3) Download the microprogram for the Hitachi TagmaStore® AMS 1000™ (0760/A-H or later).

(3-1) Procedure for download

(a) Matters to be made sure of before starting update installation.

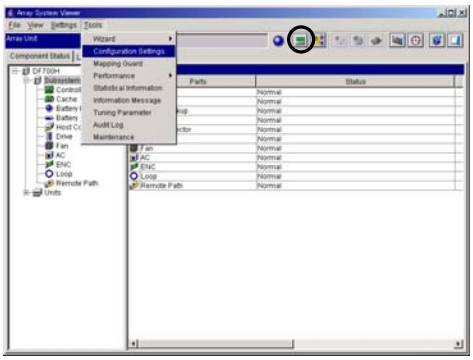
Make sure of the following before starting the update installation.

- Make sure that the main switch of the subsystem is turned on. If it is turned off, turn it on to start the subsystem.
- Check that the READY LED (green) on the Front Bezel of the Basic Chassis lights up. When the READY LED (green) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 60 minutes until it lights up because the automatic download of the ENC/SENC firmware is being executed. When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the update operation for the maximum of 30 to 85 minutes until the READY LED (green) on the front of the Basic Chassis lights up because the automatic download of the ENC/SENC firmware or the update of the flash program is being executed.
  Also, check that the WARNING LED (orange) on the Front Bezel does not light up.
- Also, check that the WARNING LED (yellow) on the Front Bezel does not light up or blink at low-speed. When it lights up or blinks at low-speed, connect it to WEB, and perform the maintenance according to the information message on WEB. After the recovery is made, install the microprogram in order to update it.
- Make sure that the system copy is not being executed through the information message (I140xy System copy started (x: Unit number, y: HDU number)) of the WEB.
  If it is in the middle of system copy, please wait until that is completed and update installation of microprogram.



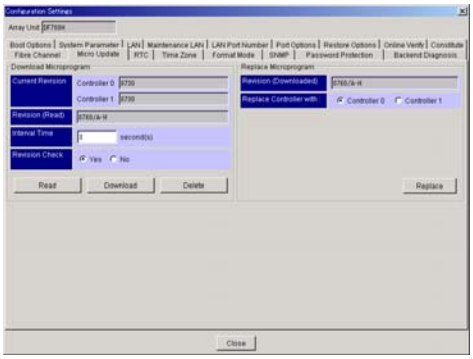
(b) Connect the LAN cross cable to the subsystem LAN connector for maintenance and connect the subsystem to the WEB. (See Subsection "3.4.4 (2) Connecting the LAN cross cable0" (HUP 03-0120).

(c) Start the Storage Navigator Modular and set the operation mode in the "Management Mode". (See Subsection "3.4.5 Changing mode of Storage Navigator Modular and registering disk array subsystem" (HUP 03-0130).)



Copyright © 2006, Hitachi, Ltd.

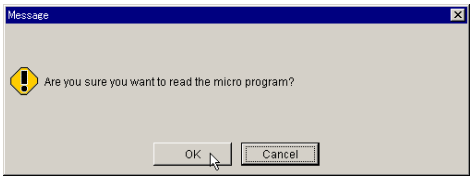
(d) Click an icon of the disk array subsystem you want to set in the main window.
There are three ways of the selection methods as shown below.



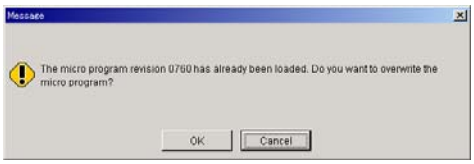
- Selecting [File] – [Open]
- Double-clicking an icon of the disk array subsystem you want to set
- Clicking [: Open]

(e) Select [Tools] – [Configuration Settings] in the unit window or click [: Configuration Settings] button.

(f) Click the [Micro Update] tab.

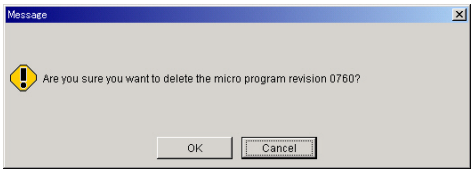


Copyright © 2006, Hitachi, Ltd.



(g) Read in the microprogram to the service PC in which Storage Navigator Modular is installed. Click the [Read] button.
When a microprogram revision is displayed in the [Revision(Read)] box, the microprogram has already been read in. When only the Unified version directory storing the microprogram is specified, the whole microprogram is read in automatically.

(h) Since a message asking for confirmation whether or not to read in the microprogram, click the [OK] button.

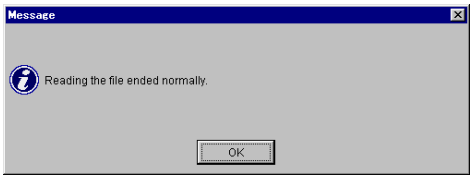


NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the download of the microprogram again from the beginning.

In the case where the microprogram has already been read in, the message asking for the confirmation is displayed. When you click the [OK] button, the microprogram is overwritten. When you abort the reading in, click the [Cancel] button.

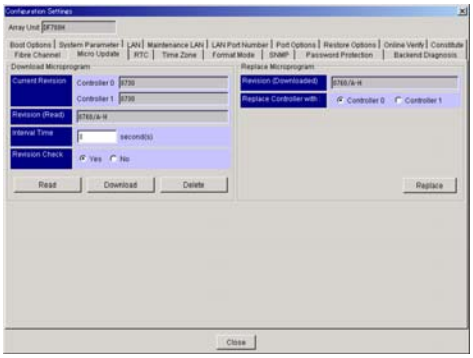
When you eliminate the microprogram that has already been read in to the computer, click the [Delete] button. Since the message asking for confirmation is displayed, click the [OK] button.

Copyright © 2006, Hitachi, Ltd.



(i) Since a window for specifying the directory in which the microprogram to be read in is stored is displayed, specify the Unified version directory. When you click the [OK] button, reading in of the microprogram is started.
Examples of the path entry are shown below.

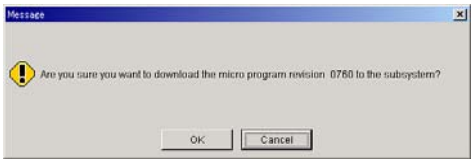
When using Windows®:



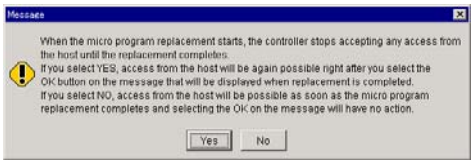
c:/diskarray-microprogram/microprogram/micro/0760A

Unified version directory in the hard disk in which the micro program is copied.

(j) Since a message is displayed when the reading in of the microprogram is completed, click the [OK] button.

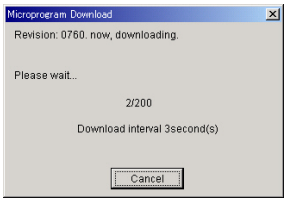


The revision of the microprogram that has been read in is displayed in the [Revision(Read)] box.

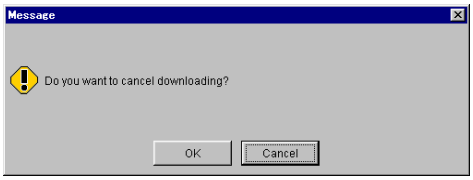


(k) Click the [Download] tab.

Copyright © 2006, Hitachi, Ltd.



(l) The confirmation window is display. Click the [OK] button.



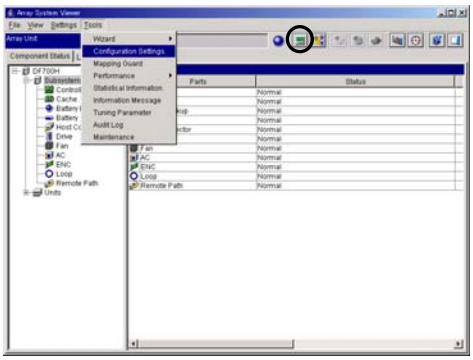
The confirmation window is display. Click the [Yes] button.

The download of the microprogram starts by clicking the [Yes] button, and the dialog is displayed.

When you abort the downloading, click the [Cancel] button.
A message asking for confirmation is displayed. When you click the [OK] button, the downloading is aborted.
When you click the [Cancel] button, the downloading is continued.

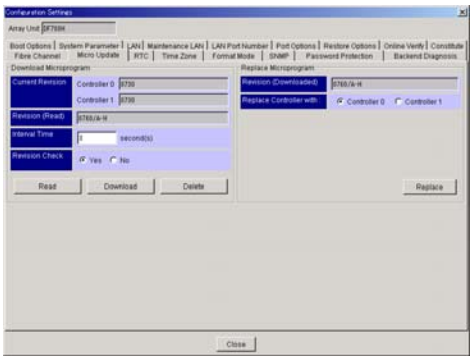
Copyright © 2006, Hitachi, Ltd.

(m) Since a message is displayed when the downloading is completed normally, click the [OK] button.



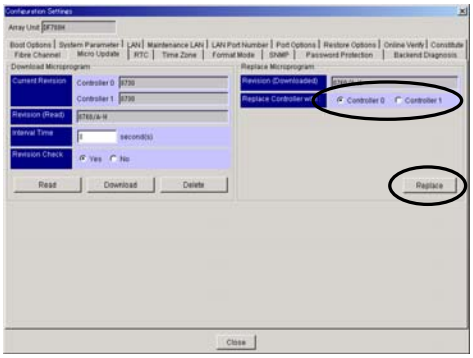
NOTE : After the microprogram is downloaded, be sure to restart the disk array subsystem or replace the microprogram. If the Control Unit board is replaced in the online mode before restarting the disk array subsystem or replacing the microprogram, the replaced Control Unit may be detached. When the subsystem is burdened with a heavy I/O load by a host at the time of the downloading, the downloading may be terminated abnormally. Perform the downloading again.

3.4.12 Replace the microprogram for Hitachi TagmaStore® AMS 1000™



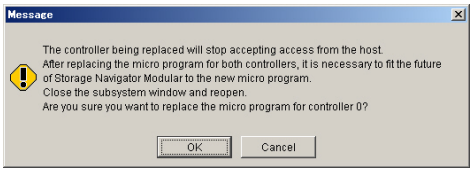
Replace the microprogram that was downloaded to the disk array subsystem with the microprogram installed in the Control Unit. When making replacement, be sure to replace the microprograms of the both Control Units 0 and 1. When the microprogram of one of the Control Units is replaced and the unit window of Storage Navigator Modular is closed, the unit window may be opened no more. When the unit window is not opened, replace the microprogram after changing the subsystem configuration by eliminating the IP address of the Control Unit whose microprogram has been replaced using an IP address of the Control Unit whose microprogram is not replaced yet.

(1) Select [Tools] – [Configuration Settings] in the unit window or click [ : Configuration Settings] button.

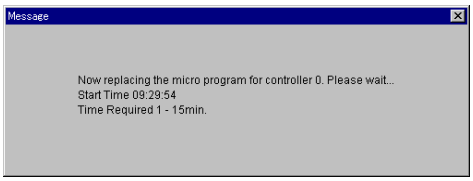


Copyright © 2006, Hitachi, Ltd.

(2) Click the [Micro Update] tab.



(3) Select the Control Unit whose microprogram is to be replaced and click the [Replace] button.



(4) The confirmation window is display. Check if the selected Control Unit is correctly displayed and click the [OK] button.

NOTE : When a LAN failure, etc. occurred and the processing of the Storage Navigator Modular terminated abnormally, execute the replace of the microprogram again from the beginning.

Copyright © 2006, Hitachi, Ltd.

↓

Click the [OK] button according to the dialog message.

(5) When the replacement of the microprogram terminates normally, a completion message is displayed. When the [OK] button is clicked, the revision of the replaced microprogram is updated and the window is displayed.

NOTE : When making the access from the host accepted by the instruction from Storage Navigator Modular, the following message may be displayed if it is not operated for 20 minutes or more in the case where Account Authentication is valid, and it may not be completed normally. Perform the dummy replacement (‡1) of the Control Unit whose microprogram was replaced to make the access from the host accepted.
If the access from the host is made accepted when the replacement of the microprogram is completed, the dummy replacement (‡1) is unnecessary.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2006, Hitachi, Ltd.

(6) After executing "3.4.8 Resetting of the host computer" (HUP 03-0300), update the microprogram of the other Control Unit as well in the procedure from "3.4.6 Setting check of the host computer" (HUP 03-0170).
When it is upgraded offline, perform the update of the microprogram in the other Control Unit also from "3.4.11 Downloading the microprogram for Hitachi TagmaStore® AMS 1000™" (HUP 03-0410).

NOTE : When the replacement of the microproram is made for only one of the dual Control Unit, the disk array subsystem is put in the status in which a warning is issued. The warning is called off when the other one of the dual Control Unit is replaced. When you replace the microprogram, be sure to make the replacement for the both Control Units continuously.

NOTE : Because TrueCopy remote replication/TrueCopy Extended Distance manages information stored in paired disk array subsystems, the path of the mate disk subsystem (not the subsystem being upgraded but the other one of the paired subsystems) is detached when TrueCopy remote replication/TrueCopy Extended Distance is used.
When the subsystem "B" shown in Figure 3.4.4 is upgraded, the path of the subsystem "A" is detached.
The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance.
This is because the "A" becomes unable to access the "B" as a result that the "B" is placed in the Maintenance mode. Therefore, this is not a problem.
However, when the pair status is changed to PSUE, there may have been a mistake in operations that have been made. Recover the pair from the PSUE status referring to Maintenance Manual Troubleshooting "6.3 Procedure for Recovery from Path Blockade when the TrueCopy remote replication/TrueCopy Extended Distance Function Is Used" (TRBL 06-1360).

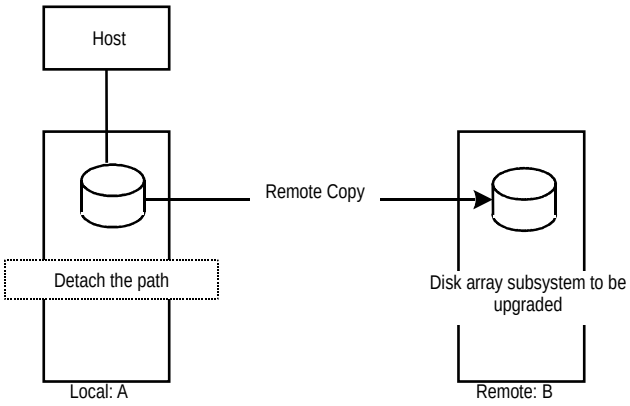


Figure 3.4.4 Paired Disk Array Subsystems (TrueCopy remote replication/TrueCopy Extended Distance)

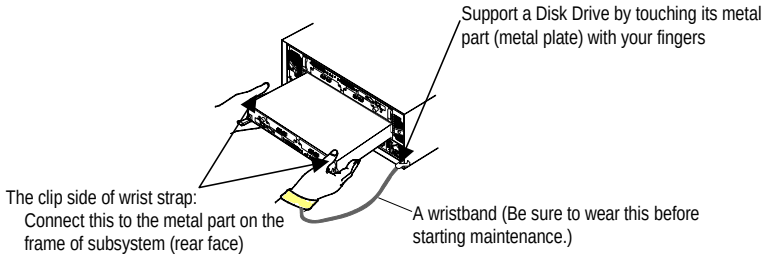
Copyright © 2006, Hitachi, Ltd.

3.4.13 Hardware upgrade work

Replace some components with those for upgrading the disk array subsystem to the Hitachi TagmaStore® AMS 1000™(RKHE). Make the replacement above and have the customer keep the components that become unused because they are used in the configuration of the Hitachi TagmaStore® AMS 1000™(RKH).
The procedure is shown below.

(1) Note on hardware upgrade works

(a) Notes when Unpacking, Installing or Removing the Parts



For installing or removing the parts, do not apply any shock as the precise parts are installed. Be sure to wear a wrist strap connected to the chassis frame before starting the work and do not take it off until it is finished.
For installing the Interface Board, Cache Unit, support it as touching the metal part at the side with the fingers of the hand that wears a wrist strap.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

CAUTION

- Be sure to wear a wrist strap connected to the chassis whenever you unpack parts from a case. Otherwise, the static electrical charge on your body may damage the parts.
- When you install the Control Unit, the Interface Board, or the Cache Unit, do the installation holding it by its sheet steel part with your hand(s) wearing the ESD grounding wrist band. The electrostatic charge can be discharged through your touch to the sheet steel part.
- In this operation, return the Interface Board, the Cache Unit and each cable to be removed once to the original installation places.

Copyright © 2006, Hitachi, Ltd.

(c) Notes on cable routing

(i) Handling of cables placed on the installation floor

- Protect the cables, which cannot be accommodated by the subsystem and thus laid on the floor or cross a passage, with the cable protection duct.
- For cables that relay between the subsystems, lay them on the floor and do not leave them from the floor.

(ii) Handling of under floor cables when the subsystem is installed on the free access floor.

- Give extra lengths to cables routed under the floor and do not make them float in the air.

(iii) Routing method

- Give a room for routing as earthquake and the like are considered.
- Give a room for routing not to disturb the part replacement for maintenance.
- Make the AC cables apart from each other and when they should be adjacent, do not make them in parallel but make them cross at right angle.
- When using a cable protection duct, be careful not to damage or cut cables by catching them.

(iv) Hold the connector to insert or pull out a cable. If the cable part is pulled, it may cause a failure.

(v) For connecting the Fibre Channel interface cable, the FC (ENC) cable, or iSCSI interface cable, bend it with a long radius (not less than 30mm) and do not give the load to the cable and the connector.

(d) Note on completing the work

Close all the external covers when the work is completed.

(The cover is to maintain the performance of the subsystem (radio wave noise suppression and others), so that be sure to keep all the external covers closed to operate the subsystem normally.)

Copyright © 2006, Hitachi, Ltd.

(2) Open the Rear Door of U7 rack frame.

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

(a) Fit an Allen wrench in the key socket on the rear door, turn the Allen wrench in the direction shown by the arrow (⟶), and open the rear door slowly leaving the wrench as it is.

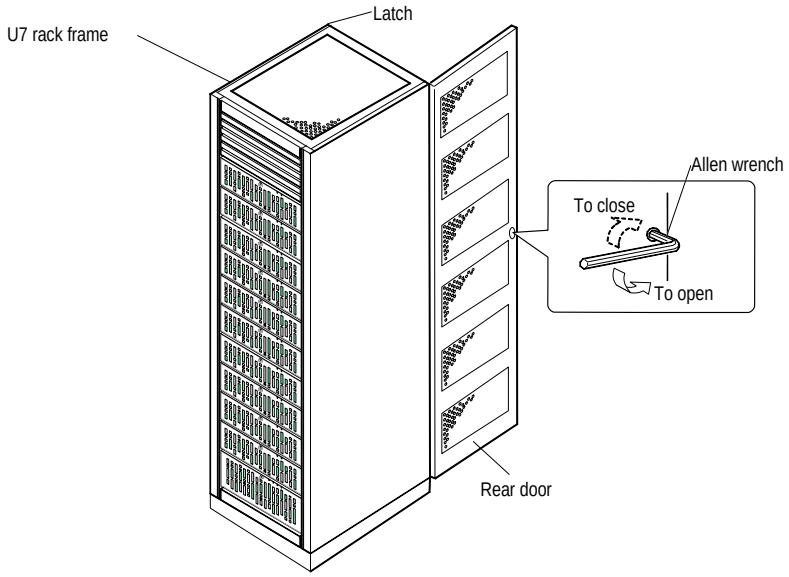


Figure 3.4.5 Procedure for Opening Rear Door

Copyright © 2006, Hitachi, Ltd.

(3) Select a procedure from the following and execute it.

No.	Power status during the replacement	Restriction	Reference section
1	Replacement with the power turned on (hot replacement)	1. Complete the replacement within five minutes. Otherwise, a powering off may occur because of an abnormal temperature rise. Perform the part replacement in haste. 2. Replace the Control Unit after blocking the Control Unit to be replaced. 3. When replacing Control Unit of both systems (CTL 0 and CTL 1), power off the subsystem before the replacement.	• See "(3-1) Procedure for replacement with the power turned on (hot replacement)" (HUP 03-0620).
2	Replacement with the power turned off	—	• See "(3-2) Procedure for replacement with the power turned off" (HUP 03-0670).

NOTE : • When replacing the Control Unit while the subsystem power is turned on, be sure to replace them one by one. When replacing the Control Unit of the both systems (Control Unit #0 and Control Unit #1) at the same time, follow the procedure explained in "(3-2) Procedure for replacement with the power turned off" (HUP 03-0670).

• System parameters are automatically loaded to the new Control Unit from the built in Disk Drive. Accordingly no setting, such as operating manually, is required.

Copyright © 2006, Hitachi, Ltd.

(3-1) Procedure for replacement with the power turned on (hot replacement)

(a) For preventive detaching of the Control Unit, press RST SW.

Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

Make sure that the CALM LED (red), EALM LED (red) or RST LED (orange) turns on within one second and the WARNING LED (orange) on the Front Bezel blinks.

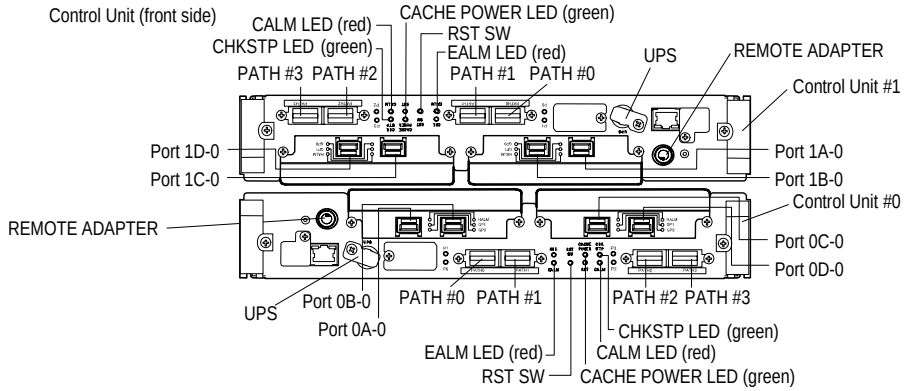

Figure 3.4.6 Control Unit replacement and LED locations

(b) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit to be replaced is installed.

(c) Loosen the screws (right and left) which are fixing the levers of the Control Unit(for RKH), push down the levers forward, and pull out the Control Unit(for RKH).

(d) Remove the all cables connected to the Control Unit(for RKH) that was blocked for prevention against a failure.

NOTE : When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

Copyright © 2006, Hitachi, Ltd.

(e) Remove the Control Unit(for RKH) by pulling it out toward you.
(f) Loosen the two fixing screws for the cover at the back of the cover, and remove it.
(g) Remove the Cache Unit mounted on the Control Unit(for RKH).
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Interface Board and Cache Unit temporarily in the place where the anti-static measures are taken.

(h) Remove that Interface Board.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit(for RKH) and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit(for RKH).

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(i) Loosen the two fixing screws for the cover at the back of the cover of the new Control Unit(for RKHE), and remove it.
(j) Install the Cache Unit removed from the Control Unit for the RKH in the position of the same slot number of the Control Unit for the RKHE.
(k) Install the Interface Board removed from the Control Unit for the RKH fitting it to the positioning pin of the same position of the Control Unit for the RKHE, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit(for RKHE).
(l) Attach the cover, and tighten the fixing two screws for the cover at the back of the cover.
(m) Connect the removed interlocking cable to the new Control Unit(for RKHE) when the special UPS is connected.
(n) Connect the ENC/SENC cables.

NOTE : • The loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC/SENC cables are connected.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

Copyright © 2006, Hitachi, Ltd.

(o) Wait for more than 20 seconds, and then insert it into the specified position with the both right and left levers of the Control Unit(for RKHE) pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit(for RKHE) turn on, then EALM LED turns off and CALM LED turns off next.
If the Control Unit(for RKHE) is inserted without waiting for 20 seconds, it is possible that the Control Unit(for RKHE) is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement(‡1) of the Control Unit(for RKHE) which was inserted.
When the Control Unit(for RKHE) is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit(for RKHE) which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the Cache Units installed.)
But, when any messages are displayed on WEB about the Control Unit(for RKHE) or the Cache Units installed, then service personnel connects the other Control Unit(for RKHE) to the WEB and takes recovery actions according to "Information Message" in the other Control Unit(for RKHE).

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit #0 and #1. Install the Control Unit #0 with the cover up and #1 with the cover down.
• When pushing the levers at the same time in the direction shown by the arrows (⟵), perform this operation within one minute. If it has taken more than one minute to perform the operation, it may not be recovered. In this case, execute the replacement procedure again. Nevertheless, if it is not recovered, perform the Control Unit replacement since the failure may be caused in the Control Unit.

(p) Make sure that the WARNING LED (orange) on the Front Bezel is off.
(The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)
If WARNING LED (orange) is on, replace the Control Unit(for RKHE) again.
If WARNING LED (orange) is blinking, make sure WARNING LED (orange) goes off by referring to WEB.

‡1 : To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more.

Copyright © 2006, Hitachi, Ltd.

(q) Connect all of the removed cables to the Control Unit for the RKHE same as the time of the RKH configuration.

NOTE : • When connecting the interface cables, insert the interface cables until they are fixed to the host connectors.
If the Interface cables are inserted half in the host connectors, the Control Unit continues to detect the failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(r) Make sure that the READY LED (green) on the front of the Basic Chassis lights up.
The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 60 minutes) before it lights up.

(s) Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated.
Check that "I5390x The CTL type different from the other CTL was detected (CTL-0 yyyy, CTL-1 zzzz)" is displayed before "I0010x CTL recovered (CTL-x)" at the time that the first Control Unit was replaced.
Check that "I5390x The CTL type different from the other CTL was detected (CTL-0 yyyy, CTL-1 zzzz)" is not displayed before "I0010x CTL recovered (CTL-x)" at the time that the second Control Unit was replaced.(‡1)
The replacement work of the Control Unit is completed if these are checked.

(t) Check that the LED of the remote adaptor connected to the Control Unit(for RKHE) is installed lights on when the remote adaptor is connected.

(u) Replace the Control Unit(for RKHE) of the other controller also following the procedure starting from Step (a).
When the replacement for the both controllers is completed normally, the Control Unit(for RKHE) replacement for the disk array subsystem is completed.

‡1 : Perform the maintenance referring to the recovery method of this message if "I5390x The CTL type different from the other CTL was detected (CTL-0 yyyy, CTL-1 zzzz)" is displayed after replacing both Control Units.

Copyright © 2006, Hitachi, Ltd.

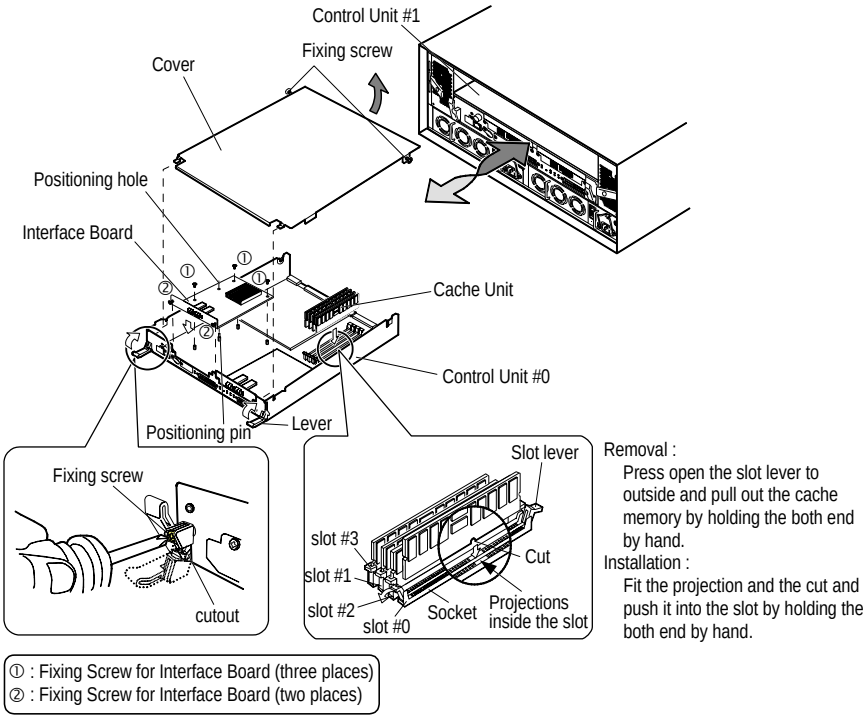

Figure 3.4.7 Control Unit replacement

Copyright © 2006, Hitachi, Ltd.

(3-2) Procedure for replacement with the power turned off

NOTE : Do not perform the planned shutdown (power-off) while the READY LED (green) on the front of the Basic Chassis is blinking at high speed (for the maximum of 40 to 60 minutes).

(a) Turn off the main switch.
(b) Make sure that the PWR LED (green) on the front of the subsystem is off.
(c) Turn off the AC Power Unit Switch of the Power Unit on the Basic and Additional subsystem.
(d) All turn off the circuit breaker of the PDB.

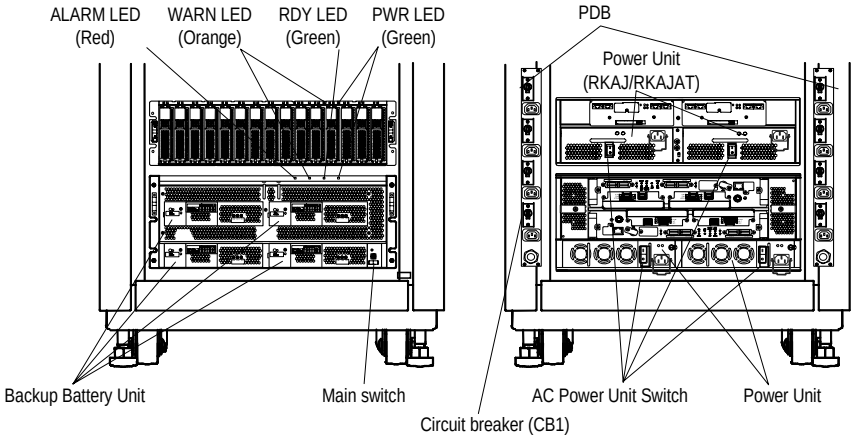

Figure 3.4.8 Locations of Switches for Power Off

(e) Loosen the screws (right and left) which are fixing the levers of the Control Unit(for RKH), push down the levers forward, and pull out the Control Unit(for RKH).
(f) Remove the all cables connected to the Control Unit(for RKH).

NOTE : • When the cable cannot be removed easily, do not pull it by force. Besides, the cable can be damaged if it is bent upward or downward forcibly.
• When removing the Interface cables, pull out the interface cables completely from the host connectors.
If the Interface cables are inserted half in the host connectors, the Control Unit continues to detect the failures, and the I/O processing of the Control Unit may be deteriorated.

⚠ CAUTION

Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

Copyright © 2006, Hitachi, Ltd.

(g) Remove the Control Unit(for RKH) by pulling it out toward you.
(h) Loosen the two fixing screws for the cover at the back of the cover, and remove it.
(i) Remove the Cache Unit mounted on the Control Unit(for RKH).
Push the slot levers which fix the Cache Unit, and pull up the Cache Unit by holding both the end of the Cache Unit, and then the cache memory can be removed.

NOTE : Place the removed Interface Board and Cache Unit temporarily in the place where the anti-static measures are taken.

(j) Remove that Interface Board.
Loosen the fixing screws ② (two places) of the Interface Board installed in the Control Unit(for RKH) and remove the fixing screws ① (three places), and then pull up the Interface Board upwards and remove it from the Control Unit(for RKH).

NOTE : Place the removed Interface Board in the place where anti-static measures are taken.

(k) Loosen the two fixing screws for the cover at the back of the cover of the new Control Unit(for RKHE), and remove it.
(l) Loosen the two fixing screws for the cover at the back of the cover of the new Control Unit(for RKHE), and remove it.
(m) Install the Cache Unit removed from the Control Unit for the RKH in the position of the same slot number of the Control Unit for the RKHE.
At this time, check that the connectors are surely inserted.
Install the Interface Board making its sheet metal part face inside of the Control Unit(for RKHE).
(n) Attach the cover, and tighten the fixing two screws for the cover at the back of the cover.
(o) Insert it into the specified position with the both right and left levers of the Control Unit(for RKHE) pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
If the Control Unit(for RKHE) is caught by something when it is inserted, do not push it in forcibly. Retry the insertion from the beginning. If forced, pins might be broken.

NOTE : • Do not catch a ENC cable, when the Control Unit for the inserted.
• The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

(p) Connect all of the removed cables to the Control Unit for the RKHE same as the time of the RKH configuration.

NOTE : • When connecting the interface cables, insert the interface cables until they are fixed to the host connectors.
If the Interface cables are inserted half in the host connectors, the Control Unit continues to detect the failures, and the I/O processing of the Control Unit may be deteriorated.
• The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

Copyright © 2006, Hitachi, Ltd.

(q) Make sure that the circuit breaker is turned off.
(r) Make sure that the main switch is turned off.
(s) Turn on the circuit breaker of the PDB.
(t) Turn on the AC Power Unit Switch of the Power Unit on the Basic and Additional Chassis.
(u) Turn on the main switch.
(v) Check that the RDY LED (green) on the front of the RKHE usually lights up after five minutes, and the ALARM LED (red) and the WARNING LED (orange) to out.(‡1)
At this time, when the RDY LED (green) is blinking at high speed, the RDY LED (green) on the front of the basic chassis lights up after blinking high-speed because the automatic download of the ENC/SENC firmware is being operated (at the maximum of 40 to 60 minutes).

NOTE : The EALM LED (red) on the Control Unit (on the rear side of the subsystem) may come on after powering on the subsystem. However, it is not a problem if the EALM LED (red) goes out until the RDY LED (green) comes on the front of the Basic Chassis.

(w) Check that "I10000 Subsystem is ready" is displayed referring to the Information Message on WEB.
Check that "I5390x The CTL type different from the other CTL was detected (CTL-0 yyyy, CTL-1 zzzz)" is not displayed before "I10000 Subsystem is ready (CTL-x)".(‡2)

3.4.14 Processing for re-recognizing the host computer

Execute the processing for re-recognizing the device of the connection host computer.

‡1 : When the WARNING LED (orange) is blinking at low speed, perform the maintenance according to the recovery method on the displayed message referring to the Information Message on WEB. When referring to the Information Message on WEB, if the array subsystem is in the WARNING status, the WARNING LED (orange) lights up, and if the array subsystem is not in the WARNING status, the WARNING LED (orange) goes out.
‡2 : Perform the maintenance referring to the recovery method of this message if "I5390x The CTL type different from the other CTL was detected (CTL-0 yyyy, CTL-1 zzzz)" is displayed after replacing both Control Units.

Copyright © 2006, Hitachi, Ltd.

3.4.15 Revalidation the TrueCopy remote replication/TrueCopy Extended Distance

This operation is not required when TrueCopy remote replication/TrueCopy Extended Distance is not used.

Perform the revalidation.

For example, even when the remote disk array subsystem is upgraded as shown in Figure 3.4.9, the microprogram of the local disk array subsystem must be updated.

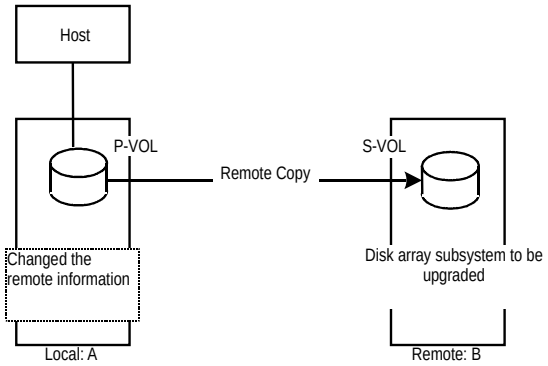

Figure 3.4.9 Change the Remote Information

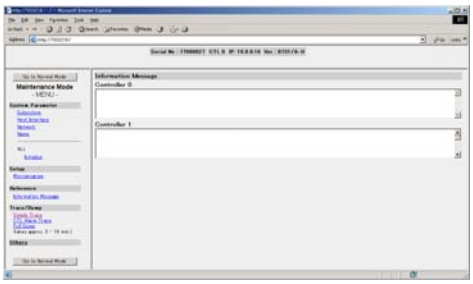
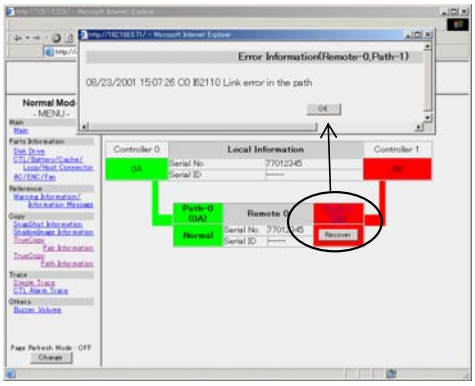
The procedure is shown below.



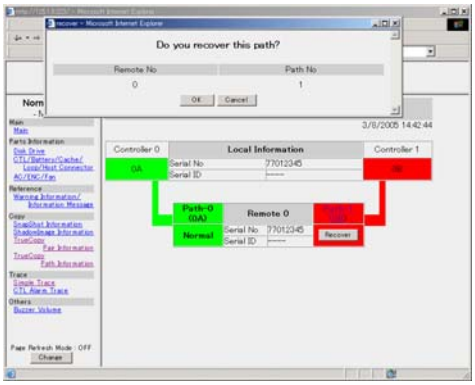
(1) Connect the maintenance PC to the other one of the two subsystems paired by TrueCopy remote replication/TrueCopy Extended Distance.

Copyright © 2006, Hitachi, Ltd.



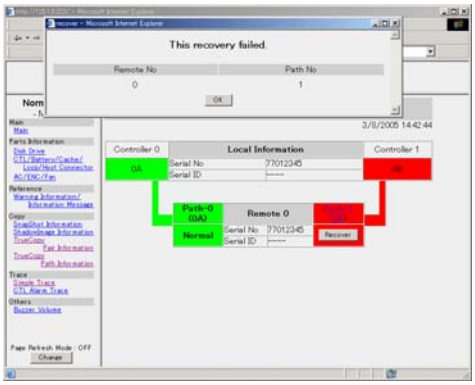
(4) Revalidate the path using the WEB.

Perform the revalidation through the "TrueCopy Path Information" window.

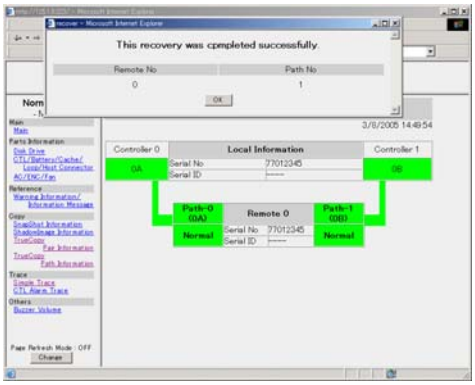


Screen 1: Image of the "Information Message" window

Screen 2: Image of the "Path Detachment Factors" window



Screen 3: Image of the "Revalidation Instruction" window



Copyright © 2006, Hitachi, Ltd.

Screen 4: Image of the "Revalidation Result" window (for the case where the operation terminated abnormally)

Screen 5: Image of the "Revalidation Result" window (for the case where the operation terminated normally)

Copyright © 2006, Hitachi, Ltd.

(5) Restart RAID Manager. Start the HORCM using the "horcmstart" command.
It is necessary to set an environmental variable (for TrueCopy) of the environment in which the command is executed. This example of the setting is premised on a configuration in which two instances in the same server (Windows NT®/Windows® 2000) use the same command device.

(a) Set an environmental variable that shows the each instance number. Enter the following via the command prompt window.

```
c:¥horcm¥etc>set HORCMINST=0
```

(b) Execute the horcm starting script, and then make sure of the configuration by executing the pairdisplay command.

```
c:¥horcm¥etc>horcmstart 0 1
starting HORCM inst 0
HORCM inst 0 starts successfully.
starting HORCM inst 1
HORCM inst 1 starts successfully.

Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)      (CL1-A , 1,   1)    174       1..P-VOL PSUS NEVER ,   175       2   -
vg01     oradb1(R)      (CL1-B , 1,   2)    175       2..S-VOL SSUS NEVER ,-----        1   -
```

A preparation for starting TrueCopy has been completed.

(6) Resynchronizing a pair
Resynchronize a pair by RAID Manager using the pairresync command.
The method for resynchronizing a TrueCopy remote replication/TrueCopy Extended Distance pair is explained below.

(a) Set the group name in the configuration definition file as "vg01".
Resynchronize a TrueCopy remote replication/TrueCopy Extended Distance pair, which has been split, using the pairresync command. When doing this, be sure to set the value of the -c option, which specifies the copy speed, as 15. Furthermore, make sure that the status of each volume becomes PAIR by executing the pairevtwait command.

```
c:¥horcm¥etc>pairresync –g vg01 –c 15
c:¥horcm¥etc>pairevtwait –g vg01 –s pair –t 300 10
pairevtwait : Wait status done.
```

(b) Make sure of the status and configuration of the resynchronized pair by executing the pairdisplay command.

```
c:¥horcm¥etc>pairdisplay -g vg01
Group    PairVol(L/R) (Port#,TID,LU),Seq#,LDEV#.P/S,Status,Fence, Seq#,P-LDEV# M
vg01     oradb1(L)      (CL1-A , 1,   1)    174       1..P-VOL PAIR NEVER , 174         2   -
vg01     oradb1(R)      (CL1-B , 2,   2)    175       2..S-VOL PAIR NEVER ,-----        1   -
```

The TrueCopy remote replication/TrueCopy Extended Distance pair has been resynchronize.
For details of the pairsplit command and its options, refer to Chapter 4 in the "RAID Manager System Administrator's Guide (Hitachi TagmaStore® AMS/WMS Series)".

Copyright © 2006, Hitachi, Ltd.

3.4.16 Changing the registration information for the monitoring failures

Change the device model name of the SNMP Agent Support Function from the RKH to the RKHE.

3.4.17 Works to be done after the upgrade is completed

When all the upgrade works are completed, do the works such as removal of the maintenance PC.
The procedure is shown below.

(1) Disconnect the maintenance PC from the disk array subsystem referring to the instruction given in Step "3.4.4 Connection of the maintenance PC" (HUP 03-0110).

(2) Close the rear door referring to the instruction given in Step "3.4.13 (2) Open the Rear Door of U7 rack frame" (HUP 03-0600).
Make sure that the rear door is latched and cannot be opened.

CAUTION

Open or close the door carefully following the procedure.
Otherwise, you may hurt you fingers by pinching them.

Chapter 4. Trouble Shooting

4.1 Error Messages

4.1.1 Progress messages

Message code	Message text	Description	Collect the error	Recovery measures
I5390x	The CTL type different from tne other CTL was detected (CTL-0 xxxx, CTL-1 yyyy)	It was detected that the Control Units of the RKH and the RKHE were mixed. The Control Units to be installed in the AMS1000 must be unified to the Control Units of the RKH or the RKHE. xxxx, yyyy : Indicates either of the RKH or the RKHE.	Simple Trace	① There is no problem if this message is displayed before "I0010x CTL recovered" after replacing one Control Unit by the upgrade from the RKH to the RKHE. Perform the upgrade work continuously. ② The Control Unit displayed as "RKH" in the message is a Control Unit of the RKH if this message is displayed before "I0010x CTL recovered" or "I10000 Subsystem is ready" after replacing the second Control Unit by the upgrade from the RKH to the RKHE. Replace the Control Unit to a Control Unit of "RKHE". ③ The Control Unit displayed as "RKHE" in the message is a Control Unit of the RKHE if this message is displayed before "I0010x CTL recovered" or "I10000 Subsystem is ready" after replacing the second Control Unit to return the configuration of the Control Unit to the RKH by the upgrade from the RKH to the RKHE. Replace the Control Unit to a Control Unit of "RKH". ④ The model name of the replaced Control Unit is different from the other Control Unit if this message is displayed before "I0010x CTL recovered" or "I1000 Subsystem is ready" after replacing the Control Unit in the status that the upgrade from the RKH to the RKHE is not performed. Replace the other Control Unit to the Control Unit of a correct model name so that both Control Units to be installed are Control Units of the RKHE or the RKH.

4.1.2 Flash detected messages

Message code	Message text	Description	Collect the error	Recovery measures
R5230x	Unsupported control unit type (CTL-x)	The Control Unit, which the microprogram stored in the system disk is not supporting, was detected. x : Control Unit # (0-1)	Simple Trace	① Refer to Maintenance Manual Troubleshooting "6.1.25 Recovery method when the Control Unit whose microprogram is not supporting was detected" (TRBL 06-1313).

Copyright © 2006, Hitachi, Ltd.

4.1.3 WEB error messages

Message code	Message text	Description	Recovery measures
—	Abnormal End Empty System Retry Full Install	The updating installation of the microprogram cannot be done because the old microprogram does not exist in the system disk drive.	① In the case where this message is displayed when the microprogram is installed in the subsystem of the RKHE for the purpose of update during the upgrade from the RKH to the RKHE, take recovery actions according to Section "4.2 When Abnormal End Empty System Retry Full Install occurs" (HUP 04-0080). ② When it is evident that the old microprogram does not exist in the system disk drive, install the microprogram newly. ③ When this message is displayed in a case other than the case ① or ②, execute the updating installation again after making sure that the system copy has been completed through the Information Message of the Web. In either of the following cases, the system copy has been completed. • "I140xy (or I140HH) System copy started" is not displayed. • "I140xy (or I140HH) System copy started" and "I141xy (or I141HH) System copy completed" are displayed consecutively. When the system copy is being made, turn off the main switch and then turn it on again later than 20 seconds. In the following case, the system copy is being made. • While "I140xy (or I140HH) System copy started" is displayed, "I141xy (or I141HH) System copy completed" is not displayed successively. Execute the updating installation again after making sure that the RDY LED (green) comes on and then the system copy is completed.
1204	A specified file doesn't exist. Confirm elements of designation.	The specified file does not exist.	① Make sure that the path to the directory of the microprogram to be installed is specified correctly.

Copyright © 2006, Hitachi, Ltd.

4.1.4 Error messages issued during upgrade made when TrueCopy remote replication/TrueCopy Extended Distance is enabled

This operation is not required when TrueCopy remote replication/TrueCopy Extended Distance is not used.

Message code	Message text	Recovery measures
I6220x	Link down time-out (Port-x)	① A state in which no link up is done has kept on longer than the regulated time at the port for which a path has been set. x: Port #
I62300	Path not connected	① <In the case of the direct connection> The remote DF that attempted to log in to the set path is not connected, or the LoopMap of the LILP is not connected one-to-one. <In the case of the connection via SW> A serial number (WWN) of the remote DF that attempted to log in to the set path is not registered in the name server of the SW.
I6250x	Path login failed	① The sending and response of FLOGI, PLOGI, RSCN, etc. to the SW terminated abnormally when a log-in to the set path was done in the case of the connection via the SW. x : Port #
I62600	Fabric connection failed (Port-x)	① Sending and response of PLOGI and PRLI done at the time of a log-in to the set path terminated abnormally.

4.1.5 Other messages

When a message other than the above is displayed, be sure to check the configuration first. Check whether the cable connections are correct, and so on following the procedure.

Example)

- RA7900 System HDU spin up failed:
  Spin-up of the system drive failed.
- HE05HH Backend down [Unit# ERR] (Unit-01):
  The back end was blocked : Abnormality was detected in the connection order of the array subsystem, the setting of the device ID, or the setting of the subsystem identification switch.
- HH1Q00 SES error inf. [SES-HDU error]:
  The Control Unit was detached because both of the two SES drives could not access the ENC.
- W080xy Loop alarm (Path-x, Loop-y):
  Since the Fibre Channel loop failed, the operation is continued with the alternative loop.

When one of the following messages is displayed, there may be a mistake in the Device ID, or some other matter. Check if the configuration is correct.

When a problem is found in the configuration related to the upgrade, correct the configuration. When no problem is found in the configuration and the operation, take some recovery action referring to the Maintenance Manual.

Copyright © 2006, Hitachi, Ltd.

4.1.6 Collecting CTL Alarm Trace

Through the CTL Alarm Trace collection, detailed information (the CTL Alarm Trace) on the immediately previous Controller blockage stored in the Controller is collected.

NOTE : When the Control Unit to be connected to WEB is blocked, the WEB connection may not be performed for two to three minutes usually (for the maximum of 50 minutes) from the time when the Control Unit was blocked because the CTL alarm trace is being created.

Since the above-mentioned CTL Alarm Trace information is taken over from the blocked Control Unit to the replaced Control Unit, it can be collected after the Control Unit is recovered from the failure. If the Control Unit is blocked while collecting the CTL Alarm Trace may not be collected normally. Therefore, in this case, collect the CTL Alarm Trace again.

The method of collecting the CTL Alarm Trace is shown below.

(1) Before collecting the CTL Alarm Trace

(a) Items to be prepared

The CTL Alarm Trace is collected in the normal mode or the maintenance mode of the WEB. For connecting to the WEB, a maintenance PC terminal with Browser installed is necessary. For collecting the CTL ALARM TRACE, disk space of 520 M bytes per one Control Unit is required. (260 M bytes for temporary data and 260 M bytes for Full Dump data)

(b) Connect the Device LAN Port for maintenance and the PC terminal with a LAN cross cable.

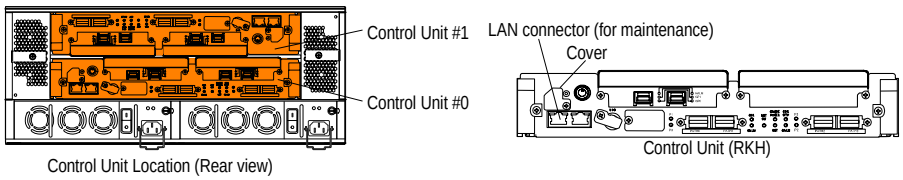

Figure 4.1.1 LAN Connector Position

(c) Collect the CTL Alarm Trace information from each Control Unit.

Save the files collected from different controllers into different directories or put different names to them so that you will see from which controller they were collected.

Copyright © 2006, Hitachi, Ltd.

(d) Make sure that the WARNING LED (orange) on the Front Bezel is not blinking fast. If it is, wait for a while (up to 80 seconds), and it stops blinking fast. (If this LED is blinking slow (at the interval of 1 second), there are no problems.)

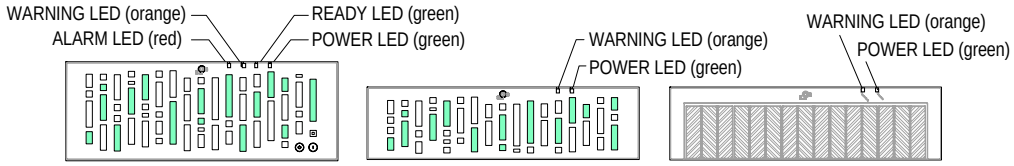

Figure 4.1.2 Indication Locations and Names of LED (Front Bezel)

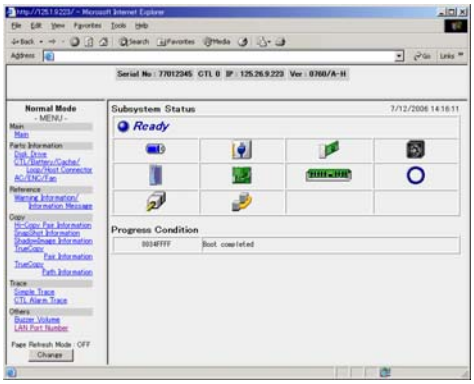
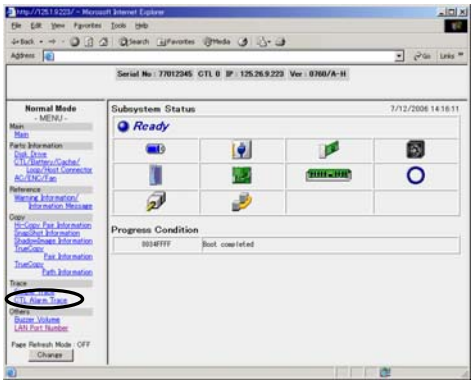


(e) Clear the cache of the browser following the procedure shown below so that the old data, which was collected at the preceding time, should not be saved.

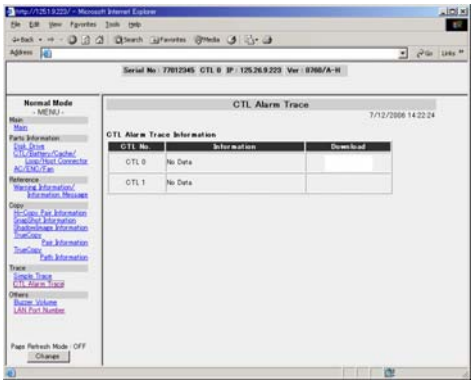
- In the case of Internet Explorer, select the [Tools] - [Internet Options] - [General] - [Temporary Internet files] - [Delete Files] in this order.
- In the case of Netscape, select the [Edit] - [Preferences] – [Cache] - [Clear Cache] in this order.



Copyright © 2006, Hitachi, Ltd.

(2) Procedure for collecting a CTL Alarm Trace

(a) Enter the IP address of the LAN connector for maintenance, to which the maintenance PC is connected, from the browser. When the Web has already been connected, update the page by pressing the Update button.



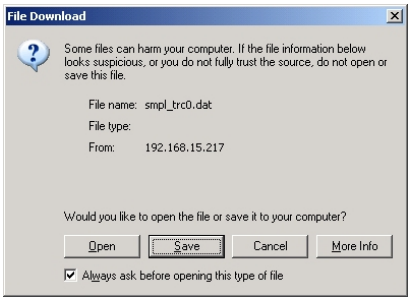
(b) Collect the memory dump according to the WEB and the following procedure.
Click “CTL Alarm Trace” in the menu frame of “Trace”.

Copyright © 2006, Hitachi, Ltd.

If CTL Alarm Trace exists, the CTL Alarm Trace information window is displayed.

Description of information

"Not Ready" ····· Indicates the situation where the trace area is not established in the device.

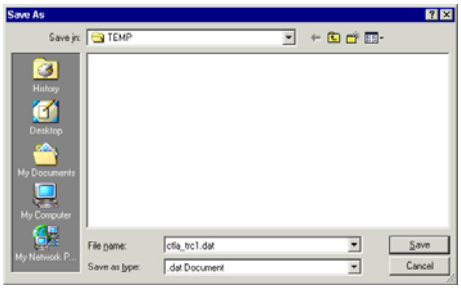


"No Data" ····· CTL Alarm Trace information does not exist or while information is being created.

"MM/DD/20YY hh:mm:ss" ····· CTL Alarm Trace information exists.

NOTE : When "Not Ready" or "No Data" is displayed on the description of "Information", or when the date of the information is different from that of the collection of this time, the CTL Alarm Trace may not be collected normally. Therefore, collect the Simple Trace.
If Simple Trace cannot be obtained through detached Control Unit, connect the Maintenance PC to the Control Unit at the opposite side, and collect the Simple Trace.

(c) Press the "Download" button on the Control Unit side to be collected in "CTL Alarm Trace information".(‡1)



(d) The following dialog is displayed. Click the [Save] button.

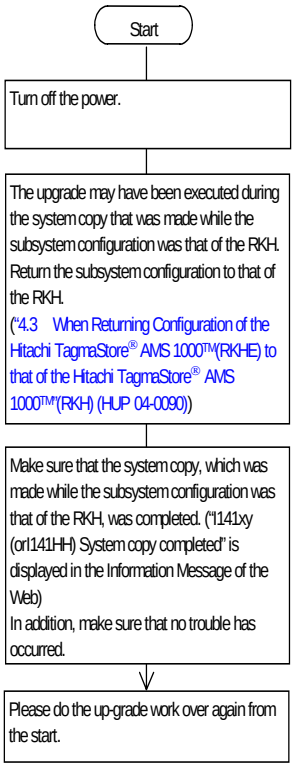
‡1 : An error message may be displayed. If it is displayed, click [OK], and collect the CTL Alarm Trace again after waiting for a while.

Copyright © 2006, Hitachi, Ltd.

(e) Select the place to save the file and file name (Default file name: ctla_trc0.dat) and click [Save](‡1).

The down-loading is started and the progress indicating message window is displayed. When the down-loading completes, the progress indicating message window is closed.

In this procedure is collected by WEB Normal mode. Similarly, CTL Alarm Trace can be collected by WEB Maintenance mode through Menu Frame.

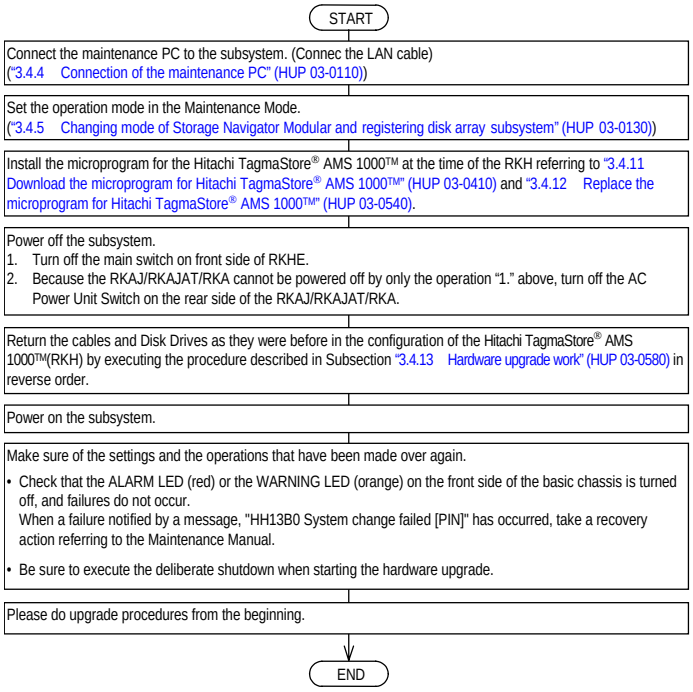


‡1 : There may be a case where the default file name is given as "ctla_trc0.dat.dat" depending on the setting of the PC. In this case, reset the file name to "ctla_trc0.dat" or any other name.

Copyright © 2006, Hitachi, Ltd.

4.2 When Abnormal End Empty System Retry Full Install occurs

The procedure for troubleshooting and actions to be taken when the Abnormal End Empty System Retry Full Install occurs are shown below.



Make a recovery from the failure following the procedure for troubleshooting.

Copyright © 2006, Hitachi, Ltd.

4.3 When Returning Configuration of the Hitachi TagmaStore® AMS 1000™(RKHE) to that of the Hitachi TagmaStore® AMS 1000™(RKH)

The procedure to be used in case the upgrade fails is explained below. In the procedure, the upgrade is made again after the configuration of the disk array subsystem is returned to that of the Hitachi TagmaStore® AMS 1000™(RKH) once.

NOTE : Be sure to review all the settings and operations that have been made before making the upgrade again.

4.3.1 System power off

Because a message, "Download Failed" is displayed and the disk array subsystem is in the Alarm status, the RKAJ/RKAJAT/RKA cannot be powered off although the main switch on the front side of the RKHE is turned off. The power of the RKAJ/RKAJAT/RKA must be turned off by the other means.

(1) Turn off the main switch.
(2) Make sure that the PWR LED (green) on the Front Bezel is off.
(3) Turn off the AC Power Unit Switches of the AC power supplies installed in the RKHE and all the RKAJ/RKAJAT/RKAs.
(4) All turn off the circuit breaker of the PDB.

Revision 1	Dec. 2006	Second Release

Preface

"**Online** FC Interface Board Addition" requires the path failover on the all servers that are connected with DF700. However, there are too many systems that are not configured with having this behavior. Therefore, RSD always recommends the using the "**Offline** FC Interface Board Addition".

In the other hand, the systems that are very difficult to stop are increasing. In such case, system should have the conditions described in this procedure.

1 Overview

This data describes the procedure for addition the Fibre Channel (FC) Interface Board at the time of the FC configuration.

When you addition the FC Interface Board, all applications cannot access to the controller that the FC Interface Board is to be added. (The FC Interface Board addition takes place by blockade the both controllers one by one.) To perform the FC Interface Board addition, always follow the checklist shown below and read the cautions.

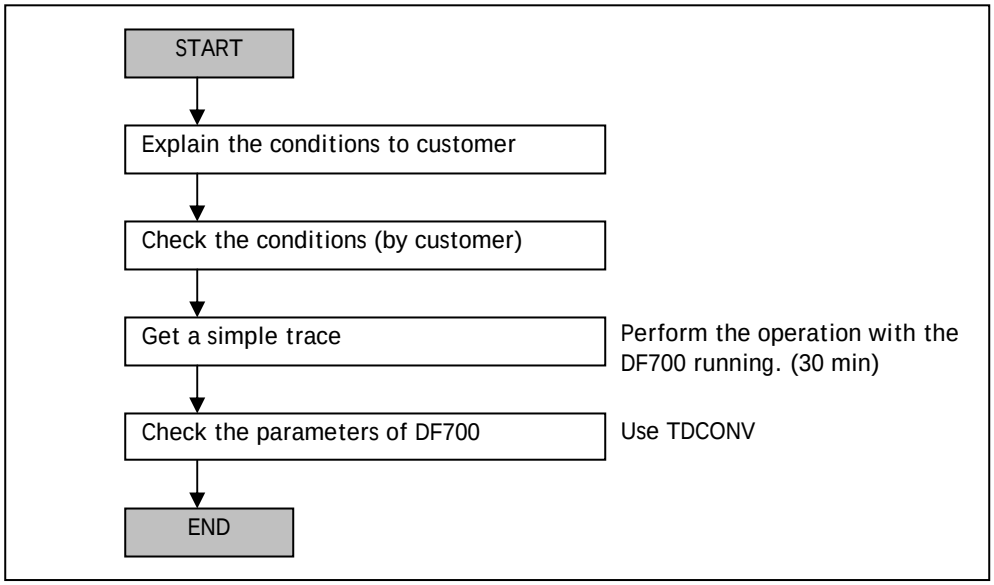
The FC Interface Board addition needs to check the status of paths and applications, so perform the operations according to your customer's schedule. And since the all accesses from servers may be concentrated on one controller during the adding, it is recommended that the operations should be performed during a time period when the I/O loads are light.

If the DF700 (AMS1000) meet the specific conditions (refer to "2 Checklist"), you will be able to perform the "Online FC Interface Board addition".

2 Checklist

If "No" is checked in the checklist, replacement with the servers suspended is required.

Table 1 Checklist for Online FC Interface Board addition



No	Contents	Yes / No
1	Does the DF700 have the dual controller configuration?	
2	Is the customer using the path switching software? (Please refer to "Table 2, Tested Path Switching Software" in the detail.)	
3	Is the controller of a main path to LUs separated from the controller of an alternative path?	
4	Is an alternative path set to all LUs?	
5	Are the host side parameters that are described in this document set correctly?	
6	Are the DF700 parameters that are described in the User's Guide of DF700 set correctly? (Before the adding, please get a simple trace to check.)	
7	Is it possible to stop the changing of pair status of ShadowImage in-system replication, TrueCopy remote replication or Copy-on-write SnapShot during the FC Interface Board addition ? (Customer cannot execute "paircreate" and "pairresync" commands.)	
8	Is it possible to change the pair status of TrueCopy Extended Distance from "PAIR" and "COPY" to "PSUS" during the FC Interface Board addition ?	
9	Is it possible to try not to execute the migration with Modular Volume Migration during the FC Interface Board addition ?	
10	If the customer uses the cluster software "MC/SG", is the lock disk stored in the disk other than the DF700?	
11	Is the boot disk stored in the disk other than the DF700? Is the redundancy condition of the boot path described on the System Construction Guide of BladeSymphony satisfied when it is connected to BladeSymphony?	
12	The I/O errors may be logged in a log file during the FC Interface Board addition, though the data accesses continue on an alternative path. Can the system ignore such the errors?	
13	Can other applications (HITRACK, HiCommand, other SNM) which perform the LAN access to the DF700 be stopped during the FC Interface Board addition?	

3 Flowchart

First step;

Please discuss with customers whether the conditions of this guideline meet with the customer's system or not. And get a simple trace to check the parameters of DF700.

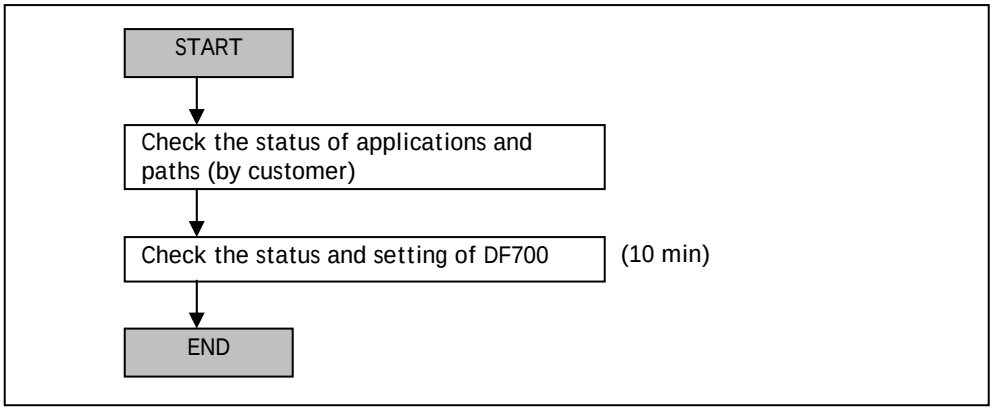


Figure 1 Flowchart of checking the conditions

Second step;

Please check the status of applications, paths, switches and DF700 before addition the FC Interface Board.

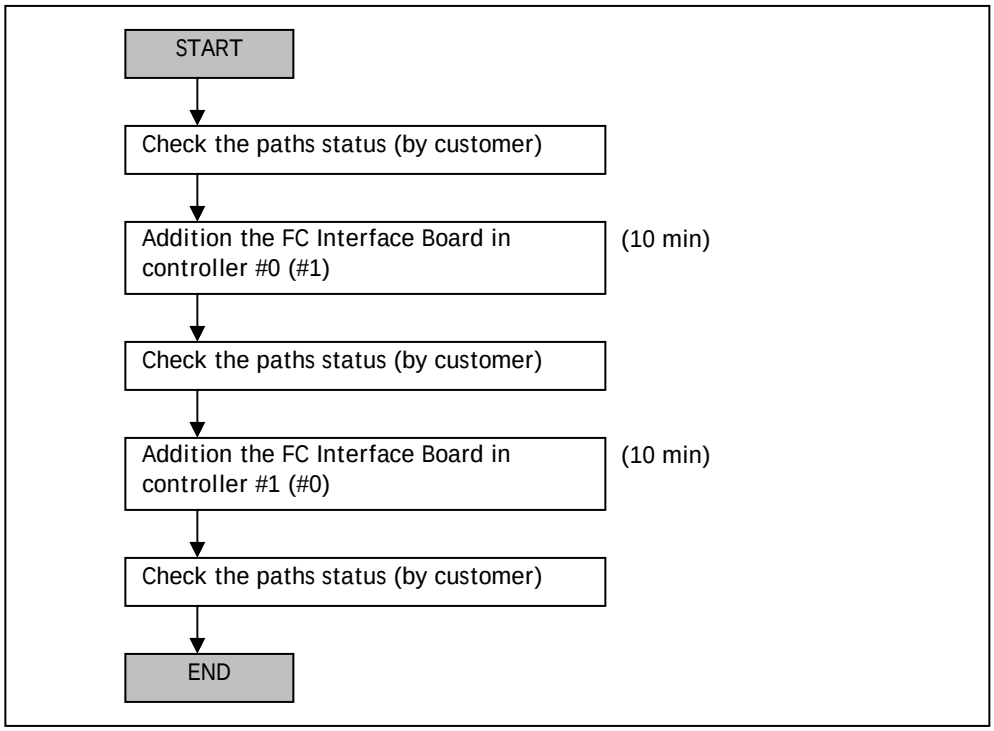

Figure 2 Flowchart of preparation of adding

Third step;

Perform the FC Interface Board addition.

Figure 3 Flowchart of adding the FC Interface Board

4 System Configuration

If the system is configured as shown below, online FC Interface Board addition is possible.

Figure 4 Figure of Configuration

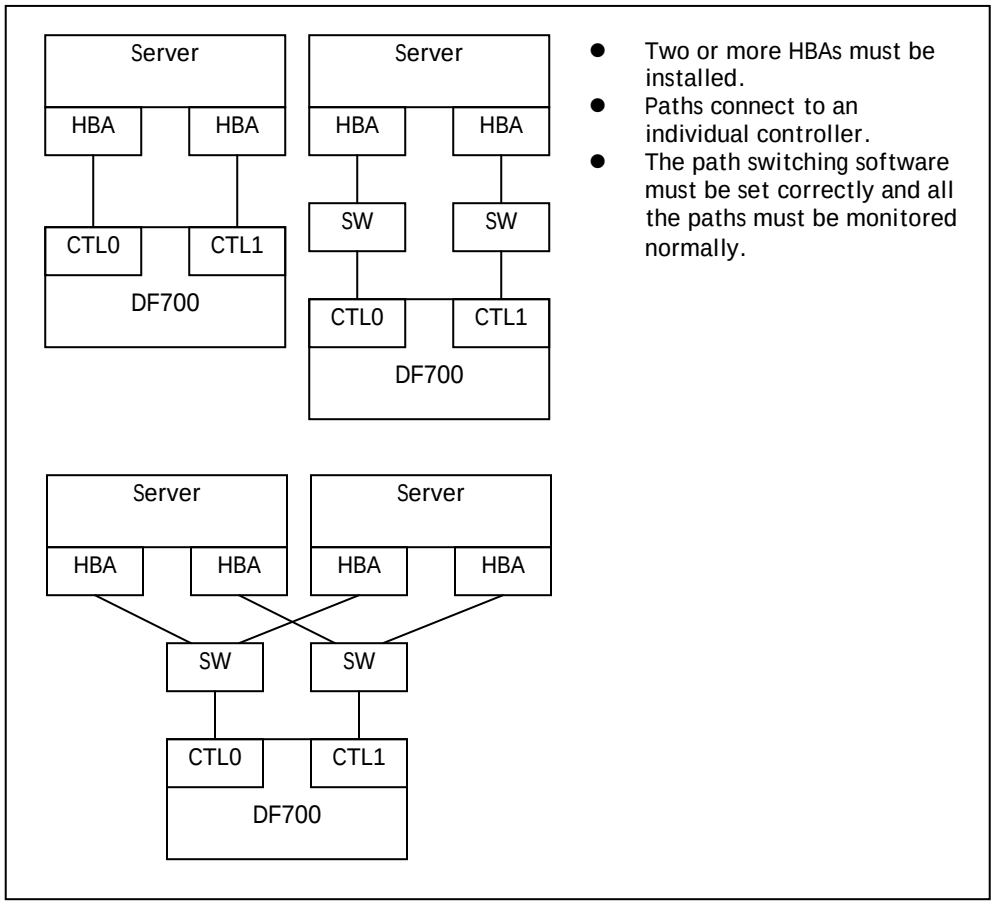

Table 2 Tested path switching software

No	OS, Version	DF700
1	HP-UX 11i, 11.0	HDLM, PVLink
2	Solaris 9, 8, 7, 2.6	HDLM, VxVM-DMP
3	AIX 5.2, 5.1, 4.3.3	HDLM
4	Windows 2K3, 2K, NT4.0	HDLM
5	Red Hat Advanced Server 2.1, Red Hat Enterprise Linux 3.0, AS 2.1, AS3(IA32), ES3(IA32), AS3(IPF)	HDLM, HFC-PCM, VxVM-DMP
6	USP/NSC/9900V	Alternative path

Note: This document uses the abbreviation "HDLM" to represent the "HiCommand Dynamic Link Manager".

Table 3 Software Parameters

No	Software	Parameter	Default	Setting
1	PVLink	IO Timeout	default (=30sec)	60sec
2		Auto Switch	On	On
3	VxVM-DMP	Please check the VxVM's manual.		
4	HDLM	Please check the HDLM's manual.		

Table 4 HBA Parameters

No	HBA	Parameter	Default	Setting
1	JNI FCE-1063	FcPortCfgEnable	0	1
	JNI FCE-6410	FailoverDelay	0	30
2	JNI FC64-1063 JNI FCI-1063 JNI FCE-1473 JNI FCE-6460 JNI FCC-6460 JNI FCX-6562	FailoverDelay	0	30

Note: In regard to the other HBAs, no parameter is required to be changed.

In regard to the system parameters of DF700, please refer to the User's Guide of DF700.

5 Cautions and Restrictions

Always follow the cautions and restrictions shown in this document and the path switching software manual.

Table 5 Cautions and Restrictions

No	Contents
1	The path switching software must run normally on all the servers connected to the DF700, and all paths to the LUs are to be duplicated by the path switching software. If there are any LUs whose path is not duplicated, addition the FC Interface Board after dismounting it beforehand.
2	All the paths must be normal. If a failure is found on the path, addition the FC Interface Board after recovering the failure.
3	Addition the FC Interface Board on the controller #0, and then addition the FC Interface Board on the controller #1. The reverse order of the addition is possible.
4	When Path Blockade is occurred in TrueCopy remote replication/TrueCopy Extended Distance while addition FC Interface Board on adding AMS1000, please recover the Path Blockade first, after stopping the addition.
5	The CCI command “paircreate” and “pairresync” cannot be executed during the adding of FC Interface Board.
6	When the pair status of TrueCopy Extended Distance is “PAIR” or “COPY”, do not perform the FC Interface Board addition.
7	Do not perform the FC Interface Board addition when the migration is being executed with Modular Volume Migration.
8	The migration of Modular Volume Migration cannot be executed during the FC Interface Board addition.
9	When Power Saving of the priced option is used, if you add the FC Interface Board after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the Control Unit recovers. Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then add the FC Interface Board. If the spin-down fails, execute the spin-down again.

6 Operations for FC Interface Board addition

To addition the FC Interface Board , follow the operations below.

This document uses the abbreviation “SNM” to represent the “Storage Navigator Modular” for DF700.

6.1 Preparation

Following procedures should be done before FC Interface Board addition.

Table 6 Checklist for Preparation of FC Interface Board Addition

No	Contents	Check
1	The parameters for DF700 are set correctly.	
2	The parameters for OS, HBA and path switching software are set correctly.	
3	The alarm light on the DF700 does not light up. And the servers and switches do not have any errors.	
4	In the case of the direct connection, the ports on the DF700 are linked up with the system.	
5	In the case of switch connection, the ports on the switches are linked up.	
6	Check that the READY LED on the DF700 lights up. When it is blinking at high speed, wait for the maximum of 30 to 85 minutes.	
7	The CCI command “paircreate” or “pairresync” is not running.	
8	Check that the pair status of TrueCopy Extended Distance was changed to “PSUS”.	
9	Check that the migration of Modular Volume Migration is not being executed.	
10	During the online FC Interface Board addition, please stop the other programs (HITRACK, HiCommand, other SNM) that may issue a command to the subsystem through the LAN, or remove the LAN cable to disconnect from such programs.	
11	To change the PVLink parameters “IO Timeout” and “AutoSwitch”, perform the following operations. Refer to the following procedures for the detail.	
12	When Power Saving of the priced option is used, check that there is no RAID Group whose power saving status is “Normal (command monitoring)” (spin-down is not being executed). If there is the RAID Group whose power saving status is “Normal (command monitoring)”, wait for a few minutes until the power saving status changes to “Normal (spin-down)”.	

[Operations of changing the PVLink parameters]

(1) Login as a user having the root authorization in HP-UX, and execute "vgdisplay /dev/dsk/c?t?d?" command.

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                     /dev/dsk/c11t0d1
PV Name                     /dev/dsk/c13t1d1        Alternate Link
VG Name                     /dev/vg02
PV Status                   available
Allocatable                 yes
VGDA                        2
Cur LV                      4
PE Size (Mbytes)            4
Total PE                    1023
Free PE                     148
Allocated PE                875
Stale PE                    0
IO Timeout (Seconds)        default
Autoswitch                  On
#
```

Default is 30 seconds. Always change it to 60 seconds or longer since server I/O may take longer time during the FC Interface Board addition.

Default is On.

(2) Execute "pvchange –t 60 /dev/dsk/c?t?d?" command to change the "IO Timeout" parameter, and execute "vgdisplay ./dev/dsk/c?t?d?" command to check the result.

(3) When "Off" is specified for "AutoSwitch" parameter, execute "pvchange –S y "dev/dsk/c?t?d?" command, and check the result.

6.2 Operations for the FC Interface Board addition

The procedure of FC Interface Board addition is performed as following.

Step1: (server side)

Check the status of paths to the LUs. If multiple OS are connected, perform the operations on all the servers connected to DF700 that the FC Interface Board is to be added.

(1) In the case of PVLink on HP-UX

Login as a user having the root authorization, and execute "vgdisplay –v vg??" command.

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0
  --- Logical volumes ---
  LV Name                   /dev/vg02/lvol1
  LV Status                 available/syncd
  LV Size (Mbytes)          1000
  Current LE                250
  Allocated PE              250
  Used PV                   1
  --- Physical volumes ---
  PV Name                   /dev/dsk/c83t0d0
  PV Name                   /dev/dsk/c24t0d0 Alternate Link
  PV Status                 available
  Total PE                  511
  Free PE                   11
  Autoswitch                On
```

Check that two or more "PV Name" of "Physical volumes" are displayed and at least one path is displayed as "Alternate Link". If any path has a failure, suspend the FC Interface Board addition and recover the failure. Also, recode the PVName of the active path.

(2) In the case of HDLM on HP-UX

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off
Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Login as a user having the root authorization, and execute “dlnkmgr view -path” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName      DskName .....   ChaPort Status  Type .....
000000  .....         HITACHI DF700F  0A      Online  Own
000001  .....         HITACHI DF700F  1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where FC Interface Board addition is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where FC Interface Board addition is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where FC Interface Board addition is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where FC Interface Board addition is only 0A.

ExampleA-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName              DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000001     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000002     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000003     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000004     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000005     ···          HITACHI .DF700F….0051       1A       Online          Non      1
 :          :            :                          :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid    000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000004
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName              DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000001     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000002     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000003     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000004     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000005     ···          HITACHI .DF700F….0051       1A       Online          Non      1
 :          :            :                          :        :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where FC Interface Board addition is only 1A.

ExampleB-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName          DskName ···      ChaPort  Status        Type   IO-Count ···

000004   ···     HITACHI .DF700F....0051   0A       Online        Own    10
000005   ···     HITACHI .DF700F....0051   1A       Offline(C)    Non    1
 :        :        :                        :        :             :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName          DskName ···      ChaPort  Status        Type   IO-Count ···
000000   ···     HITACHI .DF700F....0051   0A       Online        Own    10
000001   ···     HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000002   ···     HITACHI .DF700F....0051   0A       Online        Own    10
000003   ···     HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000004   ···     HITACHI .DF700F....0051   0A       Online        Own    10
000005   ···     HITACHI .DF700F....0051   1A       Offline(C)    Non    1
 :        :        :                        :        :             :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the DF700 side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the DF700 side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of (2) in Step1: (server side) again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

```
# diff path01.txt path02.txt
2c2
< Reduced      33        0
---
> Reduced     265        0
```

(3) In the case of VxVM-DMP on Solaris

Log into Solaris with the user who has the root authority, and check that all the paths are in the enable status using the command of VxVM.
The commands to operate differ in the cases where the version of VxVM is 3.2 or later and where it is before 3.2.

(a) When the version of VxVM is 3.2 or later, check the CTLR-NAME connecting the DF700 by the command [vxdmpadm listctlr all]. Furthermore, execute the command [vxdmpadm getsubpaths ctlr=cx] for each CTLR-NAME (cx is CTLR-NAME).

```
# vxdmpadm listctlr all
CTLR-NAME       ENCLR-TYPE      STATE           ENCLR-NAME
=================================================
c1              Disk            ENABLED         Disk
c2              AMS_WMS         ENABLED         AMS_WMS0
c3              AMS_WMS         ENABLED         AMS_WMS0

# vxdmpadm getsubpaths ctlr=c2
NAME      STATE[A]     PATH-TYPE[M]  DMPNODENAME ENCLR-TYPE  ENCLR-NAME    ATTRS
=============================================================================
c2t0d0s2  ENABLED      SECONDARY     c2t0d0s2    AMS_WMS     AMS_WMS0      -
c2t0d1s2  ENABLED(A)   PRIMARY       c2t0d1s2    AMS_WMS     AMS_WMS0      -
c2t0d2s2  ENABLED      SECONDARY     c2t0d2s2    AMS_WMS     AMS_WMS0      -
c2t0d3s2  ENABLED(A)   PRIMARY       c2t0d3s2    AMS_WMS     AMS_WMS0      -
c2t0d4s2  ENABLED      SECONDARY     c2t0d4s2    AMS_WMS     AMS_WMS0      -
c2t0d5s2  ENABLED(A)   PRIMARY       c2t0d5s2    AMS_WMS     AMS_WMS0      -
c2t0d6s2  ENABLED      SECONDARY     c2t0d6s2    AMS_WMS     AMS_WMS0      -
c2t0d7s2  ENABLED(A)   PRIMARY       c2t0d7s2    AMS_WMS     AMS_WMS0      -

# vxdmpadm getsubpaths ctlr=c3
NAME      STATE[A]     PATH-TYPE[M] DMPNODENAME ENCLR-TYPE ENCLR-NAME ATTRS
=============================================================================
c3t0d0s2  ENABLED(A)   PRIMARY       c2t0d0s2    AMS_WMS     AMS_WMS0      -
c3t0d1s2  ENABLED      SECONDARY     c2t0d1s2    AMS_WMS     AMS_WMS0      -
c3t0d2s2  ENABLED(A)   PRIMARY       c2t0d2s2    AMS_WMS     AMS_WMS0      -
c3t0d3s2  ENABLED      SECONDARY     c2t0d3s2    AMS_WMS     AMS_WMS0      -
c3t0d4s2  ENABLED(A)   PRIMARY       c2t0d4s2    AMS_WMS     AMS_WMS0      -
c3t0d5s2  ENABLED      SECONDARY     c2t0d5s2    AMS_WMS     AMS_WMS0      -
c3t0d6s2  ENABLED(A)   PRIMARY       c2t0d6s2    AMS_WMS     AMS_WMS0      -
c3t0d7s2  ENABLED      SECONDARY     c2t0d7s2    AMS_WMS     AMS_WMS0      -
```

Check that all the paths are displayed as “ENABLED”. If any path has a failure (DISABLED), suspend the FC Interface Board addition and recover the failure.

(b) When the version of VxVM is before 3.2, execute the command [vxdisk list cXtYdZs2] after checking the device by the command [vxdisk list] (cXtYdZs2 is the device file).

```
# vxdisk list
DEVICE          TYPE     DISK          GROUP         STATUS
c1t0d0s2        sliced                                error
c1t0d0s3        simple   c1t0d0s3      rootdg        online
c4t0d0s2        sliced   disk01        DG0           online
c4t0d1s2        sliced   disk01        DG1           online
c4t0d2s2        sliced   disk01        DG2           online

# vxdisk list c4t0d0s2
Device:         c4t0d0s2
devicetag:      c4t0d0
type:           sliced
hostid:

```

Check that all the paths are displayed as “enabled”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

(4) In the case of HDLM on Solaris

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName      DskName .....     ChaPort Status  Type .....
000000  .....         HITACHI DF700F    0A      Online  Own
000001  .....         HITACHI DF700F    1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where FC Interface Board addition is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where FC Interface Board addition is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where FC Interface Board addition is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where FC Interface Board addition is only 0A.

ExampleA-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName          DskName ···    ChaPort   Status          Type   IO-Count ···
000000   ···     HITACHI .DF700F….0051     0A        Offline(C)      Own    10

000004   ···     HITACHI .DF700F….0051     0A        Offline(C)      Own    10
000005   ···     HITACHI .DF700F….0051     1A        Online          Non    1
 :        :        :                        :         :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid   000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000004
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName          DskName ···    ChaPort   Status          Type   IO-Count ···
000000   ···     HITACHI .DF700F….0051     0A        Offline(C)      Own    10
000001   ···     HITACHI .DF700F….0051     1A        Online          Non    1
000002   ···     HITACHI .DF700F….0051     0A        Offline(C)      Own    10
000003   ···     HITACHI .DF700F….0051     1A        Online          Non    1
000004   ···     HITACHI .DF700F….0051     0A        Offline(C)      Own    10
000005   ···     HITACHI .DF700F….0051     1A        Online          Non    1
 :        :        :                        :         :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where FC Interface Board addition is only 1A.

ExampleB-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···        ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000001    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
000002    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000003    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
000004    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000005    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
 :          :          :                        :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid    000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···        ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000001    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
000002    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000003    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
000004    ···       HITACHI .DF700F....0051    0A       Online          Own    10
000005    ···       HITACHI .DF700F....0051    1A       Offline(C)      Non    1
 :          :          :                        :        :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the DF700 side (Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the DF700 side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of (4) in Step1: (server side) again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced       33        0
---
> Reduced      265        0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken      33        0
---

```

(5) In the case of HDLM on AIX

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /usr/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID  PathName      DskName .....     ChaPort Status  Type .....
000000  .....         HITACHI DF700F    0A      Online  Own
000001  .....         HITACHI DF700F    1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where FC Interface Board addition is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where FC Interface Board addition is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where FC Interface Board addition is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where FC Interface Board addition is only 0A.

ExampleA-1) Version 05-00 or later

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName              DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000001     ···          HITACHI .DF700F….0051       1A       Online          Non      1

000005     ···          HITACHI .DF700F….0051       1A       Online          Non      1
 :          :            :                          :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000004
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName              DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000001     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000002     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000003     ···          HITACHI .DF700F….0051       1A       Online          Non      1
000004     ···          HITACHI .DF700F….0051       0A       Offline(C)      Own      10
000005     ···          HITACHI .DF700F….0051       1A       Online          Non      1
 :          :            :                          :        :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where FC Interface Board addition is only 1A.

ExampleB-1) Version 05-00 or later

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName            DskName ···      ChaPort  Status        Type   IO-Count ···
000000   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000001   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000002   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000003   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000004   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000005   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
 :        :          :                    :        :             :
```

ExampleA-2) Version 04-xx or prior

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName            DskName ···      ChaPort  Status        Type   IO-Count ···
000000   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000001   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000002   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000003   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
000004   ···   HITACHI .DF700F....0051   0A       Online        Own    10
000005   ···   HITACHI .DF700F....0051   1A       Offline(C)    Non    1
 :        :          :                    :        :             :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /usr/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /usr/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the DF700 side (Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the DF700 side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of (5) in Step1: (server side) again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced      33        0
---
> Reduced     265        0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken     33        0
---
> Shrunken    265        0
```

(6) In the case of HDLM on Windows

Log into Windows with the user who has the Administrator authority, and execute the command [dlnkmgr view -sys -sfunc] from the command prompt.

```
# dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# dlnkmgr set -afb off
Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Open the command prompt, and execute “dlnkmgr view -path” command.

```
# dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName        DskName .....     ChaPort Status  Type .....
000000  .....           HITACHI DF700F    0A      Online  Own
000001  .....           HITACHI DF700F    1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where FC Interface Board addition is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where FC Interface Board addition is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where FC Interface Board addition is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where FC Interface Board addition is only 0A.

ExampleA-1) Version 05-00 or later

```
# dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···    ChaPort    Status          Type    IO-Count ···
000000    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000001    ···       HITACHI .DF700F….0051     1A      Online          Non     1
000002    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000003    ···       HITACHI .DF700F….0051     1A      Online          Non     1
000004    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000005    ···       HITACHI .DF700F….0051     1A      Online          Non     1
 :          :          :                      :        :              :
```

ExampleA-2) Version 04-xx or prior

```
dlnkmgr offline –pathid   000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000004
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···    ChaPort    Status          Type    IO-Count ···
000000    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000001    ···       HITACHI .DF700F….0051     1A      Online          Non     1
000002    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000003    ···       HITACHI .DF700F….0051     1A      Online          Non     1
000004    ···       HITACHI .DF700F….0051     0A      Offline(C)      Own     10
000005    ···       HITACHI .DF700F….0051     1A      Online          Non     1
 :          :          :                      :        :              :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where FC Interface Board addition is only 1A.

ExampleB-1) Version 05-00 or later

```
dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···        ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000001    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
000002    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000003    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
000004    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000005    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
 :          :          :                         :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···        ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000001    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
000002    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000003    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
000004    ···       HITACHI .DF700F....0051     0A       Online          Own    10
000005    ···       HITACHI .DF700F....0051     1A       Offline(C)      Non    1
 :          :          :                         :        :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd C:\tmp
# mkdir HDLMLOG
# cd HDLMLOG
# dlnkmgr view –path > path01.txt

   waiting for five minutes or more

# dlnkmgr view –path > path02.txt
```

When the contents are matched, perform the next operation in the DF700 side (Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the DF700 side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of (6) in Step1: (server side) again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced       33        0
---
> Reduced      265        0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken      33        0
---
> Shrunken     265        0
```

(7) In the case of HDLM on Linux

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Login as a user having the root authorization, and execute “dlnkmgr view -path” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID  PathName       DskName .....    ChaPort Status  Type .....
000000  .....          HITACHI DF700F   0A      Online  Own
000001  .....          HITACHI DF700F   1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where FC Interface Board addition is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-02 or later, execute this operation to a port of the controller where FC Interface Board addition is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where FC Interface Board addition is executed.

  dlnkmgr offline –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where FC Interface Board addition is only 0A.

ExampleA-1) Version 05-02 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 8 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where FC Interface Board addition is only 1A.

ExampleB-1) Version 05-02 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 8 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000016 OnlinePaths:000008
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName            DskName ···      ChaPort  Status        Type   IO-Count ···
000000   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000001   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
000002   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000003   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
000004   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000005   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
 :        :          :                         :        :             :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000016 OnlinePaths:000008
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID   PathName            DskName ···      ChaPort  Status        Type   IO-Count ···
000000   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000001   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
000002   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000003   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
000004   ···      HITACHI .DF700F....0051      0A       Online        Own    10
000005   ···      HITACHI .DF700F....0051      1A       Offline(C)    Non    1
 :        :          :                         :        :             :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the DF700 side (Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the DF700 side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of (7) in Step1: (server side) again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

```
# diff path01.txt path02.txt
2c2
< Reduced      33        0
---
> Reduced     265        0
```

(8) In the case of VxVM-DMP on Linux

Log into Linux with the user who has the root authority, and check CTLR-NAME connecting the DF700 by the command [vxdmpadm listctlr all]. Furthermore, execute the command [xvdmpadm getsubpaths ctlr=cx] for each CTLR-NAME (cx is CTLR-NAME).

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
# vxdmpadm listctlr all

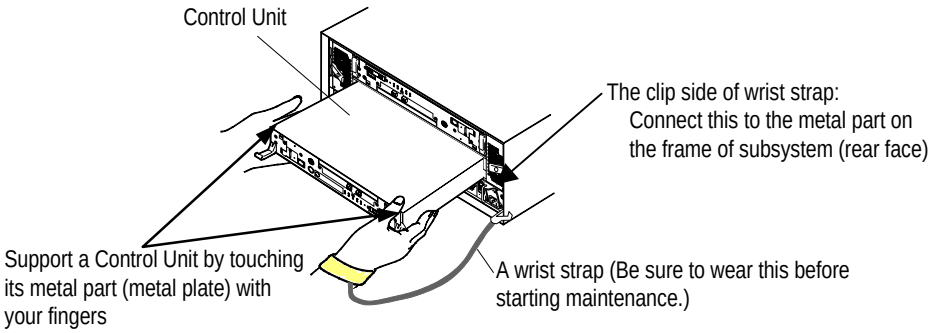
```

Check that all the paths are displayed as “ENABLED”. If any path has a failure (DISABLED), suspend the FC Interface Board addition and recover the failure.

Note: The FC Interface Board addition by pulling out the FC cables cannot be performed.

(9) In the case of USP/NSC/9900V



Maintain paths from USP/NSC/9900V to DF700, if it is necessary.

Please maintain paths with USP/NSC/9900V maintenance member.

Step2:

When adding the FC Interface Board, a failure may be caused by the electric shock since the Control Unit is precision instrument. Before starting the operation, make sure to wear a wrist strap to protect Control Unit against the electric shock.

Note: Before unpacking and adding maintenance components, be sure to wear a wrist strap and connect to ground the grounding clip in the opposite end of the wrist strap to the chassis frame (metal part).
When you insert a Control Unit into the subsystem, support the Control Unit as touching its metal part with fingers of your hand that wears a wrist strap.

(1) Press the RST SW on the Control Unit, in which the Interface Board to be added is installed, and make sure that the CALM LED (red) comes on. Use a tool with a thin tip (a precise screwdriver, etc.) because the hole of RST SW is small (3 mm in diameter).

(2) Connect OUT (J100-J10x) of the remote adaptor in the final steps and the connector (REMOTE ADAPTER) of the Control Unit installing the FC Interface Board that is not added in DF700 are connected with the remote cable (VRCx) when the remote adaptor is connected. Check that the LED of the connected remote adaptor lights on when the remote cable has already been connected. Next, remove the remote cable connected to the Control Unit in which the FC Interface Board to be added is installed.

(3) Loosen the screws (right and left) which are fixing the levers of the Control Unit, push down the levers forward, and pull out the Control Unit.

(4) Remove the all cables connected to the Control Unit.

Note: When the cable cannot be removed easily, do not pull it by force.
Besides, the cable can be damaged if it is bent upward or downward forcibly.

Note: When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Note: Touching heat sinks or ICs may cause getting burned. Be sure to handle with care.

(5) Remove the Control Unit by pulling it out toward you.

(6) Loosen the two fixing screws for the cover at the back of the cover, remove the cover.

(7) Loosen the fixing screws ② (two places) of the dummy Interface Board installed in the Control Unit and remove the fixing screws ① (three places), and then pull up the dummy Interface Board upwards and remove it from the Control Unit.

(8) Install the adding FC Interface Board fitting it to the positioning pin of the Control Unit, tighten the fixing screws ① (three places), and then fix it by tightening the fixing screws ② (two places).
At this time, check that the connectors are surely inserted.
Also, install it so that the sheet metal part of the FC Interface Board may become the inside of the Control Unit.

(9) Install the removed Host Connector in the new Control Unit.

(10) Attach the cover in the opposite direction of which it was removed, tighten the fixing screw for the cover at the back of the cover.

(11) Connect the removed interlocking cable to the Control Unit when the special UPS is connected.

(12) Make sure that 20 seconds or longer has elapsed after the Control Unit was taken out. If the controller is inserted before 20 seconds has elapsed, the Control Unit may not be recovered normally.

(13) Connect the ENC cable.

Note: The loop is not recovered and the Control Unit fails again unless the Control Unit is inserted in the state in which the ENC cable is connected.

Note: The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(14) Insert it into the specified position with the both right and left levers of the Control Unit pushed down, raise the levers with the hooks fitting to the cutouts of the subsystem, and tighten the fixing screw for the lever.
CALM LED and EALM LED of newly installed Control Unit turn on, then EALM LED turns off and CALM LED turns off next.
If the Control Unit is inserted without waiting for 20 seconds, it is possible that the Control Unit is not recovered from the failure normally.
When it is not recovered even if ten minutes or more elapsed, perform the dummy replacement of the Control Unit which was inserted.
When the Control Unit is not recovered (ten minutes or more elapsed) even if "I1G300 CTL recovery start" is displayed in the Information Message of WEB after the dummy replacement, perform the dummy replacement of the Control Unit which was inserted, again.
When it is not recovered after another ten minutes, service personnel connects it to the WEB and takes recovery actions according to "Information Message" on WEB. (There may be a problem on the Control Unit or the cache memories installed.)
But, when any messages are displayed on WEB about the Control Unit or the cache memories installed, then service personnel connects the other Control Unit to the WEB and takes recovery actions according to "Information Message" in the other Control Unit.

Note: Do not catch a ENC cable, when the Control Unit for the inserted.

Note: The installation direction is different in the Control Unit # 0 and # 1. Install the Control Unit #0 with the cover up and #1 with the cover down.

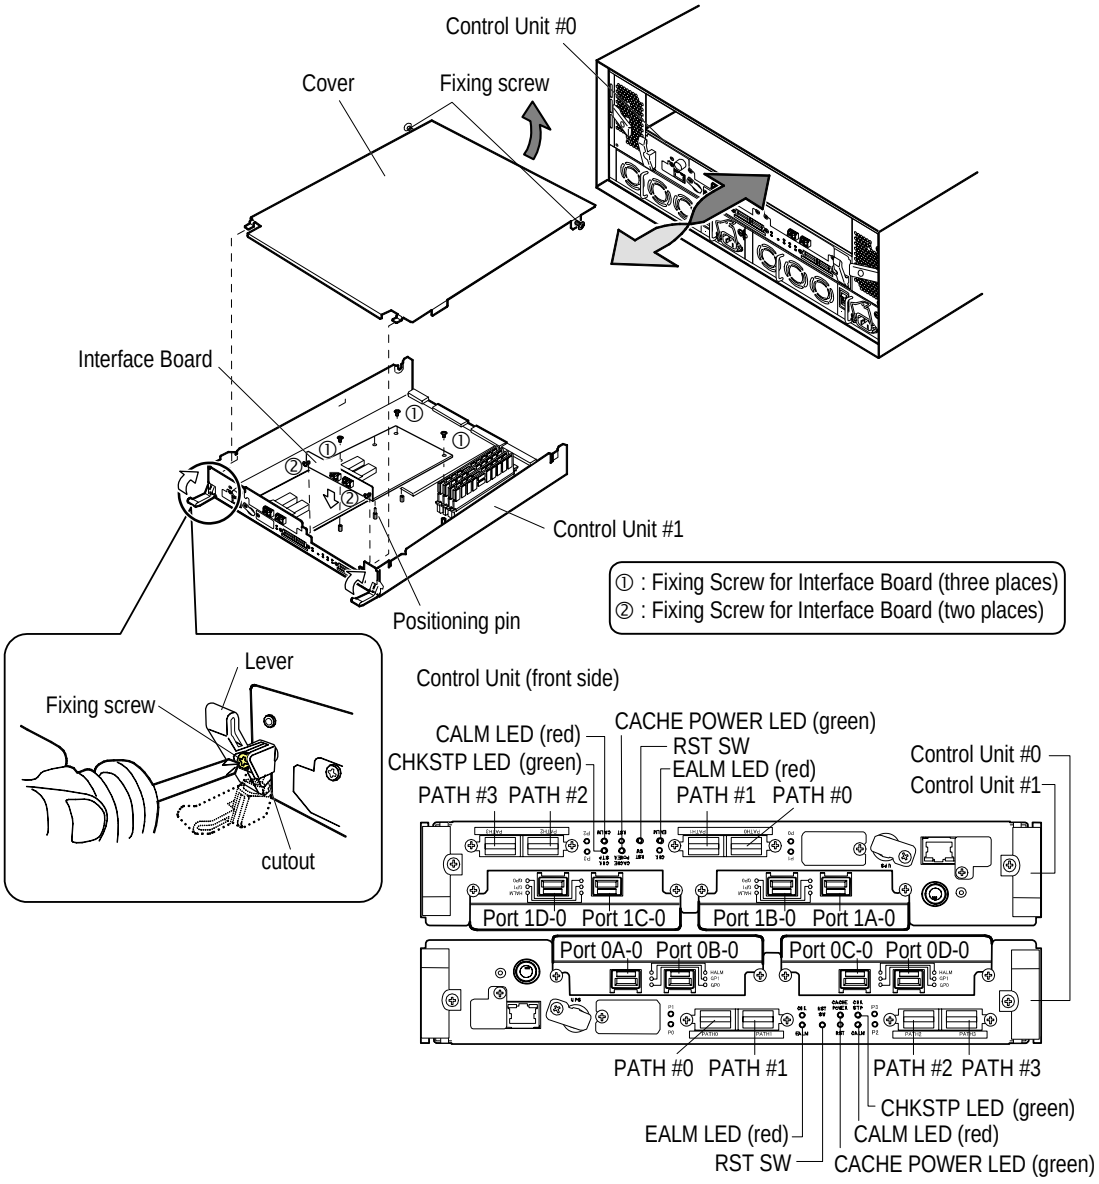
Note: When returning the levers in the arrow directions (⟶) at the same time, operate them within one second. If the operation takes longer than one second, the Control Unit may not be recovered. If it occurs, execute the recovery procedure once again. If the Control Unit is not recovered in spite of the re-execution, replace the Control Unit because it may be faulty.

(15) Check that the CALM LED (red) on the Control Unit is off.

(16) Check that the WARNING LED (orange) on the front of the Basic Chassis goes out. (The Control Unit usually recovers in about three (3) minutes, but if the I/O load from the host computer is high, it may take three (3) minutes or more to recover.)

(17) Reconnect all cables that were disconnected.

Note: When connecting the Fibre Channel interface cables removed in Procedure (4), insert them in the host connectors which are the same as those before removing.



Note: When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Note: The installed direction is different in the Control Unit #0 and #1, so that be careful of the connecting position of the cables.

(18)Make sure that the READY LED (green) on the Front Bezel is on. The READY LED (green) on the front of the Basic Chassis may blink at high speed (for the maximum of 30 to 60 minutes) before it lights up.

(19)Refer to "Information Message" on WEB, and check to see that [I0010x CTL recovered (CTL-x)] is indicated.
When this is indicated, the addition of Interface Board has completed.

(20)Check that the LED of the remote adaptor connected to the Control Unit in which the added FC Interface Board is installed lights on when the remote adaptor is connected.

Step3: (server side)

Check the status of paths to the LUs. If multiple OS are connected, perform the operations on all the servers connected to DF700 that the FC Interface Board is to be added.

(1) In the case of PVLink on HP-UX

Execute "vgdisplay –v vg??" command, and check that all the active paths returned to the initial status.

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0
  --- Logical volumes ---
  LV Name                   /dev/vg02/lvol1
  LV Status                 available/syncd
  LV Size (Mbytes)          1000
  Current LE                250
  Allocated PE              250
  Used PV                   1
  --- Physical volumes ---
  PV Name                   /dev/dsk/c83t0d0
  PV Name                   /dev/dsk/c24t0d0 Alternate Link
  PV Status                 available
  Total PE                  511
  Free PE                   11
  Autoswitch                On
```

If the path is not returned to the initial status, execute the "vgdisplay –v vg??" command every 30 seconds and check.

(2) In the case of HDLM on HP-UX

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName      DskName .....   ChaPort Status  Type .....
000000  .....         HITACHI DF700F  0A      Online  Own
000001  .....         HITACHI DF700F  1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(3) In the case of VxVM-DMP on Solaris

The commands to operate differ in the cases where the version of VxVM is 3.2 or later and where it is before 3.2.

(a) When the version of VxVM is 3.2 or later, execute the command [vxdmpadm listctlr all] and the command [vxdmpadm getsubpaths ctlr=cx], and check the path status (cx is CTLR-NAME).

```
# vxdmpadm listctlr all
CTLR-NAME       ENCLR-TYPE      STATE           ENCLR-NAME
=========================================================
c1              Disk            ENABLED         Disk
c2              AMS_WMS         ENABLED         AMS_WMS0
c3              AMS_WMS         ENABLED         AMS_WMS0

# vxdmpadm getsubpaths ctlr=c2
NAME      STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE    ENCLR-NAME  ATTRS
=============================================================================
c2t0d0s2  ENABLED(A)    SECONDARY     c2t0d0s2      AMS_WMS       AMS_WMS0    -
c2t0d1s2  ENABLED(A)    PRIMARY       c2t0d1s2      AMS_WMS       AMS_WMS0    -
c2t0d2s2  ENABLED(A)    SECONDARY     c2t0d2s2      AMS_WMS       AMS_WMS0    -
c2t0d3s2  ENABLED(A)    PRIMARY       c2t0d3s2      AMS_WMS       AMS_WMS0    -
c2t0d4s2  ENABLED       SECONDARY     c2t0d4s2      AMS_WMS       AMS_WMS0    -
c2t0d5s2  ENABLED(A)    PRIMARY       c2t0d5s2      AMS_WMS       AMS_WMS0    -
c2t0d6s2  ENABLED       SECONDARY     c2t0d6s2      AMS_WMS       AMS_WMS0    -
c2t0d7s2  ENABLED(A)    PRIMARY       c2t0d7s2      AMS_WMS       AMS_WMS0    -

# vxdmpadm getsubpaths ctlr=c3
NAME      STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE    ENCLR-NAME  ATTRS
=============================================================================
c3t0d0s2  DISABLED      PRIMARY       c2t0d0s2      AMS_WMS       AMS_WMS0    -
c3t0d1s2  ENABLED       SECONDARY     c2t0d1s2      AMS_WMS       AMS_WMS0    -
c3t0d2s2  DISABLED      PRIMARY       c2t0d2s2      AMS_WMS       AMS_WMS0    -
c3t0d3s2  ENABLED       SECONDARY     c2t0d3s2      AMS_WMS       AMS_WMS0    -
c3t0d4s2  ENABLED(A)    PRIMARY       c2t0d4s2      AMS_WMS       AMS_WMS0    -
c3t0d5s2  ENABLED       SECONDARY     c2t0d5s2      AMS_WMS       AMS_WMS0    -
c3t0d6s2  ENABLED(A)    PRIMARY       c2t0d6s2      AMS_WMS       AMS_WMS0    -
c3t0d7s2  ENABLED       SECONDARY     c2t0d7s2      AMS_WMS       AMS_WMS0    -
```

When DISABLED is included in the path status displayed by the command [vxdmpadmgetsubpaths ctlr=cx], execute the command [vxdmpadm enable ctlr=cx] for the CTLR-NAME (c3 in the above case), and change the path into the enable status. After that, execute the command [vxdmpadm getsubpaths ctlr=cx], and check that all the path statuses are returned to ENABLED (cx is CTLR-NAME).

```
# vxdmpadm enable ctlr=c3

# vxdmpadm getsubpaths ctlr=c2
NAME      STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE    ENCLR-NAME  ATTRS
================================================================================
c2t0d0s2  ENABLED       SECONDARY     c2t0d0s2      AMS_WMS       AMS_WMS0    -
c2t0d1s2  ENABLED(A)    PRIMARY       c2t0d1s2      AMS_WMS       AMS_WMS0    -
c2t0d2s2  ENABLED       SECONDARY     c2t0d2s2      AMS_WMS       AMS_WMS0    -
c2t0d3s2  ENABLED(A)    PRIMARY       c2t0d3s2      AMS_WMS       AMS_WMS0    -
c2t0d4s2  ENABLED       SECONDARY     c2t0d4s2      AMS_WMS       AMS_WMS0    -
c2t0d5s2  ENABLED(A)    PRIMARY       c2t0d5s2      AMS_WMS       AMS_WMS0    -
c2t0d6s2  ENABLED       SECONDARY     c2t0d6s2      AMS_WMS       AMS_WMS0    -
c2t0d7s2  ENABLED(A)    PRIMARY       c2t0d7s2      AMS_WMS       AMS_WMS0    -

# vxdmpadm getsubpaths ctlr=c3
NAME      STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE    ENCLR-NAME  ATTRS
================================================================================
c3t0d0s2  ENABLED(A)    PRIMARY       c2t0d0s2      AMS_WMS       AMS_WMS0    -
c3t0d1s2  ENABLED       SECONDARY     c2t0d1s2      AMS_WMS       AMS_WMS0    -

(4) In the case of HDLM on Solaris

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName        DskName .....   ChaPort Status  Type .....
000000  .....           HITACHI DF700F  0A      Online  Own
000001  .....           HITACHI DF700F  1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(5) In the case of HDLM on AIX

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName        DskName .....   ChaPort Status  Type .....
000000  .....           HITACHI DF700F  0A      Online  Own
000001  .....           HITACHI DF700F  1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(6) In the case of HDLM on Windows

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort Status   Type .....
000000   .....           HITACHI DF700F    0A      Online   Own
000001   .....           HITACHI DF700F    1A      Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(7) In the case of HDLM on Linux

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort Status   Type .....
000000   .....           HITACHI DF700F    0A      Online   Own
000001   .....           HITACHI DF700F    1A      Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(8) In the case of VxVM-DMP on Linux

When DISABLED is included in the path status displayed by the command [vxdmpadm getsubpaths ctlr=cx], execute the command [vxdmpadm enable ctlr=cx] for the CTLR-NAME (c2 in the above case), and change the path into the enable status. After that, execute the command [vxdmpadm getsubpaths ctlr=cx], and check that all the path statuses are returned to ENABLED (cx is CTLR-NAME).

```
# vxdmpadm enable ctlr=c2

# vxdmpadm getsubpaths ctlr=c2
NAME   STATE[A]      PATH-TYPE[M]  DMPNODENAME ENCLR-TYPE  ENCLR-NAME  ATTRS
==========================================================================
sdb    ENABLED(A)   PRIMARY       sdb         HDS9500V    HDS9500V0   -
sdc    ENABLED      SECONDARY     sdc         HDS9500V    HDS9500V0   -
sdd    ENABLED(A)   PRIMARY       sdd         HDS9500V    HDS9500V0   -
sde    ENABLED      SECONDARY     sde         HDS9500V    HDS9500V0   -
sdf    ENABLED(A)   PRIMARY       sdf         HDS9500V    HDS9500V0   -

```

The following message is displayed in the console window when the path returns.

```
Nov 11 17:03:28 RH3U3-2 kernel: vxvm:vxdmp: enabled path 8/0xe0 belonging
to the dmpnode 201/0x1f
```

(9) In the case of USP/NSC/9900V

Maintain paths from USP/NSC/9900V to DF700.
Please maintain paths with USP/NSC/9900V maintenance member.

Step4:

Addition the FC Interface Board on the other controller by following the procedures in Step1 to Step3.

6.3 Operations after the FC Interface Board Addition

If “IO Timeout” or “AutoSwitch” parameter of PVLink was changed, perform the following operation to recover the original value.

[Operations of returning the PVLink parameters]

(1) Login as a user having the root authorization in HP-UX, and execute “vgdisplay /dev/dsk/c?t?d?” command.

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                 /dev/dsk/c11t0d1
PV Name                 /dev/dsk/c13t1d1        Alternate Link
VG Name                 /dev/vg02
PV Status               available
Allocatable             yes
VGDA                    2
Cur LV                  4
PE Size (Mbytes)        4
Total PE                1023
Free PE                 148
Allocated PE            875
Stale PE                0
IO Timeout (Seconds)    60
Autoswitch              On
#
```

(2) If original value of “IO Timeout” parameter was default, execute “pvchange –t 0 /dev/dsk/c?t?d?” command to return. If original value was 50, execute “pvchange –t 50 /dev/dsk/c?t?d?” command. And, execute “vgdisplay ./dev/dsk/c?t?d?” command to check the result.

(3) If original value of “AutoSwitch” parameter was Off, execute “pvchange –S n “dev/dsk/c?t?d?” command to return, and check the result.

When "Auto Failback :" is disabled, execute the following.

[Operations of returning the HDLM parameters]

(1) Excute the command [dlmkmgr view -sys -sfunc].

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

(2) When "Auto Failback :" is disabled (off), execute the command [dlnkmgr set -afb on].

```
# /usr/DynamicLinkManager/bin/dlnkmgr set -afb on

Execute command? [y/n] : y

KAPL01001-I The HDLM command completed normally. Operation name = set
```

(3) Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

[Definition of terms]

Term	Meaning
RKA	In this procedure manual, it is used as the abbreviation of the DF600-RKA.
RKAJAT	In this procedure manual, it is used as the generic name of the DF700-RKAJAT.
Offline	Issue of the host I/O instruction is not required.
Online	Issue of the host I/O instruction is required.
Offline ENC/SENC Firmware Download	Function for downloading the ENC/SENC firmware supported in the offline state (offline replacement)
Online ENC/SENC Firmware Download	Function for downloading the ENC/SENC firmware supported in the online state (online replacement) This function can be used offline also.
SH Firmware	This is the general term for the following firmware shown in Web and Storage Navigator Modular, and required for the ENC operation of RKH, RKM, RKS, RKAJ and RKA. RKH, RKM, RKS, RKAJ : ENC(MAIN) RKA : ENC(MAIN), ENC(BOOT)
H8S Firmware	This is the following firmware shown in Web and Storage Navigator Modular, and required for the SENC operation of RKXS and RKAJAT. RKXS, RKAJAT: SENC(SES)
SR Firmware	This is the following firmware shown in Web and Storage Navigator Modular, and required for the SENC operation of RKXS and RKAJAT. RKXS, RKAJAT: SENC(RTR)

Chapter 1. Outline of Online ENC/SENC Firmware Download

This describes the method of downloading the ENC/SENC firmware (SH firmware, H8S firmware and SR firmware) from the PC used for maintenance through the microprogram without replacing the hard parts when the ENC/SENC firmware version-up is required.

In the Online ENC/SENC Firmware Download, firmware shown in the following table are downloaded.

Disk array unit type		DF700
Basic disk array unit	FC	(RKH, RKM, RKS) SH Firmware
	SATA	(RKXS) H8S Firmware SR Firmware
Expanded disk array unit	FC	(RKAJ, RKA) SH Firmware
	SATA	(RKAJAT) H8S Firmware SR Firmware

[Possibility of the ENC/SENC firmware download depending on whether the host I/O instruction is required or not]

The following table shows possibility of the ENC/SENC firmware download depending on whether the host I/O instruction is required or not.

Item	Issue of the host I/O instruction		Note
	Required (online state)	Not required (offline state)	
Offline ENC/SENC Firmware Download	Not executable	Executable	
Online ENC/SENC Firmware Download	Executable	Executable

Chapter 2. Preconditions for Online ENC/SENC Firmware Download

(1) To perform the Online ENC/SENC Firmware Download using Storage Navigator Modular, a service terminal is required. Besides, have the maintenance manual with you in order to cope with a failure that occurs during the Online ENC/SENC Firmware Download.

(2) State of the subsystem must be normal as shown below. Otherwise, an error message will be output when Storage Navigator Modular issues an instruction for the replacement.

- All the loops on the back end side are normal.
- Both of the controllers are normal.
- All the ENC/SENCs are normal.

(3) During the Online ENC/SENC Firmware Download, the SES drives concerning the both ENC/SENCs must be installed being combined as shown below at a minimum in order to keep watch on replacement parts of the ENC/SENCs to which no download is performed.

- HDU #0 – HDU #1
- HDU #2 – HDU #3
- HDU #0 – HDU #3
- HDU #1 – HDU #2

(4) The Online ENC/SENC Firmware Download supports the dual controller configuration only. Do not apply the procedure for the case of the single controller configuration to the Online ENC/SENC Firmware Download.

(5) Do not install the SENC firmware whose revision is less than 5.80/A in the array subsystem which uses the priced option Power Saving.
If the SENC firmware whose revision is less than 5.80/A is installed in the array subsystem which uses the priced option Power Saving, "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is displayed in Warning Information on WEB after the array subsystem is restarted, and the WARN LED (orange) on the front of the basic chassis lights up and it becomes in the warning status.
Also, if the SENC firmware whose revision is less than 5.80/A is installed in the array subsystem that "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is already displayed in Warning Information on WEB, the message code "W0GM00" does not disappear, and the warning status of the array subsystem does not recover.

Chapter 3. Restriction and notes of Online ENC/SENC Firmware Download

3.1 Restriction

(1) Do not remove or insert any parts, for maintenance or any other reason, during Online ENC/SENC Firmware Download.
Inserting or removing parts during Online ENC/SENC Firmware Download may cause a fault. If parts are inserted or removed during Online ENC/SENC Firmware Download and a fault results, action the Online ENC/SENC Firmware Download.

(2) Do not alter the disk array architecture during Online ENC/SENC Firmware Download.
Altering the disk array architecture during Online ENC/SENC Firmware Download may cause download to fail.

(3) If maintenance personnel download an Online ENC/SENC Firmware Download when one of the ENC/SENC firmware already installed is defective or there is an ENC/SENC hardware error, the ENC/SENC firmware (SH firmware, H8S firmware and SR firmware) exchange may fail. At this time, refer to the Web message and follow the maintenance manual to perform the maintenance work, and then follow this procedure manual to perform the Online ENC/SENC Firmware Download again.

(4) When each automatic diagnosis function operates due to the backend failures, the Online ENC/SENC Firmware Download fails.
In such a case, perform the Online ENC/SENC Firmware Download again after removing the failed part.

(5) Do not execute the deliberate shutdown or power turning off when the online ENC/SENC download is terminated abnormally because the ENC/SENC firmware (part for the boot) may be damaged. When the download is terminated abnormally, issue the download instruction again through Storage Navigator Modular after removing a failed part. If the online ENC/SENC download is terminated abnormally in spite of the operation above, replace the ENC/SENC.
If the deliberate shutdown or power turning off is executed after the abnormal termination of the download, the ENC/SENC may be detached at the time of the next boot of the subsystem. If it occurs, replace the ENC/SENC following the maintenance manual.

(6) Be sure to set the automatic download function to “Disable” before performing the online ENC/SENC firmware download.
Bu sure to set it to “Enable” again after executing the online ENC/SENC firmware download.

(7) When the subsystem is shut down deliberately during execution of the online ENC/SENC firmware downloading, turn off the AC Power Unit Switches of all the frames that are connected, turn them on again, and then turn on the main switch on the front side. If the subsystem is started up without performing the operation above, the ENC/SENC is detached. If it is detached, replace the ENC/SENC following the maintenance manual.

(8) The SANRISE AMS1000 can connect the DF600-RKA from the microprogram revision of 0731/A-H.

(9) The SANRISE AMS500 can connect the DF600-RKA from the microprogram revision of 0720/A-M.

Copyright © 2005, Hitachi, Ltd.

(10) The SANRISE AMS/WMS Series can connect the DF600-RKAJAT.
(11) The SANRISE AMS/WMS Series cannot connect the DF600-RKAAT.
(12) If the revision of the ENC firmware of ENC installed in the DF600-RKA is Rev. 18 or less, the revision of the ENC firmware should be updated when reducing it from the SANRISE 9570V/9580V/9585V.

Copyright © 2005, Hitachi, Ltd.

3.2 Precautions

(1) Although the WARN LED (orange) on the front of the basic chassis of the array subsystem which uses the priced option lights up, if only "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is displayed in Warning Information on WEB, the installation of the ENC/SENC firmware is executable.

Chapter 4. Time Required for Online ENC/SENC Firmware Download

For the Disk Array Subsystem, the standard time of working hours required for executing the online ENC/SENC firmware download function is shown below. The working hours of Table 4.1 show the time from starting the replacement of the ENC/SENC firmware for ENC#0 or ENC#1 by the Storage Navigator Modular to the end of the replacement.

Table 4.1 Standard of the time required for the download of the ENC/SENC for ENC#0 or ENC#1

N: Number of RKA

Model	Target chassis for ENC/SENC firmware download	Working hours	
		Standard	Maximum
WMS100	N/A	16 minutes	40 minutes
	Only RKXS or RKXS and RKAJAT		
	Only RKAJAT	15 minutes	30 minutes
AMS200	Only RKS	7 minutes	20 minutes
	Only RKAJ		
	RKS and RKAJ		
	Only RKAJAT	15 minutes	30 minutes
	(RKS or RKAJ) and RKAJAT	21 minutes	50 minutes
AMS500	Only RKM	7 minutes	20 minutes
	Only RKAJ		
	RKM and RKAJ		
	Only RKA	4 minutes + 3 minutes 20 seconds×N	10 minutes + 7 minutes×N
	RKA and (RKM or RKAJ)		
	RKAJAT	15 minutes	30 minutes
	(RKM or RKAJ) and RKAJAT	21 minutes	50 minutes
		18 minutes + 3 minutes 20 seconds×N	40 minutes + 7 minutes×N
AMS1000	Only RKH	6 minutes	20 minutes
	Only RKAJ	7 minutes	20 minutes
	Only RKM or RKAJ and RKA	4miuntes + 3 minutes 20 seconds×N	10 minutes + 7 minutes×N
	Only RKAJAT	15 minutes	30 minutes
	RKH and RKAJ	12 minutes	30 minutes
	RKH and RKA or RKH, RKAJ and RKA	10 minutes + 3 minutes 20 seconds×N	20 minutes+ 7 minutes×N
	RKH and RKAJAT	20 minutes	40 minutes
	RKAJ and RKAJAT	21 minutes	50 minutes
	RKAJAT and RKA or RKAJ, RKAJAT, and RKA	19 minutes + 3 minutes 20 seconds×N	40 minutes + 7 minutes ×N
	RKH, RKAJ and RKAJAT	27 minutes	60 minutes
	RKH, RKAJAT and RKA or RKH, RKAJ, RKAJAT and RKA	24 minutes + 3 minutes 20 seconds×N	50 minutes + 7 minutes ×N

Chapter 5. Before Starting Online ENC/SENC Firmware Download

The PC that is used for maintenance and connected to the LAN must be used to download Online ENC/SENC Firmware Download. Before beginning Online ENC/SENC Firmware Download, confirm/prepare the following:

(1) After referring to the web connection procedures in the DF700 Disk Array Subsystem Maintenance Manual WEB "Chapter 1. Before Using Web" (WEB 01-0000), prepare 1 PC on which a web browser has been installed and that can be used in a LAN.
(2) Set the service PC up. (See DF700 Disk Array Subsystem Maintenance Manual Microprogram "1.3 Preparation for installation of microprogram" (MICRO 01-0020)).
(3) Prepare a CD-ROM of the specified revision for microprogram installation.
(4) Execute the installer of the CD-ROM and store the unified version directory(‡1) under the directory, "C:\diskarray-microprogram\microprogram."
(5) If a failure occurs during the ENC/SENC firmware download, it is required to see the recovery measures. Prepare the DF700 Disk Array Subsystem Maintenance Manual, and perform the recovery work following the manual.

‡1 : For the unified version directory, refer to "5.1 Hierarchy of ENC/SENC Firmware Storage Directories" (OEMD 05-0010).

Copyright © 2005, Hitachi, Ltd.

5.1 Hierarchy of ENC/SENC Firmware Storage Directories

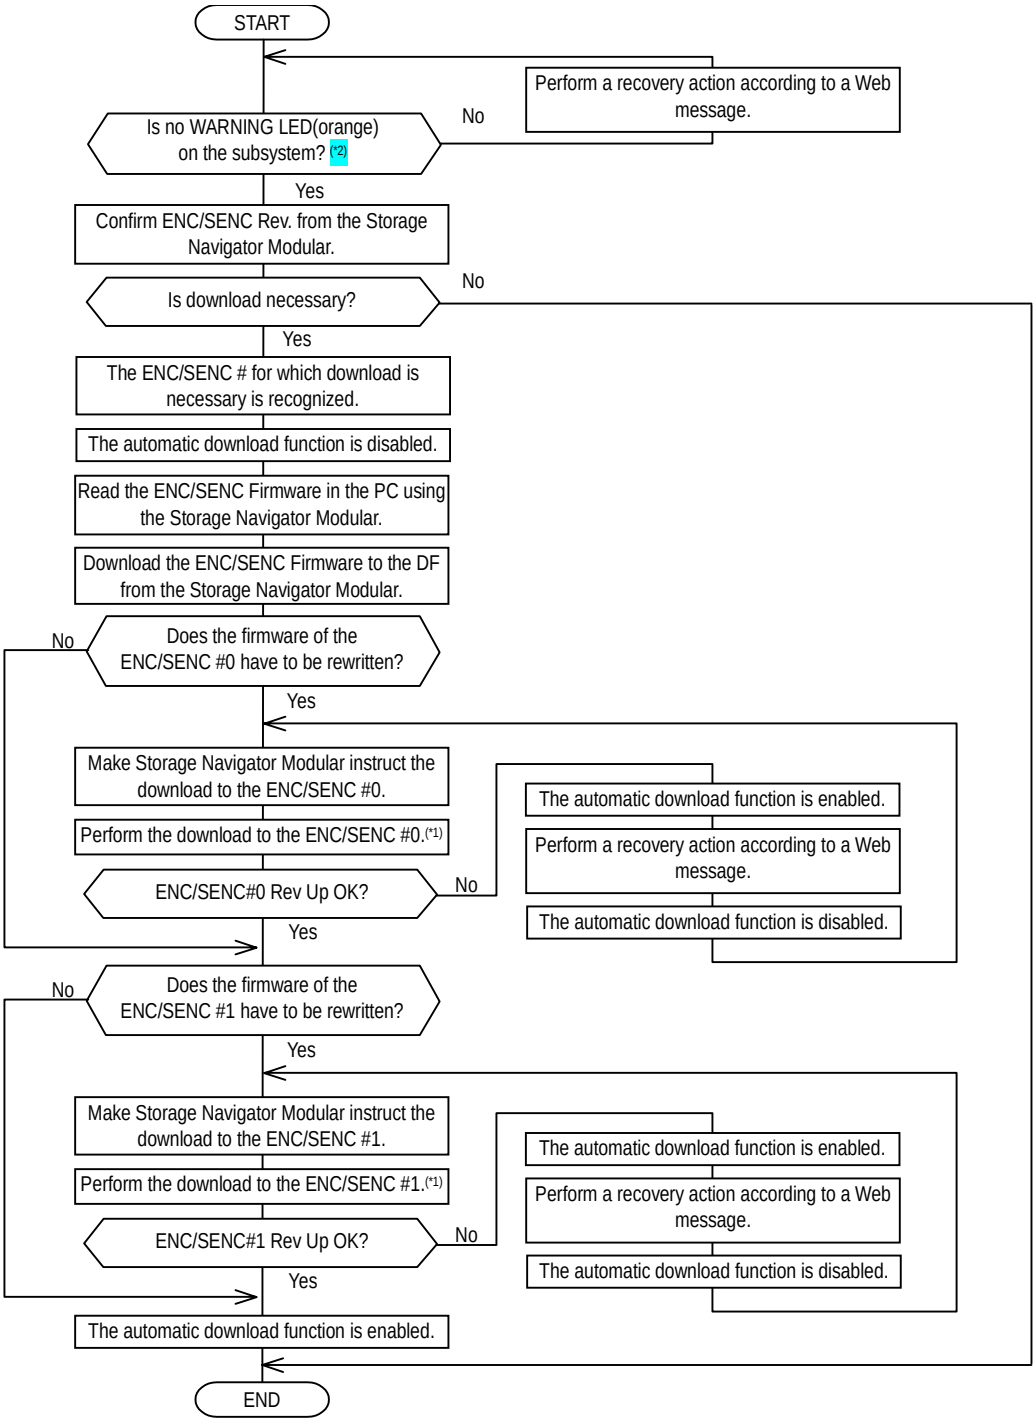
The hierarchical structure of ENC/SENC firmware storage directories is shown in Table 5.1.1. The structure of directories of the CD-ROM for installing the ENC/SENC firmware is the same as that shown in Table 5.1.1.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:\diskarray-microprogram\microprogram."
When installing the ENC/SENC firmware, specify the unified version directory.

Table 5.1.1 Directory Hierarchy

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	Microprogram file	-	-

NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

Copyright © 2005, Hitachi, Ltd.



Chapter 6. Procedure for Online ENC/SENC Firmware Download

The procedure that must be followed in order to download Online ENC/SENC Firmware Download does not support single controllers.

Copyright © 2005, 2006, Hitachi, Ltd.

6.1 Flowchart

The procedure for the maintenance operation is shown below.

*1 : The ALM LED(red) on the ENC/SENC lights on during the ENC/SENC firmware download.

*2 : Although the WARN LED (orange) on the front of the basic chassis of the array subsystem which uses the priced option lights up, if only "W0GM00 SENC which may attach restrictions on Power Saving function was detected" is displayed in Warning Information on WEB, the installation of the ENC/SENC firmware is executable.

6.2 Online ENC/SENC Firmware Download Procedure Window

6.2.1 Connecting the PC Used for Maintenance

The maintenance LAN connector and the LAN connector of the PC used for maintenance must be connected using a LAN cross cable. Follow the procedure shown below to make the necessary connection.

(1) Confirm the following before connecting the PC used for maintenance:
Check the following LEDs before connecting the PC used for maintenance:

- POWER LED(green) confirmation:
  Confirm that the POWER LED(green) located on the top of the front bezel is lit.
  If the POWER LED(green) is not lit, refer to the DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000) for details on how to correct the error.
- WARNING LED(orange) confirmation:
  Confirm that the WARNING LED(orange) located on the top of the front bezel is not lit.
  If the WARNING LED(orange) is lit or blinking, refer to the DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000) for details on how to correct the error.

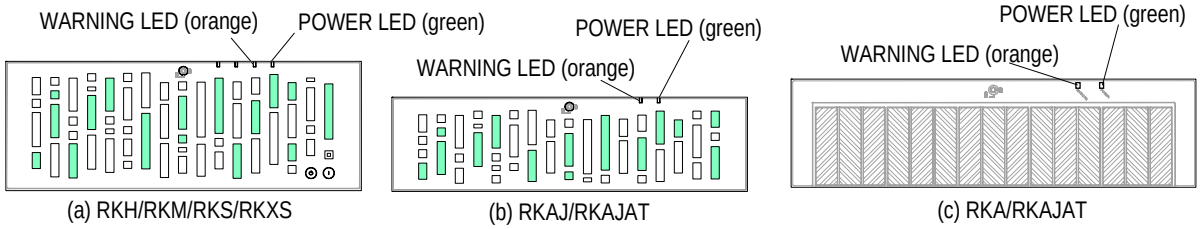

Figure 6.2.1 Locations and Name of LED

- Controller CHKSTP LED(red) confirmation:
  Confirm whether or not the CHKSTP LED(red) located on the top of the controller is lit.
  Replace any controllers on which the CHKSTP LED(red) is lit. For details on how to replace controllers, refer to the DF700 Disk Array Subsystem Maintenance Manual Replace "2.2.5 Replacing Control Unit" (REP 02-0400) for details on how to correct the error.

Copyright © 2005, Hitachi, Ltd.

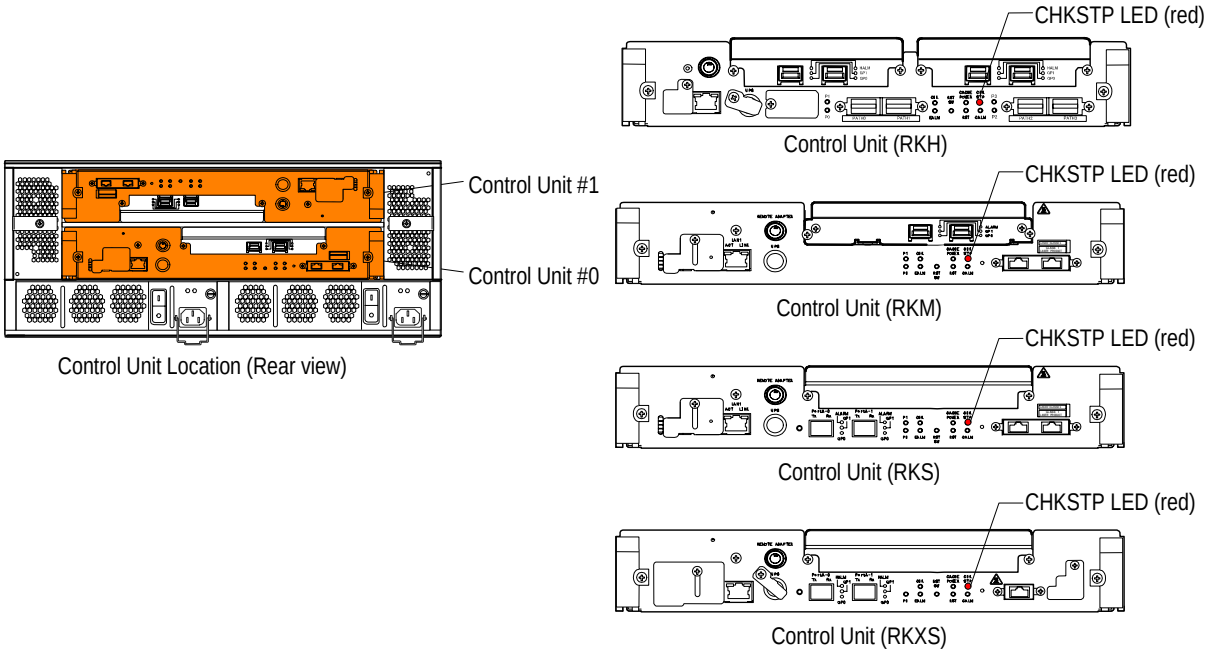

Figure 6.2.2 Locations and Name of LED

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

(2) Preparing the maintenance terminal for use

Table 6.2.1 Preparing the maintenance terminal

Item Number	Customer Environment	Terminal used for maintenance	Preparation
1	Uses controller's maintenance-use LAN connector	Use the LAN to connect the PC that is being carried and will be used for maintenance.	• PC used for maintenance • LAN cross cable

(3) Controller to be connected

With dual system architecture, the browser connection is identical no matter which controller is connected. First, connect to controller #0.

If controller #0 is closed, subsequent information can only be referenced on the controller #1 side. If controller #0 is closed, connect to controller #1.

(4) Connecting the procedures of the PC Used for Maintenance

- Remove the cover located above the controller on the unit. Using the LAN cable, connect the maintenance LAN connector and the connector of the PC used for maintenance.

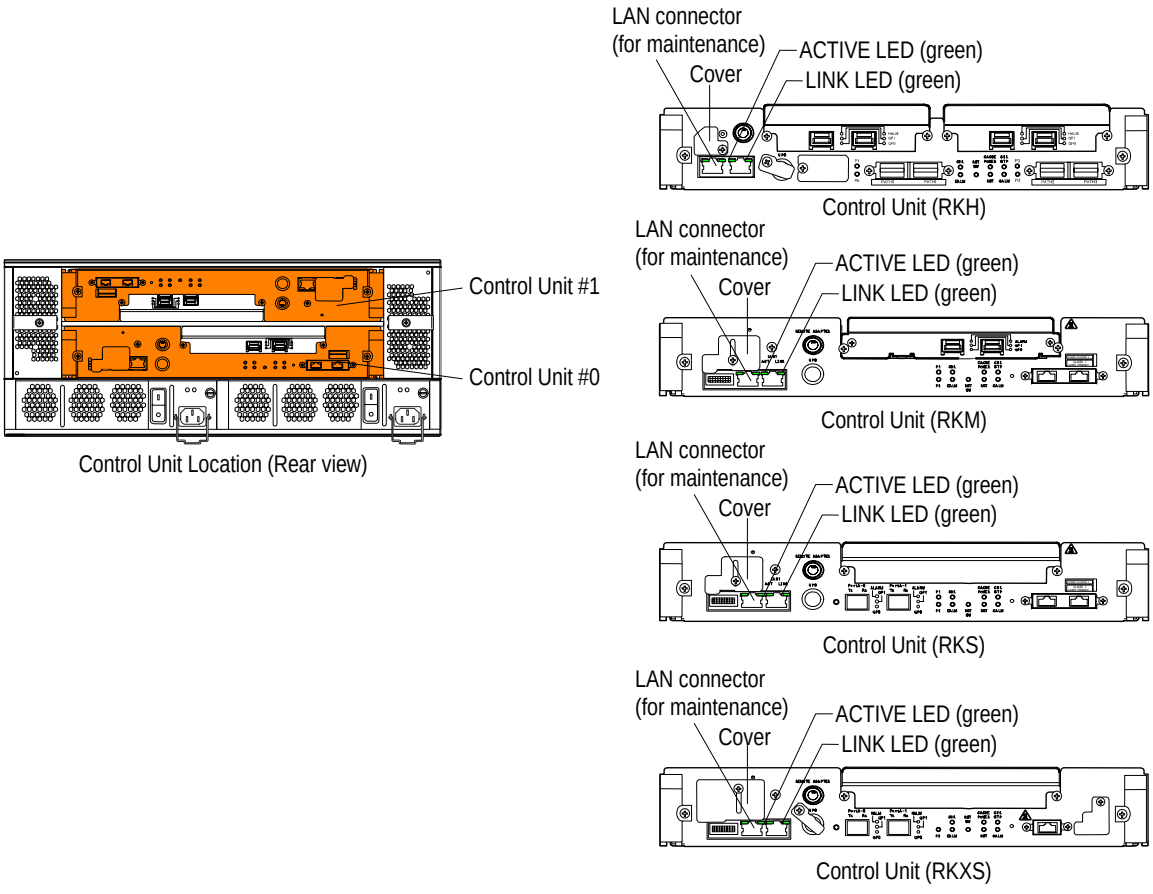

Figure 6.2.3 LAN Connector Position

Copyright © 2005, Hitachi, Ltd.

- Start up the maintenance PC.
- Change the IP address of the network parameter for the maintenance PC.
  For the maintenance PC, set the IP address shown in No. 1 in Table 6.2.2 below.
  If the maintenance PC cannot be connected, set the value in No.2 to No.5.

Table 6.2.2 Operating Environment

No.	Subsystem (LAN port for maintenance)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 0.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL 0: 192.168.233.16 CTL 1: 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL 0: 172.23.211.16 CTL 1:172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL 0: 10.197.181.16 CTL 1:10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0

- Manual change of the network parameter of the Maintenance port
  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.

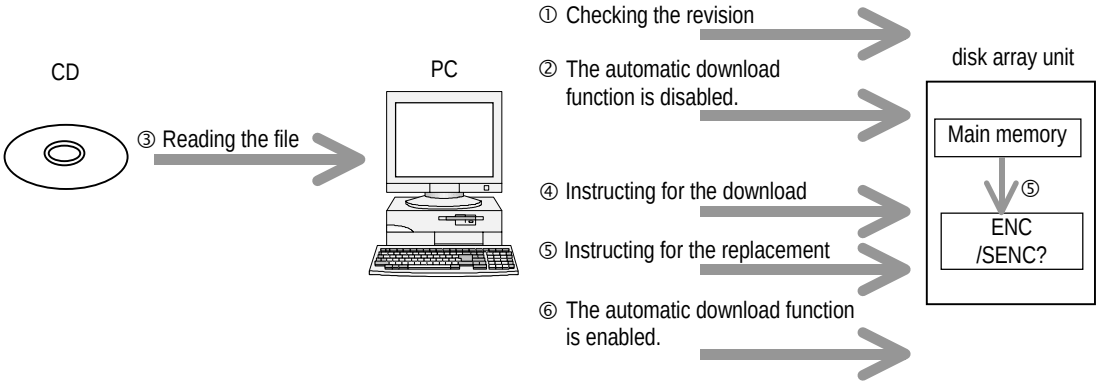
NOTE : When the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
The network address set to the maintenance port cannot be used for the LAN device to be connected to the User management port via the Gateway.
Therefore, use a network address other than that set for the maintenance port.

Copyright © 2005, Hitachi, Ltd.

6.2.2 Online ENC/SENC Firmware Download

The procedure for downloading the ENC/SENC firmware using Storage Navigator Modular is shown below. According to the procedure, the following operations are performed in due order.

① Checking the revision.
② The automatic download function is disabled.
③ Reading the ENC/SENC firmware.
④ Instructing for the download to the disk array unit (from the Storage Navigator Modular to the disk array unit main memory).
⑤ Instructing for the replacement of the ENC/SENC firmware (from the disk array unit main memory to the ENC/SENC).
⑥ The automatic download function is enabled.



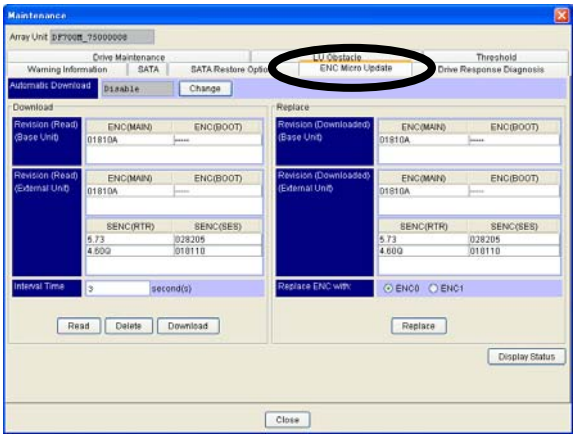


Figure 6.2.4 Procedure for ENC/SENC firmware download

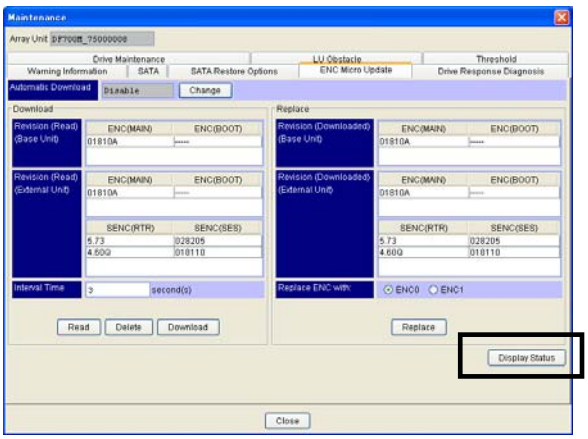
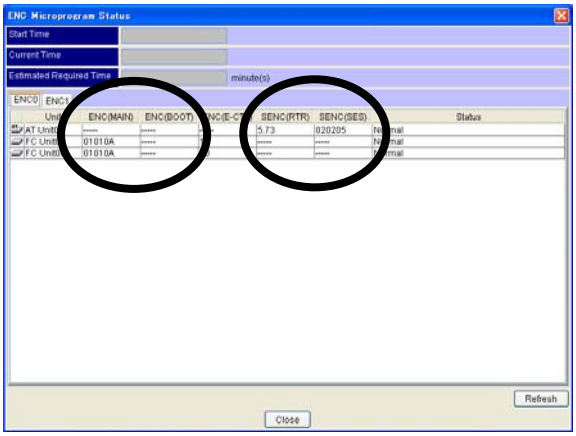


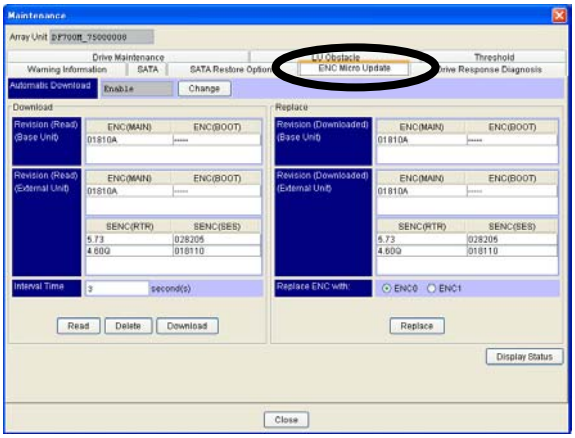
(1) Checking the revision

(a) Select the "ENC Micro Update" tab in the Storage Navigator Modular maintenance window.

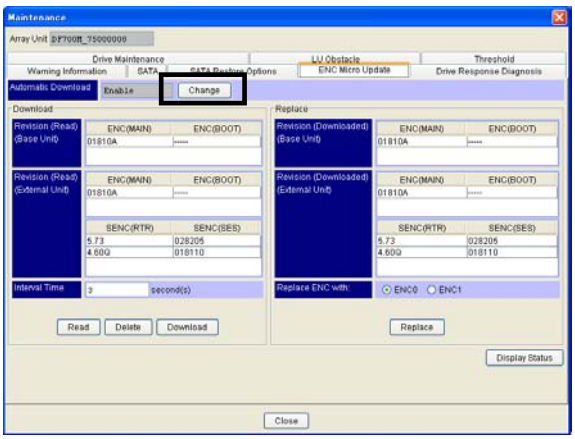


Copyright © 2005, Hitachi, Ltd.

(b) Display the revision of the current ENC/SENC firmware by selecting the "Display Status" button.

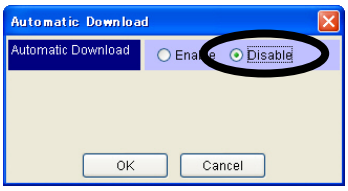


(c) Check the revision of the current ENC/SENC firmware.
When the Rev. of the ENC/SENC #0 and #1 are both the same with or newer than the Rev. to be downloaded, it is not necessary to download the ENC/SENC firmware, so that terminate the work.
When either or both of the Rev. of the ENC/SENC #0 and #1 are older than the Rev. to be downloaded, go to the Step (2).
For RKA, both ENC (MAIN) and ENC (BOOT) become the checking target.



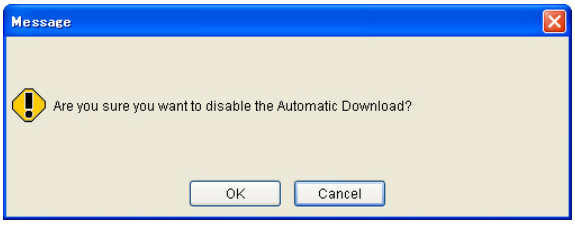
(2) The automatic download function is disabled.

(a) Select the "ENC Micro Update" tab in the Storage Navigator Modular maintenance window.

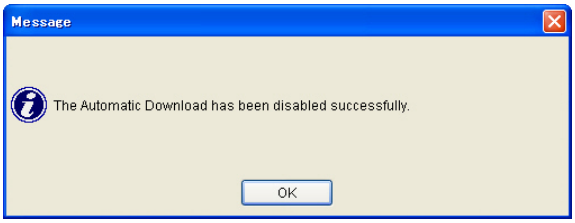


Copyright © 2005, Hitachi, Ltd.

(b) Press the “Change” button on the “Automatic Download”.

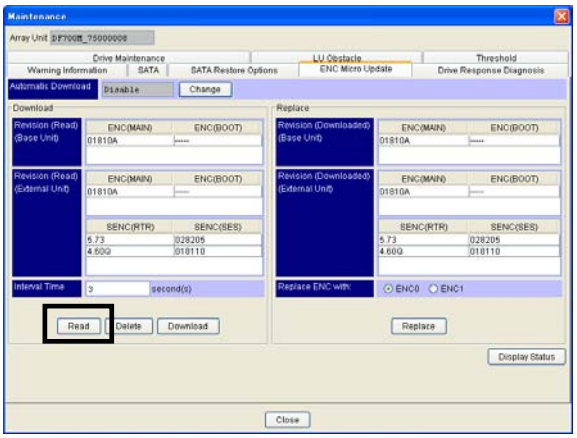


(c) Selected “Disable” in the Automatic Download window.

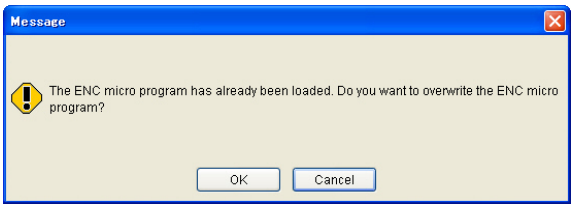


Press the “OK” button.

(d) The configuration message dialog box appears. Press the “OK” button.

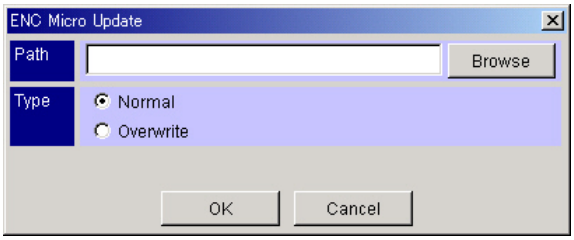


(e) When the set is completed normally. Press the “OK” button.



Copyright © 2005, 2006, Hitachi, Ltd.

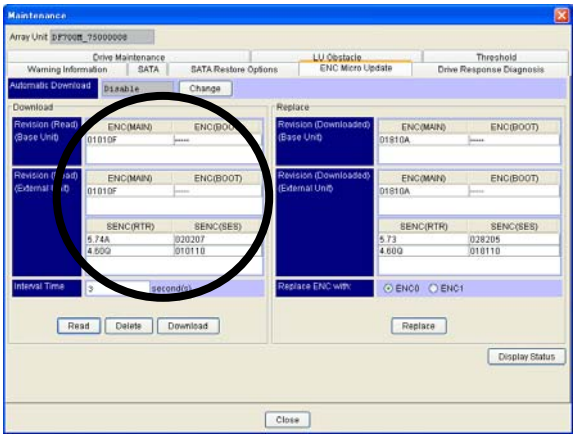
(3) Reading the ENC/SENC firmware (It is described as a procedure to the ENC/SENC #0.)



(a) Select the "Read" button on the "ENC Micro Update" tab.

(b) The "Configuration Message" dialog box appears. Press the “OK” button.

(c) Specify the unified version directory(‡1) to the “Path”, check that the “Type” is the Normal version, and press the “OK” button.
When “Overwrite” is selected, specify “Normal”.
Select “Overwrite” only when there is the instruction to select it.

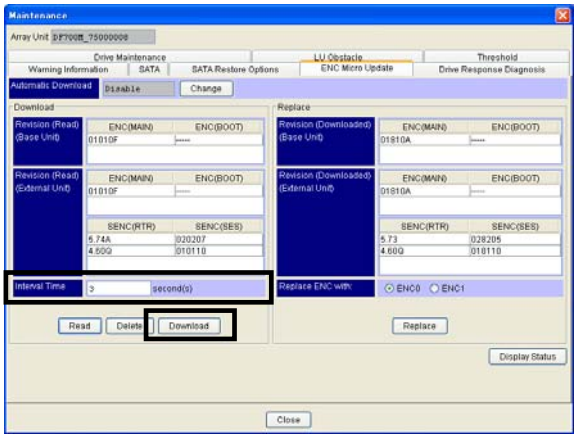


(d) When the download of the file is completed, press the “OK” button.

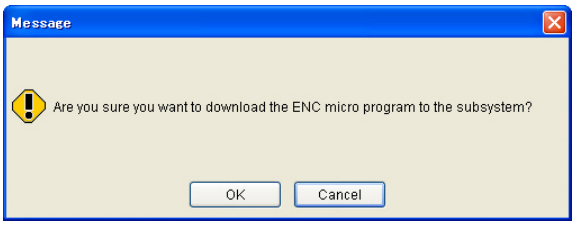
‡1 : For the unified version directory, refer to “5.1 Hierarchy of ENC/SENC Firmware Storage Directories” (OEMD 05-0010).

Copyright © 2005, 2006, Hitachi, Ltd.

(e) The revision of the ENC/SENC firmware that has been read in is displayed in the "ENC Micro Update" tab. Make sure that the revision of the displayed ENC/SENC firmware is the same as that to be downloaded. If they are not the same, read in the ENC/SENC firmware again.



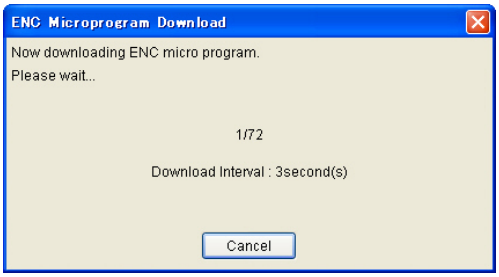
(4) Instructing for the download to the disk array unit



(a) Download the ENC/SENC firmware that has been read in the Storage Navigator Modular to the disk array unit.

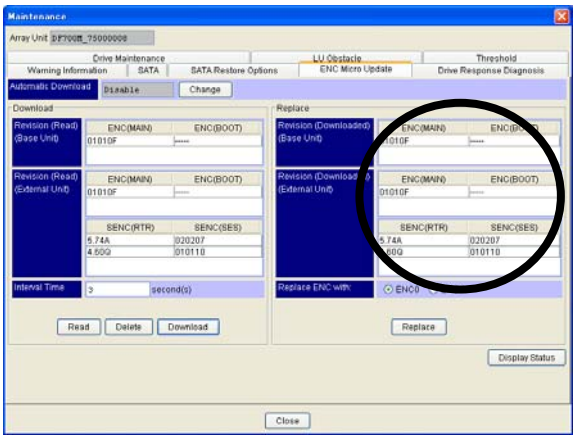
To perform the download, enter the "Interval Time" and press the "Download" button.

Three seconds or more of the default value are recommended to avoid the influence on the host I/O for the "Interval Time".



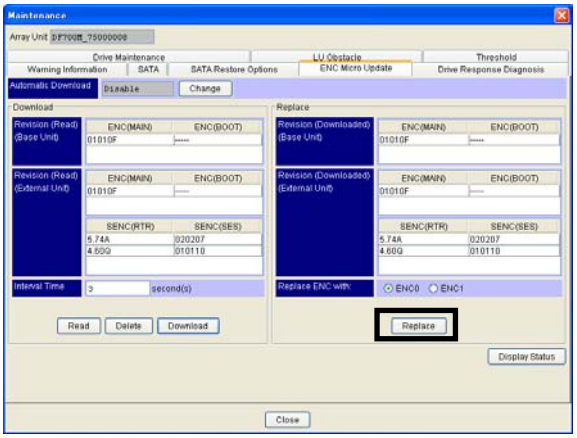
(b) The "Configuration Message" dialog box appears. Press the "OK" button.

Copyright © 2005, Hitachi, Ltd.

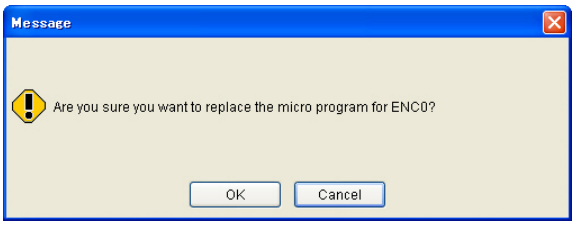


(c) During the download, a dialog box showing that the download is in progress is displayed. When the “Cancel” button is pressed, the download is aborted and the window is returned to the "ENC Micro Update" tab.

(d) When the download is completed normally, press the “OK” button.

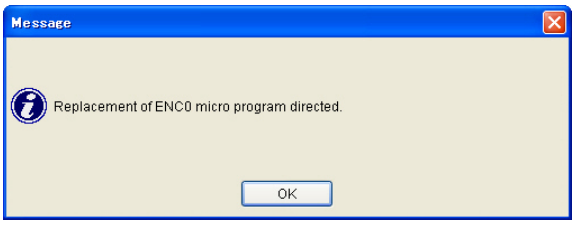


(e) When the window is returned to the "ENC Micro Update" tab, the revision of the firmware that has been downloaded is displayed.



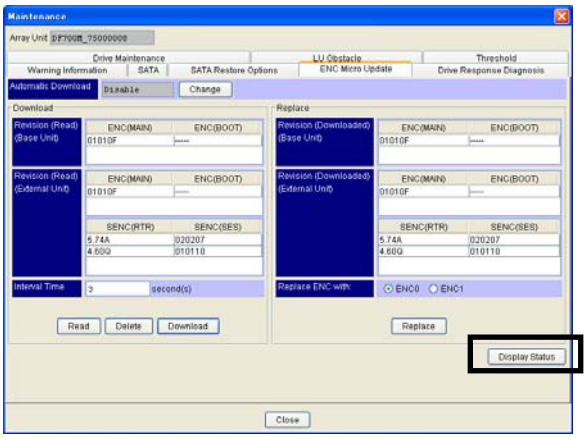
Copyright © 2005, Hitachi, Ltd.

(5) Instructing for the replacement of the ENC/SENC firmware

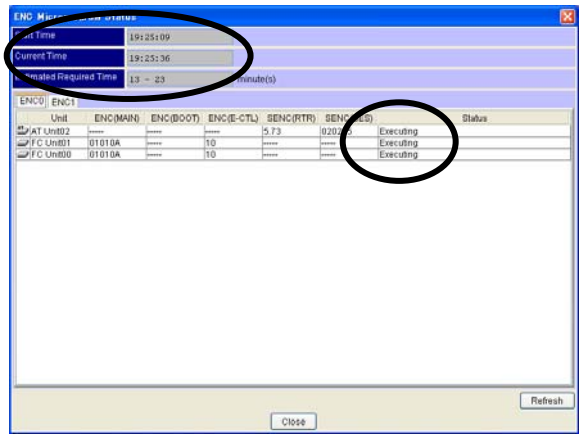


(a) When starting the download of the ENC/SENC firmware, specify the number of the ENC/SENC whose firmware is to be replaced and press the "Replace" button.

(b) The "Configuration Message" dialog box appears. Press the “OK” button.



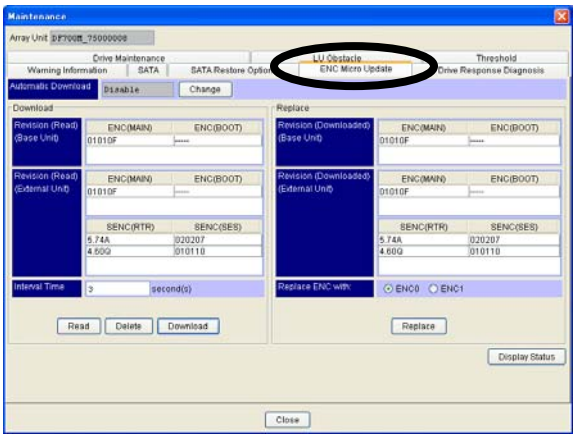
(c) When the “OK” button is pressed, the window is returned to the original window of Step (a).



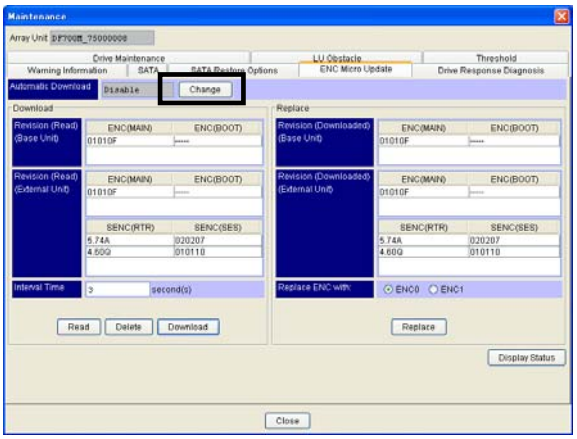
Copyright © 2005, Hitachi, Ltd.

(d) Display the current progress state of the ENC/SENC firmware downloading by selecting the "Display Status" button.

(e) Make sure of the current progress state of the ENC/SENC firmware downloading.

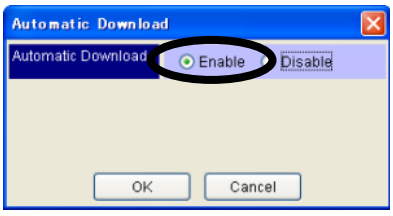


When the download of the other ENC/SENC is necessary, return to the Step (3) and work.
If the download is unnecessary, go to the Step (6).



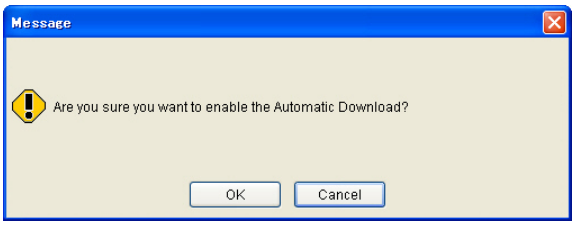
Copyright © 2005, Hitachi, Ltd.

(6) The automatic download function is enabled.
When the function is changed from “Disable” to “Enable”, check if the automatic download is required again. Therefore, the start and termination messages of the automatic download are displayed.

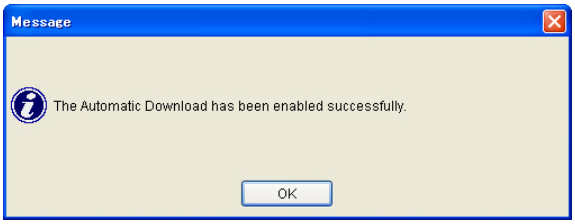


(a) Select the "ENC Micro Update" tab in the Storage Navigator Modular maintenance window.

(b) Press the “Change” button on the “Automatic Download”.



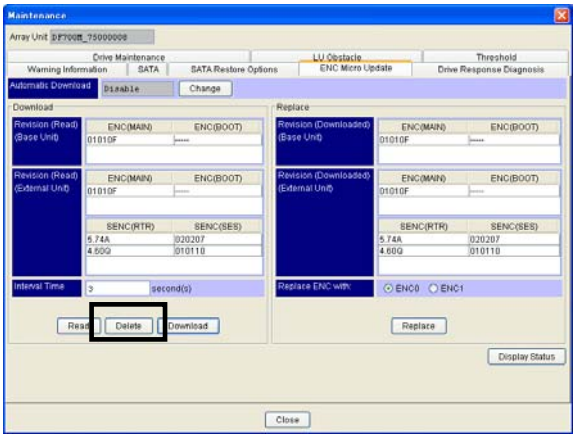
(c) Selected “Enable” in the Automatic Download window.



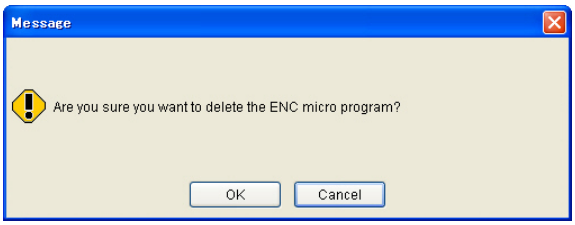
Press the “OK” button.

Copyright © 2005, 2006, Hitachi, Ltd.

(d) The configuration message dialog box appears. Press the "OK" button.

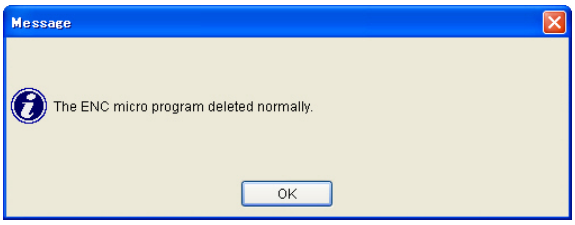


(e) When the set is completed normally. Press the "OK" button.

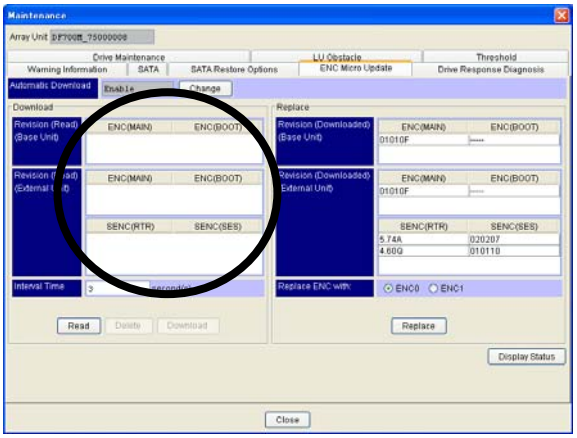


Copyright © 2005, Hitachi, Ltd.

(7) Deleting the file



(a) When deleting the ENC/SENC firmware that has been read in the Storage Navigator Modular, press the "Delete" button.



(b) The "Configuration Message" dialog box appears. Press the “OK” button.

(c) When the deletion of the firmware is completed normally, press the “OK” button.

(d) If it returns to the “Enc Micro Update” tab, the revision, which has already been read, displays a blank column.

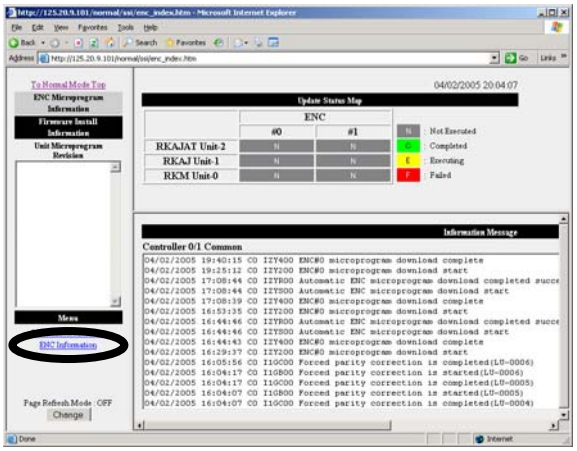
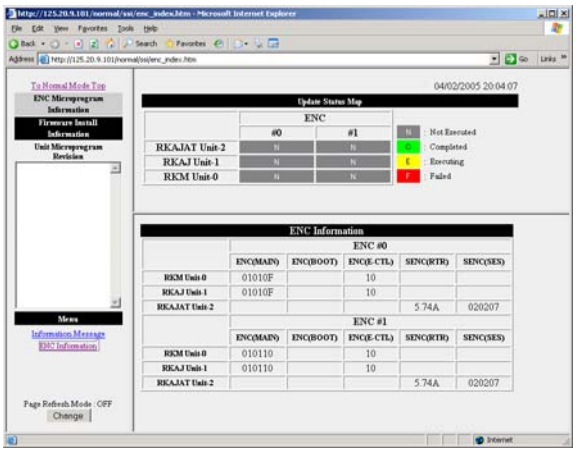
Chapter 7. Procedure for Displaying ENC/SENC Firmware Revision Using Web



The revision of the ENC/SENC firmware can be looked up using not only Storage Navigator Modular but also the Web.

The window for displaying the ENC/SENC firmware revision is displayed through an entry of the following URL into the Web browser using the PC connected to the disk array subsystem.



http://"IP address of a controller"/encmicro

Entries of a "User's Name" and "Password" may be required when connecting or operating the Web. In such a case, enter "maintenance" as a user's name and "hosyu9500" as a password.

- Select "ENC Information" from the "Menu" in the window displaying the ENC/SENC firmware revision.

- The ENC/SENC firmware revision is displayed.

[Definition of terms]

Term	Meaning
RKA	In this procedure manual, it is used as the abbreviation of the DF600-RKA.
RKAJAT	In this procedure manual, it is used as the generic name of the DF700-RKAJAT and the DF600-RKAJAT.
Offline	Issue of the host I/O instruction is not required.
Online	Issue of the host I/O instruction is required.
Offline ENC/SENC Firmware Download	Function for downloading the ENC/SENC firmware supported in the offline state (offline replacement)
Online ENC/SENC Firmware Download	Function for downloading the ENC/SENC firmware supported in the online state (online replacement) This function can be used offline also.
SH Firmware	This is the general term for the following firmware shown in Web and Storage Navigator Modular, and required for the ENC operation of RKH, RKM, RKS, RKAJ and RKA. RKH, RKM, RKS, RKAJ : ENC(MAIN) RKA : ENC(MAIN), ENC(BOOT)
H8S Firmware	This is the following firmware shown in Web and Storage Navigator Modular, and required for the SENC operation of RKXS and RKAJAT. RKXS, RKAJAT:SENC(SES)
SR Firmware	This is the following firmware shown in Web and Storage Navigator Modular, and required for the SENC operation of RKXS and RKAJAT. RKXS, RKAJAT:SENC(RTR)

Chapter 1. Offline ENC/SENC Firmware Download Overview

This document explains how to use the microprogram to download ENC/SENC Firmwares from the PC used for maintenance without replacing any hardware parts in the event of an ENC/SENC Firmware malfunction.

The following three types of download are implemented during ENC/SENC firmware download:

- SH Firmware download
- H8S Firmware download
- SR Firmware download

Copyright © 2005, 2006, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

Chapter 2. Offline ENC/SENC Firmware Download Prerequisites

(1) A maintenance terminal is required to connect to the web and download ENC/SENC firmware. Keep the maintenance manual at hand in order to be prepared for errors that may occur during ENC/SENC Firmware download.

(2) To download the ENC/SENC firmware making a connection to the Web, it is required to connect the LAN connector of the Controller 0. If the Controller 1 is connected, the ENC/SENC firmware cannot be downloaded.

(3) Either HDD #0 or HDD #2 must be installed at each unit in the disk array when downloading ENC/SENC firmware for ENC #0. Either HDD #1 or HDD #3 must be installed at each unit in the disk array when downloading ENC/SENC firmware for ENC #1. In addition, ENC #0 and ENC #1 must be installed at each expansion unit. Attempting ENC/SENC firmware download when the aforementioned are not installed may cause a subsystem to go down. In the event of a subsystem error, restart the ENC/SENC firmware download after confirming that the required HDDs and ENC/SENC units have been installed.

(4) Maintenance personnel must only use the ENC/SENC firmware download function when the subsystem is offline. The following tasks and situations will occur during Offline ENC/SENC Firmware download procedures:

- Maintenance personnel must perform the planned stop of the disk array subsystem on the measurement screen.
- Maintenance personnel must start the disk array in start mode (ENC Micro-Download Mode).
- The disk array subsystem may reboot automatically.

If the ENC/SENC firmware download is performed when the system is online, abnormal termination will result. The host computer may also detect I/O errors and refuse to recognize LUs, which will cause business applications to stop responding. If any of the aforementioned errors occurs, take the system offline and restart the ENC/SENC firmware.

Also, stop the failure monitoring such as the E-Mail ASSIST function, the PC ASSIST, the SNMP monitoring, the failure monitoring of the Storage Navigator Modular, the Hi-Track monitoring, etc.

And, restart the failure monitoring after completing the download of the ENC/SENC firmware.

Offline is used to explain the situation detailed below.

The host computer neither accesses the disk array unit nor recognizes the LU, does not execute a drive restoration (dynamic sparing, copy back, and/ or correction copy), LU formatting, pair creation/resynchronization of ShadowImage in-system replication, and restoration of Copy-on-write Snapshot within the disk array unit and does not execute the resynchronization of TrueCopy remote replication between the disk array units. If the host computer will not access the disk array subsystem, either all power to the host computer is turned off or the host computer is ready but the disk array subsystem, including direct fiber optic cable connections and switches, is physically disconnected.

Copyright © 2005, 2006, Hitachi, Ltd.

(5) Do not download ENC/SENC firmware if the ENC/SENC unit is not installed at the expansion unit. If the ENC/SENC unit opposite the number of the ENC/SENC firmware to be downloaded is removed or if an ENC/SENC firmware download is attempted when the ENC/SENC unit is uninstalled, a loop switch fault on the drive side will result, causing the subsystem to go down.

(6) Confirm that the subsystem is ready and there is not an error other than an ENC/SENC error in the subsystem. If an ENC/SENC firmware is downloaded when there is an error other than an ENC error in the subsystem, the download may result in an abnormal shutdown. When an abnormal shutdown occurs, confirm the subsystem's status on the web, and, after addressing the error, restart the ENC/SENC firmware download.

(7) In order to prevent user data loss and other problems that may occur when the Offline ENC/SENC Firmware download function is used, perform the planned stop of the subsystem before attempting to download the ENC/SENC firmware. After the subsystem boots up again, download the ENC/SENC firmware once the subsystem is in the system ready status.
Be aware that the ENC/SENC firmware download function can be used without performing the planned stop. The ENC/SENC firmware download function cannot be used when the subsystem is in one of the statuses listed below. When the subsystem is in one of the following statuses, refer to the maintenance manual for instructions on how to properly correct the error. After the error has been corrected, restart the ENC/SENC firmware download.
  - Forced parity recovery is required.
  - User data is stored in the cache.

(8) When the READY LED (green) on the Front Bezel of a Basic disk array unit is blinking quickly, the ENC/SENC firmware is being downloaded. Therefore, start the downloading after the READY LED (green) becomes kept on.

(9) When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the work. The automatic download of the ENC/SENC firmware or the update of the flash program is being executed. Perform the work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up.

(10) When the TrueCopy remote replication is enabled, and the array subsystem, which the ENC/SENC firmware download is to be performed, is a remote disk subsystem, perform the ENC/SENC firmware download after changing the pair status (S-VOL) of TrueCopy remote replication to PSUS.
However, although a path blockade occurs if the ENC/SENC firmware download is performed, the pair blockade is automatically recovered by turning on the power supply of the array subsystem after performing the ENC/SENC firmware download.
After the offline ENC/SENC firmware dounload is completed, set the pair status (S-VOL) of the TrueCopy remote replication to previous state.
Also, if the ENC/SENC firmware download is performed, the following phenomena occur.
  - Both paths of the TrueCopy remote replication are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
  - When the pair status of the TrueCopy remote replication is PAIR or COPY, the pair status changes to PSUE.

Copyright © 2005, 2006, Hitachi, Ltd.

(11) When the TrueCopy Extended Distance is enabled, and the array subsystem, which the ENC/SENC firmware download is to be performed, is a remote disk subsystem, perform the ENC/SENC firmware download after changing the pair status (S-VOL) of TrueCopy Extended Distance to PSUS.
However, although a path blockade occurs if the ENC/SENC firmware download is performed, the pair blockade is automatically recovered by turning on the power supply of the array subsystem after performing the ENC/SENC firmware download.
After the offline ENC/SENC firmware dounload is completed, set the pair status (S-VOL) of the TrueCopy Extended Distance to previous state.
Also, if the ENC/SENC firmware download is performed, the following phenomena occur.

- Both paths of the TrueCopy Extended Distance are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the pair status of the TrueCopy Extended Distance is PAIR or COPY, the pair status changes to PSUE.

(12) When it sets to the mode that executes the offline ENC/SENC firmware replacement and the array subsystem starts, the Disk Drives, which were spun down due to the Power Saving of the priced option, spin up.
When the array subsystem normally starts and it becomes the Ready status after completing the offline ENC/SENC firmware replacement, the Disk Drives set to the Power Saving spin down.

(13) Do not install the SENC firmware whose revision is less than 5.80/A in the array subsystem which uses the priced option Power Saving.
If the SENC firmware whose revision is less than 5.80/A is installed in the array subsystem which uses the priced option Power Saving, “W0GM00 SENC which may attach restrictions on Power Saving function was detected” is displayed in Warning Information on WEB after the array subsystem is restarted, and the WARN LED (orange) on the front of the basic chassis lights up and it becomes in the warning status.

This page is for editorial purpose only.

Copyright © 2006, Hitachi, Ltd.

Chapter 3. Restriction and Notes of Offline ENC/SENC Firmware Download

(1) Do not remove or insert any parts, for maintenance or any other reason, during ENC/SENC firmware download.
Inserting or removing parts during ENC/SENC firmware download may cause a fault. If parts are inserted or removed during ENC/SENC firmware download and a fault results, retry the ENC/SENC firmware download.
Do not download ENC/SENC firmware if the ENC/SENC unit is not installed at the expansion unit. If an ENC/SENC firmware download is attempted when ENC/SENC is not installed at the expansion unit, a loop switch error will result at the drive side, causing the system to go down.

(2) Do not alter the disk array architecture during ENC/SENC firmware download. Altering the disk array architecture during ENC/SENC firmware download may cause download to fail.

(3) If maintenance personnel download an ENC/SENC firmware when one of the ENC/SENC firmware already installed is defective or there is an ENC/SENC hardware error, the ENC/SENC firmware (SH firmware, H8S firmware and/or SR firmware) exchange may fail. If a failure occurs, correct the error by retrying the ENC/SENC firmware download in accordance with the procedure manual and/or referring to web messages and the maintenance manual.

(4) After downloading an ENC/SENC firmware, the ALARM LED (red) on the ENC/SENC unit that performed the download will light up. This means that the ENC/SENC is automatically rebooting after the ENC/SENC firmware was downloaded and does not indicate an error. In accordance with offline ENC/SENC firmware download procedure, turn the AC power supply switch power off after the download has been completed. After turning the power to the subsystem back on, confirm that the subsystem boots up properly and that the ENC/SENC firmware has been updated.

(5) When returning the revision of the ENC/SENC firmware to the previous one after downloading the firmware because of its trouble, etc., it is required to invalidate the automatic downloading function before downloading the firmware.
For the procedure for invalidating the automatic downloading function, "Chapter 9. Procedure for Invalidating the Automatic ENC/SENC Firmware Downloading Function" (EMD 09-0000).

(6) The SANRISE AMS1000 can connect the DF600-RKA from the microprogram revision of 0731/A-H.

(7) The SANRISE AMS500 can connect the DF600-RKA and the DF600-RKAAT from the microprogram revision of 0720/A-M.

(8) The SANRISE AMS/WMS Series can connect the DF600-RKAJAT.

(9) The SANRISE AMS/WMS Series cannot connect the DF600-RKAAT.

(10) If the revision of the ENC firmware of ENC installed in the DF600-RKA is Rev. 18 or less, the revision of the ENC firmware should be updated when reducing it from the SANRISE 9570V/9580V/9585V.

(11) When it sets to the mode that executes the offline ENC/SENC firmware replacement and the array subsystem starts, the Disk Drives, which were spun down due to the Power Saving of the priced option, spin up.
When the array subsystem normally starts and it becomes the Ready status after completing the offline ENC/SENC firmware replacement, the Disk Drives set to the Power Saving spin down.

Chapter 4. Offline ENC/SENC Firmware Download Time

The table below shows the amount of time required to download an ENC/SENC firmware in the disk array subsystem. These figures do not include the amount of time required for the system (including the host computer) to go online. The working hours of Table 4.1 show the time from instructing the download of the ENC/SENC firmware for ENC#0 or ENC#1 by WEB to the end of the download.

Table 4.1 Standard of the time required for the off-line ENC/SENC firmware download of the SANRISE AMS500/AMS200

#	Item	Time Required					
	Target chassis for ENC/SENC firmware download	Only RKS Only RKM Only RKAJ Only RKA Optional combination of (RKS, RKAJ or RKA) Optional combination of (RKM, RKAJ or RKA)		Only RKAJAT		(RKS, RKAJ or RKA) and RKAJAT are mixed. (RKM, RKAJ or RKA) and RKAJAT are mixed.

Chapter 5. Before Beginning an Offline ENC/SENC Firmware Download

Before beginning ENC/SENC firmware download, confirm/prepare the following:

(1) After referring to the web connection procedures in the DF700 Disk Array Subsystem Maintenance Manual WEB "Chapter 1. Before Using Web" (WEB 01-0000), prepare 1 PC on which a web browser has been installed and that can be used in a LAN.
The PC that is used for maintenance and connected to the LAN must be used to download ENC/SENC firmware.

(2) Set the service PC up. (See DF700 Disk Array Subsystem Maintenance Manual Microprogram "1.3 Preparation for installation of microprogram" (MICRO 01-0020)).

(3) Prepare a CD-ROM of the specified revision for microprogram installation.

(4) Execute the installer of the CD-ROM, and save the unified version directory(‡1), where the ENC/SENC firmware is stored, under the directory "C:¥diskarray-microprogram¥microprogram".

(5) If a failure occurs during the ENC/SENC firmware download, it is required to see the recovery measures. Prepare the DF700 Disk Array Subsystem Maintenance Manual, and perform the recovery work following the manual.

(6) ENC/SENC firmware can only be downloaded when the system is off (when the host I/O is stopped). (When the LU formatting, drive restoration (dynamic sparing, copy back, and/or correction copy), pair creation/resynchronization of ShadowImage in-system replication, or restore of Copy-on-write Snapshot, or copying of TrueCopy remote replication is in progress, perform the downloading after the operation above is completed.

(7) Stop the failure monitoring such as the E-Mail ASSIST function, the PC ASSIST, the SNMP monitoring, the failure monitoring of the Storage Navigator Modular, the Hi-Track monitoring, etc.
And, restart the failure monitoring after completing the download of the ENC/SENC firmware.

(8) Confirm that the subsystem is ready and there is not an error other than an ENC/SENC error in the subsystem. If an ENC/SENC firmware is downloaded when there is an error other than an ENC error in the subsystem, the download may result in an abnormal shutdown. When an abnormal shutdown occurs, confirm the subsystem's status on the web, and, after addressing the error, restart the ENC/SENC firmware download.

(9) In order to prevent user data loss and other problems that may occur when the Offline ENC/SENC Firmware download function is used, perform the planned stop of the subsystem before attempting to download the ENC/SENC firmware. After the subsystem boots up again, download the ENC/SENC firmware once the subsystem is in the system ready status.
Be aware that the ENC/SENC firmware download function can be used without performing the planned stop. The ENC/SENC firmware download function cannot be used when the subsystem is in one of the statuses listed below. When the subsystem is in one of the following statuses, refer to the maintenance manual for instructions on how to properly correct the error. After the error has been corrected, restart the ENC/SENC firmware download.

- Forced parity recovery is required.
- User data is stored in the cache.

‡1 : For the unified version directory, refer to "5.1 Hierarchy of ENC/SENC Firmware Storage Directories" (EMD 05-0010).

Copyright © 2005, 2006, Hitachi, Ltd.

(10) When the READY LED (green) on the Front Bezel of a Basic disk array unit is blinking quickly, the ENC/SENC firmware is being downloaded. Therefore, start the downloading after the READY LED (green) becomes kept on.

(11) When the WARNING LED (orange) on the front of the Basic Chassis is blinking at high speed, do not perform the work. The automatic download of the ENC/SENC firmware or the update of the flash program is being executed. Perform the work after checking that the WARNING LED (orange) on the front of the Basic Chassis goes out and the READY LED (green) lights up.

(12) When the TrueCopy remote replication is enabled, and the array subsystem, which the ENC/SENC firmware download is to be performed, is a remote disk subsystem, perform the ENC/SENC firmware download after changing the pair status (S-VOL) of TrueCopy remote replication to PSUS.

However, although a path blockade occurs if the ENC/SENC firmware download is performed, the pair blockade is automatically recovered by turning on the power supply of the array subsystem after performing the ENC/SENC firmware download.

Also, if the ENC/SENC firmware download is performed, the following phenomena occur.

- Both paths of the TrueCopy remote replication are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the pair status of the TrueCopy remote replication is PAIR or COPY, the pair status changes to PSUE.

(13) When the TrueCopy Extended Distance is enabled, and the array subsystem, which the ENC/SENC firmware download is to be performed, is a remote disk subsystem, perform the ENC/SENC firmware download after changing the pair status (S-VOL) of TrueCopy Extended Distance to PSUS.

However, although a path blockade occurs if the ENC/SENC firmware download is performed, the pair blockade is automatically recovered by turning on the power supply of the array subsystem after performing the ENC/SENC firmware download.

Also, if the ENC/SENC firmware download is performed, the following phenomena occur.

- Both paths of the TrueCopy Extended Distance are blocked. The notice of SNMP Agent Support Function and TRAP occur at the time of the path blockade. Perform the notice and the check to the Failure Monitoring Department in advance. The path blockade automatically recovers after restarting.
- When the pair status of the TrueCopy Extended Distance is PAIR or COPY, the pair status changes to PSUE.
- When Power Saving of the priced option is used, if you perform the download of the ENC/SENC firmware after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host when the array subsystem starts. Check that there is no RAID Group whose power saving status is “Normal (command monitoring)” after executing the spin-down, and then perform the download of the ENC/SENC firmware.

  If the spin-down fails, execute the spin-down again.

5.1 Hierarchy of ENC/SENC Firmware Storage Directories

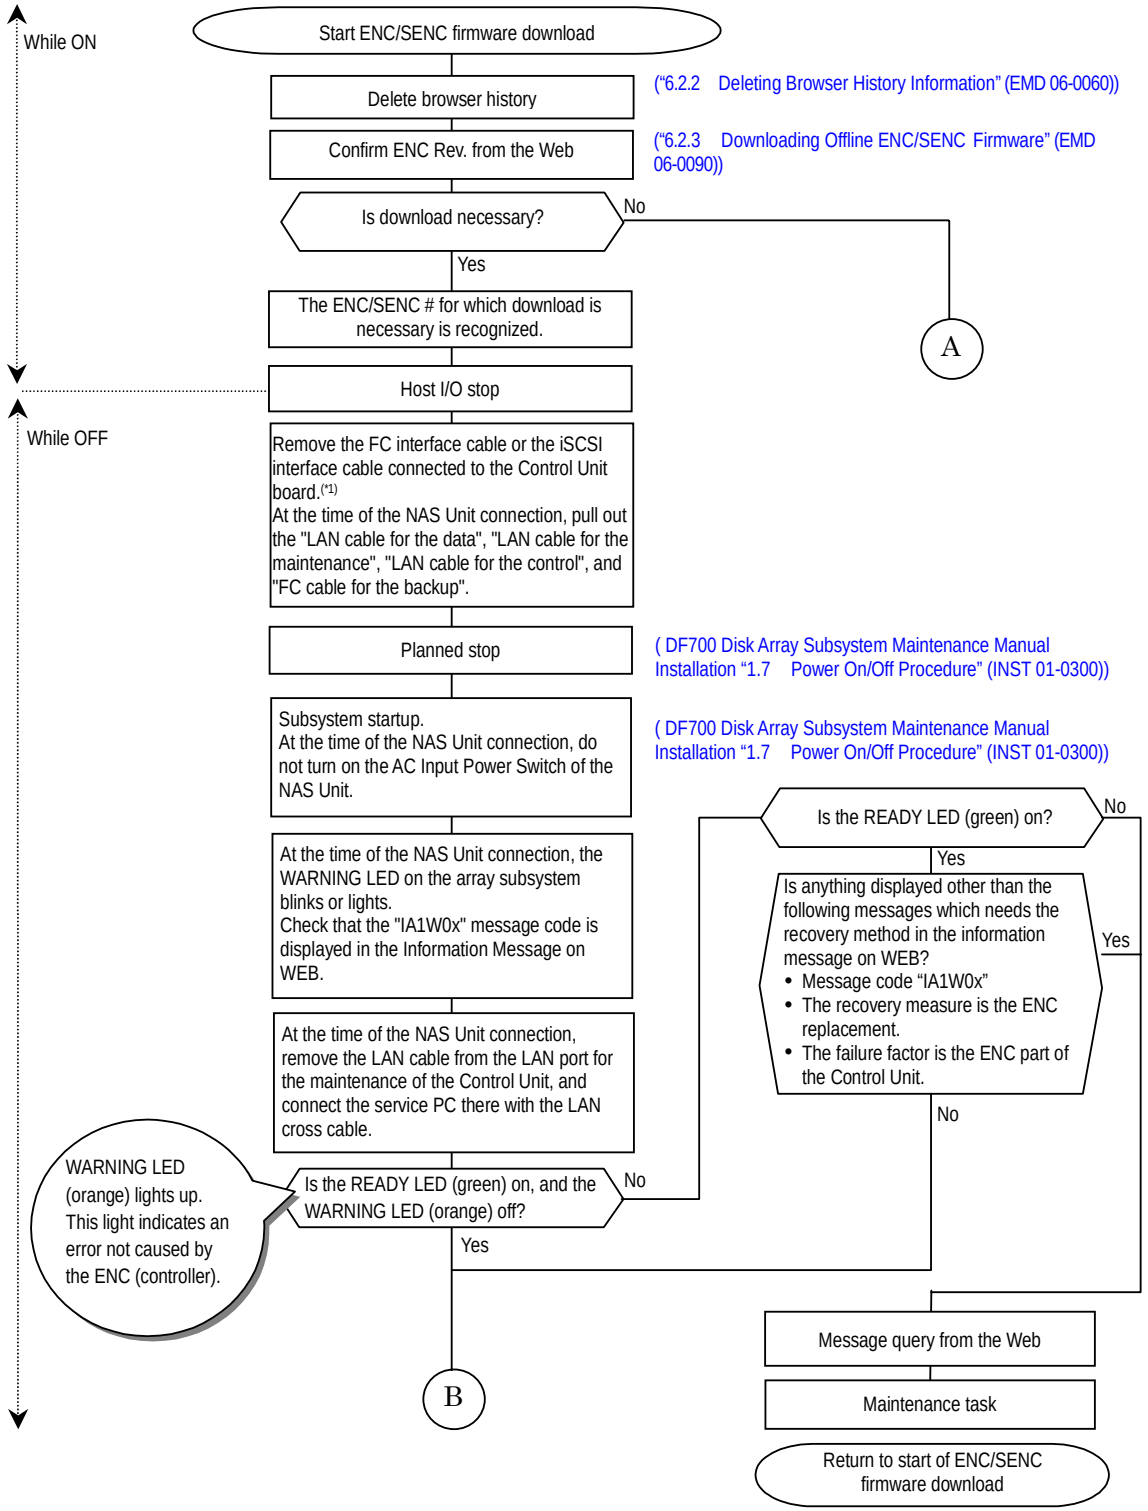
The hierarchical structure of ENC/SENC firmware storage directories is shown in Table 5.1.1. The structure of directories of the CD-ROM for installing the ENC/SENC firmware is the same as that shown in Table 5.1.1.
When the CD-ROM installer is executed, the unified version directory is stored under the directory, "C:¥diskarray-microprogram¥microprogram."
When installing the ENC/SENC firmware, specify the unified version directory.

Table 5.1.1 Directory Hierarchy

First stratum	Second stratum	Third stratum	Fourth stratum	Fifth stratum
Unified version directory	DF700M	disk 01 - disk X	Microprogram file	-
		fmins		-
	DF700S	disk 01 - disk X		-
		fmins		-
	DF700H	disk 01 - disk X		-
		fmins		-
	DF700XS	disk 01 - disk X		-
		fmins		-
	ENC	online	update	ENC/SENC firmware file
			overwrite	
		offline	update	
			overwrite	
	NAS_BIOS	Microprogram file	-	-

NOTE : Do not change a name of the unified version directory or directory in a stratum under the unified version directory. The ENC/SENC firmware becomes unable to be installed if the directory name is changed.

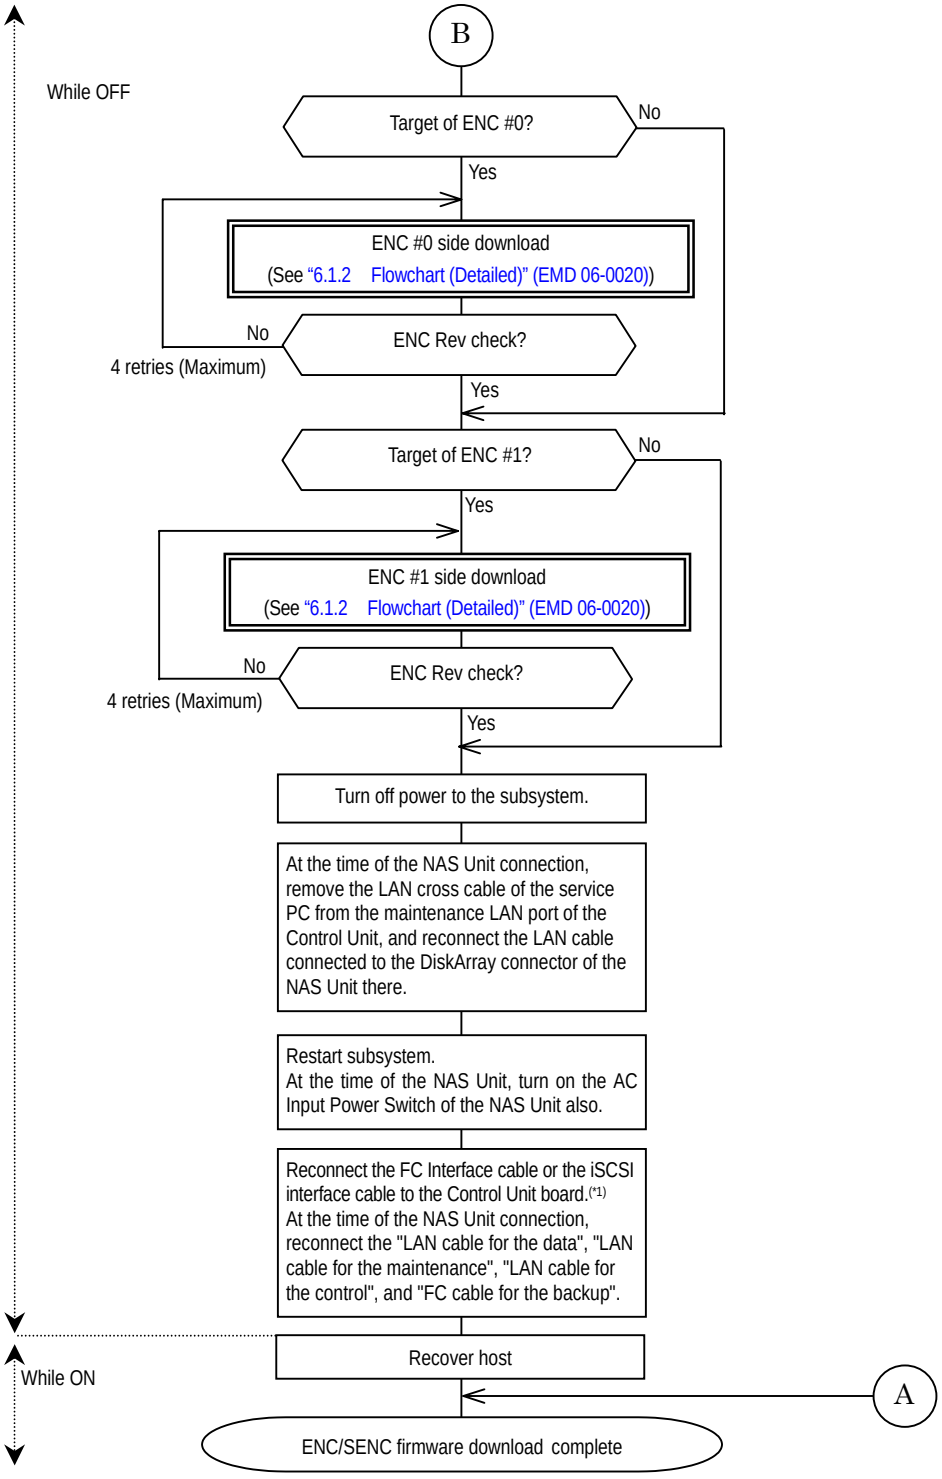
Copyright © 2005, Hitachi, Ltd.



Chapter 6. Offline ENC/SENC Firmware Download Procedure (Dual Controller)

The procedure that must be followed in order to download ENC/SENC firmware differs depending on whether RKM/RKS/RKXS use single or dual controller configuration. For details on using dual controller configuration when downloading ENC/SENC firmware, refer to "6.1 Flowchart" (EMD 06-0010). For details on using single controller configuration when downloading ENC/SENC firmware, refer to "Chapter 7. Offline ENC/SENC Firmware Download Procedure (Single Controller)" (EMD 07-0000). For details on the ENC/SENC firmware download operation for the AMS1000, refer to "Chapter 6. Offline ENC/SENC Firmware Download Procedure (Dual Controller)" (EMD 06-0000).

Copyright © 2005, Hitachi, Ltd.

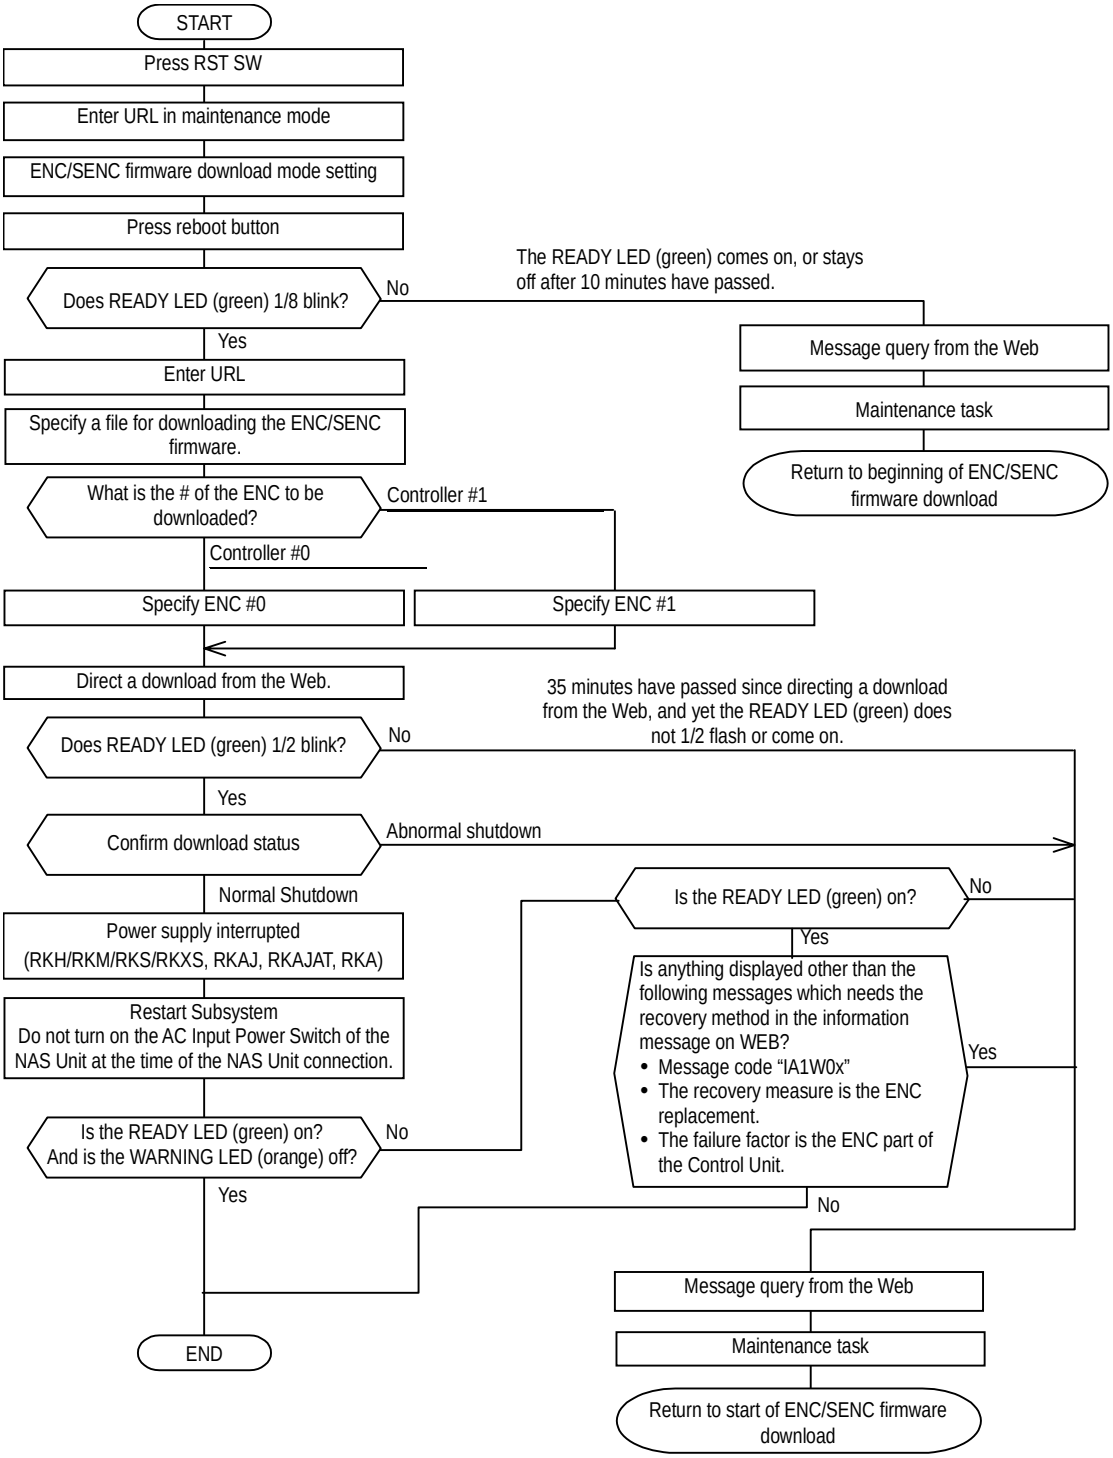


6.1 Flowchart

6.1.1 Flowchart (General)

*1 : When removing the Fibre Channel Interface cables, pull out the Fibre Channel interface cables completely from the host connectors. If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

Copyright © 2005, 2006, Hitachi, Ltd.



*1 : When connecting the Fibre Channel interface cables, insert the Fibre Channel interface cables until they are fixed to the host connectors.
If the Fibre Channel Interface cables are inserted half in the host connectors, the Control Unit continues to detect the Fibre Channel failures, and the I/O processing of the Control Unit may be deteriorated.

6.2 Offline ENC/SENC Firmware Download Procedure Screen (Dual Controller)

6.2.1 Connecting the PC Used for Maintenance

The maintenance LAN connector and the LAN connector of the PC used for maintenance must be connected using a LAN cross cable. Follow the procedure shown below to make the necessary connection.

(1) Confirm the following before connecting the PC used for maintenance:
Check the following LEDs before connecting the PC used for maintenance:

- POWER LED(green) confirmation:
  Confirm that the POWER LED(green) located on the top of the front bezel is lit.
  If the POWER LED(green) is not lit, refer to the DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000) for details on how to correct the error.
- WARNING LED(orange) confirmation:
  Confirm that the WARNING LED(orange) located on the top of the front bezel is not lit.
  If the WARNING LED(orange) is lit or blinking, refer to the DF700 Disk Array Subsystem Maintenance Manual Troubleshooting "Chapter 8. Trouble Analysis by LED Indication" (TRBL 08-0000) for details on how to correct the error.

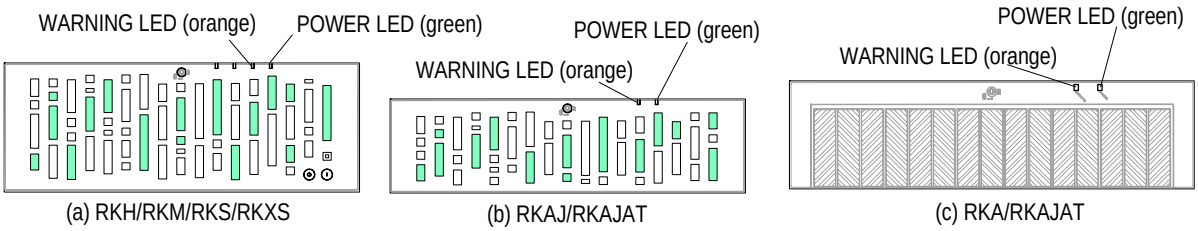

Figure 6.2.1 Locations and Name of LED

- Controller CHKSTP LED(red) confirmation:
  Confirm whether or not the CHKSTP LED(red) located on the top of the controller is lit.
  Replace any controllers on which the CHKSTP LED(red) is lit. For details on how to replace controllers, refer to the DF700 Disk Array Subsystem Maintenance Manual Replace "2.2.5 Replacing Control Unit" (REP 02-0400) for details on how to correct the error.

Copyright © 2005, Hitachi, Ltd.

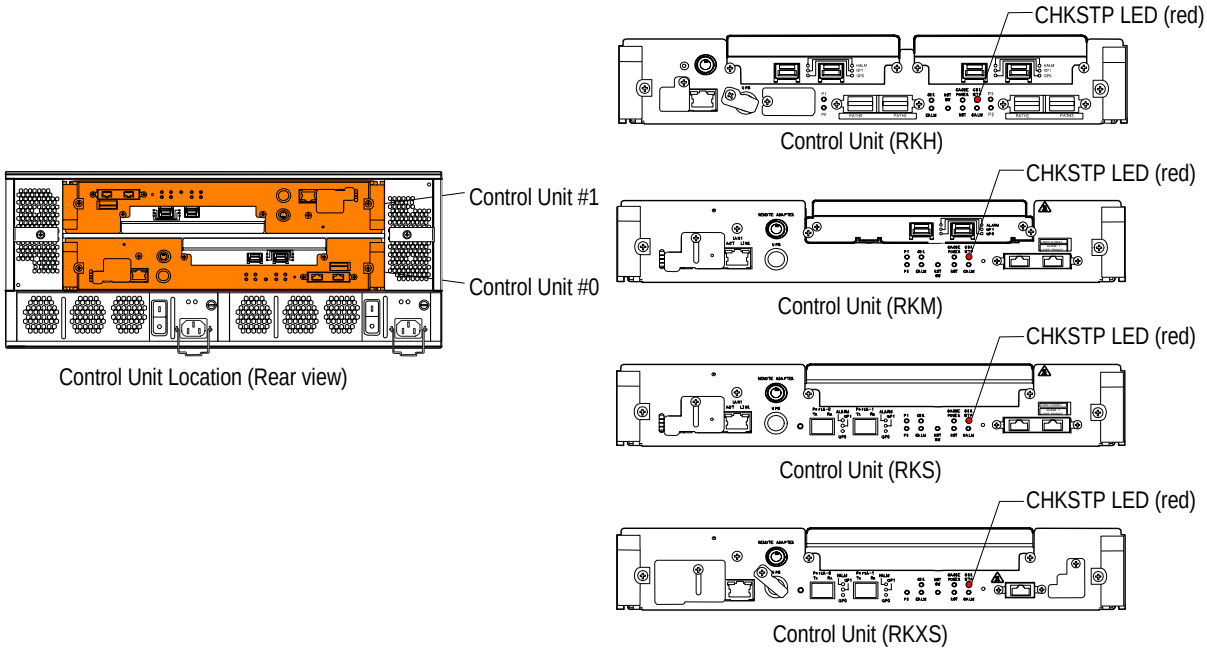

Figure 6.2.2 Locations and Name of LED

Copyright © 2005, Hitachi, Ltd.

This page is for editorial purpose only.

Copyright © 2005, Hitachi, Ltd.

(2) Preparing the maintenance terminal for use

Table 6.2.1 Preparing the maintenance terminal

Item Number	Customer Environment	Terminal used for maintenance	Preparation
1	Uses controller's maintenance-use LAN connector	Use the LAN to connect the PC that is being carried and will be used for maintenance.	• PC used for maintenance • LAN cross cable

(3) Controller to be connected

With dual system architecture, the browser connection is identical no matter which controller is connected. First, connect to controller #0.

If controller #0 is closed, subsequent information can only be referenced on the controller #1 side. If controller #0 is closed, connect to controller #1.

When performing the offline ENC/SENC firmware downloading, however, perform it through the Controller #0. The firmware is not downloaded through the Controller #1.

(4) Procedure to connect portable maintenance PC to WEB

(a) Remove the cover on the Control Unit. Connect the LAN-Connecter for maintenance and the LAN-Connecter of Maintenance PC with a LAN-cross-cable.

At the time of the RKNAS connection, remove the cover of the LAN connector for the maintenance in the RKNAS (rear side), and connect the LAN connector for the maintenance and the LAN connector of the Maintenance PC.

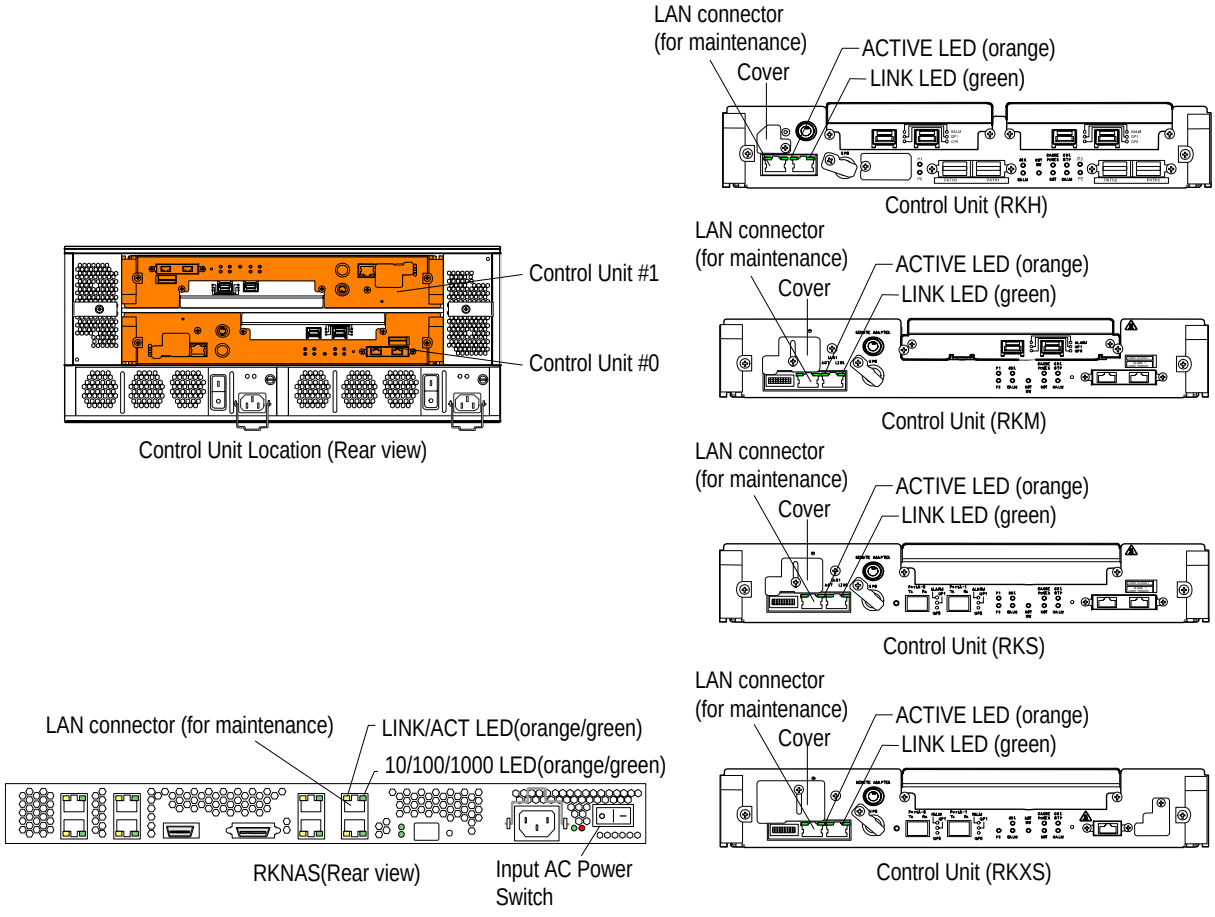

Figure 6.2.3 LAN Connector Position

Copyright © 2005, Hitachi, Ltd.

(b) Start up the maintenance PC.

(c) Change the IP address of the network parameter for the maintenance PC.

For the maintenance PC, set the IP address shown in No. 1 in Table 6.2.2 below.

If the maintenance PC cannot be connected, set the value in No.2 to No.5.

Table 6.2.2 Operating Environment

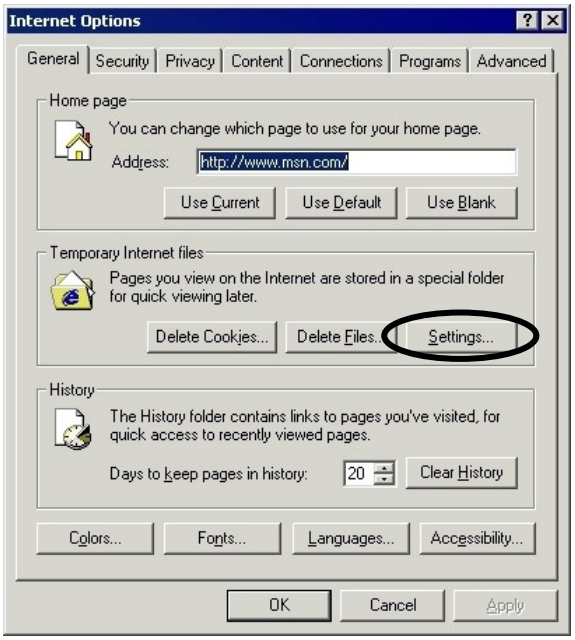
No.	Subsystem (LAN port for maintenance)		Maintenance PC	
	IP Address	Subnet Mask	IP Address	Subnet Mask
1	CTL 0: 10.0.0.16 CTL 1: 10.0.0.17 (At the time of shipment)	255.255.255.0 (At the time of shipment)	10.0.0.2 to 0.0.0.9	255.255.255.0
2	CTL 0: 192.168.0.16 CTL 1: 192.168.0.17	255.255.255.0	192.168.0.2 to 192.168.0.9	255.255.255.0
3	CTL 0: 192.168.233.16 CTL 1: 192.168.233.17	255.255.255.0	192.168.233.2 to 192.168.233.9	255.255.255.0
4	CTL 0: 172.23.211.16 CTL 1:172.23.211.17	255.255.255.0	172.23.211.2 to 172.23.211.9	255.255.255.0
5	CTL 0: 10.197.181.16 CTL 1:10.197.181.17	255.255.255.0	10.197.181.2 to 10.197.181.9	255.255.255.0

- Manual change of the network parameter of the Maintenance port

  When the User management port is set as the same network address as the Maintenance port, the communication cannot be made normally. Prepare five patterns of the network parameter fixed values to be used in the Maintenance port, and change the network parameter fixed values to be used in the Maintenance port manually by the network parameter of the User management port.

  NOTE : When the network address of the LAN device, which is connected via the Gateway in the extension of the User management port, is the same as that of the Maintenance port, the communication cannot be made normally because of the conflict between them.
  The network address set to the maintenance port cannot be used for the LAN device to be connected to the User management port via the Gateway.
  Therefore, use a network address other than that set for the maintenance port.

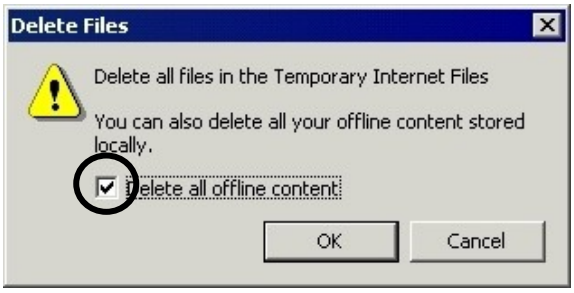
Copyright © 2005, Hitachi, Ltd.



6.2.2 Deleting Browser History Information

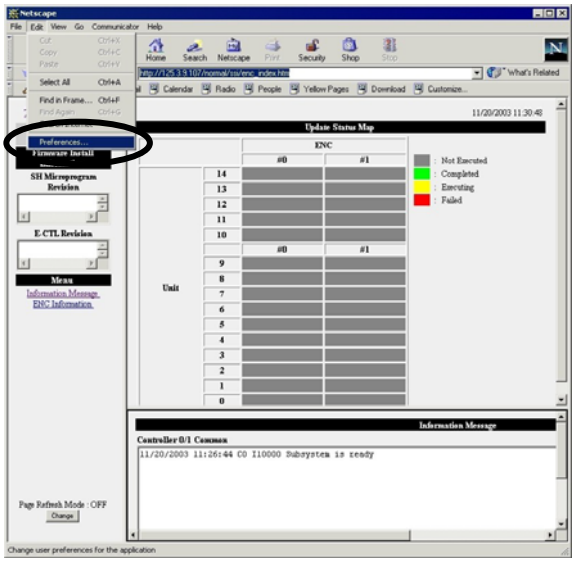
Boot up the browser on the PC used for maintenance and delete history information.

(1) Internet Explorer



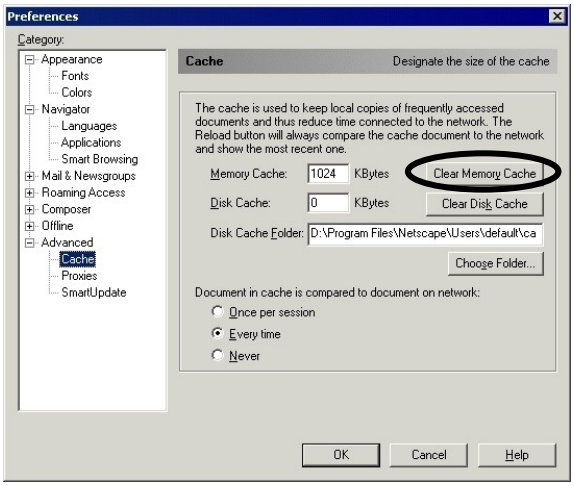
(a) From the menu, select "Tool" - " Internet Options".

(b) Click the "Delete Files" button, which is located on the Temporary Internet File section of the general tag.



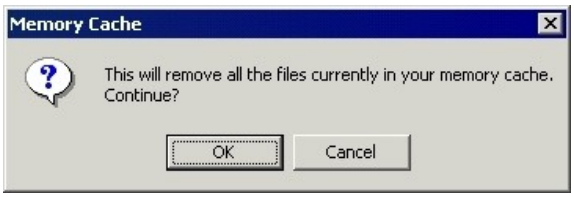
Copyright © 2005, Hitachi, Ltd.

(c) A dialog box will be displayed. Check "Delete all offline content" and click the "OK" button.

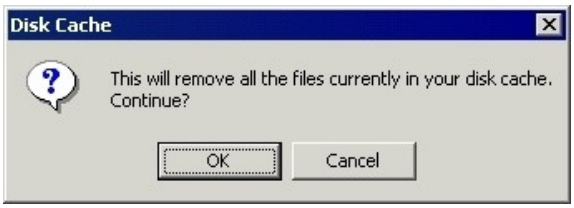


(2) Netscape

(a) From the menu, select "Edit" – "Preferences".

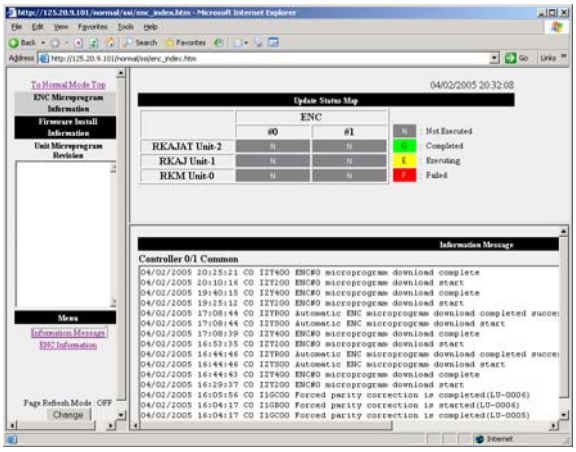


(b) From categories, select "Details" – "Cache". Click the "Clear memory cache" button.

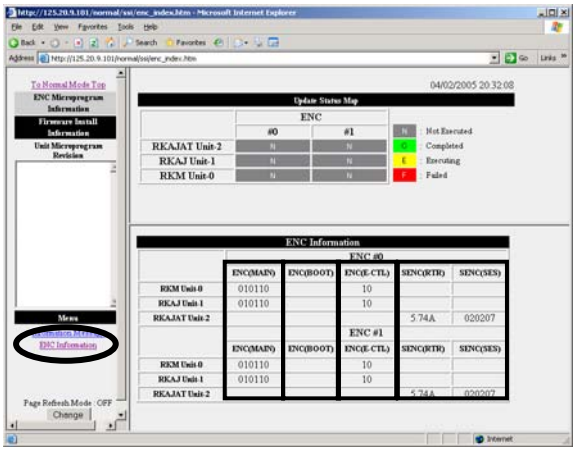


Copyright © 2005, Hitachi, Ltd.

(c) A dialog box will be displayed. Click the "OK" button.



(d) Click the "Clear disk cache" button to display dialog box ③. Click the "OK" button.



Copyright © 2005, Hitachi, Ltd.

6.2.3 Downloading Offline ENC/SENC Firmware

(1) While the disk array subsystem is on, enter the following URL in the browser of the PC used for maintenance: "http:// subsystem maintenance LAN port IP address/encmicro". A screen showing the ENC/SENC Firmware Rev. will be displayed.
At the time when the Web is connected or operated, entries of a user name and a password may be required. In such a case, enter "maintenance" as a user name and "hosyu9500" as a password.

(2) Press "ENC Information" in the menu section, and check Rev. of the current ENC/SENC firmware (SH firmware, H8S firmware and SR firmware) displayed in "ENC Information". When the Rev. of the ENC/SENC #0 and #1 are both the same with of newer than the Rev. to be downloaded, it is not necessary to download the ENC/SENC firmware, so that terminate the work. When either or both of the Rev. of the NEC/SENC #0 and #1 are older than the Rev. to be downloaded, go to the Step (2).

Copyright © 2005, 2006, Hitachi, Ltd.

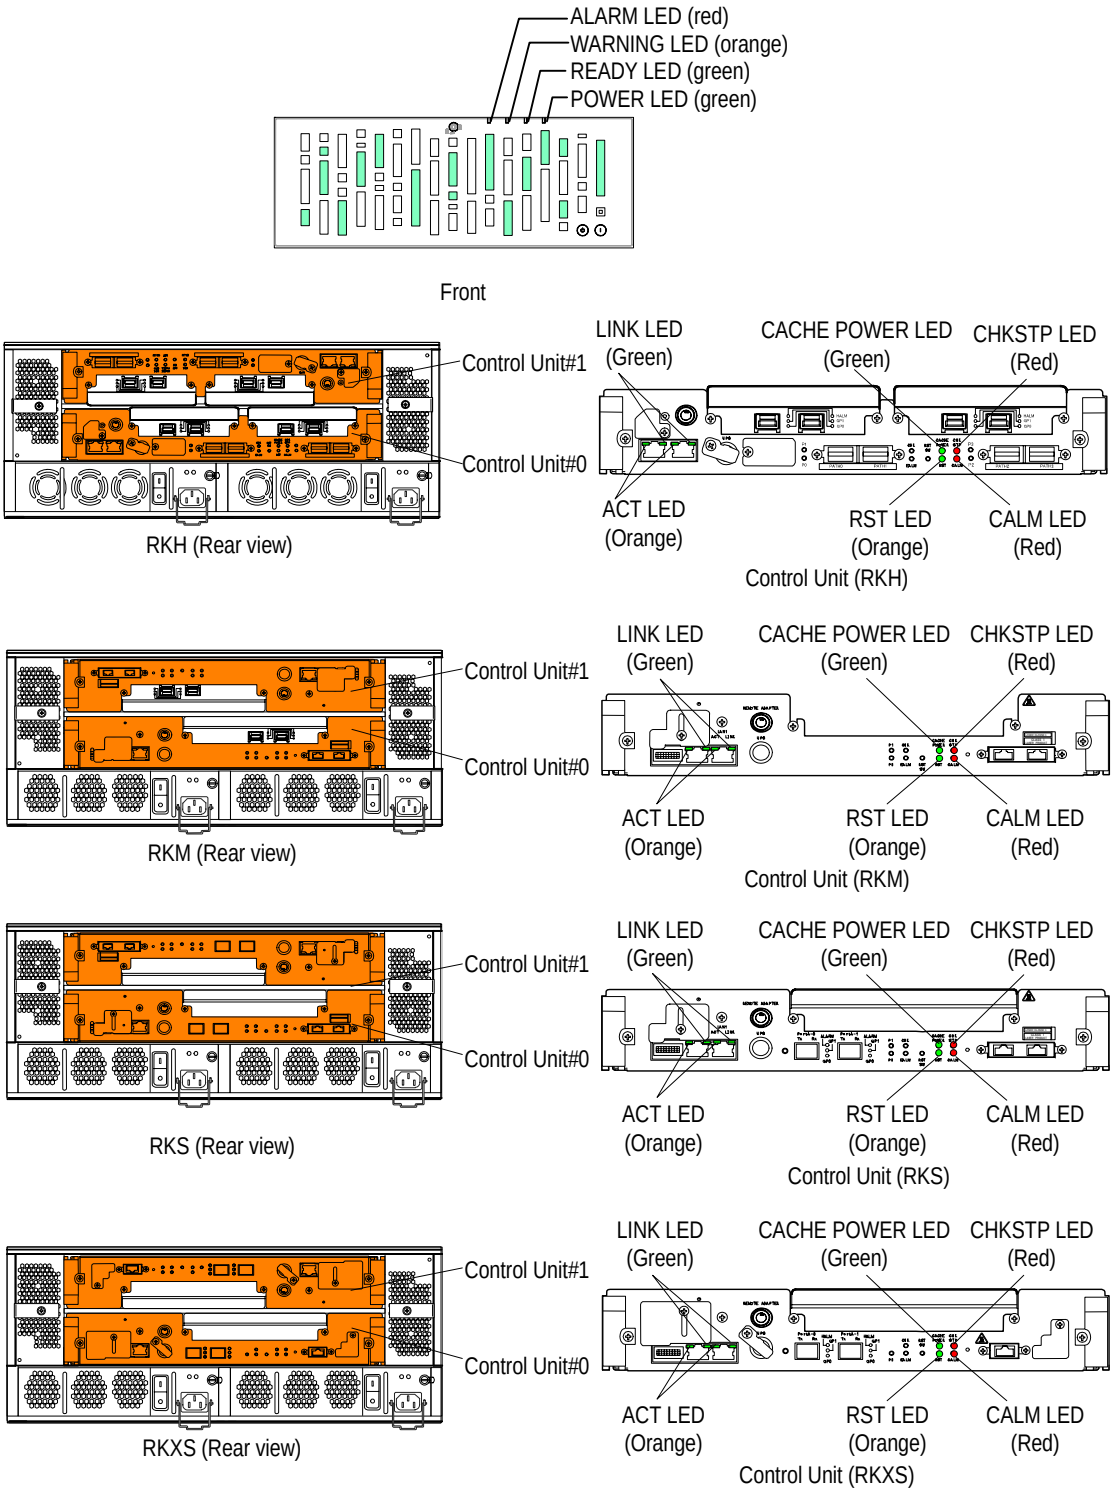
(3) When the downloading of the ENC/SENC firmware is required, make sure that none of the host I/O, LU formatting, drive restoration (dynamic sparing, copy back, or correction copy), pair creation/resynchronization of ShadowImage in-system replication, resynchronization of Copy-on-write Snapshot, and copying of TrueCopy remote replication is not in progress, and then perform the deliberate shutdown of the disk array subsystem.
When Power Saving of the priced option is used, if you perform the planned shutdown of the array subsystem after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host when the array subsystem starts.
Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then perform the planned shutdown of the array subsystem.
If the spin-down fails, execute the spin-down again.
After normal completion of the planned stop, reboot the disk array subsystem and confirm that the READY LED (green) is lit and that the WARNING LED (orange) is blinking.

(4) Press the RST SW on each controller and proceed to the maintenance mode.
(a) Proceeding to the Maintenance Mode
The method used to proceed to the maintenance mode differs depending on whether the READY LED (green) or the ALARM LED (red), both of which are located on the top of the front bezel (RKH/RKM/RKS/RKXS) is lit.
- If the READY LED (green) is lit, proceed to Step (ii) of the procedures.
- If the ALARM LED (red) is lit, wait 3 minutes before proceeding to Step (ii).
- If neither the READY LED (green) nor the ALARM LED (red) lights up after the power to the subsystem has been turned on for 10 minutes, follow the procedure listed below.

(i) Confirm that the WARNING LED (orange) on the front bezel is not blinking at a high rate of speed (in 125 ms intervals).
If the WARNING LED (orange) is blinking at a high rate of speed, wait for up to 80 seconds. The LED will stop blinking.
There is no error if the LED is blinking at a low rate of speed (once per second).
(ii) Perform the change to the maintenance mode.
- Single controller
  Press the RST SW on the single controller (the RST LED (orange) will light up while the RST SW is pressed).
- Dual controller

① Press the RST SW on controller #0 (the RST LED (orange) will light up while the RST SW is pressed).
② Press the RST SW on controller #1 (within 10 seconds of the first time the CALM LED (red) on controller #0 lights up). (A buzzer may sound when the RST SW is pressed. You need not turn this buzzer off until the procedures listed above are complete.)
If the CALM LED (red) on controller #0 has not lit up by this point, turn the power to the subsystem off and back on without removing the controller, return to Step (a), and repeat the procedure.

Copyright © 2005, 2006, Hitachi, Ltd.



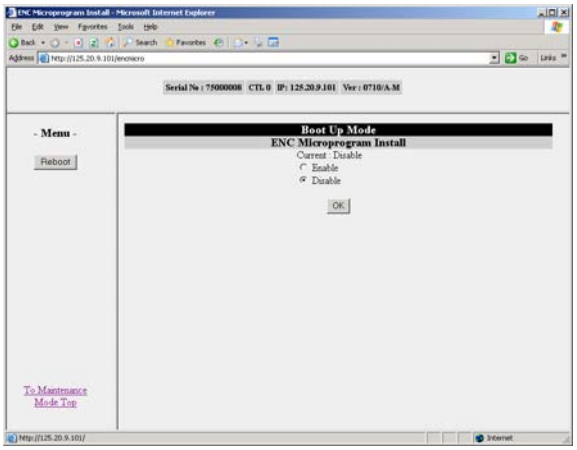


Figure 6.2.4 Indication Position

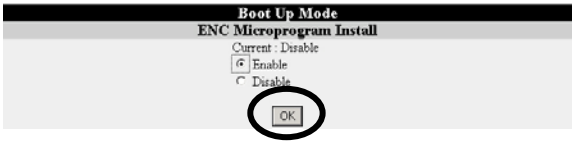
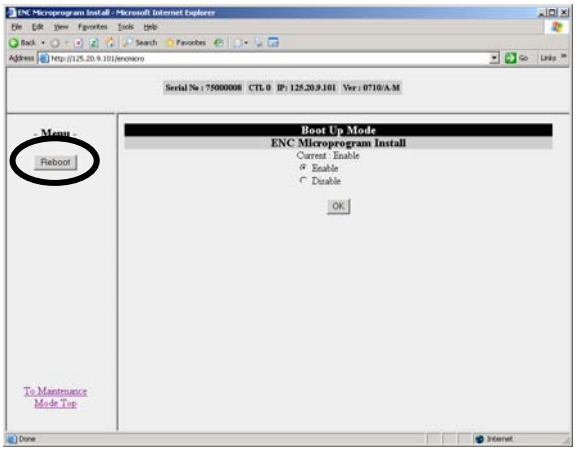
The figure above shows a rack-mounted model. Floor models are equipped with identical functions.



Copyright © 2005, Hitachi, Ltd.

NOTE : • The controller will remain closed while the subsystem is in the maintenance mode. No commands from the host computer can be performd during this time.
To recover, you must reboot the controller.
The subsystem will proceed to the maintenance mode once the CALM LED (red) on controller #0 and the READY LED (orange) on the front bezel are both lit.
• Using DNS at the network TCP/IP settings increases the time it takes to connect to the network. To expedite connections, set "Do not use DNS". Refer to the instruction manual of the PC in use for details on how to make settings.
• The subsystem cannot connect to the network if the browser is set to use the proxy server. Confirm that the browser is set not to use it.
Refer to the instruction manual of the browser in use for details on how to confirm settings.

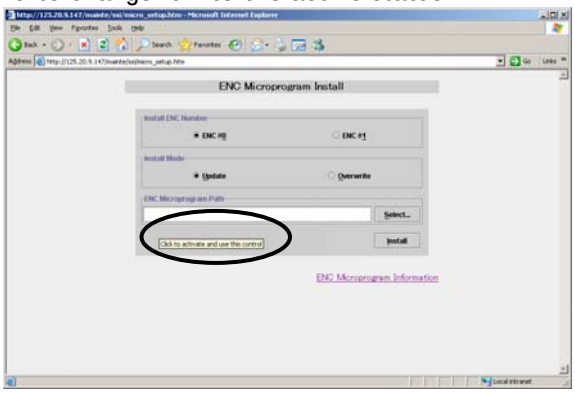
(5) Enter the following URL in the browser of the PC used for maintenance: "http://subsistem maintenance LAN port IP address/encmicro". The bootup settings screen for firmware download will be displayed.

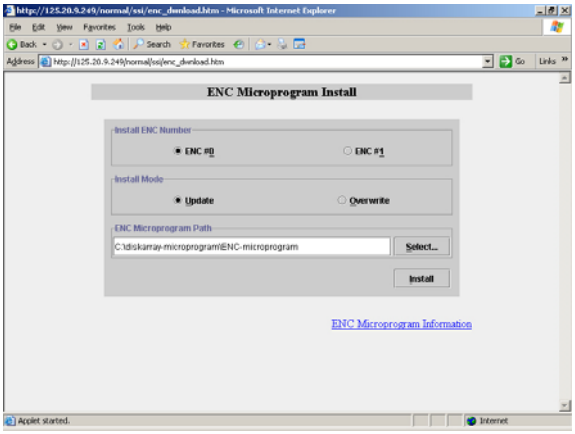


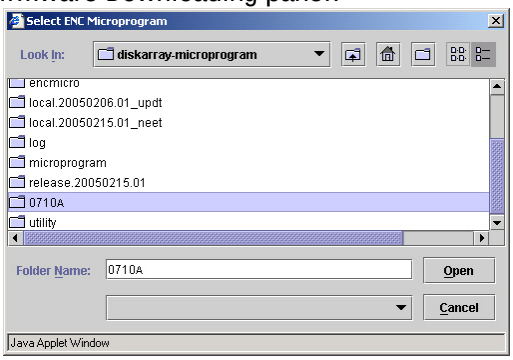
(6) Change the Boot Up Mode to Enable and click the "OK" button. Confirm that Enable has been selected.

Copyright © 2005, Hitachi, Ltd.

(7) Click the "Reboot" button on the menu. Reboot the subsystem according to the instructions provided by the dialog box.

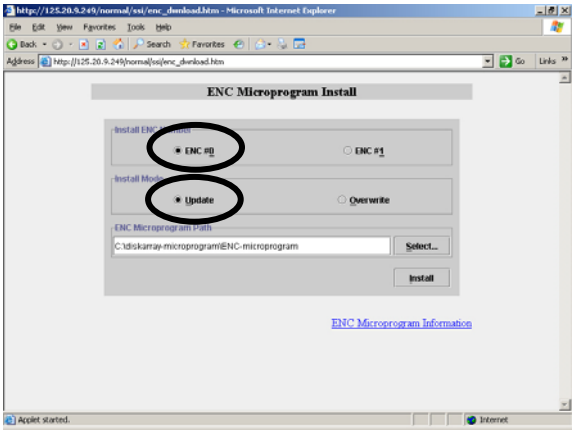






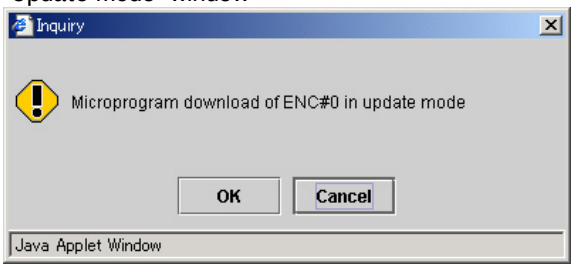
Copyright © 2005, Hitachi, Ltd.

(8) When the READY LED (green) on the subsystem starts to blink for 1/8 seconds, enter the following URL in order to display the ENC/SENC firmware download screen (Java applet): "http://subsystem maintenance LAN port IP address/encmicro".(‡1) If the READY LED (green) blinks for less than 1/8 seconds, enter the following URL in the browser in order to confirm the subsystem's status: "http://subsystem maintenance LAN port IP Address" and correct the error in accordance with the maintenance manual.
If the READY LED (green) on the subsystem lights up instead of blinking for 1/8 seconds, enter the following URL in the browser of the PC used for maintenance in order to display the information screen for the ENC/SENC firmware: "http:// subsystem maintenance LAN port IP address/encmicro". Refer to the "Information Message" displayed. Refer to the maintenance manual for details on how to correct it.
When the following message is displayed, it is necessary to click ActiveX Control with a mouse and to change it into the active status.



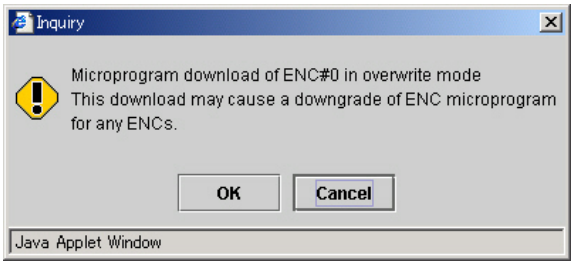
Specify the unified version directory(‡2) by pressing the "Select…" button on the ENC/SENC Firmware Downloading panel.

‡1 : The Disk Drives, which were spun down due to the Power Saving of the priced option, are also spinning up.
‡2 : For the unified version directory, refer to "5.1 Hierarchy of ENC/SENC Firmware Storage Directories" (EMD 05-0010).

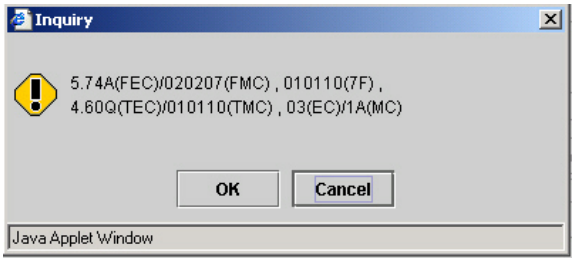


Copyright © 2005, 2006, Hitachi, Ltd.

(9) The ENC number in which the ENC/SENC firmware is downloaded from "Install ENC Number" is checked.
Also, check that "Update" of "Install Mode" is selected. Specify it for "Update" when "Overwrite" is selected. Select "Overwrite" only when there is an instruction.
The download procedure from ENC #0 is shown in this procedure.

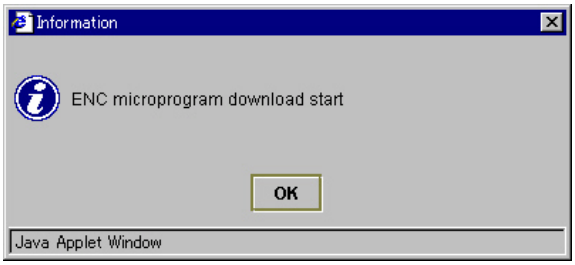


Click the "Install" button to display the dialog box in which the number of the ENC to be downloaded can be confirmed. Check the ENC number to be downloaded and press the "OK" button.

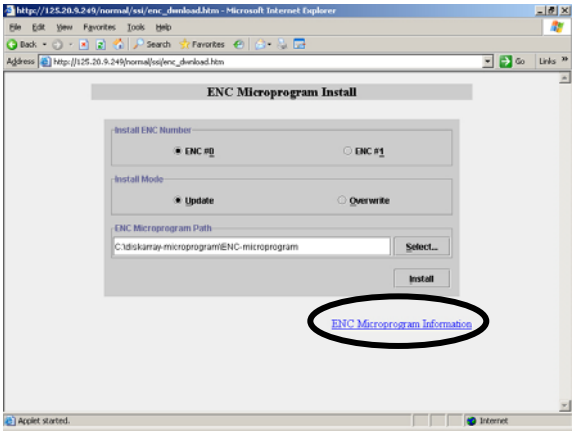


"Update mode" window

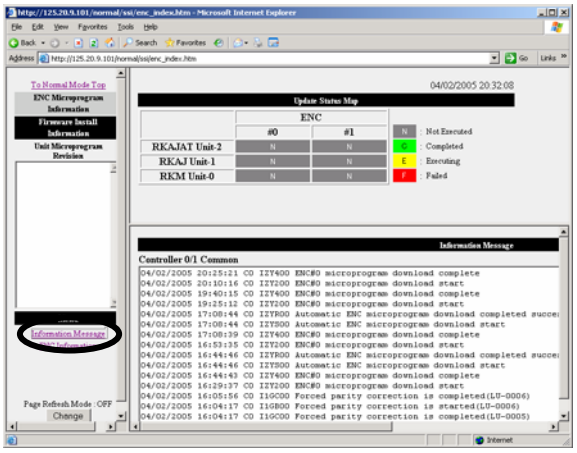
"Overwrite mode" window



(10) The "dialog box for the confirmation of the ENC/SENC firmware Rev." will be displayed. If there is no error in Rev. to be downloaded, press the "OK" button. The transfer of the ENC/SENC firmware file will begin.

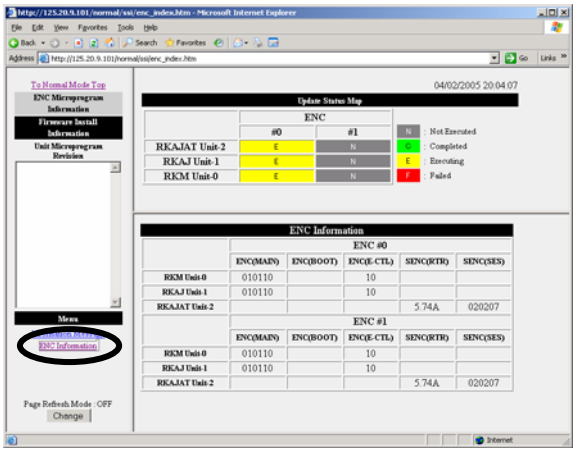


Copyright © 2005, Hitachi, Ltd.



(11) If all the ENC/SENC Firmware file transfers are accepted normally, the "ENC microprogram download start" dialog box will be displayed. Click the "OK" button.
The download of the SH firmware, H8S firmware and SR firmware will begin.

(12) Click "ENC Microprogram Information" to display the ENC/SENC firmware download status view screen. The progress of the ENC/SENC firmware download can be confirmed at this screen.



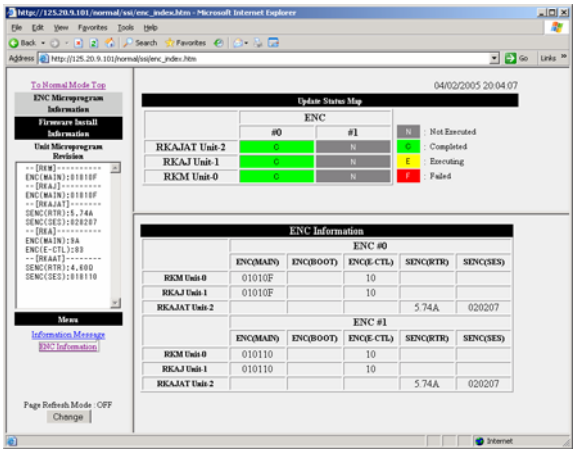
A message indicating the download status can be confirmed by clicking "Information Message" on the menu.

Copyright © 2005, Hitachi, Ltd.

When the download starts, "ENC #x microprogram download start" is displayed in the "Information Message" column.

Download status is indicated by different colors on the "Update Status Map" and "ENC Information". The status indicated by each color is as shown on the table below.

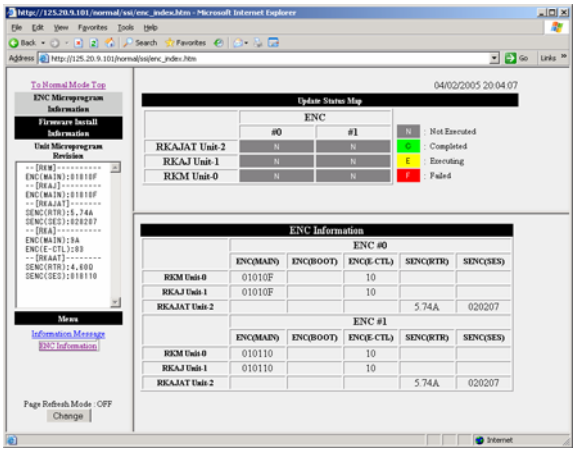
Screen (color)		Status
	Gray	Not targeted for download
	Green	Download complete
	Yellow	Downloading
	Red	The downloading failed (a failure occurred) or it was attempted for firmware outside the range to be downloaded (*1).



*1 : When it is intended to download only a part of the ENC/SENC firmware, a window, which shows the status of the ENC/SENC of a disk array unit having firmware outside the range to be downloaded, may be displayed in red. In this case, you can see which of the above is the case in point by checking whether or not a failure has occurred referring to the "Information Message" for a message as shown below.

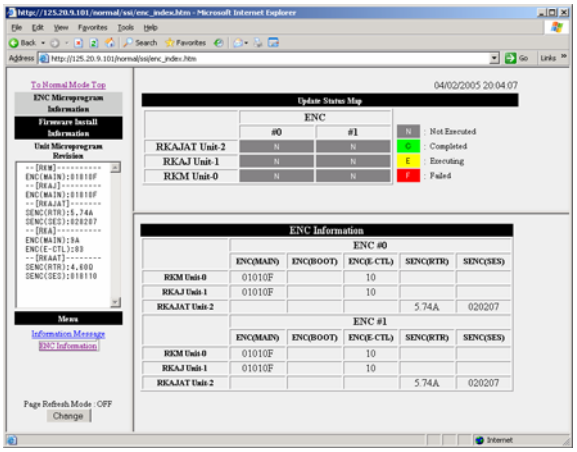
Copyright © 2005, Hitachi, Ltd.

(13) After all ENC/SENC firmware installation is complete, "ENC#X microprogram download complete" will be displayed in "Information Message" and the READY LED (green) on the subsystem will blink for 1/2 seconds.



Note: After an ENC/SENC firmware download has been completed normally, the ENC ALARM of the ENC/SENC that downloaded the firmware will light up. This light means that the ENC/SENC has rebooted automatically and does not indicate an error.

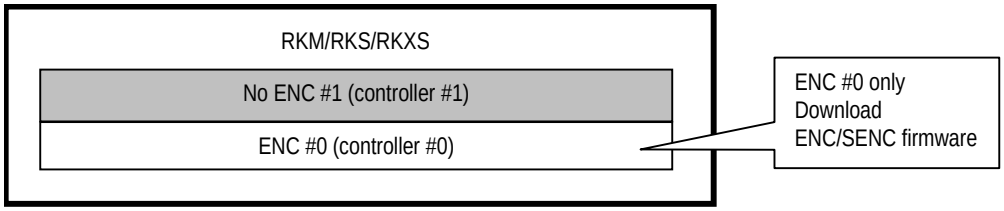
If the message "ENC #x microprogram download complete" is not displayed or if the READY LED (green) on the subsystem don't blink for 1/2 seconds 35 minutes after the message "ENC #x microprogram download start" is displayed, refer to (See Step (12)) and refer to the maintenance manual for details on how to correct the error. If an error message is displayed between "ENC #x microprogram download start" and "ENC #x microprogram download complete", correct the error in accordance with the instructions in the error message.



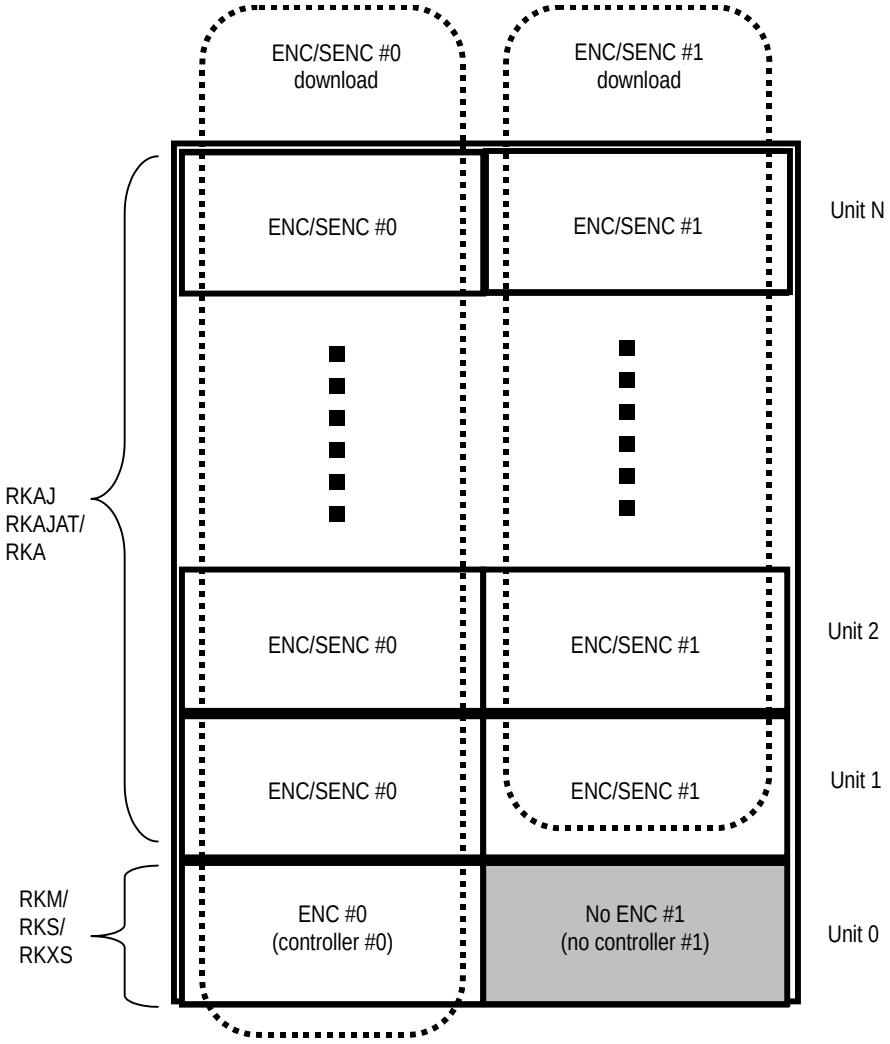
Copyright © 2005, Hitachi, Ltd.

(14) Turn off all unit AC power to the disk array subsystem. After turning the power back on, use the main switch to boot up the subsystem again. Confirm that the subsystem is Ready and that the WARNING LED (orange) is off. If the subsystem does not become Ready or the WARNING LED (orange) does not light up/blink, refer to the maintenance manual for details on how to correct the error.
Next, enter the following URL in the browser: "http://IP address/encmicro", click "ENC Information" on the menu, and confirm that the Revs of the SH firmware, H8S firmware and SR firmware that were downloaded are equivalent to or greater than the Revs that were overwritten.

(15) When the download is necessary for the other ENC/SENC, repeat (4) to (14) of "6.2.3 Downloading Offline ENC/SENC Firmware" (EMD 06-0090), and download the ENC/SENC firmware.



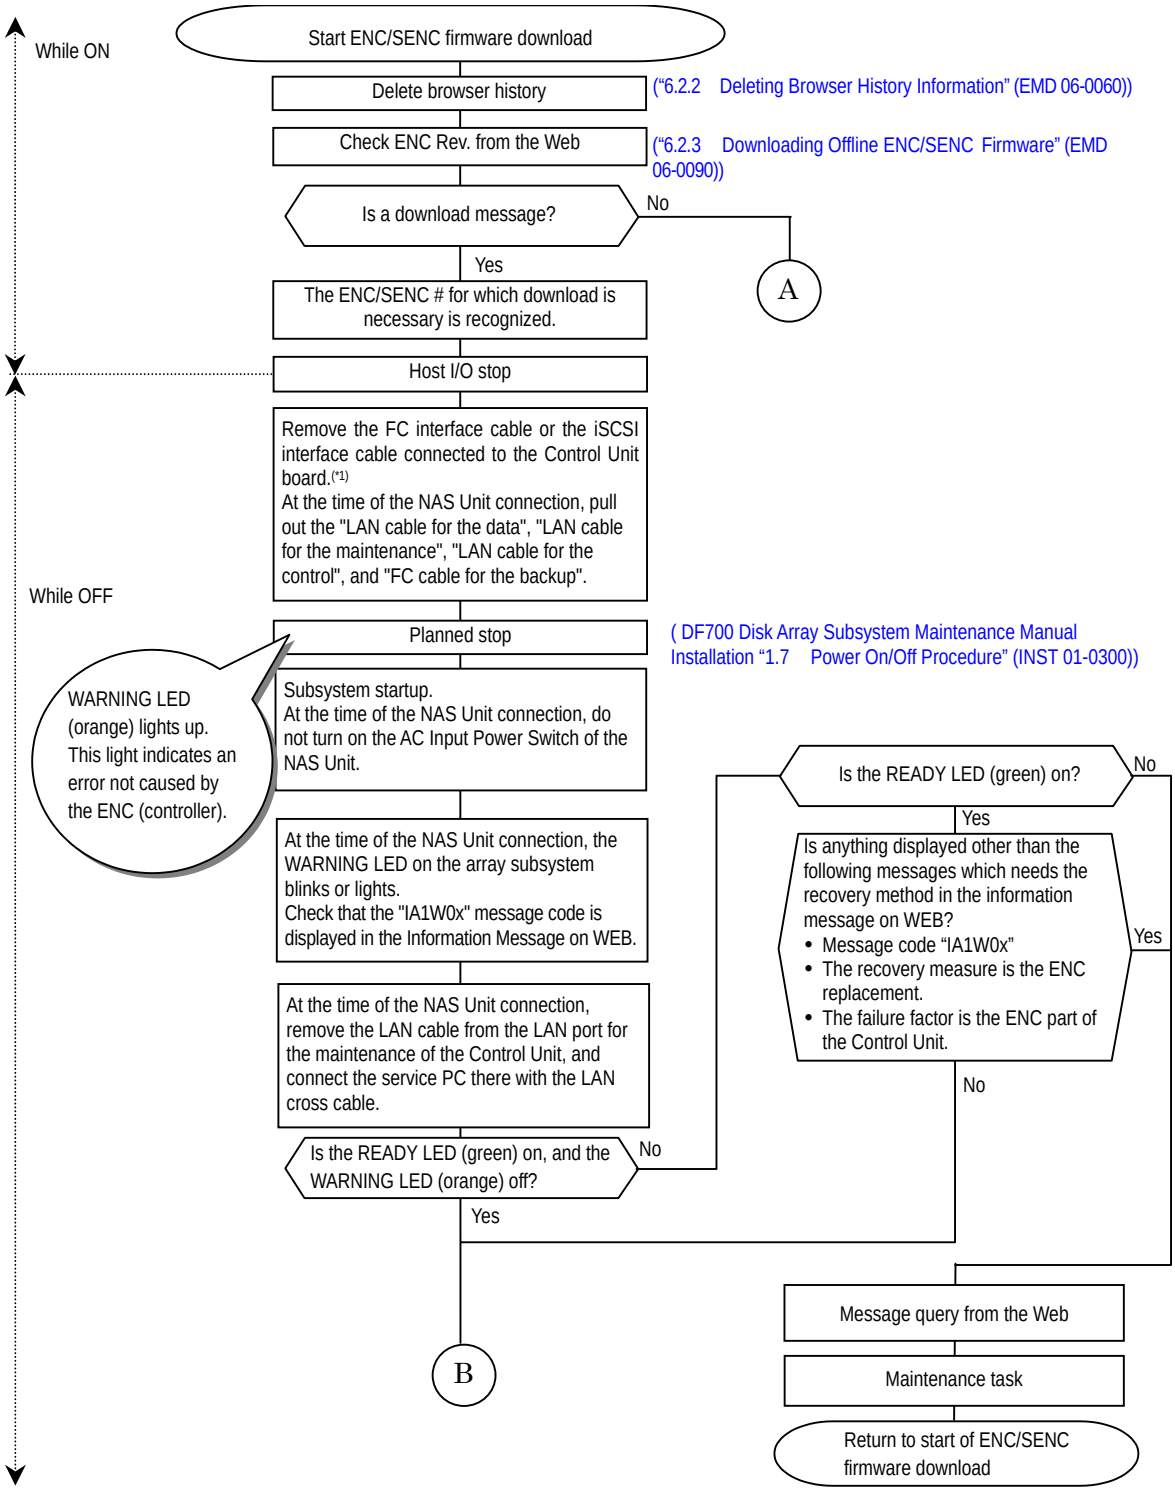
Copyright © 2005, Hitachi, Ltd.



Chapter 7. Offline ENC/SENC Firmware Download Procedure (Single Controller)

This procedure is explained below, with the mounted controller as controller #0.

- For RKM/RKS/RKXS only
  Since the RKM/RKS ENC forms a single unit with the controller, download ENC #0 only.



- For RKM+RKAJ/RKAJAT/RKA
  RKS+RLAJ/RKAJAT
  For RKXS+RKAJAT
  Although RKM/RKS/RKXS has only ENC #0, RKAJ/RKAJAT/RKA includes both ENC/SENC #0 and ENC/SENC #1. Therefore, it is necessary to download to both ENC/SENC #0 and ENC/SENC #1.

7.2 Offline ENC/SENC Firmware Download Procedure Screen (Single Controller)

The download procedure of the ENC/SENC firmware is the same procedure as the dual Control Unit.

(1) Use a LAN cross cable to connect the LAN connector used for maintenance to the LAN connector of the PC used for maintenance. (See "6.2.1 Connecting the PC Used for Maintenance" (EMD 06-0030).)
(2) Start the browser on the PC used for maintenance, and delete the history. (See "6.2.2 Deleting Browser History Information" (EMD 06-0060).)
(3) Download the ENC/SENC firmware. (See "6.2.3 Downloading Offline ENC/SENC Firmware" (EMD 06-0090).)

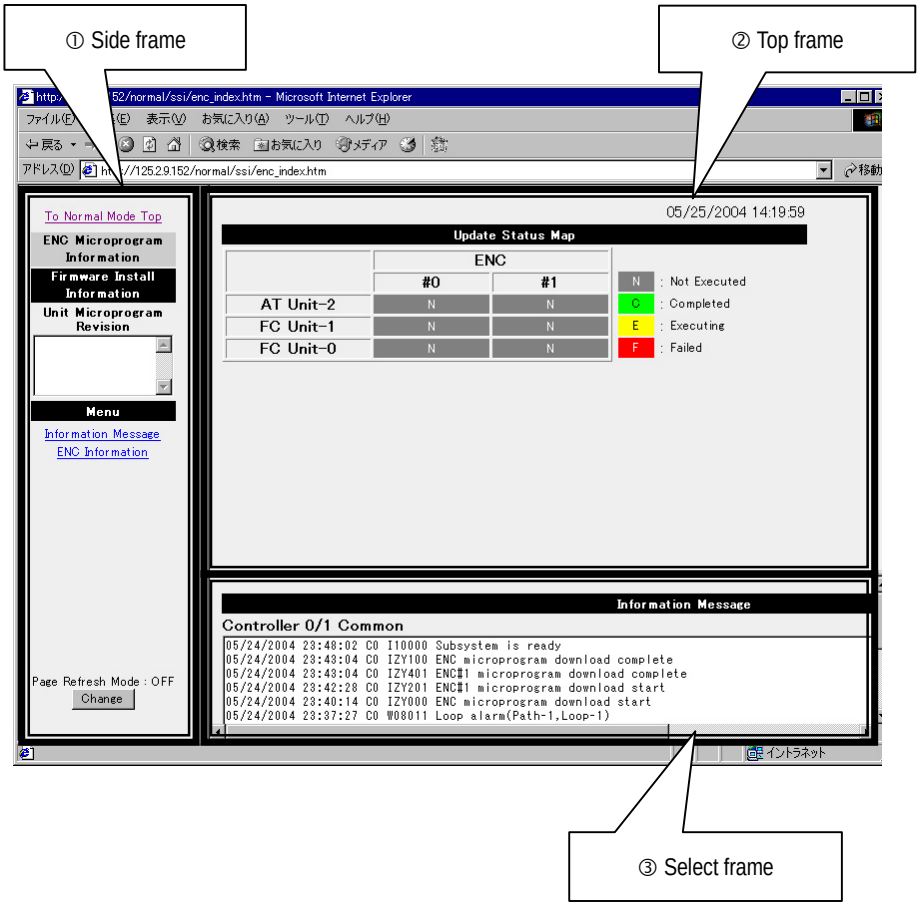
Copyright © 2005, Hitachi, Ltd.

Chapter 8. Offline ENC/SENC Firmware Download Web Display Screen

8.1 URLs

The ENC/SENC firmware Rev. display screen is displayed by entering the following URL in the Web browser of the PC connected to DF. (ENC/SENC firmware download status reference screen during ENC/SENC firmware download.)

http://controller IP address/encmicro



At the time when the Web is connected or operated, entries of a user name and a password may be required. In such a case, enter "maintenance" as a user name and "hosyu9500" as a password.

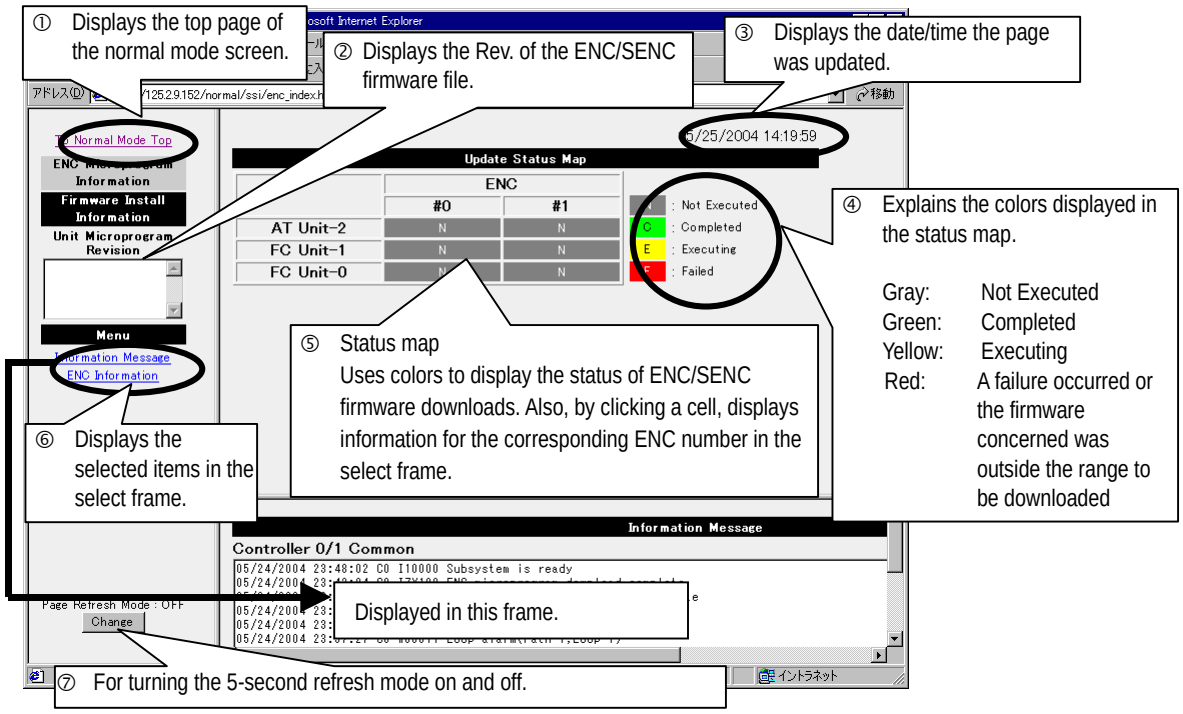
8.2 Web Screen Image

A Web screen image of the ENC/SENC firmware Rev. display as it appears in Internet Explorer is shown below.

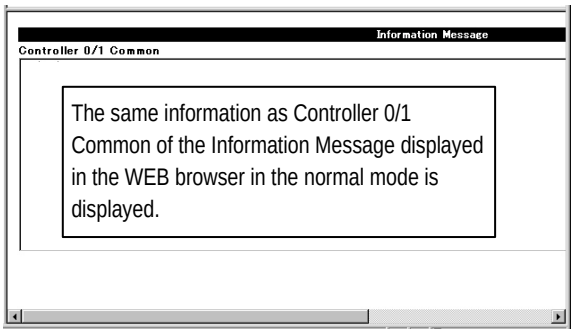


After the INQUIRY information is fixed, enter the URL to display the following screen.
In the figure below, the left side is called the Side frame, the top right half is called the Top frame, and the bottom half is called the Select frame.

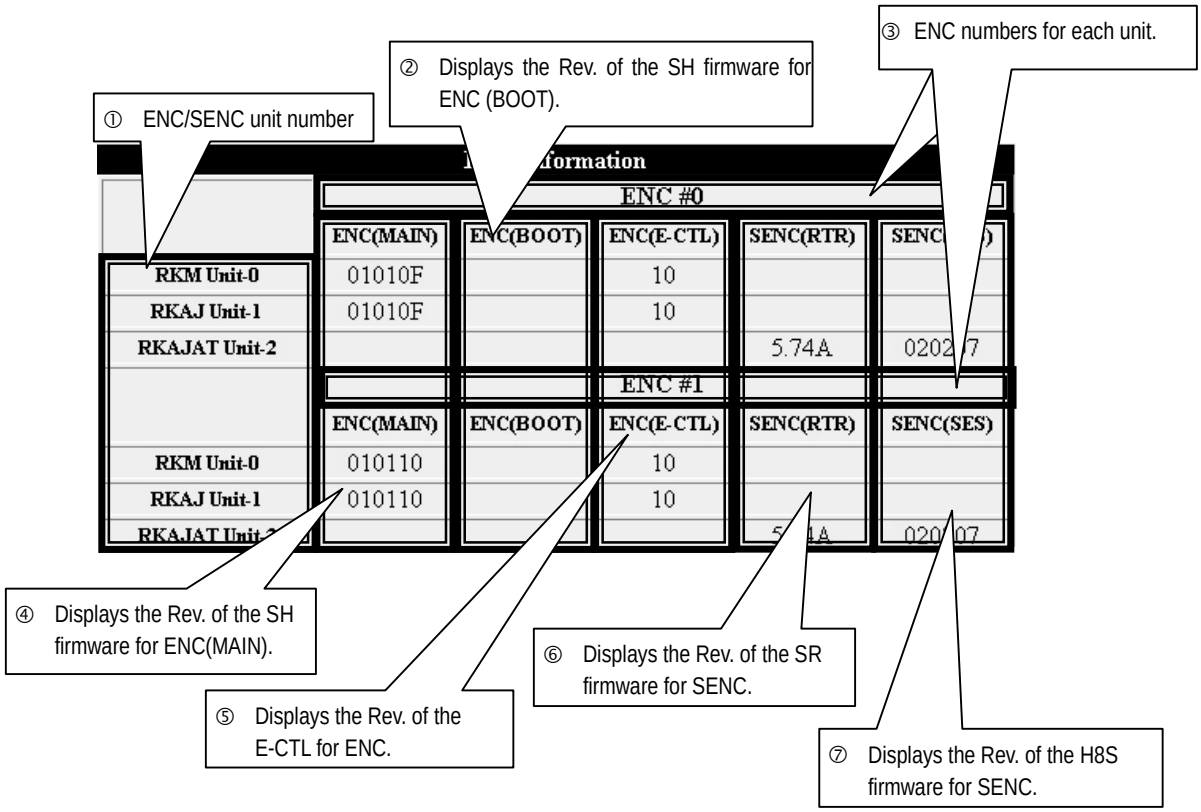
Copyright © 2005, Hitachi, Ltd.

8.2.1 Side Frame and Top Frame Image Screen Details

The details of the side frame and top frame are shown below.



Copyright © 2005, Hitachi, Ltd.



8.2.2 Select Frame Image Screen Details

The details of the select frame are shown below.
One of the following two patterns is displayed, depending on settings.

(1) The select frame screen when an Information Message is selected is shown below.

(2) The select frame screen when ENC Information is selected is shown below.

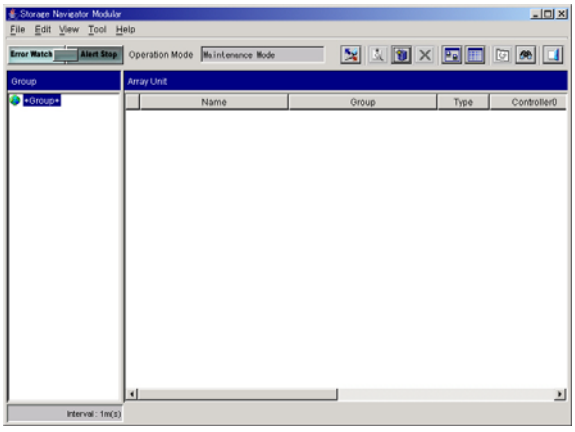
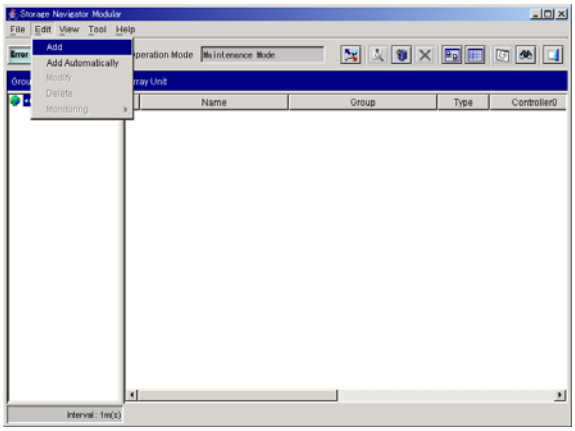
Chapter 9. Procedure for Invalidating the Automatic ENC/SENC Firmware Downloading Function

When returning the revision of the ENC/SENC firmware to the previous one after downloading the firmware because of its trouble, etc., it is required to invalidate the automatic downloading function before downloading the firmware.
Execute the following procedure using Storage Navigator Modular.



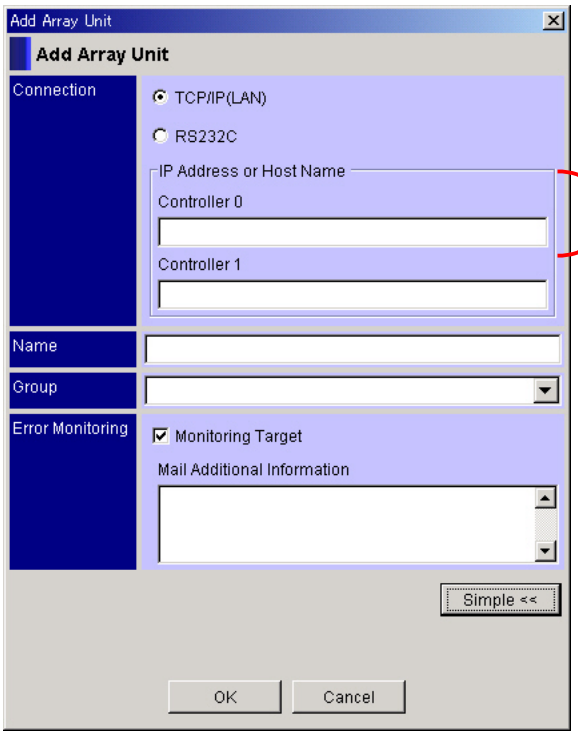
(1) Double click the icon of Storage Navigator Modular "  " on the desktop. Storage Navigator Modular is started.
You can also start Storage Navigator Modular by positioning the pointer on Program in the Start menu and select Storage Navigator Modular.

(2) The Storage Navigator Modular is activated in the Normal Mode and the main window is displayed.



(3) In the main window, position the focus "  " on the icon "  " of the array subsystem register by pressing the "Tab" key, and then press the Ctrl, Shift, and E keys at the same time.

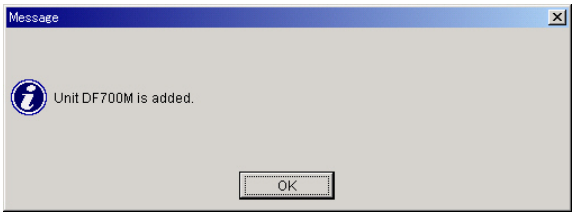
(4) Maintenance Mode is displayed in the Active Mode field at the top right on the Main screen, and the Storage Navigator Modular operates in the maintenance mode.



Copyright © 2005, Hitachi, Ltd.

(5) Select "Add" in the main window or click "  : Add".

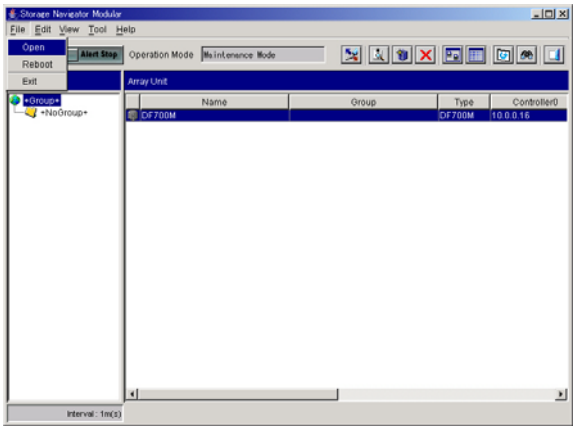
(6) Click the "Detail" button.
Select "TCP/IP (LAN)" for the connection form. Enter the information for the registration and click the "OK" button.



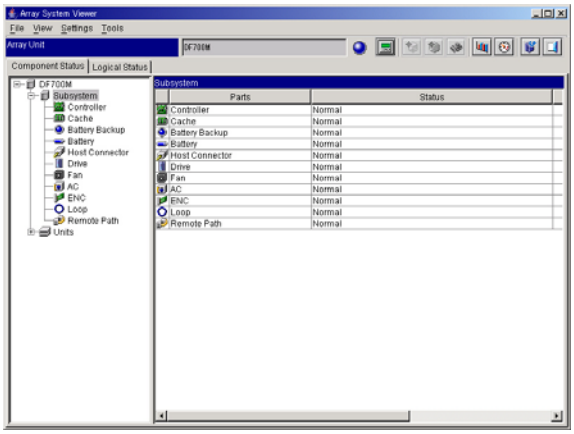
- In the case of the single CTL configuration, enter the IP address of the CTL 0 side only.
- In the case of the dual CTL configuration, enter the IP address of the CTL connected to the network (*).

*: When the personal computer is directly connected, enter only the IP address of the CTL that is connected to a LAN. When the both CTLs are connected via a LAN, enter the IP addresses of the both CTLs.

Copyright © 2005, Hitachi, Ltd.



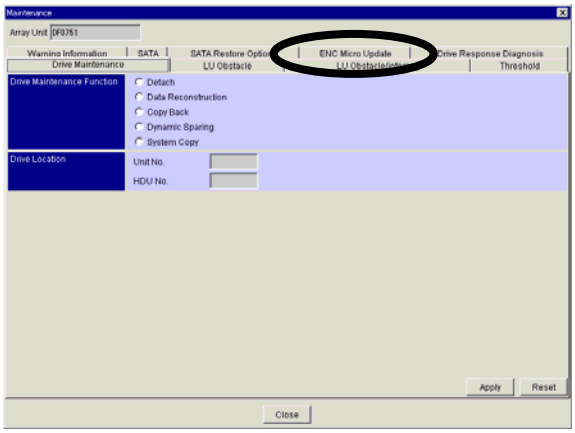
(7) Since a message informing of a completion of the registration is displayed, click the "OK" button.



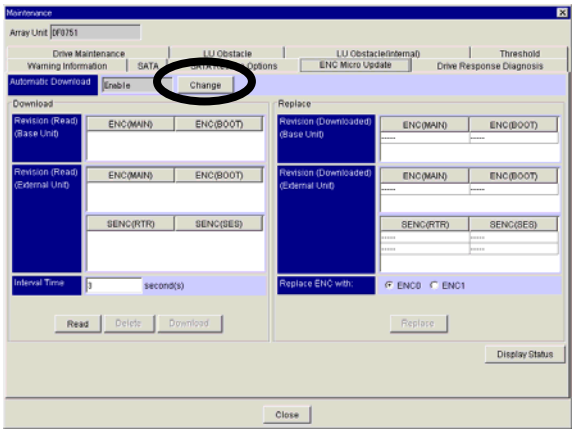
(8) An icon of the disk array subsystem that has been registered with the main window is added.

(9) Select the icon of the disk array subsystem by clicking it in the main window.

(10) Selecting "File" – "Open".

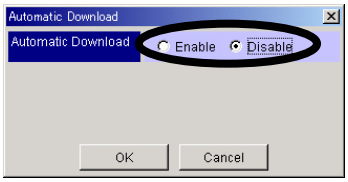


(11) The unit window is opened.



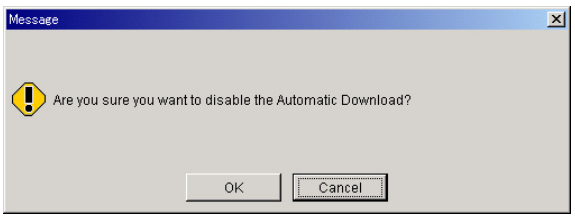
Copyright © 2005, Hitachi, Ltd.

(12) Select “Maintenance” from the Settings menu.

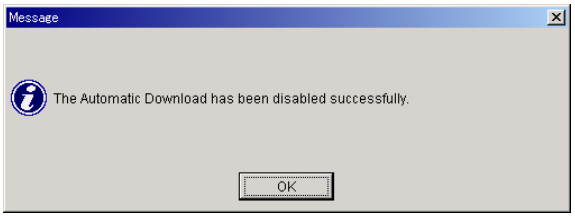


(13) Select the "ENC Micro Update" tab.

(14) Press the “Change” button on the “Automatic Download”.



(15) Remove the check on “Enable” in the Automatic Download window.



(16) Press the “OK” button.

Copyright © 2005, Hitachi, Ltd.

(17) The configuration message dialog box appears. Press the "OK" button.

(18) When the set is completed normally. Press the "OK" button.

Drive Recovery Guideline

Hitachi Proprietary

Preface

This guideline describes how to recover the HT-4064 drive.

The drive recovery time for the theoretical values described in this guideline indicates the time in case no access is provided from the host.
If continuous access is provided from the host, the recovery gets later than the indicated time.

Trademark and Copyright

Hitachi is a trademark or registered trademark of Hitachi, Ltd.

The Hitachi logo is a trademark or registered trademark of Hitachi, Ltd.

All other brands and products names mentioned in this guideline may be trademarks or registered trademarks of their respective holders.

Export restrictions

Follow the necessary procedures for export of the data included in this guideline that is subject to the requirements of the Japanese Foreign Exchange and Foreign Trade Law and to the trade control laws and associated regulations of the United States. If there are any ambiguities, contact our sales representative.

7. Operation Mode of Spare Drives 5

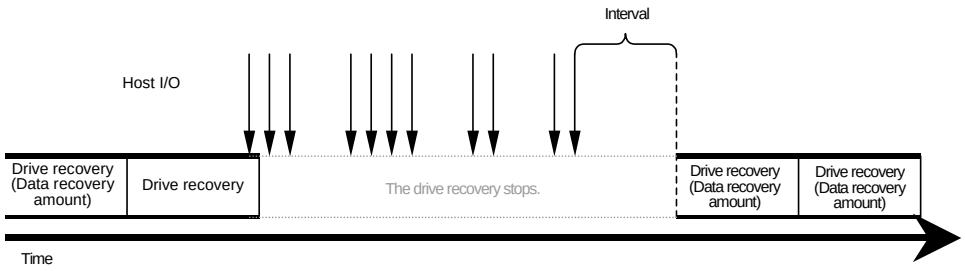
8. Operation Mode in the Spare Drive Mode 6

9. Execution Time of Collection Copy 8

9.1 Execution time of collection copy with I/O not provided form the host 8
9.2 Execution time of collection copy with I/O provided form the host 9

1. Drive Recovery Mode

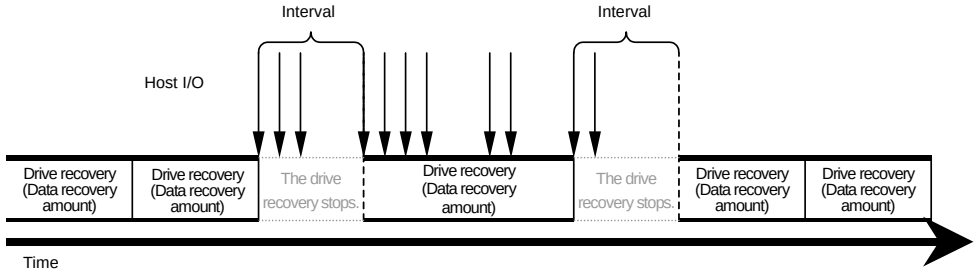
The following table shows how to recover a drive.



Setting value	Initial value	Description	
Background		Select this mode when the input/output (I/O) is not provided from the host to the disk array subsystem at night. For the time required for the drive recovery, see Maintenance Manual, Table 9.1.1 Standard execution time for collection copy. Example: In the configuration of RAID 15D+1P with 71.3-gigabyte HDD, copying to a spare drive takes three hours. Select this mode if the I/O from the host stops more than three hours so that copying to the HDD's spare disk is complete within a day. Note: If the I/O is provided from the host, the drive recovery will stop. If the I/O is not provided, the drive recover will resume.	Drive recovery without host I/O: Invalid Drive recovery with host I/O: Improper Affection to host I/O: None
Interleave (standard)		Select this mode if you cannot the I/O from the host and you perform preferentially the processing from the host. Since the processing from the host is executed preferentially, the processing time for the drive recovery will not be guarantied.	Drive recovery without host I/O: Valid Drive recovery with host I/O: Valid Affection to host I/O: Small

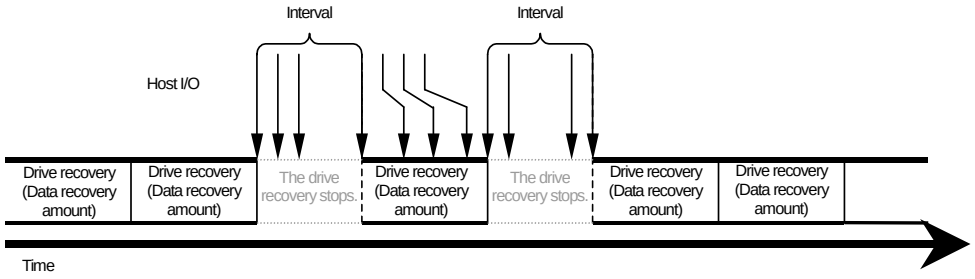
Setting value	Initial value	Description	
Interleave (preference)	✓	Select this mode if the I/O from the host is not provided and the drive recovery is preferentially executed. Since the drive is preferentially recovered before the processing from the host, the drive recovery time is guarantied as in Table 9.2.2 Correction copy execution time in the interleave (preference) mode.	Drive recovery without host I/O: Valid Drive recovery with host I/O: Valid Affection to host I/O: Large

2. Operation of Each Mode during Drive Recovery



- Background
  If the host I/O is not provided, the drive recovery is sequentially performed in data recovery amounts.
  When the host I/O provided during the drive recovery, the recovery stops and the host I/O processing is executed. If the host I/O stops and the interval time elapses, the drive recovery will resume.

Figure 2.1 Drive recovery (background mode)



- Interleave (Standard)
  If the host I/O is not provided, the drive recovery is sequentially performed in data recovery amounts.
  If the host I/O is provided during the drive recovery, it stops at the interval and then the host I/O processing is performed. When the interval time elapses, the drive recovery resumes, but the host I/O and other processing are preferably performed. Therefore, the time required until the completion of the drive recovery cannot be guarantied.

Figure 2.2 Drive recovery (Interleave (standard) mode))

- Interleave (preference)
  If the host I/O is not provided, the drive recovery is sequentially performed in data recovery amounts.
  If the host I/O is provided during the drive recovery, it stops at the interval and then the host I/O processing is performed. When the interval time elapses, the drive recovery resumes and then it is preferably executed to the host I/O. The performance of the host I/O processing lowers, but the processing time of the drive recovery is guarantied as shown in Table 9.2.2 Correction copy execution time in the interleave (preference) mode.

Figure 2.3 Drive recovery (Interleave (preference) mode))

3. Trigger for Drive Recovery

This chapter specifies the data reconfiguration to the failed drive, data reconfiguration to the spare drive, data copy on the spare drive to the original drive, and automatic or manual startup of the dynamic sparing processing.

Setting value	Initial value	Description
Manual		This sets when you start manually the data reconfiguration and the processing that copies the data on the spare drive to the original drive (copy back).
Automatic	✓	This sets when you start automatically the data reconfiguration and the processing that copies the data on the spare drive to the original drive (copy back).

4. Interval Time

The interval time specifies an interval of the recovery processing. The default is a zero. Specify an integer between 0 and 255 in 10 ms. For example, when you specify value 10, the interval time of 10×10 ms = 100 ms will be specified.

This interval time indicates the time until the I/O from the host stops in the background mode. In the interleave mode (standard or preference), it indicates the time when the drive stops if the host I/O is provided.

You must set to the proper time considering the data recovery amount and the interval time.

Setting value	Initial value	Description
0 to 255	0	Specify an interval of recovery processing in 10 ms.

5. Amount of Data Recovery

Specify the unit amount of data. The default is one. Specify an integer between 1 and 511 as a unit of 128 blocks. For example, when you specify value 10, the data recovery amount of 10×128 (block) ×512 (bytes/block) = 640 KB will be specified.

If the host I/O is provided in the interleave mode (standard or preference), it recovers the data amount specified here and then waits for the time specified by the interval time, recovering the next data.

You must set to the proper time by considering the data recovery amount and the interval time.

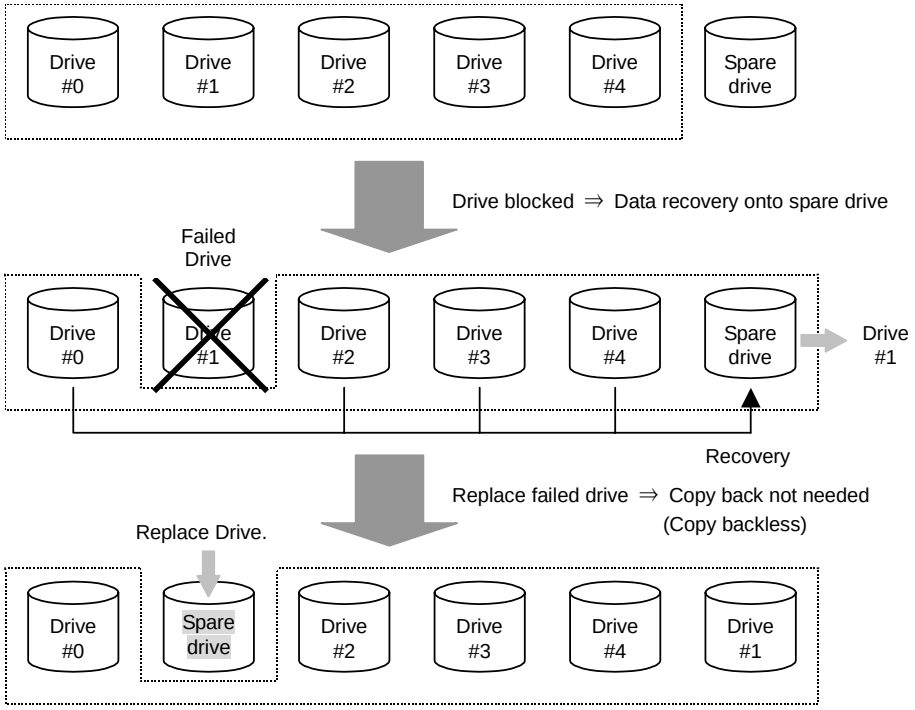
Setting value	Initial value	Description
1 to 511	1	Specify the unit amount of data recovery in 128 blocks.

6. Dynamic Sparing

If the number of failure occurrences managed by the preventive maintenance exceeds a threshold, specify a mode that recovers data to the spare drive.

Setting value	Initial value	Description
Execution (Read/write & online verify)	✓	If the number of failure occurrences of a read/write error or online verify error exceeds a threshold, recover the data in the unused spare drive and then block the failed drive.
Execution (Read/write)		If the number of failure occurrences of a read/write error exceeds a threshold, recover the data in the unused spare drive and then block the failed drive. If the number of failure occurrences of an online verify error exceeds a threshold, dynamic sparing will not be performed.
Non-execution		If the number of failure occurrences of a read/write error or online verify error exceeds a threshold, dynamic sparing will not be performed.

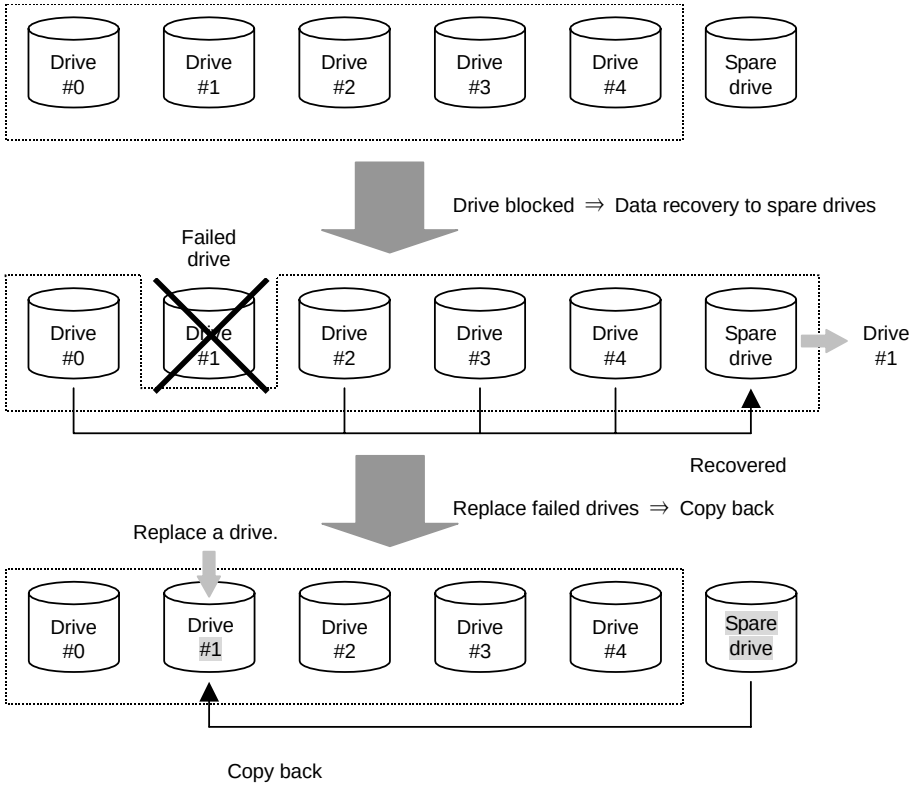
7. Operation Mode of Spare Drives



The table below shows how to operate a spare drive.

Setting value	Initial value	Description
Variable	✓	When you replace a failed drive, the drive becomes a spare drive (copy backless).
Fixed		The set drive becomes a fixed spare drive.

8. Operation Mode in the Spare Drive Mode



- Variable (copy backless)
  Even if you insert a replacement drive into the mounting location where a failure occurred, data is not recovered on the drive, leaving operated as a spare drive.

Figure 8.1 Operation modes of spare drives (variable)

- Fixed
  If you insert a replacement drive into the mounting location where a failure occurred, data onto the drive is recovered (copy back).
  If the drive recovery trigger is set to "Auto", copy-back is started automatically. If set to "Manual", copy-back must be performed by the instructions on the Storage Navigator Modular (SNM).

Figure 8.2 Operation mode of spare drives (fixed)

9. Execution Time of Collection Copy

9.1 Execution time of collection copy with I/O not provided form the host

- DF700 conditions
  - Subsystem: RKM, RKAJAT
  - RAID configuration: RAID 5（4D+1P, 15D+1P）
  - LU: 1 LU (Capacity: 20 GB)
  - Microprogram revision: 0710/A

- Measuring
  - Set to the drive block mode.
  - Unplug a drive.
  - Insert the drive after a while.
  - Start the drive recovery.
  - Measure the time from the startup of drive recovery to the end of the recovery.
  - The time of the collection copy of full capacity is calculated from the time of the collection copy of LU of 20 GB.

Table 9.1.1 Execution time of collection copy without I/O (in minutes)

		Execution time
71.3 GB HDD FC	RAID5 4D+1P	30
	RAID5 15D+1P	90
143.3 GB HDD FC	RAID5 4D+1P	60
	RAID5 15D+1P	200
287.6 GB HDD FC	RAID5 4D+1P	190
	RAID5 15D+1P	440
245.7 GB HDD SATA	RAID5 4D+1P	90
	RAID5 15D+1P	380
393.5 GB HDD SATA	RAID5 4D+1P	285
	RAID5 15D+1P	510

Note:
Without the host I/O, both the background and interleave (standard or preference) modes take the same processing time.

9.2 Execution time of collection copy with I/O provided form the host

- Host conditions

  - Tool: I/O meter
  - Data pattern: Random read/write (70:30)
  - Data length: 4 KB
  - Multiplicity of I/O: FC drive… 8
    SATA drive… 4
  - Host I/O: FC drive… 620 IOPS approx
    SATA drive… 180 IOPS approx

- DF700 conditions

  - Subsystem: RKM, RKAJAT
  - RAID configuration: RAID 5（4D+1P）
  - LU: 1LU (Capacity: 20 GB)
  - Microprogram revision: 0710/A 0720

- Measuring

  - Set to the drive block mode.
  - Run the host I/O.
  - Unplug a drive.
  - Insert the drive after a while.
  - Start the drive recovery.
  - Measure the time from the startup of drive recovery to the end of the recovery.
  - The time of the collection copy of full capacity is calculated from the time of the collection copy of LU of 20 GB.

Table 9.2.1 Execution time of collection copy in the interleave mode (standard) with I/O provided (for 0710/A)

(day/hour: Minute)

Drive recovery mode: Interleave (standard)		Interval setting value (in ms in parenthesis)					
Drive configuration							
71.3 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)

	300(38,400)	2:00	02:15	02:15	02:15	02:45	03:15
	511(65,408)	2:00	02:00	02:15	02:15	02:30	02:45
287.6 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	04:00	06:45	19:30	1/05:00	11/12:00	27/10:00
	10(1,280)	04:00	04:45	05:30	06:30	1/08:30	2/23:00
	100(12,800)	04:00	04:15	04:30	04:30	07:00	11:00
	300(38,400)	04:00	04:15	04:15	04:30	05:15	06:30
	511(65,408)	04:00	04:15	04:15	04:15	04:45	05:30
245.7 GB HDD, SATA, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	3/01:00	5/08:00	6/09:30	8/00:00	18/14:00	33/05:30
	10(1,280)	3/01:00	4/06:30	4/19:00	5/08:00	8/12:00	10/00:00
	100(12,800)	3/01:00	3/17:30	4/00:00	4/19:00	6/09:00	8/12:00
	300(38,400)	3/01:00	3/17:00	3/15:00	4/00:00	5/07:30	8/04:30
	511(65,408)	3/01:00	3/14:00	3/15:00	3/17:30	4/03:30	4/16:30
393.5 GB HDD, SATA, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	4/20:30	8/12:30	10/05:00	12/18:30	29/17:30	53/04:00
	10(1,280)	4/20:30	6/19:30	7/16:00	8/12:30	13/14:30	16/00:00
	100(12,800)	4/20:30	5/23:00	6/09:30	7/16:00	10/05:00	13/14:00
	300(38,400)	4/20:30	5/19:00	5/19:00	6/09:30	8/12:00	13/02:00
	511(65,408)	4/20:30	5/17:30	5/19:00	5/23:00	6/15:00	7/10:30

Note 1:
Since the execution time of collection copy depends on the measurement conditions, the above values may increase or decrease.

Note 2:
The host I/O performance deteriorates while the disk drive is restoring.
FC drive: 160 to 260 IOPS, SATA drive: 110 to 125 IOPS

Note 3:
The interleave time and the operation when the amount of the data restoration is the default value are shown in the shaded area.

Table 9.2.2 Execution time of collection copy in the interleave mode (preference) with I/O provided (for 0710/A)

(day/hour: Minute)

Drive recovery mode: Interleave (preference)		Interval setting value (in ms in parenthesis)					
Drive configuration							
71.3 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	1:00	02:00	05:00	08:45	3/03:00	7/16:30
	10(1,280)	1:00	01:00	01:30	01:45	08:30	19:30
	100(12,800)	1:00	01:00	01:15	01:15	01:45	02:45
	300(38,400)	1:00	01:00	01:00	01:00	01:15	01:30
	511(65,408)	1:00	01:00	01:00	01:00	01:15	01:15
143.3 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	1:45	03:30	09:30	17:00	6/06:15	15/10:30
	10(1,280)	1:45	02:00	02:30	03:15	16:30	1/16:30
	100(12,800)	1:45	02:00	02:00	02:00	03:15	05:30
	300(38,400)	1:45	01:45	01:45	02:00	02:30	03:00
	511(65,408)	1:45	01:45	01:45	02:00	02:15	02:30
287.6 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	3:15	07:00	19:00	1/10:00	12/03:15	33/10:30
	10(1,280)	3:15	04:00	05:00	07:15	1/09:15	3/03:30
	100(12,800)	3:15	03:45	03:30	04:00	05:45	11:00
	300(38,400)	3:15	03:30	03:45	03:45	04:30	05:45
	511(65,408)	3:15	03:15	03:30	03:30	03:45	04:00
245.7 GB HDD, SATA, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	2/19:00	6/04:00	7/10:30	13/06:30	21/05:15	43/00:00
	10(1,280)	2/19:00	4/19:00	5/07:30	7/10:30	9/13:30	11/22:15
	100(12,800)	2/19:00	3/17:30	4/06:15	6/05:00	7/04:15	9/00:30
	300(38,400)	2/19:00	3/11:00	3/11:00	3/17:30	4/13:30	5/11:15
	511(65,408)	2/19:00	3/07:00	3/08:30	3/11:00	3/13:30	3/17:15
393.5 GB HDD, SATA, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	4/10:30	9/20:30	11/21:30	21/05:30	33/23:00	68/19:00
	10(1,280)	4/10:30	7/15:45	8/12:00	11/21:30	15/07:00	19/02:00
	100(12,800)	4/10:30	5/22:45	6/19:15	9/22:00	11/11:15	14/10:30
	300(38,400)	4/10:30	5/12:45	5/12:45	5/22:45	7/05:15	8/18:00
	511(65,408)	4/10:30	5/05:15	5/08:30	5/12:30	5/16:45	5/22:45

Note 1:
Since the execution time of collection copy depends on the measurement conditions, the above values may increase or decrease.

Note 2:
The host I/O performance deteriorates while the disk drive is restoring.
FC drive: 160 to 260 IOPS, SATA drive: 110 to 125 IOPS

Note 3:
The interleave time and the operation when the amount of the data restoration is the default value are shown in the shaded area.

Table 9.2.3 Execution time of collection copy in the interleave mode (standard) with I/O provided (for 0720)

(day/hour: Minute)

Drive recovery mode: Interleave (standard)		Interval setting value (in ms in parenthesis)					
Drive configuration							
71.3 GB HDD, FC, RAID 5, 4D+1P		0(0)	1(10)	5(50)	10(100)	100(1,000)	255(2,550)
Setting value of data recovery amount (Block counts in parenthesis)	1(128)	1:00	2:00	4:30	9:45	3/02:00	10/04:15
	10(1,280)	1:00	1:30	1:45	2:00	9:00	21:00

Document Revision Level

Revision	Date	Description
Revision 1	Feb. 2004	First Release
Revision 2	Mar. 2004	Addition of checklist Addition of cautions and restrictions
Revision 3	May. 2004	Addition of checklist Addition of cautions and restrictions

Revision 4	Sep. 2004	Addition of checklist Addition of preparation Addition of cautions and restrictions
Revision 5	Jan. 2005	Addition of checklist Addition of system configuration Addition of step1 and step3 of operations for the micro program replacement
Revision 6	Apr. 2005	Addition of DF700.
Revision 7	Jan. 2006	Addition of DF700H.
Revision 8	Feb. 2006	Addition of TrueCopy Extended Distance
Revision 9	Mar. 2006	Change of the procedure in case of HDLM. Addition of cautions and restrictions
Revision 10	June. 2006	Change of the procedure in case of FC.
Revision 11	Sep. 2006	Supersedes and replaces Revision 10.
Revision 12	Dec. 2006	Supersedes and replaces Revision 11.

Preface

"**Online** Micro Program Replacement" requires the path failover on the all servers that are connected with DF700/DF600/DF500. However, there are too many systems that are not configured with having this behavior. Therefore, RSD always recommends the using the "**Offline** Micro Program Replacement".

In the other hand, the systems that are very difficult to stop are increasing. In such case, system should have the conditions described in this guideline.

1 Overview

This data describes the procedure for replacing the microprogram at the time of the Fibre Channel (FC) configuration.

When you replace the micro program, all applications cannot access to the controller that the micro program is to be replaced. (The micro program replacement takes place by rebooting the both controllers one by one.) To perform the micro program replacement, always follow the checklist shown below and read the cautions.

The micro program replacement needs to check the status of paths and applications, so perform the operations according to your customer's schedule. And since the all accesses from servers may be concentrated on one controller during the replacement, it is recommended that the operations should be performed during a time period when the I/O loads are light.

If the DF700, DF600 and DF500 meet the specific conditions (refer to "2 Checklist"), you will be able to perform the "Online Micro Program Replacement".

The Interface Board can be installed in the following configuration in the DF700.

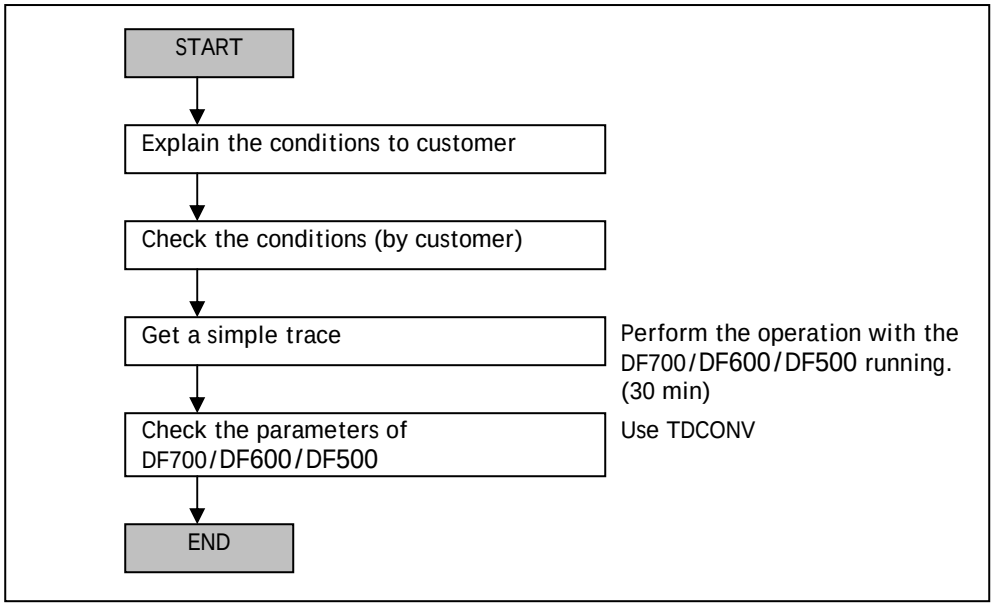
Installation case	Installation position		
	Interface Board #0	Interface Board #1	
1	FC Interface Board	Not installed	← **Target configuration of this data**
2	Not installed	NAS Interface Board	
3	iSCSI Interface Board	Not installed	
4	FC Interface Board	FC Interface Board	← **Target configuration of this data**
5	FC Interface Board	NAS Interface Board	
6	iSCSI Interface Board	FC Interface Board	
7	iSCSI Interface Board	NAS Interface Board	

2 Checklist

If "No" is checked in the checklist, replacement with the servers suspended is required.

Table 1 Checklist for Online Micro Program Replacement

No	Contents	Yes / No
1	Does the DF700/DF600/DF500 have the dual controller configuration?	
2	Is the customer using the path switching software? (Please refer to "Table 2, Tested Path Switching Software" in the detail.)	



No	Contents	Yes / No
3	Is the controller of a main path to LUs separated from the controller of an alternative path?	
4	Is an alternative path set to all LUs?	
5	Are the host side parameters that are described in this document set correctly?	
6	Are the DF700/DF600/DF500 parameters that are described in the User's Guide of DF700/DF600/DF500 set correctly? (Before the replacement, please get a simple trace to check.)	
7	Is it possible to stop the changing of pair status of ShadowImage, SnapShot, QuickShadow or TrueCopy or Hi-Copy during the micro program replacement? (Customer cannot execute "paircreate" and "pairresync" commands.)	
8	Is it possible to change the pair status of TrueCopy Extended Distance from "PAIR" and "COPY" to "PSUS" during the microprogram replacement?	
9	Is it possible to try not to execute the migration with Modular Volume Migration during the microprogram replacement?	
10	If the customer uses the cluster software "MC/SG", is the lock disk stored in the disk other than the DF700/DF600/DF500?	
11	Is the boot disk stored in the disk other than the DF700/DF600/DF500? Is the redundancy condition of the boot path described on the System Construction Guide of BladeSymphony satisfied when it is connected to BladeSymphony?	
12	The I/O errors may be logged in a log file during the micro program replacement, though the data accesses continue on an alternative path. Can the system ignore such the errors?	
13	The completion of I/O processing may take approximately 60 seconds during the micro program replacement. Can the customer's system wait for this time?	
14	Is it possible to stop Format? (The microprogram replacement during the LU format and the LU format during the microprogram replacement cannot be executed.)	
15	Is ShadowImage in-system replication/ShadowImage I/O Switch Mode disabled?	
16	Can other applications (HITRACK, HiCommand, other DAMP/SNM) which perform the LAN access to the SANRISE be stopped during the microprogram replacement?	

3 Flowchart

First step;

Please discuss with customers whether the conditions of this guideline meet with the customer's system or not. And get a simple trace to check the parameters of DF700/DF600/DF500.

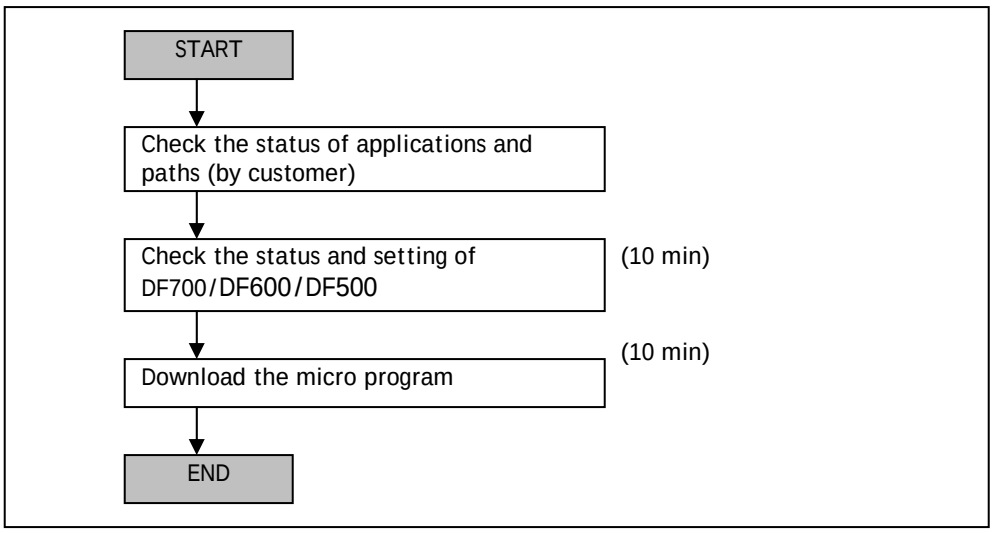


Figure 1 Flowchart of checking the conditions

Second step;

Please check the status of applications, paths, switches and DF700/DF600/DF500 before replace the micro program.

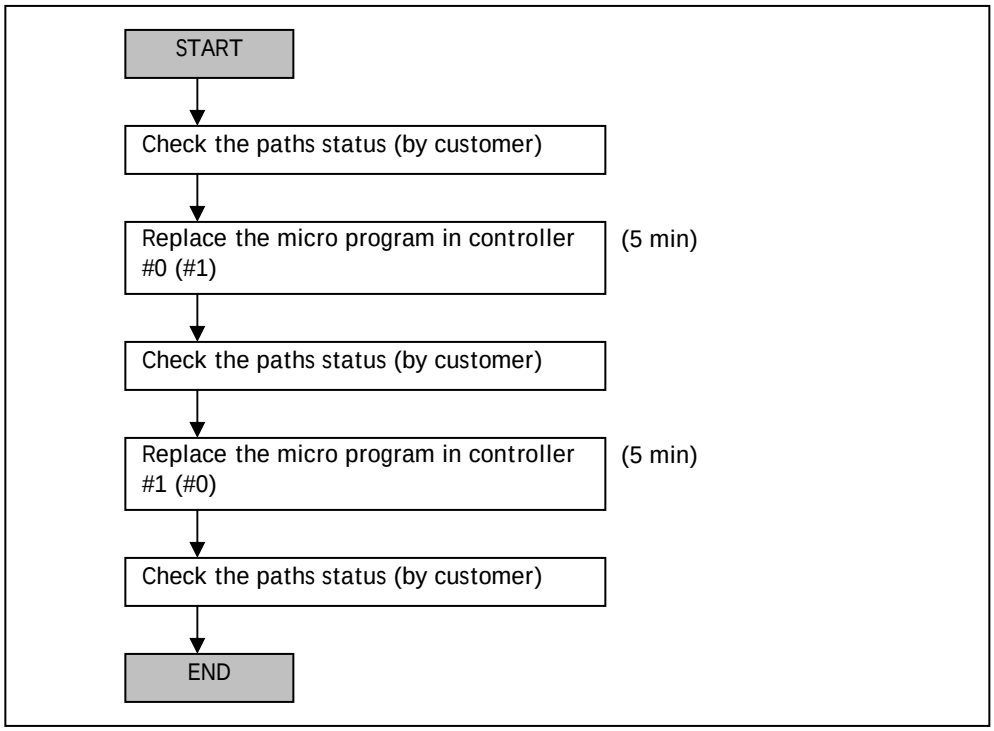

Figure 2 Flowchart of preparation of replacement

Third step;

Perform the replace the micro program.

Figure 3 Flowchart of replace the micro program

4 System Configuration

If the system is configured as shown below, online micro program replacement is possible.

Figure 4 Figure of Configuration

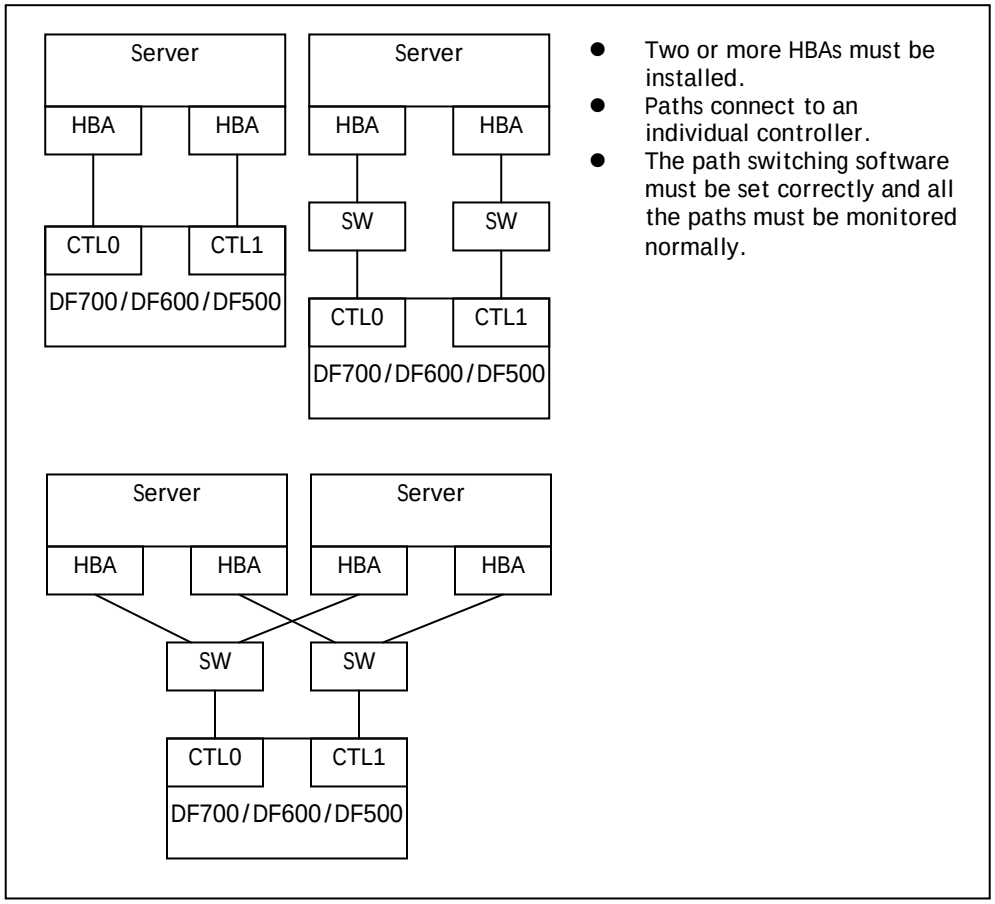

Table 2 Tested path switching software

No	OS, Version	DF700	DF600	DF500 (Fibre)
1	HP-UX 11i, 11.0, 10.20	PVLink	PVLink, HDLM *1	PVLink, HDLM *1
2	Solaris 9, 8, 7, 2.6	VxVM-DMP, HDLM	VxVM-DMP, HDLM	VxVM-DMP, HDLM, HPM
3	AIX 5.2, 5.1, 4.3.3	HDLM	HDLM	HDLM, HPM *2
4	Windows 2K3, 2K, NT4.0	HDLM	HDLM	HDLM, HPM *3
5	Red Hat Advanced Server 2.1, Red Hat Enterprise Linux 3.0, AS 2.1, AS3(IA32), ES3(IA32), AS3(IPF)	VxVM-DMP, HDLM	VxVM-DMP, HDLM	VxVM-DMP, HDLM
6	9900V	Alternative path	Alternative path	

Note: This document uses the abbreviation "HDLM" to represent the "HiCommand Dynamic Link Manager", and "HPM" to represent the "Hitachi Path Manager".

*1: HDLM can be used on HP-UX 11i and 11.0 only.

*2: HPM can be used on AIX 5.1 and 4.3.3 only.

*3: HPM can be used on Windows 2K (or with SP1/2) and NT4.0 (with SP3/4/5/6a) only.

Table 3 Software Parameters

No	Software	Parameter	Default	Setting
1	PVLink	IO Timeout *1	default (=30sec)	60sec
2		Auto Switch	On	On
3	VxVM-DMP	Please check the VxVM's manual.		
4	HDLM	Please check the HDLM's manual.		
5	HPM	Please check the HPM's manual.		

Table 4 HBA Parameters

No	HBA	Parameter	Default	Setting
1	JNI FCE-1063	FcPortCfgEnable	0	1
	JNI FCE-6410	FailoverDelay	0	30
2	JNI FC64-1063 JNI FCI-1063 JNI FCE-1473 JNI FCE-6460 JNI FCC-6460 JNI FCX-6562	FailoverDelay	0	30

Note: In regard to the other HBAs, no parameter is required to be changed.

In regard to the system parameters of DF700/DF600/DF500, please refer to the User's Guide of DF700, DF600 and DF500.

5 Cautions and Restrictions

Always follow the cautions and restrictions shown in this document and the path switching software manual.

Table 5 Cautions and Restrictions

No	Contents
1	The path switching software must run normally on all the servers connected to the DF700/DF600/DF500, and all paths to the LUs are to be duplicated by the path switching software. If there are any LUs whose path is not duplicated, replace the micro program after dismounting it beforehand.
2	All the paths must be normal. If a failure is found on the path, replace the micro program after recovering the failure.
3	Replace the micro program on the controller #0, and then replace the micro program on the controller #1. The reverse order of the replacement is possible.
4	If customer is using WinNT and HPM, the number of partitions per LU is within 30.
5	When HDD blockade is occurred, the HDD data recovery may fail by the replacement. In such case, please stop the replacement and recover the HDD failure first. Please refer to the DF600-EN-040116-2.
6	When Path Blockade is occurred in TrueCopy Basic/TrueCopy remote replication/TrueCopy Extended Distance while replacing micro program on replacing AMS1000, please recover the Path Blockade first, after stopping the replacement.
7	Down grade to the micro program version “055G/L” or prior of DF500 and “0653/A” or prior of DF600 is not supported.
8	When the customer is using the function that is not supported by the old micro program, the function must be disabled before down grade to the old micro program.
9	The up/down grade of micro program should not be executed while CCI command “paircreate” and “pairresync” is running.
10	The CCI command “paircreate” and “pairresync” cannot be executed during the up/down grade of micro program.
11	When the pair status of TrueCopy Extended Distance is “PAIR” or “COPY”, do not perform the microprogram replacement.
12	Do not perform the microprogram replacement when the migration is being executed with Modular Volume Migration.
13	In case of online micro program replacement to "055H/C" or prior for DF500, controller failure with a check code error may occurs. Please refer to DF500-EN-0225-3.
14	The migration of Modular Volume Migration cannot be executed during the microprogram replacement.
15	Format cannot be executed during the up/down grade of micro program.
16	The up/down grade of micro program should not be executed when ShadowImage I/O Switch Mode is enabled and the pair status is PSUE(S-VOL Switch).
17	In case of DF600H/DF600HE, when downgrade to 1657/X or prior and more than 16 drives are set, please release spare drives to less than 15 drives in reverse sequence of the order the spare drives were set. If the order in which they were set is unknown, release all spare drives before performing the download.

No	Contents
18	When copy function (ShadowImage, QuickShadow or TrueCopy Basic or Hi-Copy) is installed, upgrade to the version x658 or later and x659 may fail. Please upgrade to the version x659/A or later.
19	When Power Saving of the priced option is used, if you perform the replace the micro program on the controller after executing the spin-down and before completing it, the spin-down may fail because of the recognition processing of the host immediately after the microprogram replacement is completed. Check that there is no RAID Group whose power saving status is "Normal (command monitoring)" after executing the spin-down, and then replace the micro program on the controller. If the spin-down fails, execute the spin-down again.

Table 6 Downgrade Restrictions for each Function

No	Function	Restrictions Condition	Restrictions Version
1	OPEN LDEV Guard	When OPEN LDEV Guard P.P. is enabled and access attribute is set.	"X655/X" or prior of DF600
2	Hi-Speed Sequential Write Mode	When Hi-Speed Sequential Write Mode is enabled.	"X656/X" or prior of DF600
3	Specifying Random Simple Buffer Size 0%	When Specifying Random Simple Buffer Size 0% is enabled.	"X656/X" or prior of DF600
4	RKAAT	When RKAAT is connected.	"X657/X" or prior of DF600
5	ShadowImage I/O Switch Mode	When ShadowImage I/O Switch Mode is enabled.	"X657/X" or prior of DF600
6	Concurrent use of QuickShadow and FlashAccess	When QuickShadow and FlashAccess are used concurrently.	"X657/X" or prior of DF600
7	Spare drive	When Spare drives are set more than 16 drives.	"1657/X" or prior of DF600

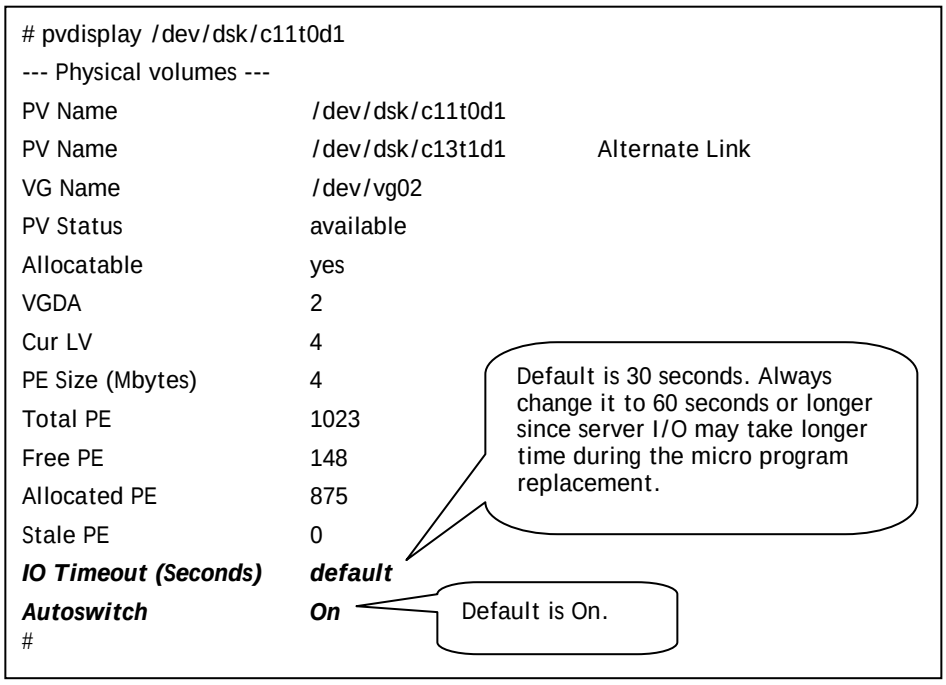
6 Operations for Micro Program Replacement

To replace the micro program, follow the operations below.

This document uses the abbreviation "DAMP" to represent the "Disk Array Management Program" for DF600/DF500. Note that the version of DAMP to be used is 7.50 or later.

This document uses the abbreviation "SNM" to represent the "Storage Navigator Modular" for DF700.

6.1 Preparation



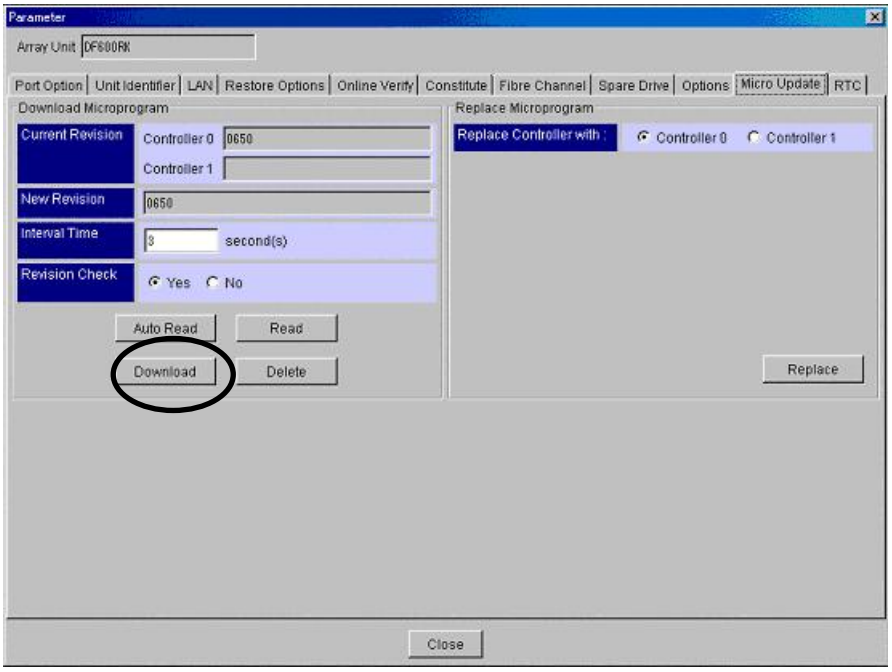
Following procedures should be done before micro program replacement.

Table 7 Checklist for Preparation of Micro Program Replacement

No	Contents	Check
1	The parameters for DF700/DF600/DF500 are set correctly.	
2	The parameters for OS, HBA and path switching software are set correctly.	
3	The alarm light on the DF700/DF600/DF500 does not light up. And the servers and switches do not have any errors.	
4	In the case of the direct connection, the ports on the DF700/DF600/DF500 are linked up with the system.	
5	Check that the READY LED on the SANRISE lights up. When it is blinking at high speed, wait for the maximum of 15 to 30 minutes for the SANRISE 9500V and the maximum of 30 to 85 minutes for the SANRISE AMS/WMS.	
6	In the case of switch connection, the ports on the switches are linked up.	
7	The CCI command “paircreate” or “pairresync” is not running.	
8	Check that the pair status of TrueCopy Extended Distance was changed to “PSUS”.	
9	Check that the migration of Modular Volume Migration is not being executed.	
10	When Power Saving of the priced option is used, check that there is no RAID Group whose power saving status is “Normal (command monitoring)” (spin-down is not being executed).	
11	During the online micro program replacement, please stop the other programs (HITRACK, HiCommand, other DAMP/SNM) that may issue a command to the subsystem through the LAN, or remove the LAN cable to disconnect from such programs.	
12	To change the PVLink parameters “IO Timeout” and “AutoSwitch”, perform the following operations. Refer to the following procedures for the detail.	
13	Connect the DAMP/SNM and download the micro program to be replaced. Refer to the following procedures for the detail.	

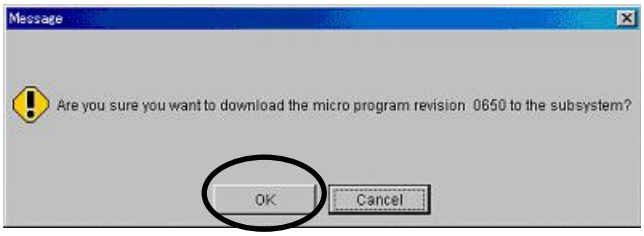
[Operations of changing the PVLink parameters]

(1) Login as a user having the root authorization in HP-UX, and execute "vgdisplay /dev/dsk/c?t?d?" command.



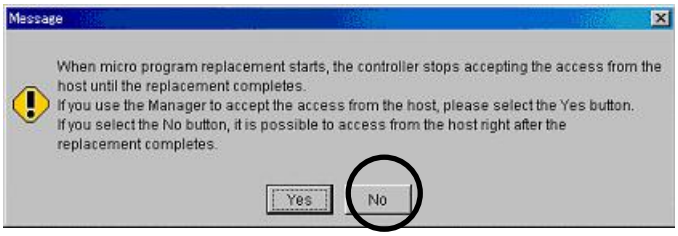
(2) Execute "pvchange –t 60 /dev/dsk/c?t?d?" command to change the "IO Timeout" parameter, and execute "vgdisplay ./dev/dsk/c?t?d?" command to check the result.

(3) When "Off" is specified for "AutoSwitch" parameter, execute "pvchange –S y "dev/dsk/c?t?d?" command, and check the result.

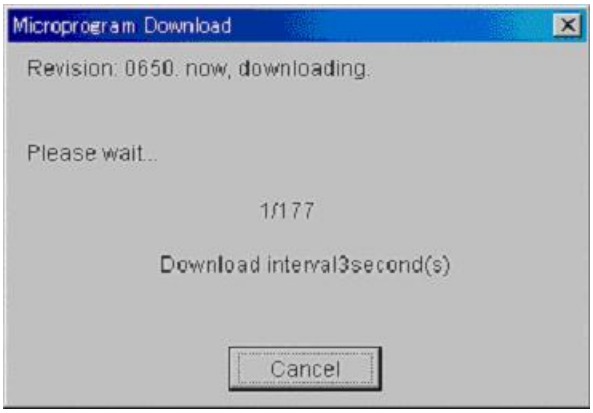


[Operations of download the micro program]

(1) Click the “Download” button on the “Micro Update” window of DAMP/SNM.



Note: This operation only downloads the microprogram in the SANRISE subsystem, and the replacement (upgrade/downgrade) is executed in "Step 2:" in Chapter 6.2.



(2) Click the “OK” button.

(3) If the version of micro program for the DF600 is x6x3/F or later and that for the DF500 is x5xH or later, the following window is displayed. Click the “**No**” button.

(4) A downloading message is displayed. Wait for a while.

(5) When the download is completed, the following window is displayed. Click the "OK" button.

6.2 Operations for the Micro Program Replacement

The procedure of micro program replacement is performed as following.

Step1: (server side)

Check the status of paths to the LUs. If multiple OS are connected, perform the operations on all the servers connected to DF700/DF600/DF500 that the micro program is to be replaced.

(1) In the case of PVLink on HP-UX

Login as a user having the root authorization, and execute "vgdisplay –v vg??" command.

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0
  --- Logical volumes ---
  LV Name                   /dev/vg02/lvol1
  LV Status                 available/syncd
  LV Size (Mbytes)          1000
  Current LE                250
  Allocated PE              250
  Used PV                   1
  --- Physical volumes ---
  PV Name                   /dev/dsk/c83t0d0
  PV Name                   /dev/dsk/c24t0d0 Alternate Link
  PV Status                 available
  Total PE                  511
  Free PE                   11
  Autoswitch                On
```

Check that two or more "PV Name" of "Physical volumes" are displayed and at least one path is displayed as "Alternate Link". If any path has a failure, suspend the micro program replacement and recover the failure. Also, recode the PVName of the active path.

(2) In the case of HDLM on HP-UX

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off
Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Login as a user having the root authorization, and execute “dlnkmgr view -path” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort Status   Type .....
000000   .....           HITACHI DF600F    0A      Online   Own
000001   .....           HITACHI DF600F    1A      Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where micro program replacement is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where micro program replacement is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where micro program replacement is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where micro program replacement is only 0A.

ExampleA-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···    ChaPort    Status          Type    IO-Count ···
000000    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own     10

000004    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own     10
000005    ···       HITACHI .DF600F….0051     1A      Online          Non     1
 :          :          :                      :        :              :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid    000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000004
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···    ChaPort    Status          Type    IO-Count ···
000000    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own     10
000001    ···       HITACHI .DF600F….0051     1A      Online          Non     1
000002    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own     10
000003    ···       HITACHI .DF600F….0051     1A      Online          Non     1
000004    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own     10
000005    ···       HITACHI .DF600F….0051     1A      Online          Non     1
 :          :          :                      :        :              :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where micro program replacement is only 1A.

ExampleB-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···      ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF600F....0051   0A       Online          Own    10

000003    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000004    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000005    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
 :          :          :                       :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid    000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···      ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000001    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000002    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000003    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000004    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000005    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
 :          :          :                       :        :               :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the SANRISE side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the SANRISE side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of "[Operations of download the micro program]" in 6.1 again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

```
# diff path01.txt path02.txt
2c2
< Reduced      33        0
---
> Reduced     265        0
```

(3) In the case of VxVM-DMP on Solaris

Log into Solaris with the user who has the root authority, and check that all the paths are in the enable status using the command of VxVM.
The commands to operate differ in the cases where the version of VxVM is 3.2 or later and where it is before 3.2.

(a) When the version of VxVM is 3.2 or later, check the CTLR-NAME connecting the SANRISE by the command [vxdmpadm listctlr all]. Furthermore, execute the command [vxdmpadm getsubpaths ctlr=cx] for each CTLR-NAME (cx is CTLR-NAME).

```
# vxdmpadm listctlr all
CTLR-NAME       ENCLR-TYPE      STATE           ENCLR-NAME
=================================================
c1              Disk            ENABLED         Disk
c2              AMS_WMS         ENABLED         AMS_WMS0
c3              AMS_WMS         ENABLED         AMS_WMS0

# vxdmpadm getsubpaths ctlr=c2
NAME      STATE[A]     PATH-TYPE[M] DMPNODENAME ENCLR-TYPE ENCLR-NAME ATTRS
=============================================================================
c2t0d0s2  ENABLED      SECONDARY    c2t0d0s2    AMS_WMS    AMS_WMS0    -
c2t0d1s2  ENABLED(A)   PRIMARY      c2t0d1s2    AMS_WMS    AMS_WMS0    -
c2t0d2s2  ENABLED      SECONDARY    c2t0d2s2    AMS_WMS    AMS_WMS0    -
c2t0d3s2  ENABLED(A)   PRIMARY      c2t0d3s2    AMS_WMS    AMS_WMS0    -
c2t0d4s2  ENABLED      SECONDARY    c2t0d4s2    AMS_WMS    AMS_WMS0    -
c2t0d5s2  ENABLED(A)   PRIMARY      c2t0d5s2    AMS_WMS    AMS_WMS0    -
c2t0d6s2  ENABLED      SECONDARY    c2t0d6s2    AMS_WMS    AMS_WMS0    -
c2t0d7s2  ENABLED(A)   PRIMARY      c2t0d7s2    AMS_WMS    AMS_WMS0    -

# vxdmpadm getsubpaths ctlr=c3
NAME      STATE[A]     PATH-TYPE[M] DMPNODENAME ENCLR-TYPE ENCLR-NAME ATTRS
=============================================================================
c3t0d0s2  ENABLED(A)   PRIMARY      c2t0d0s2    AMS_WMS    AMS_WMS0    -
c3t0d1s2  ENABLED      SECONDARY    c2t0d1s2    AMS_WMS    AMS_WMS0    -
c3t0d2s2  ENABLED(A)   PRIMARY      c2t0d2s2    AMS_WMS    AMS_WMS0    -
c3t0d3s2  ENABLED      SECONDARY    c2t0d3s2    AMS_WMS    AMS_WMS0    -
c3t0d4s2  ENABLED(A)   PRIMARY      c2t0d4s2    AMS_WMS    AMS_WMS0    -
c3t0d5s2  ENABLED      SECONDARY    c2t0d5s2    AMS_WMS    AMS_WMS0    -
c3t0d6s2  ENABLED(A)   PRIMARY      c2t0d6s2    AMS_WMS    AMS_WMS0    -
c3t0d7s2  ENABLED      SECONDARY    c2t0d7s2    AMS_WMS    AMS_WMS0    -
```

Check that all the paths are displayed as “ENABLED”. If any path has a failure (DISABLED), suspend the micro program replacement and recover the failure.

(b) When the version of VxVM is before 3.2, execute the command [vxdisk list cXtYdZs2] after checking the device by the command [vxdisk list] (cXtYdZs2 is the device file).

```
# vxdisk list
DEVICE          TYPE     DISK          GROUP         STATUS
c1t0d0s2        sliced                                error
c1t0d0s3        simple   c1t0d0s3      rootdg        online
c4t0d0s2        sliced   disk01        DG0           online
c4t0d1s2        sliced   disk01        DG1           online
c4t0d2s2        sliced   disk01        DG2           online

# vxdisk list c4t0d0s2
Device:         c4t0d0s2
devicetag:      c4t0d0
type:           sliced

```

Check that all the paths are displayed as “enabled”. If any path has a failure, suspend the micro program replacement and recover the failure.

(4) In the case of HDLM on Solaris

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName      DskName .....     ChaPort Status  Type .....
000000  .....         HITACHI DF600F    0A      Online  Own
000001  .....         HITACHI DF600F    1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where micro program replacement is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where micro program replacement is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where micro program replacement is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where micro program replacement is only 0A.

ExampleA-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName            DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000001     ···          HITACHI .DF600F….0051      1A      Online          Non      1
000002     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000003     ···          HITACHI .DF600F….0051      1A      Online          Non      1
000004     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000005     ···          HITACHI .DF600F….0051      1A      Online          Non      1
 :          :            :                         :       :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid   000000
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000002
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000004
   :
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID     PathName            DskName ···     ChaPort     Status          Type     IO-Count ···
000000     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000001     ···          HITACHI .DF600F….0051      1A      Online          Non      1
000002     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000003     ···          HITACHI .DF600F….0051      1A      Online          Non      1
000004     ···          HITACHI .DF600F….0051      0A      Offline(C)      Own      10
000005     ···          HITACHI .DF600F….0051      1A      Online          Non      1
 :          :            :                         :       :               :
```

Confirm the value of ‘OnlinePaths’. This value should be decreased by the number of 0A ports. And confirm the status of the 0A Port. This value should be the Offline (C) status.

Example B) Port of the controller 1 where micro program replacement is only 1A.

ExampleB-1) Version 05-00 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000001
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName            DskName ···      ChaPort   Status          Type    IO-Count ···
000000    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000001    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
000002    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000003    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
000004    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000005    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
 :          :           :                        :         :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName            DskName ···      ChaPort   Status          Type    IO-Count ···
000000    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000001    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
000002    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000003    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
000004    ···        HITACHI .DF600F….0051      0A        Online          Own     10
000005    ···        HITACHI .DF600F….0051      1A        Offline(C)      Non     1
 :          :           :                        :         :               :
```

Confirm the value of ‘OnlinePaths’. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the SANRISE side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the SANRISE side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of "[Operations of download the micro program]" in 6.1 again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced       33         0
---
> Reduced      265         0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken      33         0
---
> Shrunken     265         0
```

(5) In the case of HPM on Solaris

Login as a user having the root authorization, and execute “datapath query adapter” command.

```
# /opt/HITdpo/bin/datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State      Mode      Select  Errors  Paths  Active
  0 QLGC,isp@0,1000     NORMALACTIVE 36098   0       8       8
  1 QLGC,isp@1,1000     NORMALACTIVE 38      0       8       8
```

ck that all the paths are connected to the DF500 and the “State” is displayed as “NORMAL” and “Mode” is displayed as “ACTIVE”. If neither “NORMAL” nor “ACTIVE” is displayed, suspend the micro program replacement and recover the failure.

(6) In the case of HDLM on AIX

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /usr/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort  Status   Type .....
000000   .....           HITACHI DF600F    0A       Online   Own
000001   .....           HITACHI DF600F    1A       Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where micro program replacement is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where micro program replacement is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where micro program replacement is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where micro program replacement is only 0A.

ExampleA-1) Version 05-00 or later

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

 :          :            :                          :       :               :
```

ExampleA-2) Version 04-xx or prior

```
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced      334         0

PathID    PathName          DskName ···      ChaPort   Status          Type    IO-Count ···
000000    ···       HITACHI .DF600F....0051   0A        Online          Own     10
000001    ···       HITACHI .DF600F....0051   1A        Offline(C)      Non     1
000002    ···       HITACHI .DF600F....0051   0A        Online          Own     10
000003    ···       HITACHI .DF600F....0051   1A        Offline(C)      Non     1
000004    ···       HITACHI .DF600F....0051   0A        Online          Own     10
000005    ···       HITACHI .DF600F....0051   1A        Offline(C)      Non     1
 :          :          :                :         :          :              :
```

Confirm the value of ‘OnlinePaths’. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /usr/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /usr/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the SANRISE side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the SANRISE side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of "[Operations of download the micro program]" in 6.1 again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced       33         0
---
> Reduced      265         0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken      33         0
---
> Shrunken     265         0
```

(7) In the case of HPM on AIX

Login as a user having the root authorization, and execute “datapath query adapter” command.

```
# /opt/HITdpo/bin/datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State      Mode      Select   Errors   Paths   Active
  0       fscsi0        NORMAL ACTIVE    36098    0        8       8
  1       fscsi1        NORMAL ACTIVE    38       0        8       8
```

Check that all the paths are connected to the DF500 and the “State” is displayed as “NORMAL” and “Mode” is displayed as “ACTIVE”. If neither “NORMAL” nor “ACTIVE” is displayed, suspend the micro program replacement and recover the failure.

(8) In the case of HDLM on Windows

Log into Windows with the user who has the Administrator authority, and execute the command [dlnkmgr view -sys -sfunc] from the command prompt.

```
# dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# dlnkmgr set -afb off
Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Open the command prompt, and execute “dlnkmgr view -path” command.

```
# dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName       DskName .....     ChaPort Status  Type .....
000000  .....          HITACHI DF600F    0A      Online  Own
000001  .....          HITACHI DF600F    1A      Online  Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where micro program replacement is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-00 or later, execute this operation to a port of the controller where micro program replacement is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where micro program replacement is executed.

  /usr/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where micro program replacement is only 0A.

ExampleA-1) Version 05-00 or later

```
# dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 3 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName            DskName ···   ChaPort   Status          Type   IO-Count ···
000000    ···       HITACHI .DF600F….0051     0A      Offline(C)      Own    10

000002    ···       HITACHI .DF600F….0051      0A       Online        Own    10
000003    ···       HITACHI .DF600F….0051      1A       Offline(C)    Non    1
000004    ···       HITACHI .DF600F….0051      0A       Online        Own    10
000005    ···       HITACHI .DF600F….0051      1A       Offline(C)    Non    1
 :          :            :                      :        :             :
```

ExampleA-2) Version 04-xx or prior

```
# dlnkmgr offline –pathid   000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid   000005
   :
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# dlnkmgr view –path
Paths:000006 OnlinePaths:000003
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName            DskName ···      ChaPort  Status        Type   IO-Count ···
000000    ···       HITACHI .DF600F….0051      0A       Online        Own    10
000001    ···       HITACHI .DF600F….0051      1A       Offline(C)    Non    1
000002    ···       HITACHI .DF600F….0051      0A       Online        Own    10
000003    ···       HITACHI .DF600F….0051      1A       Offline(C)    Non    1
000004    ···       HITACHI .DF600F….0051      0A       Online        Own    10
000005    ···       HITACHI .DF600F….0051      1A       Offline(C)    Non    1
 :          :            :                      :        :             :
```

Confirm the value of 'OnlinePaths'. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd C:\tmp
# mkdir HDLMLOG
# cd HDLMLOG
# dlnkmgr view –path > path01.txt

   waiting for five minutes or more

# dlnkmgr view –path > path02.txt
```

When the contents are matched, perform the next operation in the SANRISE side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the SANRISE side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of "[Operations of download the micro program]" in 6.1 again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

HDLM version is 03-02 or later

```
# diff path01.txt path02.txt
2c2
< Reduced       33        0
---
> Reduced      265        0
```

HDLM version is 03-01 or earlier

```
# diff path01.txt path02.txt
2c2
< Shrunken       33        0
---
> Shrunken      265        0
```

(9) In the case of HPM on Windows

Press the “Start” menu and open “Program” -> “Path Manager” -> “Path Management”, then execute “datapath query adapter” command.

```
C:\Program Files\Hitachi\Path manager> datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State     Mode      Select  Errors  Paths  Active
  0     Scsi Port0 Bus0 NORMAL    ACTIVE    36098   0       8      8
  1     Scsi Port1 Bus0 NORMAL    ACTIVE    38      0       8      8
```

Check that all the paths are connected to the DF500 and the “State” is displayed as “NORMAL” and “Mode” is displayed as “ACTIVE”. If neither “NORMAL” nor “ACTIVE” is displayed, suspend the micro program replacement and recover the failure.

(10)In the case of HDLM on Linux

Login as a user having the root authorization, and execute “dlnkmgr view -sys -sfunc” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

When "Auto Failback :" is enabled (on), execute the command [dlnkmgr set -afb off].

```
# /opt/DynamicLinkManager/bin/dlnkmgr set -afb off

Execute command? [y/n] : y
KAPL01001-I The HDLM command completed normally. Operation name = set
```

Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
KAPL01001-I The HDLM command completed normally. Operation name = view
```

Execute the command [dlnkmgr view -path].

Login as a user having the root authorization, and execute “dlnkmgr view -path” command.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort Status   Type .....
000000   .....           HITACHI DF600F    0A      Online   Own
000001   .....           HITACHI DF600F    1A      Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”. If any path has a failure, suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.

Execute “dlnkmgr offline” command, and change all the paths of the controller where micro program replacement is executed to the offline(C) status. This Operation is different according to the version of HDLM.

- In case of version 05-02 or later, execute this operation to a port of the controller where micro program replacement is executed. Once this operation is executed, all the paths of the targeted port number are changed to the offline(C) status.

  dlnkmgr offline –cha –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command.

- In case of version 04-xx or prior, execute this operation to all the paths of the port of the controller where micro program replacement is executed.

  dlnkmgr offline –pathid <PathID>

  <PathID> Specify the PathID corresponding to the storage subsystem name(DskName) and port number(ChaPort) which is shown by ‘dlnkmgr view –path’ command. Execute the above ‘dlnkmgr offline’ command to all the paths of the targeted port (ChaPort).

Example A) Port of the controller 0 where micro program replacement is only 0A.

ExampleA-1) Version 05-02 or later

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –cha –pathid 00000000
KAPL01055-I All the paths which pass the specified CHA port will be changed to the Offline(C) status.
Is this OK? [y/n]:y
KAPL01056-I If you are sure that there would be no problem when all the paths which pass the specified
CHA port are placed in the Offline(C) status, enter y. Otherwise, enter n. [y/n]:y
KAPL01061-I 8 path(s) were successfully placed Offline(C); 0 path(s) were not. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
```

Execute the 'dlnkmgr view –path' command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000006 OnlinePaths:000003

000003    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000004    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000005    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
 :          :          :                       :        :               :
```

ExampleA-2) Version 04-xx or prior

```
# /opt/DynamicLinkManager/bin/dlnkmgr offline –pathid    000001
Execute command? [y/n] : y
KAPL01022-I 1 path(s) were processed. Operation name = offline
KAPL01001-I The HDLM command completed normally. Operation name = offline
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000003
   :
# /usr/DynamicLinkManager/bin/dlnkmgr offline –pathid    000005
   :
```

Execute the ‘dlnkmgr view –path’ command to confirm the offline(C) status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000016 OnlinePaths:000008
PathStatus   IO-Counts   IO-Errors
Reduced     334         0

PathID    PathName          DskName ···      ChaPort  Status          Type   IO-Count ···
000000    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000001    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000002    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000003    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
000004    ···       HITACHI .DF600F....0051   0A       Online          Own    10
000005    ···       HITACHI .DF600F....0051   1A       Offline(C)      Non    1
 :          :          :                       :        :               :
```

Confirm the value of ‘OnlinePaths’. This value should be decreased by the number of 1A ports. And confirm the status of the 1A Port. This value should be the Offline (C) status.

Output dlnkmgr view -path to the file after the Office(C) operation.
Compare the contents by outputting dlnkmgr view -path to the file again after waiting for five minutes or more to check the path determination.

```
# cd /tmp
# mkdir HDLMLOG
# cd HDLMLOG
# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path01.txt

   waiting for five minutes or more

# /opt/DynamicLinkManager/bin/dlnkmgr view –path | grep -v “Online” > path02.txt
# diff path01.txt path02.txt
```

When the contents are matched, perform the next operation in the SANRISE side(Note 1).
When the contents are mismatched, perform the following according to the mismatched contents.

(a) When IO-Counts displayed in dlnkmgr view -path are mismatched
Output dlnkmgr view -path to the file after waiting for further five minutes or more, and compare it with the previous output content.
If they are matched, perform the operation in the SANRISE side.
If they are mismatched, perform the operation of (a) again.

(b) When Offline(E) is displayed in dlnkmgr view -path.
Operate the procedure of "[Operations of download the micro program]" in 6.1 again with the path which is Offline(E).

Note 1: The following difference may occur in the comparison (diff) of the dlnkmgr view -path results. There is no problem because this is the one that the I/O count value increased as the I/O flowed to the Online path after offline(C).

```
# diff path01.txt path02.txt
2c2
< Reduced      33        0
---
> Reduced     265        0
```

(11)In the case of VxVM-DMP on Linux

Log into Linux with the user who has the root authority, and check CTLR-NAME connectin ghe SANRISE by the command [vxdmpadm listctlr all]. Furthermore, execute the command [xvdmpadm getsubpaths ctlr=cx] for each CTLR-NAME (cx is CTLR-NAME).

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
# vxdmpadm listctlr all
CTLR-NAME          ENCLR-TYPE          STATE     ENCLR-NAME

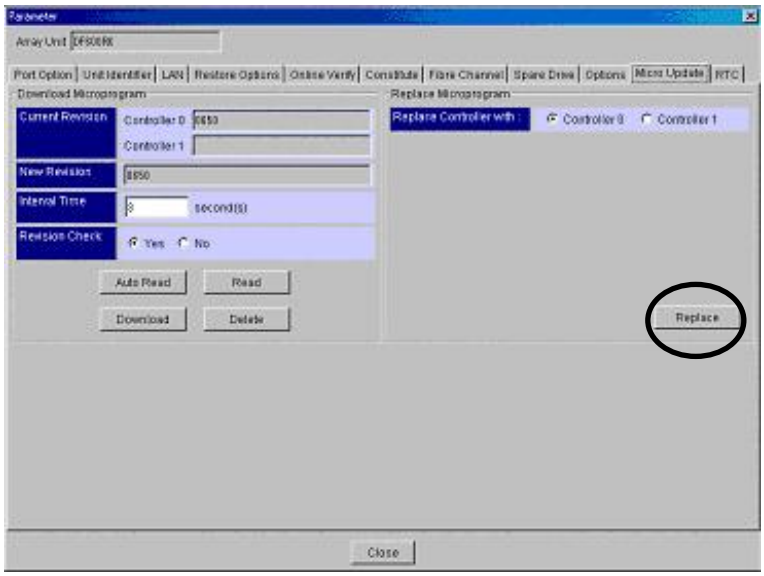
```

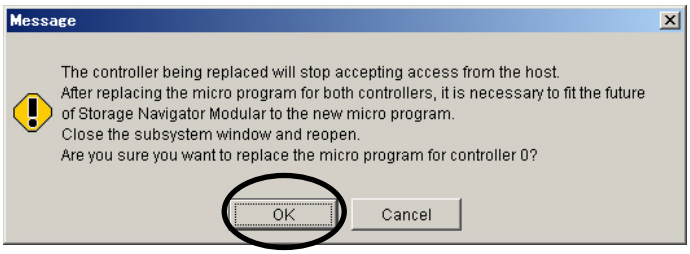
Check that all the paths are displayed as “ENABLED”. If any path has a failure (DISABLED), suspend the micro program replacement and recover the failure.

Note: The microprogram replacement by pulling out the FC cables cannot be performed.



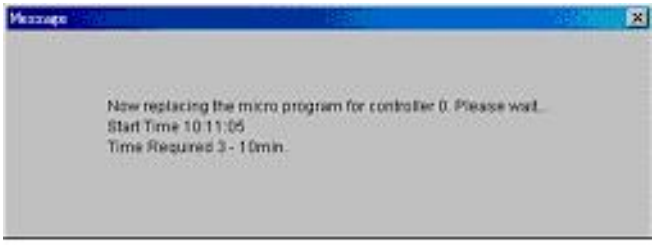
(12)In the case of 9900V

Maintain paths from 9900V to DF700/DF600, if it is necessary.



Please maintain paths with 9900V maintenance member.

Step2:

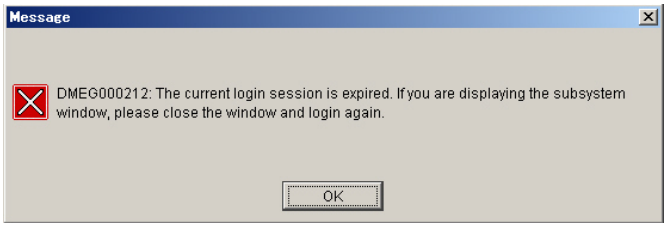


Select a controller unit to replace the micro program on the "Micro Update" window of DAMP/SNM and then click the "Replace" button.

Click the "OK" button.

The following window is displayed and the micro program is updated.

[For DF500]



When the micro program update is completed, following message is displayed on the DAMP. Click the "OK" button.

Note: If the operations for changing the system configuration (for example, LU creation, format, LU owner right change) were done before Online Micro Program Replacement, "I140xy (or I140HH) system copy started (Unit-x, HDU-y)" message on the information message of WEB may be displayed multiple times. However, there is no problem.

Note: When making the access from the host accepted by the instruction from Storage Navigator Modular, the following message may be displayed if it is not operated for 20 minutes or more in the case where Account Authentication is valid, and it may not be completed normally. Perform the dummy replacement (To remove the part concerned once, and then to reinstall it after waiting for 20 seconds or more) of the Control Unit whose microprogram was replaced to make the access from the host accepted.
If the access from the host is made accepted when the replacement of the microprogram is completed, the dummy replacement is unnecessary.

Step3: (server side)

Check the status of paths to the LUs. If multiple OS are connected, perform the operations on all the servers connected to DF700/DF600/DF500 that the micro program is to be replaced.

(1) In the case of PVLink on HP-UX

Execute "vgdisplay –v vg??" command, and check that all the active paths returned to the initial status.

```
# vgdisplay –v vg02
--- Volume groups ---
VG Name                     /dev/vg02
VG Write Access             read/write
VG Status                   available
Max LV                      255
Cur LV                      4
Open LV                     4
Max PV                      16
Cur PV                      1
Act PV                      1
Max PE per PV               1016
VGDA                        2
PE Size (Mbytes)            4
Total PE                    511
Alloc PE                    500
Free PE                     11
Total PVG                   0
Total Spare PVs             0
Total Spare PVs in use      0
   --- Logical volumes ---
   LV Name                  /dev/vg02/lvol1
   LV Status                available/syncd
   LV Size (Mbytes)         1000
   Current LE               250
   Allocated PE             250
   Used PV                  1
   --- Physical volumes ---
   PV Name                  /dev/dsk/c83t0d0
   PV Name                  /dev/dsk/c24t0d0 Alternate Link
   PV Status                available
   Total PE                 511
   Free PE                  11
   Autoswitch               On
```

If the path is not returned to the initial status, execute the "vgdisplay –v vg??" command every 30 seconds and check.

(2) In the case of HDLM on HP-UX

Execute the “dlnkmgr online” command and change the offline path to the online status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the “dlnkmgr view -path” command

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID   PathName        DskName .....     ChaPort Status   Type .....
000000   .....           HITACHI DF600F    0A      Online   Own
000001   .....           HITACHI DF600F    1A      Online   Non
```

Check that the values of “Paths:” and “OnlinePaths:” are the same. Then, check that all paths are “Online”.

(3) In the case of VxVM-DMP on Solaris

The commands to operate differ in the cases where the version of VxVM is 3.2 or later and where it is before 3.2.

(a) When the version of VxVM is 3.2 or later, execute the command [vxdmpadm listctlr all] and the command [vxdmpadm getsubpaths ctlr=cx], and check the path status (cx is CTLR-NAME).

```
# vxdmpadm listctlr all
CTLR-NAME       ENCLR-TYPE      STATE           ENCLR-NAME
=============================================================
c1              Disk            ENABLED         Disk
c2              AMS_WMS         ENABLED         AMS_WMS0
c3              AMS_WMS         ENABLED         AMS_WMS0

# vxdmpadm getsubpaths ctlr=c2
NAME    STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE   ENCLR-NAME  ATTRS
=============================================================================
c2t0d0s2 ENABLED(A)   SECONDARY     c2t0d0s2      AMS_WMS      AMS_WMS0    -
c2t0d1s2 ENABLED(A)   PRIMARY       c2t0d1s2      AMS_WMS      AMS_WMS0    -
c2t0d2s2 ENABLED(A)   SECONDARY     c2t0d2s2      AMS_WMS      AMS_WMS0    -
c2t0d3s2 ENABLED(A)   PRIMARY       c2t0d3s2      AMS_WMS      AMS_WMS0    -
c2t0d4s2 ENABLED      SECONDARY     c2t0d4s2      AMS_WMS      AMS_WMS0    -
c2t0d5s2 ENABLED(A)   PRIMARY       c2t0d5s2      AMS_WMS      AMS_WMS0    -
c2t0d6s2 ENABLED      SECONDARY     c2t0d6s2      AMS_WMS      AMS_WMS0    -
c2t0d7s2 ENABLED(A)   PRIMARY       c2t0d7s2      AMS_WMS      AMS_WMS0    -

# vxdmpadm getsubpaths ctlr=c3
NAME    STATE[A]      PATH-TYPE[M]  DMPNODENAME   ENCLR-TYPE   ENCLR-NAME  ATTRS
=============================================================================
c3t0d0s2 DISABLED     PRIMARY       c2t0d0s2      AMS_WMS      AMS_WMS0    -
c3t0d1s2 ENABLED      SECONDARY     c2t0d1s2      AMS_WMS      AMS_WMS0    -
c3t0d2s2 DISABLED     PRIMARY       c2t0d2s2      AMS_WMS      AMS_WMS0    -
c3t0d3s2 ENABLED      SECONDARY     c2t0d3s2      AMS_WMS      AMS_WMS0    -
c3t0d4s2 ENABLED(A)   PRIMARY       c2t0d4s2      AMS_WMS      AMS_WMS0    -
c3t0d5s2 ENABLED      SECONDARY     c2t0d5s2      AMS_WMS      AMS_WMS0    -
c3t0d6s2 ENABLED(A)   PRIMARY       c2t0d6s2      AMS_WMS      AMS_WMS0    -
c3t0d7s2 ENABLED      SECONDARY     c2t0d7s2      AMS_WMS      AMS_WMS0    -
```

When DISABLED is included in the path status displayed by the command [vxdmpadmgetsubpaths ctlr=cx], execute the command [vxdmpadm enable ctlr=cx] for the CTLR-NAME (c3 in the above case), and change the path into the enable status. After that, execute the command [vxdmpadm getsubpaths ctlr=cx], and check that all the path statuses are returned to ENABLED (cx is CTLR-NAME).

```
# vxdmpadm enable ctlr=c3

# vxdmpadm getsubpaths ctlr=c2
NAME      STATE[A]      PATH-TYPE[M] DMPNODENAME   ENCLR-TYPE   ENCLR-NAME  ATTRS
================================================================================
c2t0d0s2  ENABLED       SECONDARY    c2t0d0s2      AMS_WMS      AMS_WMS0    -
c2t0d1s2  ENABLED(A)    PRIMARY      c2t0d1s2      AMS_WMS      AMS_WMS0    -
c2t0d2s2  ENABLED       SECONDARY    c2t0d2s2      AMS_WMS      AMS_WMS0    -
c2t0d3s2  ENABLED(A)    PRIMARY      c2t0d3s2      AMS_WMS      AMS_WMS0    -
c2t0d4s2  ENABLED       SECONDARY    c2t0d4s2      AMS_WMS      AMS_WMS0    -
c2t0d5s2  ENABLED(A)    PRIMARY      c2t0d5s2      AMS_WMS      AMS_WMS0    -
c2t0d6s2  ENABLED       SECONDARY    c2t0d6s2      AMS_WMS      AMS_WMS0    -
c2t0d7s2  ENABLED(A)    PRIMARY      c2t0d7s2      AMS_WMS      AMS_WMS0    -

# vxdmpadm getsubpaths ctlr=c3
NAME      STATE[A]      PATH-TYPE[M] DMPNODENAME   ENCLR-TYPE   ENCLR-NAME  ATTRS
================================================================================
c3t0d0s2  ENABLED(A)    PRIMARY      c2t0d0s2      AMS_WMS      AMS_WMS0    -
c3t0d1s2  ENABLED       SECONDARY    c2t0d1s2      AMS_WMS      AMS_WMS0    -
c3t0d2s2  ENABLED(A)    PRIMARY      c2t0d2s2      AMS_WMS      AMS_WMS0    -
c3t0d3s2  ENABLED       SECONDARY    c2t0d3s2      AMS_WMS      AMS_WMS0    -
c3t0d4s2  ENABLED(A)    PRIMARY      c2t0d4s2      AMS_WMS      AMS_WMS0    -
c3t0d5s2  ENABLED       SECONDARY    c2t0d5s2      AMS_WMS      AMS_WMS0    -
c3t0d6s2  ENABLED(A)    PRIMARY      c2t0d6s2      AMS_WMS      AMS_WMS0    -
c3t0d7s2  ENABLED       SECONDARY    c2t0d7s2      AMS_WMS      AMS_WMS0    -
```

(b) When the version of VxVM is before 3.2, execute the command [vxdisk list cXtYdZs2], and check that all the paths are returned to the owner Control Unit.

```
# vxdisk list c4t0d0s2
Device:         c4t0d0s2
devicetag:      c4t0d0
type:           sliced
hostid:

```

The following message is displayed in the console window when the path returns.

```
vxdmp: [ID 916426 kern.notice] NOTICE:
vxvm:vxdmp: enabled controller
/sbus@a,0/fcr@2,400000 connected to disk array ???
```

(4) In the case of HDLM on Solaris

Execute the "dlnkmgr online" command and change the offline path to the online status.

```
# /opt/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the "dlnkmgr view -path" command

```
# /opt/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName        DskName .....   ChaPort Status  Type .....
000000  .....           HITACHI DF600F  0A      Online  Own
000001  .....           HITACHI DF600F  1A      Online  Non
```

Check that the values of "Paths:" and "OnlinePaths:" are the same. Then, check that all paths are "Online".

(5) In the case of HPM on Solaris

Execute "datapath query adapter" command.

```
# /opt/HITdpo/bin/datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State     Mode    Select  Errors  Paths   Active
  0 QLGC,isp@0,1000     DEGRAD    ACTIVE  36098   0       8       8
  1 QLGC,isp@1,1000     NORMAL    ACTIVE  38      0       8       8
```

Since the server cannot complete the I/O issued to the controller replacing the micro program, the status of the path may change to "DEGRAD" or "FAILED" from "NORMAL". If you want to switch this status to "NORMAL", use the "datapath set adapter ? online" command. (? = adapter number)

```
# /opt/HITdpo/bin/datapath set adapter 0 online
```

After execution of this command, execute "datapath query adapter" command to check that the "State" of the path is "NORMAL".

(6) In the case of HDLM on AIX

Execute the "dlnkmgr online" command and change the offline path to the online status.

```
# /usr/DynamicLinkManager/bin/dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the "dlnkmgr view -path" command

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus        IO-Counts        IO-Errors
Online            310              0

PathID  PathName        DskName .....     ChaPort Status  Type .....
000000  .....           HITACHI DF600F    0A      Online  Own
000001  .....           HITACHI DF600F    1A      Online  Non
```

Check that the values of "Paths:" and "OnlinePaths:" are the same. Then, check that all paths are "Online".

(7) In the case of HPM on AIX

Execute "datapath query adapter" command.

```
# /opt/HITdpo/bin/datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State    Mode    Select  Errors  Paths  Active
  0     fscsi0          DEGRAD   ACTIVE  36098   0       8      8
  1     fscsi1          NORMAL   ACTIVE  38      0       8      8
```

Since the server cannot complete the I/O issued to the controller replacing the micro program, the status of the path may change to "DEGRAD" or "FAILED" from "NORMAL". If you want to switch this status to "NORMAL", use the "datapath set adapter ? online" command. (? = adapter number)

```
# /opt/HITdpo/bin/datapath set adapter 0 online
```

After execution of this command, execute "datapath query adapter" command to check that the "State" of the path is "NORMAL".

(8) In the case of HDLM on Windows

Execute the "dlnkmgr online" command and change the offline path to the online status.

```
# dlnkmgr online
Execute command?
[y/n] : y
KAPL01022-I The six paths are processed. Operation name = online
KAPL01001-I The HDLM command was completed normally. Operation name =
online
```

Execute the "dlnkmgr view -path" command

```
# dlnkmgr view –path
Paths:000012 OnlinePaths:000012
PathStatus      IO-Counts       IO-Errors
Online          310             0

PathID  PathName        DskName .....   ChaPort Status  Type .....
000000  .....           HITACHI DF600F  0A      Online  Own
000001  .....           HITACHI DF600F  1A      Online  Non
```

Check that the values of "Paths:" and "OnlinePaths:" are the same. Then, check that all paths are "Online".

(9) In the case of HPM on Windows

Execute "datapath query adapter" command.

```
C:\Program Files\Hitachi\Path manager> datapath query adapter

Active Adapters :2
  Adpt# Adapters Name   State     Mode    Select  Errors  Paths   Active
  0     fscsi0          DEGRAD    ACTIVE  36098   0       8       8
  1     fscsi1          NORMAL    ACTIVE  38      0       8       8
```

Since the server cannot complete the I/O issued to the controller replacing the micro program, the status of the path may change to "DEGRAD" or "FAILED" from "NORMAL". If you want to switch this status to "NORMAL", use the "datapath set adapter ? online" command. (? = adapter number)

```
C:\Program Files\Hitachi\Path manager> datapath set adapter 0 online
```

After execution of this command, execute "datapath query adapter" command to check that the "State" of the path is "NORMAL".

(10)In the case of VxVM-DMP on Linux

When DISABLED is included in the path status displayed by the command [vxdmpadm getsubpaths ctlr=cx], execute the command [vxdmpadm enable ctlr=cx] for the CTLR-NAME (c2 in the above case), and change the path into the enable status. After that, execute the command [vxdmpadm getsubpaths ctlr=cx], and check that all the path statuses are returned to ENABLED (cx is CTLR-NAME).

```
# vxdmpadm enable ctlr=c2

# vxdmpadm getsubpaths ctlr=c2
NAME   STATE[A]      PATH-TYPE[M]  DMPNODENAME ENCLR-TYPE  ENCLR-NAME  ATTRS
==========================================================================
sdb    ENABLED(A)   PRIMARY       sdb         HDS9500V    HDS9500V0   -
sdc    ENABLED      SECONDARY     sdc         HDS9500V    HDS9500V0   -

```

The following message is displayed in the console window when the path returns.

```
Nov 11 17:03:28 RH3U3-2 kernel: vxvm:vxdmp: enabled path 8/0xe0 belonging
to the dmpnode 201/0x1f
```

(11)In the case of 9900V

Maintain paths from 9900V to DF700/DF600.
Please maintain paths with 9900V maintenance member.

Step4:

Replace the micro program on the other controller by following the procedures in Step1 to Step3.

6.3 Operations after the Micro Program Replacement

If "IO Timeout" or "AutoSwitch" parameter of PVLink was changed, perform the following operation to recover the original value.

[Operations of returning the PVLink parameters]

(1) Login as a user having the root authorization in HP-UX, and execute "vgdisplay /dev/dsk/c?t?d?" command.

```
# pvdisplay /dev/dsk/c11t0d1
--- Physical volumes ---
PV Name                 /dev/dsk/c11t0d1
PV Name                 /dev/dsk/c13t1d1        Alternate Link
VG Name                 /dev/vg02
PV Status               available
Allocatable             yes
VGDA                    2
Cur LV                  4
PE Size (Mbytes)        4
Total PE                1023
Free PE                 148
Allocated PE            875
Stale PE                0
IO Timeout (Seconds)    60
Autoswitch              On
#
```

(2) If original value of "IO Timeout" parameter was default, execute "pvchange –t 0 /dev/dsk/c?t?d?" command to return. If original value was 50, execute "pvchange –t 50 /dev/dsk/c?t?d?" command. And, execute "vgdisplay ./dev/dsk/c?t?d?" command to check the result.

(3) If original value of "AutoSwitch" parameter was Off, execute "pvchange –S n "dev/dsk/c?t?d?" command to return, and check the result.

When "Auto Failback :" is disabled, execute the following.

[Operations of returning the HDLM parameters]

(1) Excute the command [dlmkmgr view -sys -sfunc].

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : off
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```

(2) When "Auto Failback :" is disabled (off), execute the command [dlnkmgr set -afb on].

```
# /usr/DynamicLinkManager/bin/dlnkmgr set -afb on

Execute command? [y/n] : y

KAPL01001-I The HDLM command completed normally. Operation name = set
```

(3) Execute the command [dlnkmgr view -sys -sfunc], and check the change.

```
# /usr/DynamicLinkManager/bin/dlnkmgr view –sys –sfunc
HDLM Version : 04-00
Load Balance : on
Support Cluster :
Elog Level : 3
Elog File Size(KB) : 1000
Trace Level : 1
Path Health Checking : on(30)
Auto Failback : on(1)
Reservation Status : on(0)
KAPL01001-I The HDLM command completed normally. Operation name = view
```
